INSECTS.—ROSE CHAFER, GRAPE VINE FLEA BEETLE, Spotted Pelidnota, Tree Beetle, Caterpillars, Yellow Bear, Hog Caterpillar, Grape Vine Sphinx, Blue Caterpillar, Proctis Americana, Leaf Rollers, Thrips, Aphs, Red Spider, Vine Scale, Diseases, Mildew, Sun Scald.—15 Illustrations.

DESCRIPTION OF (nearly Seventy) VARIETIES.

REVIEW OF VARIOUS SYSTEMS OF PRUNING AND TRAINING, Reversing the Arms, Single Arm System, Bow System, Long Rod Spur System, Upright Canes, Thimery System.—Index.

SENT POST-PAID. PRICE \$1.50.

ORANGE JUDD & CO., 41 Park Row.

A GREAT SUCCESS.

The Gothic Free Fruit Box,

For marketing Strawberries, Raspberries, Blackberries, Grapes, and all small fruits.

Price, \$10 per 1000, for either size, quarts or pints. Sample Boxes of 100 sent upon receipt of \$2.50.

This Box was unanimously commended at the meeting of the "Farmers' Club" of the American Institute, held at their Rooms, April 2d, 1867, and is thus recommended by all the prominent Hotel keepers of New York, Philadelphia, Baltimore, and Washington.

This is to certify, That we consider the Gothic Fruit-Box the best fruit package yet offered to the public; combining, as it does, to a greater degree than any other that we have examined, perfect ventilation, convenience, as well as compactness and beauty of form, and cheapness.

We would, therefore, recommend its use to all fruit growers and dealers, as a matter of economy and self-interest.

Influenced ourselves by such motives, we propose to give the preference hereafter, in our purchases of fruits, to those dealers who pack them in the Gothic Fruit-Box.

Signed: Hitchcock, Darling & Co., Fifth Avenue Hotel; S. Leland & Co., Metropolitan; Stetson & Co., Astor House; Spotts & Hawks, St. Nicholas Hotel, and 23 others.—PHILADELPHIA.—J. E. Kingsley & Co., Continental Hotel; B. Washington, St. Lawrence Hotel; M. A. Hockley, Markoe House; Wm. H. Baker, Ashland House, and 17 others.—BALTIMORE.—Dennis Barnum per Joseph Dorsey, Barnum's Hotel; R. B. Coleman, Butaw House; Wm. C. Reamer, Howard House, and 5 others.—WASHINGTON.—Sykes, Chadwick & Co., Willard's Hotel; Sprague & Co., Kirkwood House; A. L. Potts, Metropolitan Hotel; H. S. Benson, National Hotel.

THE RESULT OF TWENTY YEARS' ORIGINAL INVESTIGATIONS AND HIGHLY SUCCESSFUL PRACTICE.

Over Ten Thousand (10,000) Copies Sold in Two Months!

THE AMERICAN FARMER'S HORSE BOOK.

BY

ROBERT STEWART, M. D., V. S.

One Agent: a Veterinary Surgeon, writes: "I have examined the book carefully, and it is everything I could wish. Send me on more books immediately, for I can hardly keep the sample I have got." Another says: "One gentleman, on my delivering his book, after examining it, handed me \$5.00 and said I need not give him back any change, as he considered it worth more than \$5.00." Another writes: "I think it the best book published on the Horse in this country. I have been doctoring horses, for my neighbors, off and on for the last five years, and have read Youatt, Dadd, and others, on the Horse, but I like Dr. Stewart's book the best, on account of its plain, simple language, and its sound sense on all subjects pertaining to the Horse." Another writes, March 4th: "Prospects good. Those that have received the work are highly pleased with it. The beauty of the work, they say, is, they can understand it, it being so very plain. I was called some few days ago to our County Infirmary, to see one of their valuable horses, and found the animal dangerously ill with lung fever. I thought it a good chance to try Dr. Stewart's remedy, and I must say that I never had an animal recover so quickly under any other treatment." Another report reads: "The work sells well. If there is not a large number sold, I think the fault will be with the Agents." Another Agent: a Veterinarian of long practice, writes, after having read the book: "I am fully convinced of its excellence. Having all my life been familiar with the horse and nearly all his diseases, I feel free to recommend the work to the public." The same person writes in a subsequent letter: "My mare has had a violent attack of Distemper, but thanks to the book, I treated her according to Dr. Stewart's directions, and she will soon be ready for the road." Another says: "It is a most gratifying success. All who have received or seen it, are highly pleased with it."

The work is written from a standpoint DISTINCTIVELY AMERICAN, and covers the WHOLE GROUND OF

Stock Raising and Stock Management, including the treatment of the Diseases of the Horse, (especially the AMERICAN Horse,) more satisfactorily than any other book extant.

☞ Sold only by Subscription.

☞ Send for Circulars, giving full particulars, terms, &c. For Territory in the Western or South Western States, address either

IMPORTANT TO OWNERS OF STOCK.

THE AMERICAN STOCK JOURNAL & FARMERS' AND STOCK BREEDERS' ADVERTISER.

A first class Monthly Journal devoted to Farming and Stock Breeding. Each number contains 36 large double column pages, illustrated with numerous engravings. Only \$1.00 a year. Specimen copies free.

HORSE AND CATTLE DOCTOR FREE.

The publishers of THE AMERICAN STOCK JOURNAL have established a Veterinary Department in the columns of the Journal, which is placed under the charge of a distinguished Veterinary Professor, whose duty it is to receive questions as to the ailments or injuries of all kinds of stock, and to answer in print in connection with the question, how they should be treated for a cure. These prescriptions are given gratis, and thus every subscriber to the Journal has always at his command a Veterinary Surgeon free of charge. Every Farmer and Stock Breeder should subscribe for it. We will send until the 1st of January for 50 cents. Address

N. F. BOYER & CO., Gum Tree, Chester Co., Pa.

500,000 ARBOR VITÆ, 6 to 12 inches high, for sale at \$5.00 per 1,000. A. P. CHAPMAN, 154 Fulton-st., New York.

BRADMA POOTRAS, bred from stock weighing 24 lbs. per pair at maturity. Warranted pure. Can be seen on owner's premises. Price, \$3 per pair; \$12 per trio. Eggs, \$2 per dozen. J. M. HALSTED, 63 Pearl-st., New York.

(Business Notices \$2.50 per Agate Line of Space.)

THE GREAT AMERICAN TEA COMPANY

(Established, 1861).

THE IMMENSE PROFITS OF THE TEA TRADE.

The Proprietors of "THE GREAT AMERICAN TEA COMPANY," became fully convinced, several years ago, that the consumers of Tea and Coffee were paying too many and too large profits, on these articles of every day consumption, and therefore organized THE GREAT AMERICAN TEA COMPANY, to do away, as far as possible, with these enormous drains upon the Consumers, and to supply them with these necessities at the smallest possible price.

To give our readers an idea of the profits which have been made in the Tea trade, we will start with the American houses, leaving out of the account entirely the profits of the Chinese factors.

1st.—The American House in China or Japan makes large profits on their sales or shipments—and some of the richest retired merchants in this country have made their immense fortunes through their houses in China.

2d.—The Banker makes large profits upon the foreign exchange used in the purchase of Teas.

3d.—The Importer makes a profit of 33 to 50 per cent. in many cases.

4th.—On its arrival here it is sold by the cargo, and the Purchaser sells it to the Speculator in invoices of 1,000 to 2,000 packages, at an average profit of about 10 per cent.

5th.—The Speculator sells it to the Wholesale Tea Dealer in lines at a profit of 10 to 15 per cent.

6th.—The Wholesale Tea Dealer sells it to the Wholesale Grocer in lots to suit his trade, at a profit of about 10 per cent.

7th.—The Wholesale Grocer sells it to the Retail Dealer at a profit of 15 to 25 per cent.

8th.—The Retailer sells it to the consumer for *all the profit he can get*.

When you have added to these *eight* profits as many brokerages, cartages, storages, cooperages, and waste, and add the original cost of the tea, it will be perceived what the consumer has to pay. And now we propose to show why we can sell so very much lower than small dealers.

We propose to do away with all these various profits and brokerages, cartages, storages, cooperages, and waste, with the exception of a small commission paid for purchasing to our correspondents in China and Japan, one cartage, and a small profit to ourselves—which, on our large sales, will amply pay us.

Some parties inquire of us how they shall proceed to get up a club. The answer is simply this: Let each person wishing to join in a club, say how much tea or coffee he wants, and select the kind and price from our Price List, as published in the paper or in our circulars. Write the names, kinds, and amounts plainly on a list, and when the club is complete send it to us by mail, and we will put each party's goods in separate packages, and mark the name upon them, with the cost, so there need be no confusion in their distribution—each party getting exactly what he orders, and no more. The cost of transportation the members of the club can divide equitably among themselves.

The funds to pay for the goods ordered can be sent by drafts on New York, by Post-Office money orders, or by Express, as may suit the convenience of the club. Or, if the amount ordered exceeds thirty dollars, we will, if desired, send the goods by Express, to "collect on delivery."

Parties getting their Teas from us may confidently rely upon getting them pure and fresh, as they come direct from the Custom House Stores to our warehouses.

The Company have selected the following kinds from their Stock, which they recommend to meet the wants of clubs. They are sold at Cargo Prices, the same as the Company sell them in New York, as the List of prices will show.

Hereafter we will send a complimentary package to the party getting up the club. Our profits are small, but we will be as liberal as we can afford. We send no complimentary package for clubs of less than \$50.

All goods sold are warranted to give satisfaction.

PRICE LIST:

YOUNG HYSON (Green), 80c., 90c., \$1, \$1.10, best \$1.25 per pound.

GREEN TEAS, 80c., 90c., \$1, \$1.10, best \$1.25 per pound.

MIXED, 70c., 80c., 90c., best \$1 per pound.

JAPAN, \$1, \$1.10, best \$1.25 per pound.

OOLONG (Black), 70c., 80c., 90c., best \$1 per pound.

IMPERIAL (Green), best \$1.25 per pound.

ENGLISH BREAKFAST (Black), 80c., 90c., \$1, \$1.10, best \$1.20 per pound.

GUNPOWDER (Green), \$1.25, best \$1.50 per lb.

P. S.—All towns, villages, or manufactories, where a large number of men are engaged, by CLUBBING together, can reduce the cost of their Teas and Coffees about one-third by sending directly to the

GREAT AMERICAN TEA COMPANY,
31 and 33 Vesey-Street.

Post-Office Box, 5,643 New-York City.

We call special notice to the fact that our Vesey Street Store is at Nos. 31 and 33 Vesey Street, a large double store.

From the Methodist, N. Y. City.

We call special attention to the advertisement of THE GREAT AMERICAN TEA CO., in one of the columns of this paper, from which it will be seen that, by their "Club System," they offer extraordinary inducements to the consumers of the beverage which "cheers but not inebriates," claiming the saving of a very large percentage. Of this the purchaser may judge for himself by reference to their Price List. We have tested the quality of their Teas, and, so far as our experience goes, we are prepared to say that they are all that is claimed for them.

From the Evangelist, N. Y. City.

TEAS.—The attention of persons who purpose attending the May Anniversaries is directed to the advertisement of THE GREAT AMERICAN TEA CO., Nos. 31 and 33 Vesey Street. It will be seen that this Company have made arrangements to supply families with the choicest new crop of Black, Green and Japan Teas at wholesale prices. The Company guarantee all the goods they sell to give entire satisfaction. This will be a good opportunity for parties from a distance to lay in a stock for family use at wholesale prices, thus saving several profits.

From the Christian Intelligencer, N. Y. City.

THE GREAT AMERICAN TEA COMPANY.—This Company are doing an immense wholesale and retail business, and are thus enabled to offer their Teas and Coffees at very low prices, and of a quality which cannot fail to give entire satisfaction. Those who wish to economize are requested to read the advertisement of the Company in another column of this paper.

MAY ANNIVERSARIES.

A good opportunity for sending Club Orders will be afforded by the many persons who will be attending the Anniversaries to be held in New York City during the month of May. A visit to our Establishment of half an hour, and inspecting our method of doing business, &c., will be time well spent.

We shall be happy to see any of our friends who may attend the Anniversaries.

THE GREAT AMERICAN TEA CO.,
31 and 33 Vesey-street, N. Y.

On page 190 of the *Agriculturist*, the Company publish their mode of doing business, and other matters interesting to consumers of Teas and Coffees. It is worthy of perusal.

SPECIAL NOTICE.

A Valuable New Book Just Published.

THE AMERICAN FRUIT CULTURIST.

By JOHN J. THOMAS,

Associate Editor of "Cultivator and Country Gentleman."

In one handsome Post Octavo Volume of over FIVE HUNDRED pages, illustrated by FOUR HUNDRED and EIGHTY accurate engravings. Strongly and beautifully bound in extra muslin.

Price, \$3.00, by mail, FREE OF POSTAGE.

This is the most thorough and complete work on the subject published in this country. It covers the whole ground of Fruit Culture—containing in a clear, practical, and systematic manner the simplest detail as well as the more difficult methods of cultivation. It seems as if nothing had escaped the attention of its experienced author.

The criticisms of the Press are WITHOUT EXCEPTION, of the most flattering and favorable character.

A few will show the opinion expressed by all:

"Possesses sterling value."—*N. Y. Daily Tribune*.
"Superior to any Fruit book yet published."—*Illinois Journal, Springfield*.

"If has an honest look about it: we advise all who feel an interest in Fruit culture to put themselves in possession of it at once."—*Moore's Rural New Yorker*.

"A book of great value."—*Farm and Fireside, Philadelphia, Pa.*

"The most complete and practical work on the subject published."— *Rochester Daily Democrat*.

"Mr. Thomas is master of the matter of which he writes so well."—*Boston Traveller*.

"We commend it both to experienced practitioners and to new beginners with entire confidence."—*Cultivator and Country Gentleman*.

"No Agriculturist or Horticulturist ought to be without it—we recommend it unhesitatingly."—*Practical Farmer, Philadelphia*.

"A safe and reliable guide, on the various subjects on which it treats."—*Worcester Gazette*.

"The book is one of great value."—*New Haven Register*.

"The best and most comprehensive horticultural treatise for general use it has ever been our fortune to read."—*New Bedford Mercury*.

"The work is a practical one."—*Philadelphia Inquirer*

THE EUREKA BRICK MACHINE

makes 3,000 splendid Brick per hour, with only nine men and one pair horses, or 4,320 per hour by steam power. Has no complex machinery to be getting out of order or breaking down. Its great simplicity and marvelous power command the approval of every expert, at sight.

We challenge the world to produce its equal.

Satisfaction guaranteed to all purchasers.

ABRAM REQUA, General Agent,
No. 141 Broadway, New York.

NEW WATER PIPE.

WHY RUN ANY RISK?
That leaden pipes contain water, spiny water, and injure the health, is beyond question. A certain protection is the recently invented EXPOSED BLOCK TIN PIPE. Water flowing through this pipe, cannot be impregnated with poisonous solutions of lead, as it comes in contact with pure block tin only. Pamphlets of reports, and opinions, sent free on application. THE COLWELLS, SHAW & WILLARD MET'G. CO., Foot of West 27th St., N. Y.

SQUIRE'S PATENT FRUIT JAR.

Fruits Preserved Without Sugar.

The Only Jar for Preserving Vegetables.

The Newest, Most Convenient and Economical Jar extant.

This Jar is constructed so that the contents can be cooked in it, and all handling of Hot Fruit or Hot Jars or Tempering of Jars avoided; the contents retain all their natural flavor, and the labor of preserving is lessened more than one-half. Pamphlets sent on application.

J. B. BARTLETT, Wholesale Manufacturer,
69 Murray-street, New York.

THE PHRENOLOGICAL JOURNAL is a first-class Pictorial Monthly, devoted to Ethnology, Physiology, Physiognomy, with signs of character, and how to read them. Only \$2 a year, or 20 cents a number. Address the editor, S. R. WELLS, No. 330 Broadway, New York. A good medium for select advertisements. Phrenological examinations daily.

LARGE PROFITS

Can be made in the STENCIL BUSINESS. Complete outfits of Tools and Stock of the best quality furnished by M. J. METCALF & SON, 101 Union-st., Boston, Mass.

OUR FEATHERED FRIENDS. — Drawn and Engraved for the American Agriculturist.

The usefulness of birds, and the damage which some kinds do, are, and will continue to be, subjects of discussion. That they fall legitimately under the dominion of man, and may be encouraged by him if they aid him, and suppressed if they injure him, can hardly be questioned. Regarded among the most beautiful and interesting objects of creation, every one is drawn toward birds, though there are a few we can not but regard with dislike. In the

group in the above engraving will be recognized some of the most beautiful and most common of the small birds, native to the larger part of the Union, and, could we show colors in our printing the collection would be brilliant indeed.

The center of the group is the Blue Jay, (*Cyanura cristata*), closely related to the Crow, easily tamed, and having many of the characteristics of its relatives, ravens and magpies. Above, on the right, is the Baltimore Oriole, or Fire

Hang-nest, (*Icterus Baltimore*), in color, gold and black, weaving a pendant pocket for a nest; on the right, the Red-winged Blackbird, (*Agelaius phoeniceus*), and Red-headed Woodpecker, (*Melanerpes erythrocephalus*). Below, from right to left, the common Yellowbird, (*Chrysomitris tristis*), so pretty and so readily domesticated; the chatty and very useful House Wren, (*Troglodytes aedon*); and the beautiful Cedar Bird, or Wax-wing, (*Anipetis cedrorum*).

Back Volumes Supplied.—The back volumes of the *Agriculturist* are very valuable. They contain information upon every topic connected with rural life, out-door and in-door, and the last ten volumes make up a very complete library. Each volume has a full index for ready reference to any desired topic. We have on hand, and print from stereotype plates as wanted, all the numbers and volumes for ten years past, beginning with 1857—that is, Vol. 16 to Vol. 25, inclusive. Any of these volumes sent complete (in numbers) at \$1.75 each, post-paid, (or \$1.50 if taken at the office). The volumes neatly bound, are supplied for \$2 each, or \$2.50 if to be sent by mail. Any single numbers of the past ten years will be supplied, post-paid, for 15 cents each.

AMERICAN AGRICULTURIST.

NEW-YORK, JUNE, 1867.

June is a month of severe labor, constant care, and unremitting diligence. Throughout the Northern and Middle States the advance of the season is astonishing. It bursts upon us every year with as surprising a fervor as if we had not experienced the same thing ever since we can recollect. The last of May finds the Corn, and similar crops, Sorghum and Broom corn, puny and shivering in their narrow blades, pale, and living apparently on the hope of sunshine coming by and by. June comes, solstitial warmth infuses new life into the plants, they unfurl their broad green banners to the warm, moist airs, and atmosphere, and soil and sunshine favor their making amends for the delays of May. Over a considerable portion of the Northern States, in fact, so far as our exchanges and correspondents inform us, the season has been over the whole country, as with us, unusually backward. A less breadth of Spring grains, especially of oats, has been sown, but on the whole the grain crops promise remarkably well. The planting of potatoes and sowing of roots have been also much delayed. April work was crowded into May, and it is no more than to be expected that May work will hinder and complicate the proper labors for this month. If we remember distinctly, we have before alluded to the great necessity, in successful farming, of working with a definite plan for each month and each day, but we venture to throw out the hint again. A plan makes all the difference between success and failure—between a thrifty, fore-handed well-to-do man, and the shiftless, thriftless, worked-to-death plodder, who toils on his weary days and years, almost literally "taking no thought for the morrow."

Do not over work yourselves, your wives, your sons, or your cattle. Many a farmer has spurred up his growing son to do man's work at 15, and seen the boy broken down at 20, an old man at 30, and very likely, having learned no wisdom by experience, at 40 putting his own boys through the same time-honored course. Feed work-cattle of all sorts in a good degree in proportion to the amount of work required of them, and they will seldom be ailing if there is steady, hard work to do, and they are not strained by extra loads or overwork.

Hints About Work.

Clearing up.—It is to be taken for granted that however late the season, the manure has been hauled out and, except small quantities of rich compost for especial purposes, or the recent accumulations of fertilizing materials, the barn yards and manure sheds are quite cleaned out. Barns at the East at least have been woefully empty for two or three months, and ought long ago to have been swept and cleaned of hay-seed and litter of all kinds; Old hay and straw compactly packed at one side, yet conveniently come-at-able, and the whole establishment put in order for the coming crops. If this has not been done, do it the first rainy day.

Cattle stalls, cow byres and calf pens are empty now, for the most part, and it is a good time, and good wet weather work, to lift the floors, renewing them, cleaning and drying the beams and sills, painting those parts where wood becomes moistened by manure, when quite dry, with hot coal tar, sanding thoroughly before relaying the floors. Make gutters at the same time to carry off the liquids. These should be one part cement and three of good sharp, clean sand. The more time cement gutters, floors or walls have to harden before frost, the better.

Pastures.—Look to the water supply in pastures. Nothing dries up the fountains of milk like a lack of water. See also that the grass is not fed off too close, for any rain may be the last for some weeks, and then permanent damage would be sustained by over-stocked land.

Mowing land.—Early in the month it is usually well to go through the meadows and pastures, and pull or cut up with a spud the roughest of the weeds, or those most damaging to the grass and hay.

Clover, if cut early when just coming into blossom, and given a light dressing of plaster or of any fine compost, will, if the stools are strong, make a vigorous second growth, and ripen a paying crop of seed. Every farmer might raise his own clover seed in most parts of the country.

Haying will begin in favored spots—warm, moist, sunny meadows—and there are many meadows which it is worth while to cut early, in order to get this much out of the way before the main crop of grass is suffering for cutting. Such are especially those meadows which you can rely upon for a good after-math. Cut close on thick sods, but not on thin or open ones. Cut with the machine when the dew is all off the grass, and if a tedder is used, keep it in motion through the grass all the time, after it has lain about an hour; the more the grass is tossed and aired the quicker it will dry. Rake it up while the sun is still very hot, having all in winrows before four o'clock, and leaving it in cocks big enough to retain the heat well into the night. A good part will need but very little sunning the next day, and ought usually to be simply opened and shaken up after the dew is off and the ground hot. Where mowing machines and hay tedders can not be used, cut while the dew is on, turn once, rake up while warm, give the cocks a daily airing and sunning, but do the curing of the hay in the cocks, leaving them well made to shed rain and to hold the heat of the hay. Never let any dew fall on the loose hay.

Corn.—Early maturing kinds will do very well planted the first week in June; soak in warm water until it nearly sprouts, then stir it about with a little previously warmed pine tar until every kernel is coated, then sprinkle with plaster or lime.

Hoeing.—The use of hoeing is not only to kill the weeds, and a clean field is often an unproductive one, but the thorough working and stirring of the soil is equal to a dressing of manure on land in poor heart. The use of mere weeder and surface workers effects but little except the destruction of the weeds. It is most useful to cultivate deeply, and the one horse plow discreetly used between the rows, not to hill up too much, but to mellow and work the soil before the roots get into it, is preferable to any of the cultivators. These implements are most useful after the roots begin to fill the soil more. First the harrow, then the plow, last the cultivator. This doctrine applies equally to corn and potatoes. Frequent and thorough stirring by horse power so as not to hurt the roots, will insure good crops on any good soil.

Root Crops.—Carrots, and parsnips, and beets, may be sowed as late as early in June with fair success. Rutabagas are preferably sown about the 20th in good deep soil, well manured and dressed with bone dust or superphosphate of lime.

White Field Beans may be planted any time during the month. It is best to put them in drills. Bluepod or White Marrowfat are good varieties, the latter much the largest, the former yielding the surest.

Green Forage Crops.—Indian corn, sown in drills about two feet apart, is probably the most reliable crop for furnishing green fodder during the summer. The cost of the seed is an item which, of itself, may deter farmers from using it extensively, especially when Sorghum will do nearly as well both for green and dry use. Millet and Hungarian grass if cut before the seed ripens, afford good fodder also, and will do well on soil somewhat exposed to drought. Peas and oats together may be sowed even in June for cutting and curing as hay or feeding green. This crop requires a good well mellowed soil, but is not especially exhausting. The seed required is about two bushels of each kind to the acre.

Cabbages.—Sow for late crop in seed beds, near the land on which they are to be grown, such varieties as Flat Dutch, Drumhead, Late Bergen, etc. There is ordinarily a good market for cabbages in all our larger cities, and they are fully equal to mangels for cattle, and as sure a crop. A crop of cabbages is one of the best for killing weeds. New land, with a plenty of good manure, is to be preferred. Mr. Henderson says that lime in any form, (bones or otherwise), will prevent club-foot.

Tobacco.—Select the largest plants from the seed beds, and, on a rainy day, transplant them to the field, so as to make the general planting about the 20th. The land should be very rich and mellow, warm, and well tilled. The plants may suffer from attacks of cut worms and grubs, and all missing ones must be reset, as fast as vacancies occur.

Animals of all kinds must have clean airy quarters, or in hot weather they will be exposed to lung diseases from exhalations of fermenting manure, etc. Use plaster freely in stables and fowl houses to arrest ammonia; dry soil is almost equally as good.

Fowls, if confined, should have fresh water and fresh sods daily, and every few days their scratching ground should be forked up and freshened. Especially provide good dusting boxes, and fresh water.

Cattle.—In providing for an increase of stock in the natural way, let no penny-wise policy interfere with the employment of the very best male animals. Use only well-bred bulls of one of the approved breeds, Shorthorn, Devon, Ayrshire, Alderney, etc., if they can be found within a reasonable distance.

Sheep.—We approve of early shearing, without washing, as explained last month. Tub washing has fewer objections than stream washing, and one important recommendation of it, to us, is, that the greater part of the yolk, or grease, may be saved for manurial purposes. This advantage is, however, we believe, generally overlooked. "Beware of dogs." Secure through legislation on the subject, if possible, and the carrying out of good laws. Dip the entire flock in some approved dip, as soon as the sores caused by shearing are entirely well, and there are no sun scalds or other open or tender spots on the sheep. The dips all have some very active poison, arsenic, tobacco, etc., as their bases, and must be used with great care.

Orchard and Nursery.

If the often repeated injunctions to make war on *Insects* have been followed, the orchard will be nearly free from these pests. If a nest or cluster of eggs has escaped, the insects will be the more readily seen on account of their rarity.

Moths may be killed in great numbers by keeping fires or putting lanterns in the orchard at night.

The *Black-knot*, which superficial observers ascribe to Curculio, but which might as well be charged to lobsters, will appear on cherries and plums, bursting up through the bark. Cut and burn at its first appearance, and don't wait until it gets old and black.

Pruning is best done this month, if trees have been so neglected as to need it. Make an open and well balanced head, and remove all limbs that crowd and elude others. If melted grafting wax be brushed over the wounds, it will facilitate their healing. The rubbing off of superfluous shoots, as they start on young trees, will save much cutting next year. Remove suckers.

Grafts will need looking to, and will be making a vigorous growth. If some of the shoots get the lead of others, pinch their growing points. A graft should be treated just as if it were a young tree—indeed it is a young tree planted in another instead of being planted in the soil. Where two grafts have been set, and only one is needed, cut out the weaker one of the two.

Shoots from buds or stock grafts will often be so vigorous and succulent as to be easily broken by the wind, all such should be properly staked until the stem becomes strong and woody.

Borers.—June is the time when most of the eggs are laid, especially of the peach-tree borer. If it were generally understood that the egg of the borer was laid on the outside of the trunk, there hatched, and that the maggot worked its way into the tree, the remedies would be more intelligently applied. Any impediment will prevent the insect from depositing its eggs, and the various remedies of growing tanzy close to the tree, piling stones around it, heaping tobacco stems, earth, or ashes, around it, all act upon the same principle—that of imposing an obstacle to the parent insect. The simplest way is wrap the base of the tree with brown paper for

a foot or so above the ground, letting the lower edge of the paper go below the surface of the soil. Of course all borers already in the tree must be probed out. A wound or depression in the bark will show where they have entered; one who has a proper regard for his trees will examine them frequently, and if there are any signs of the borer, not rest content until it has been killed. The point of a knife will frequently do the work, but if the grub has penetrated deeply, cut a hole with a gonge and follow him up with a wire or flexible strip of whalebone. Don't leave the tree until you are sure that every grub in it is dead.

The *Curculio* will now need attention if one would have plums or cherries. All "applications" have so far been found useless. Nothing serves save jarring the trees and catching and killing the insect. This should be done every morning, early. Various contrivances for catching the insect have been proposed, but any one with a little ingenuity can arrange a convenient cloth for the purpose. A sudden jar is needed to throw the insect down, and it is a good plan to saw off a useless limb and leave a butt against which to strike with a wooden mallet.

The *Slug*, a green slimy and disgusting thing, now appears on the leaves of cherry and pear trees. It is soft, and seems to be easily killed by any dry powder. Dusting lime over the trees is the old and effectual remedy, and Thomas, who is good authority, says that dry road dust will answer as well. We sometime ago suggested the use of white hellebore, but have not heard of its trial.

Aphides, or plant lice, often gather in such quantities on the young growth of fruit trees as to blacken them. They of course do much injury, and should be treated to an infusion of tobacco mixed with soft soap, which is readily applied by means of a syringe or garden engine.

Mulch newly transplanted trees before the drouth comes on, it will often save those that would otherwise perish, especially stone fruits.

Layers should be made as noted on page 222.

Seed beds of fruit and ornamental trees will need special care this month. Thin where the plants are too much crowded, and shade by means of a lattice of lath. If evergreen seedlings show signs of "damping off," as the gardeners call it, or rotting, sprinkle an inch or so of fine dry sand over the bed.

Evergreens may be removed this month if sufficient care be taken to keep the roots from drying. Single trees, hedges, or screens may be trimmed, always keeping the upper branches shorter than the lower ones. Have the tree "furnished" to the ground.

Thinning of fruit may be commenced as soon as it is seen what the "set" is. There is but little danger of removing too much. Most of our careful cultivators find it necessary to thin two or three times. There is no danger of taking off too much.

Cultivation.—That is a frequent stirring of the soil, around newly planted trees, is of the greatest importance. It is now conceded that mellow earth is one of the most valuable kinds of mulch. Besides, it is of importance to keep down

Weeds, which should never be seen in a well-kept Nursery or Orchard. As to whether he should grow

Crops in the Orchard, see our notes last month.

Fruit Garden.

The notes in regard to pruning, insects, thinning fruit, and cultivation, given under Orchard, apply with even more force to the Fruit garden, where we suppose the highest culture is practised.

Dwarf trees will need to be formed by pinching, and whatever system is followed should be faithfully carried out. Every grower of dwarf trees, which he means to keep as dwarfs, should read Rivers' *Miniature Fruit Garden*. If one wishes to

Exhibit fruit at any of the coming fairs, he should begin to prepare his specimens. The fine shows made of large fruit are produced by severe thinning and high feeding and mulching. We have not much sympathy with this culture, but if one is to practise it, it is well to begin in season.

Currants will now be making many useless

shoots, which should be rubbed out as they start. Mulching the soil will increase the size of the fruit. On the first appearance of the currant worm, dust the bushes with white hellebore. The same remarks as to general treatment, apply to

Gooseberries, which, if marketed, as well as currants, bring better prices when green than when ripe. If mildew appears on the bushes, use sulphur freely.

Raspberries and Blackberries of these varieties disposed to make suckers, should have all removed that are not needed for new plants. Tie up the new growth to stakes or trellises, or in field culture stop the canes at the height of four or five feet, and make them self-supporting.

Grapes should have all superfluous shoots rubbed off. Do not let young vines overbear. One bunch to the shoot is enough for the first year. More failure of varieties is due to over fruiting, when the vine is young, than to any real fault of the variety. On old vines pinch off the fruiting shoot at three leaves beyond the last cluster. Never remove leaves to expose the fruit to the sun. The leaves do the work, and the berries develop best when shaded. Keep young vines to a single cane. Use sulphur freely on the first appearance of mildew. For the larger insect pests, such as beetles and caterpillars, hand picking is the only remedy.

Strawberries must be mulched before the fruit gets large. Use straw, dry hay, corn stalks, or similar material. Saw-dust is bad, as it soils the fruit almost as much as earth. In hill or row culture, keep the runners off and keep all plantations free of weeds. See article on picking on page 220.

Kitchen Garden.

The most important crop to be looked after this month is weeds. A sharp steel rake or a hoe-rake should be kept in constant use, and in a properly managed garden no weed will get so large that it cannot be demolished by the use of one of these. It takes but little time to go over the garden with a rake, and if it be frequently done, it will save much subsequent digging with the hoe. Very few people have an idea of how a garden should be kept, and they would get a good lesson if they could but see some of the market gardens around New York City, where gardening is not pursued for pleasure, but on high priced lands and for the money that is to be made out of it.

Replanting will be necessary when late cold rains have caused the early sowing to rot, or where late frosts have destroyed the crop. Most things, in northern climates, sown the first of June, will in the end do as well as if sown earlier.

Asparagus should not be cut too late. When peas are ready, stop cutting, hoe over the bed, and if there is any good compost at hand, give it a top dressing, and then let the tops have their own way, and grow to give strength to the roots.

Beans may still be planted for snaps or dried beans. Limas in cold localities may still be planted. The best for late plantings is the small lima. See notes under this head last month.

Cabbages, Cauliflowers, Broccoli, and Brussels Sprouts.—The early cabbages and cauliflowers from cold frames will be ready for use or market, and the ground may be cleared for other crops. In whatever condition the crops may be, they should be kept well hoed until they get too large to work among. Set out plants for late crops, and look out for the cut worm. Its holes are easily found, and when its retreat is discovered, dig out and destroy. In small plantings it may be well to wrap the stem of the plant with a leaf or bit of paper as a prevention, but on a large scale this is not practicable. See article on transplanting on page 221.

Beets.—Keep down the weeds and thin freely. Four to six inches is the proper distance. The early sorts will now be ready for use. The thinnings of the beet crop make excellent greens. Sow seeds of the Long Blood for a late crop.

Carrots may still be sown. The early ones must be thinned and weeded. Early carrots, even if not larger than a finger, bring a good price in the market.

Celery.—Keep the seed beds well weeded and cut back the plants to make them grow stocky. For early celery, some plants may be set in well manured trenches, but in our warm climate there is but little satisfaction in raising early celery.

Corn should be planted at intervals of about two weeks, and a succession of good sweet corn may be had until frost stops its growth. The variety called Stowell's Evergreen is the best for late.

Cupsicums.—This month is early enough to put out this tropical plant. Give it a warm exposure and rich feed, and it will reward you for the care in time with its pungent fruit.

Cucumbers.—Set out plants started under glass. Sow for pickles in well prepared land about 4 feet apart, giving a shovelful of good manure to each hill. Put in plenty of seed to give the bugs a fair chance to leave some plants to grow.

Egg Plants are dainty and uncertain. Sometimes a plant will give 6 or 8 fine fruit, and again it will be satisfied with yielding only one. Give them all the hoeing you can, all the liquid or other manure you can spare, let them have the warmest exposure, and then if they will, they will, and if they wont, they wont. We know of no more freaky plant.

Endive may be sown for a late salad. When the plants are large enough to handle, put them out a foot apart each way.

Lettuce in the warm months is apt to run to seed. The India is the best for summer sowing.

Melons.—The directions as to cucumbers apply to them. Earlier fruit may be had by thinning as soon as the crop has set. More fruit is usually set upon a vine than will ripen.

Onions.—No crop needs more care in weeding and thinning than this. In marketing, it will pay to send very young onions for sale. For ripe bulbs, thin to 3 or 4 inches. Potato onions are ripe when the tops fall over. Several remedies have been suggested for the maggot. Hot water seems to be the most generally successful application.

Parsnips should be thinned and hoed as soon as they are large enough to handle.

Peas.—Plant for late crops. Stick brush to those that need it. In field culture hoe earth up to the stems and let them run.

Radishes may be sowed for succession wherever there is a vacant spot in light soil.

Rhubarb.—Keep the flower stalks down and remove all weeds from the beds. Now that fruit is in season, the plants may have a rest, and all the better if they have a good dressing of manure. If it is desirable to dry or bottle a supply for winter, now is the time to do it.

Ruta Bogas.—Sow the latter part of the month, and as soon as the plants show themselves, give them a dusting of lime or ashes, to keep off the fly.

Salsify.—This is a most neglected vegetable, of culture as easy as that of carrots. It is capable of being cooked in several ways, and is liked by most people, and will afford an acceptable variety at the farmer's table. It may be sown now and treated like parsnips, and, as it is perfectly hardy, like that, may be left in the ground all winter.

Spinach.—Sow for succession. See last month.

Squashes.—Sow the running kinds, Marrow, Yokohama, Turban, Hubbard, and others, in well manured soil. Let the runners take root. If a vine appears to wilt, look near the root for a borer, cut him out and cover the wounded part with soil.

Sweet Potatoes.—Plant, if not already done, according to directions in April and May numbers, where the best methods of cultivation are given.

Tomatoes.—It is not too late in most places at the North to put these out with expectations of a crop. A light warm soil is best. We have published most of the proposed methods of training; but our own experience, and that of others, has shown us that any elaborate system of training is only of use in gardens where space is valuable. For general crops, any arrangement of brush or rails, that will keep the fruit from the ground, is all the train-

ing that will pay. Those who wish to have the plants look neatly, will use some kind of a trellis.

Liquid manure is a grand thing judiciously applied. An infusion of sheep or barn-yard manure, of the color of "boarding-house tea," which means nothing too strong, may be used with great advantage. In European gardens they have a systematic use of liquid manure, and there as well as in Japan—a country from which we have yet much to learn—much of their horticultural success depends upon the use of human feces in a liquid form. Stimulants of this kind should not be applied in a dry time, unless a proportionate amount of watering, by irrigation or otherwise, be done. The plant cannot grow in a time of drouth, and manure at this time is only an injury.

Last month's notes should be looked over. Several things mentioned there, and now seasonable, have been omitted here for want of room.

Weeds.—We end these notes as we began, with the injunction to never let a weed get too large to be raked out. Don't raise any weed seed.

Flower Garden and Lawn.

Impatience is the great fault of all lovers of flowers; for the boy or girl who plants seeds one day and digs them up the next, to the older one who has read all about gardening and has invested untold sums in plants, all are impatient. Those who have, despite our frequent caution not to be in a hurry, put out their verbenas, heliotropes and the like, and have seen what work these cold May storms have made with them, will probably recollect that these plants are raised in a warm propagating house, and that the change is a little too severe. We do not advise, in the climate of New York, the putting out of any of these things before the 20th of May, and the first of June is full soon enough, as at that time the soil gets warm, the cold nights are over, and the plants have only to go on and grow. If put out too early they get a chill, from which they are a long while in recovering. So

Bedding Plants may still be satisfactorily put out. Those of a low growing habit should be pegged down by some of the modes given on page 219.

Green-house Plants that have grown too large are often turned into the borders with advantage, and cuttings taken for a new stock for the green-house. Among the most desirable these are the

Abutilons, which make admirable plants out of doors as well as in the house, and make good house plants in one year from cuttings.

Fuchsias should also be more freely used in places where they will not be hurt by the sun.

Oleanders, **Oranges**, and the like, do well when turned out into the borders, and the next winter seem to grow all the better for the root pruning they get when taken up in fall. We have not tried yet the hardiness of many of our green-house plants. There are, doubtless, many now considered tender that will prove hardy when put out.

Bulbs should have all the time they require for leaf-growth, and not be lifted until the leaves show signs of decay. When taken up, let the bulbs dry off and the leaves thoroughly wither before they are removed. Wrap the bulbs in paper, label, and store in a cool place, free from vermin.

Annuals.—Those already up will need transplanting. It is not too late now to sow most kinds with the prospect of satisfactory flowers, though the plants may not perfect seed. Asters are now so numerous in varieties, and all so fine, that one can hardly go amiss, and nothing gives a finer show.

Tagetes signata pumila.—Though as a general thing, we prefer a flower of some other color than yellow, is one of the finest of the later annuals. Its foliage is so delicately cut, and its habit is so compact, that we do not notice the very strongly marked "yaller" of the numerous blossoms. Of course every one will have Candytuft, Mignonette, double Zinnia, and the whole class of

Everlasting Flowers, which not only give pleasure while they are growing, but are pleasing after they

are plucked. **Helichrysums**, **Aeroeliniums**, **Rhodanthuses**, and all the rest, are fine in the garden and the dried flowers are pleasing in the parlor in winter.

Herbaceous Perennials are generally multiplied by division of the roots, but when one has command of a propagating house, he can multiply them by divisions of the stems before they flower.

Tie up all plants that need support. Much of the neatness of a garden depends upon sticks and strings, and these should be used in a manner that will be effective and not obtrusive.

Green and Hot-Houses.

The plants will, of course, be taken out according to their hardiness. The old custom of clearing the houses is now giving way to proper shading and ventilating, and keeping many of the plants inside, where they do better than if exposed to burning suns, drenching rains and cold winds out of doors. It is of benefit to many of the

Green-house Shrubs to turn them out altogether, as it gives them a new root growth, and they are finer plants when potted for the next winter.

Plants in Pots should be placed on planks or a layer of coal ashes, so that worms may not enter the pots, and if the pots are plunged, some ashes should be placed at the bottom of the hole for the same purpose. Camellias and other plants, with evergreen leaves, should have the shade of an evergreen screen or be placed under a lattice. Do not neglect to give potted plants the necessary water.

Houses may now be repaired, and the plants left in them made to make the best possible display. Do not neglect to provide means for

Shading, which is necessary for even tropical plants. Whitewash upon the outside will usually last long enough, or muslin screens may be put on the inside.

Potting Soil of the best kind is made by stacking up sods from a pasture and allowing them to rot. It is well to turn the heap over occasionally and pick out the worms and grubs.

Cold Grapery.

When the vines are in flower, watering must be discontinued, and sudden changes of temperature avoided. The temperature should be from 85 to 90 at mid-day, and allowed to sink very gradually at night. Perfect fertilization is secured by giving the bunches a gentle flirt with the finger when they are in full flower. Leave only one bunch to a shoot, and stop the shoot at the third leaf beyond the bunch. Avoid over-cropping, especially on young vines. Thin the berries when they are as large as peas, removing one-half or more. As the bunches increase in weight, they will need to be supported by tying up to the vines.

Apiary in June.—Prepared by M. Quinby.

Swarms may be expected throughout this month. Any colony that was good early in the season, and has not increased enough to swarm by July, should be examined for the cause. If diseased, and bees enough are left, drive out into a clean hive, to begin anew. If queenless, or if the queen be barren, or a drone layer, give the stock a new queen, first removing the old one. In a good season the apiarian, if he understands his business, can control his bees, according as he wants surplus honey, or increase of stocks. He should not expect an excess of both. When swarms are wanted, make them as directed last month. Any live, containing clean combs, where bees have died last winter, may be used again for new swarms. Be careful to remove all clusters of dead bees, moldy or soiled combs, before the bees are introduced. If kept long in warm weather, worms will appear; use a little smoke of brimstone to destroy them, even if very small. Sulphured hives may be used the next day, if needed, without harm to the bees. Light hives, set away partly full last fall, where they have frozen, will not need smoking—no worms hatch. If colonies are multiplied, and no box honey is made, it should

not be carried too far. With the movable combs very much can be done toward equalizing and strengthening the weak stocks, yet, if all are weak, it is very difficult. A hive that does not swarm, can be made to assist others, by frequently giving them a comb or two filled with sealed brood. A hive, kept especially for this purpose, pays well. You will get *more bees* and *surplus honey* from one strong hive, than from a half dozen weak ones. When the increase of colonies is limited to one from each stock, it will, as a rule, give the best satisfaction. There will be enough bees to keep all strong, at all times, and chances for surplus honey are very good. To do this, (arrest swarming,) where they are allowed to swarm naturally, examine all the combs a week after the swarm issues, and remove all the queen cells but one, leaving this to hatch—or, if you have a laying queen, introduce her, which is much better. Where stocks are plenty, and box honey is the object, swarms should be prevented. This can usually be done by removing the old queen, and in due time destroying all royal cells but one, or introducing a young queen, reared in some other way. As soon as the hive is full of bees, plenty of boxes, with clean, white comb in them—the more, the better—as heretofore directed, should be immediately put on, and as fast as filled, removed, and replaced by others—without waiting for every cell to be sealed.

Those Two Extra PREMIUMS! FOR YOU!

We have prepared two most excellent and valuable Annuals, viz. the **Agricultural Annual No. 1**, and the **Horticultural Annual No. 1**. Though of large size, and costly, they are sold at only **50 Cents each**, and many thousands have been disposed of already. They are designed for *general use*, and one or both of them should be found in every Family in America. But they were originated and executed too late to be ready at the beginning of the year, and so they did not get so large a general distribution as they really merit. We design to make these Annuals a "permanent institution," that is, to issue both of them at the beginning of every year, and we have begun the preparation of material that will make the next numbers (for 1868), much superior even to the valuable volumes of this year.

Now we want everybody to get the first number, so as to have the series complete from the beginning, for we know everybody will want the future numbers. THEREFORE, we make the following offer: To every person who shall, after May 1st, send us a subscriber to the *Agriculturist* for this year, at the regular rate (\$1.50), we will present and send post-paid, either a copy of the No. 1 *Agricultural Annual* or of No. 1 *Horticultural Annual*, whichever is desired, (if applied for at the time of subscribing.) They are each in neat ornamental covers, beautiful inside and outside, and full of valuable information, including a full almanac, calendar of operations for each month, all finely illustrated, and contain many useful articles and suggestions.

Each present subscriber, not already supplied, can thus get one or both of these annuals *free* of expense, simply by procuring and forwarding one or two subscribers—(if the new subscriber thus obtained wants one of the annuals, he can get it for himself by furnishing another subscriber, and so on.) We shall keep the Annuals on the press until June 30, and print all that may be called for under this offer. This extra premium is entirely distinct from our regular premiums offered on this page.

AMERICAN AGRICULTURIST.

ORANGE JUDD & Co., Publishers, 41 Park Row, N. Y. City.

ANNUAL SUBSCRIPTION TERMS (always in advance): \$1.50 each for less than four copies: Four to nine copies, \$1.25 each: Ten to nineteen copies, \$1.20 each: Twenty copies and upwards, \$1 each. Papers are addressed to each name.

ALL THIS MONTH

Can be used in filling up premium lists begun, and in making new lists of subscribers, to secure the valuable articles in the table below. **Take Notice**, that two subscribers sent in for the rest of this year, (the second half of the present volume,) may count as one full subscriber towards a premium. Large numbers of premium names were sent in last year during **June**, and the same may be done this month.

Look over our premium list, choose the premium you would like, take a copy of the paper, rally out among neighbors and friends, in your own neighborhood and elsewhere (for premium clubs need not be all at one post-office), and in a brief time the desired number of subscribers can be gathered, and the premium secured.

Table of Premiums and Terms, For Volume 26—(1867).

Every article offered is new and of the very best manufacture. No charge is made for packing or boxing any of the articles in this Premium List. The forty-three Premiums, Nos. 1, 2, 6, and from 29 to 32, and from 40 to 75 inclusive, will each be delivered FREE of all charges, by mail or express, (at the Post-Office or express office nearest recipient), to any place in the United States or Territories, excepting those reached only by the Overland Mail.—The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance that may be specified.

We take so much pains to procure only good articles in all cases, that any one securing anything from our premium list, saves the risk usually run of getting poor or indifferent goods, when buying of unknown or irresponsible parties. Every thing we send out as a premium is guaranteed to be the best of its kind and price.

Old and new subscribers count in premium lists.

Our premiums are standard articles, and enough can be obtained to supply all calls for premiums for six months. Every canvasser can take abundant time, but

As fast as subscriptions are obtained, send them along, that the subscribers may begin to receive the paper; and when all the names that can be obtained are forwarded, select the premium, and it will be promptly furnished. To save mistakes and keeping accounts, send with each list of names, the exact subscription money.

Remit in Post-Office money orders, drafts or checks on N. Y. City; if these can not be had, register money letters.

Every name designed for a premium list must be so marked WHEN sent in. (We can not count others.)

For Full Description of the several premiums see October *Agriculturist*, pages 349 to 352, or apply for a Descriptive List, which will be furnished free and post-paid. We have room here for only the following:

No. 63 to 74—Good Libraries.—These can be selected by the recipients, from any of the books named in the list in this column. The books will be delivered free of cost, by mail or express.

No. 75—General Book Premium.—

Any one not desiring the specific Book premiums, 63 to 74, on sending any number of names above 25, may select Books from the list (below), to the amount of 10 cents for each subscriber sent at \$1: or to the amount of 30 cents for each name sent at the (ten) club price of \$1.20 each: or to the amount of 60 cents for each name at \$1.50. This offer is only for clubs of 25 or more. The books will be sent by mail or express, prepaid by us.

BOOKS FOR FARMERS AND OTHERS.

[For sale at the office of the *Agriculturist*, or they will be forwarded by mail, post-paid, on receipt of price. All these are included in our Premiums, Nos. 63 to 75, above.]

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the *American Agriculturist*, show at a glance the transactions for the month, ending May 15, 1867, and also for the same month last year:

1. TRANSACTIONS AT THE NEW-YORK MARKETS.

RECEIPTS.	Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.
26 days this month.....	234,000	1,087,000	3,269,000	525,000	41,000	
25 days last month.....	218,000	1,040,000	2,914,000	596,000	709,000	

SALES.	Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.
26 days this month.....	234,000	1,087,000	3,269,000	525,000	41,000	
25 days last month.....	218,000	1,040,000	2,914,000	596,000	709,000	

2. Comparison with same period at this time last year.

RECEIPTS.	Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.
25 days 1867.....	131,700	221,000	136,000	4,750	89,000	31,000
25 days 1866.....	135,000	5,500	69,000	1,100	107,000	34,000

SALES.	Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.
25 days 1867.....	234,000	1,087,000	3,269,000	525,000	41,000	
25 days 1866.....	218,000	1,040,000	2,914,000	596,000	709,000	

3. Exports from New York, Jan. 1 to May 15:

	Flour.	Wheat.	Corn.	Rye.	Oats.	Barley.
1867.....	150,471	35,439	2,942,114	127,282	95,799	788,780
1866.....	351,039	109,467	2,160,516	171,826	676,620	
1865.....	439,003	219,946	149,767	111	24,913

CRANBERRIES.....	12 00	20 00

Since our last, there have been frequent fluctuations in gold—the market closing buoyantly at 136 1/2.... Breadstuffs have been in quite brisk demand, most of the month, at advancing prices. Much of the business has been on speculative account. Toward the close, the inquiry began to diminish, and prices to recede, especially for Corn, which, from the high prices reached through speculative management, has suddenly declined 20¢@25¢. per bushel, closing decidedly in favor of purchasers. California has sent hither further liberal supplies of Flour and Wheat, which are in high favor with buyers. Mixed Corn of last year's crop has been coming forward quite freely, adding to the depression in the market at the close.... Provisions have been in fair demand at generally well maintained figures.... Cotton has been in less demand at variable prices, closing pretty firmly, on more favorable reports from Liverpool.... A very light business has been transacted in Wool, which has been tending downward. Holders have evinced more disposition to realize.... Hay has been in better supply, and has receded 15¢@20¢. per 100 lbs, within a few weeks. At the reduced rates, the demand has been fair.... Tobacco has been moderately dealt in at steady quotations.... Seeds have been dull and lower.... Other agricultural products have been quiet.

New York Live Stock Markets.

As with wheat, so with live stock, prices have been, and still are, higher than any one could have calculated upon. The comparatively light run of shad this year has helped out the meat markets; a heavy run would have made a very material difference in the value of cattle.... **Beef Cattle** have continued to increase in supply from 4,800, April 16, to 6,000 this week, yet prices have gone up, so that the sales this week are higher than for a year past. Plenty of first quality bullocks sold yesterday at rates equivalent to 18¢@18 1/2¢. **Sheep** for the dressed weight; good, fair lots, 16 1/2¢@17 1/2¢, and the poor at 15 1/2¢@16¢.... **Milch Cows** have been little called for, until within a few days, but beef is so high that milkmen are selling off their poorer milkers, when in anything like selling order, and buying fresh ones. Some families going to the country for the summer, are also taking good cows. Present rates are \$60@75 for poorer cows, \$80@90 for good; and \$95 to \$125 for extra, or fancy animals—calves always included.... **Veal Calves** have been plentiful, but the supply is less this week, and, influenced by the high price of beef, the best calves sell at 10 1/2¢@11 1/2¢. or 12¢. **Sheep** live weight; common to poor, 10¢@11¢.... **Sheep and Lambs**—Sheep are in good supply, and prices declining from the rates two weeks ago. Sheared sell at 7¢@9¢. **Pigs**, live weight, according to quality. Spring lambs are scarcer than usual at this season, and bring 15¢. to 18¢. **Live Hogs** have been abundant and lower, but these are also now influenced by the beef market, and prices rather better, the latest sales being at 7 1/2¢@8¢. **Live Hogs**. The supply during the past five weeks has been quite fair for the season, as is shown in the following table:

Containing a great variety of items, including many good hints and suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Take Notice!—All Subscriptions begin with the Volume, unless otherwise desired and specified when subscribing. All subscriptions received up to June 15th are entered down for the entire volume, and the numbers from January 1st are forwarded. We keep on hand, or print from our electrotype plates, as needed, the entire numbers of the volume, to supply to new subscribers, and to others desiring them. Subscriptions received after June 15th, begin at the middle of the volume, unless otherwise desired or specified.

"41 Park Row To Let."—A subscriber writes, anxiously, that he sees our present office is "To Let," and asks if we are going to "suspend," or "contract."—Far from it; on the contrary, we are expanding. Our present quarters—though occupying the whole of the first floor through from Park Row to Nassau Street, and the large basement under our own floor, and part of that under the Times Office—are becoming too limited. Besides, our lease extends only 3 years longer, and we do not care to erect costly machinery with no certainty of having it remain. To remedy these difficulties and secure a permanent home for the *Agriculturist*, the Publishers have purchased the large buildings right across the Park from the Old Office, viz.: 245 Broadway, with an L opening upon Murray Street. This gives us 5 large floors, 25 feet on Broadway, 14 1/2 feet deep, with the extension to Murray Street, 12 1/2 feet wide, giving an ample rear entrance, hatchways, etc. There are 5 stories, (to which we shall probably add a sixth Mansard story for printing rooms,) and ample basements under the whole for steam-engines, presses, etc. The new building is most admirably located, facing the open Park between the grand New Post Office to be built, and the old City Hall and new County Court House.—As we have control of the old office for three years, and the lease is very valuable, we may remain here sometime yet, and move across the Park when the right kind of a customer comes along to take our present lease; or we may let the

new office, until we need it for immediate occupancy. So, until further notice, our readers may expect to find us in the accustomed place. In the mean time, 41 Park Row, or 245 Broadway, in whole or in part, will be for lease for a time—only one of them, whichever is first called for.

Agricultural and Farmers' Columns.—It has of late become quite the fashion for the secular as well as the religious press to employ some penny-a-liner, with a smattering of agricultural and horticultural affairs, to furnish matter to fill a column or two with talk on these subjects, which is generally "talk" of the concentrated essence of ignorance. These writers are employed at so much a week and the perquisites; as they are generally "on the make," it is not to be supposed that their notices of this machine or that fruit, are given without a consideration. A publisher recently told us that he gave one of these chaps five copies of a work, as he wrote for five different papers. As this "writer" is a "purchasing agent," we suppose that the copies will be turned into cash when his purchasing agency gets an order for the work. It is interesting to see how these fellows get on committees for award of premiums for agricultural implements, and then to see how the owners of these implements hold protracted interviews with them. Of course committee men only seek for the best implements, and makers of implements only seek for the best committee men, and so it is all right. These "column" writers are highly amusing and we would not have them stop on any account, as they would deprive us of a laugh at least once a week.

Fine Engravings.—We take much pleasure in referring to the beautiful engraving on page 226. As a specimen of the art, it has not been excelled, if it has been equalled, by any engraving published in any journal of the country. Where the sheet is printed on both sides, much of the beauty of an engraving is injured, and, as we are often written to for nice impressions of our illustrations, we have had a limited number of copies of this carefully printed on fine, heavy paper, fit for framing. These will be sent post-paid for 50 cts. each. Copies of "Suspense," the much admired dog picture, that appeared in March last, may be had on the same terms.

Gift Enterprises, or Lotteries.—Of the "Ohio Benevolent Gift Enterprise," by Tindor, Gates & Co., referred to last month, Mr. Gates writes, "we have in our possession the originals from which our indorsements are printed." This being the case, the word "pretended" should be stricken out of our remarks, but this makes it so much the worse for the "Governors, Members of Congress, etc.," for we believe they misuse their official position and reputation by giving their names to indorse any Gift Enterprise, however plausible it may seem, or however good its real objects. If Mr. Gates, or Gov. Cox, or Treasurer Warner, or Senator Sherman, etc., can tell us wherein the Ohio Benevolent Gift Enterprise differs in principle or operation, from the Havana or Covington Lotteries, they will perhaps lessen the force of our objections. The best that can be said is, that the profits go to a good object instead of to private pockets. But this makes the matter worse, for the people are led into lottery operations and practices, partly by their sympathies, and partly by the sugar coating of quasi-respectability given to the scheme. The end does not sanctify the means. If Lotteries (alias "Gift Enterprises"), are proper to aid soldiers, then they are also proper for building up schools and churches, paying government debts, etc., and we may at once go back to the custom of the last century. Lotteries offer mainly money prizes to be distributed by lot (the kind of lot is not essential); the gift enterprises offer money, and country seats, farms, houses and other "gifts" in addition. They stimulate people to false hopes of acquiring riches. The judgment of enlightened people has banished lotteries and lottery dealers from most of our States; the benevolent and other gift enterprises are merely bringing back old customs under new names. We commend to Messrs. Tindor, Gates & Co. the recent decision of the Massachusetts Courts in the case of Harris Brothers, whose scheme was ostensibly every way like that of the "Ohio Benevolent Gift Enterprise," in form, means, and proposed objects, except that the Boston operators attempted to make this journal appear to indorse their scheme. The result was they were fined \$14,000, and subjected themselves to a further forfeiture of, in all, about \$50,000.

[From The Boston Daily Herald, April 16, 1867.]

In the Superior Criminal Court, this morning, before Judge Morton, Luther M. Harris and James W. Harris appeared for sentence on an indictment charging them with promoting a lottery, (found at the June term, 1865), and on which they were found guilty, and the exceptions taken, overruled; also on an indictment, found the present year, for having in their possession for sale, and offering to sell, certain lottery tickets; and on a third indictment charging them with promoting a lottery known as the "Rural Home".

scheme. On the last indictment a verdict of guilty was taken and exceptions filed and allowed, but which the Harris Brothers waived to-day. District Attorney Sanger stated to the Court that at the time of the search about \$23,000 of U. S. securities were found in the defendants' trunk; also that a large number of letters were found at the Post Office directed to these brothers, respecting the lottery business, and that the clerk at the Dead Letter Office testified to receiving on an average of five letters a day respecting Harris Brothers' schemes, and that Harnden's Express Company also testified to money packages coming very frequently for the defendants. He also shew a number of letters which had been received by the Chief of Police, the Mayor of this city and the Governor of this State, from parties who had received them from Harris Brothers, and requesting that prosecutions might be made. The District Attorney claimed that this money had been illegally gotten, and that the maximum fine should be imposed.

Chas. H. Hudson, Esq., who appeared in connection with Geo. Starkweather, Esq., as defendants' counsel, stated to the Court that he had but recently been brought into the case, and, as far as he was able to ascertain, he felt sure that the defendants believed that they were doing a legitimate business within the law, and very likely they have been reputed to be doing more than they really were. Mr. Hudson did not deem the business done by the defendants any more of a lottery than Fire Insurance companies, of one of which the District Attorney is President. Inasmuch as the indictment under which the defendants might be sent to the State Prison had been laid on file on account of doubtful questions of law, Mr. H. did not feel like urging the matter of clemency with too much persistency.

Judge Morton said he could not but characterize the business carried on by the defendants,—to call it by its right name,—as an extensive swindle, and he was unable to see how he could do otherwise than impose the maximum fine, as, in his opinion, to do less would be offering a premium to swindlers.

The prisoners (for their bail had been surrendered) were then fined, each, on the first indictment, \$2000; on the second, \$1000 on two counts; and on the "Rural Home" indictment \$1000, making a total of \$14,000, with costs, which will amount to about two hundred dollars. Under the 8th section of chapter 167 of the General Statutes, [of Mass.], the defendants forfeit to the Commonwealth—about \$50,000 worth of property, which includes the \$23,000 in U. S. securities, the "Rural Home" at Woburn, valued at \$13,000, and the fine of \$14,000 and costs.

Washing Compounds of any kind we cannot commend. We do not say there cannot be a good one, but we do not know any one which we are willing to recommend. We regret that the admission by oversight or mistake of an advertisement of such compounds should make us appear to recommend them. It will not be likely to occur again, at least until we find one we can positively indorse from a knowledge of its composition and use. Our advice is, buy none of these things, patented or unpatented, but use good soap, made at home, or by some well known or well recommended manufacturer. See our last volume, page 403, (November Number).

Weighing on the Farm.—Too much "guessing" is practised in disposing of bulky farm products, whereby the buyer, but more frequently the seller, is the loser. Dealers are usually expert from long practice and have the farmer at a disadvantage. A drover soon learns to weigh a bullock with his eye, so as to come within fifty lbs. of his weight every time. A fairbanks or other good scale on the farm will change this, and put both parties on the same footing. (We name the Fairbanks as of well-known reliability.) In addition to insuring fair dealing, such an apparatus will enable one to conduct many interesting and profitable experiments in feeding stock, etc., and to ascertain their comparative thrift at any time.

Sundry Humbugs.—We have no "true" to offer to the swindling fraternity, but it would seem that after the many exposures given in these columns, little more need be said, just now, to guard our readers against the multitudinous schemes constantly resorted to to filch money from the unwary. No regular reader of the *Agriculturist* can be pitied, if, after what has been said, he throws his money away upon any one of these "confidence men" who pretend to solicit his services as an agent for any ticket or lottery scheme. We earnestly caution the reader against every one of these gift enterprises, ticket schemes, prize concerts, secret medicines, Union Associations, artists' unions, jewelry associations, five dollar sewing machines, express parcel men, soldiers' orphans and widows' "distributions" of various kinds, cheap oil manufacturers, ink and washing compounds, honey recipes, wonderful corn and other seeds before unheard of, every advertising doctor, Howard Association, advice to the married, ditto to the unmarried; eye cures, vile instruments, Union book companies, silent friends, cheap money, \$100 to \$500 a month salary or wages, "greenbax," magic wands, hunter's secret, cider recipes, vinegar recipes, complexion beautifiers, love powders, price and prize associations and parcels, farms sold by lot or tickets, Elixirs, etc., etc., etc. We have before us hundreds of these letters, circulars, and advertisements, all of them humbugs. Scarcely one in a hundred of the operators will ever send any return for money forwarded them by mail, or even acknowledge its receipt.

Perhaps in one case in ten thousand, a showy article is sent as a blind to draw the foolish recipient into a larger investment, to his loss.

The Fair of the N. E. Agricultural Society, is to be held this year, at Providence, R. I., beginning September 3d. It is to be upon the new Sprague Park, and, by the reports, the buildings and accommodations promise to be of unusual elegance and convenience. We hope for a large attendance.

The Paris Exposition.—We hear from the daily papers, that this exhibition is rich in this and that, but we learn very little about American agricultural implements. In the first World's Fair in London, 1851, we astonished the world with our implements. We do not know what has been sent to the present Paris Show. There was an American Commission to select articles to send over; this Commission was composed of a great many nobodies, with just a few somebodies to give it respectability. We do not know who made up this "Commission"—but their fitness for the work is shown by the fact that Mr. Greeley, a life-long advocate of total abstinence, was put on the sub-committee on fermented drinks, or liquors, we have forgotten which. If all the other sub-committees were made up with equal fitness, there will be a show well worth going to Paris to see. Of course, there must have been a choice in the agricultural implements, and the man who was most convincing probably had the preference. Now that the Show is fairly open, we look with interest for the results. We are glad to learn that Mr. Ruggles and Prof. Joy, are going over, as they will save the American Department from utter contempt. These gentlemen will worthily represent the scientific interests of our community. Who shall represent our agricultural interests? We learn that the Department of Agriculture has appointed some one to represent its insignificance, but who shall represent our noble body of farmers? Can not some State Society send out a proper person? At all events, we would say to European farmers, that the Department of Agriculture of this country, is in the charge of a man who is kept there in spite of the recorded protest of every or nearly every Agricultural Society in the country. It is our National disgrace, our repulsive sore. Whoever may be sent to represent this miserable concern, no more represents American Agriculture than a lump of clay represents a Sevres Vase.

American Pomology.—The reception given to this work everywhere must be very gratifying to its distinguished author, as it certainly is to his publishers. Very few, who have not tried to classify any thing, can have any idea of the difficulties of the task, and when it comes to putting in order things that are so nearly alike, as are the different varieties of apples, the difficulty is greatly increased. We look upon Dr. Warder's Catalogue of Apples as a remarkable result of patient labor in classifying life-long observations, and this, which is in size a very small portion of his book, should entitle him to the gratitude of every true pomologist.

Manure Making—Bommer's Method.—There is so much good sense, albeit mingled with comparatively harmless error, in the old patent method of Bommer for making (or rather increasing the value and quantity of) manure, that we are not surprised that a considerable edition of the old pamphlets should have been sold, at the low price we offered them at. The old patented process is fully described, and all that used to be sold for \$10, may now be had for 25 cents, for to accommodate those who constantly order it, we bought the old plates and had a new edition printed. The aim of the author is to explain the best method of preparing vegetable and mineral composts; to augment and improve the manure of the farm; to prepare fertilizing liquid for irrigation; to convert into manure the refuse of manufactories, distilleries and kitchens; to revive bot beds without changing the litter.

At the Paris Exhibition.—The *American Agriculturist* will be represented by Mr. Judd in person—wind and tide favoring. He will probably also extend his trip to St. Petersburg, perhaps to have a little chat about our new Northwestern Farm.—The *Agriculturist* is abundantly provided for editorially and otherwise, and matters will go on as usual during his absence.

The Department of Agriculture.—We have, at last, seen one journal that praises the present management of the Department of Agriculture. It is the "Watchman and Reflector," of Boston, and we are sorry to see it "reflecting" the stupidity of the National Seed Shop. The article says: "Mr. Newton has been denounced by several agricultural societies by votes, asking his removal. These votes were procured, undoubtedly, in most cases, by the manage-

ment of aspirants for Mr. Newton's place, and it is time somebody asked for him at least, fair play." Some Boston Societies are involved in this matter, and probably the "Watchman and Reflector" knows what means were used to influence their votes—but we do not believe that any influence was needed to procure from any respectable association an endorsement of the present official's stupidity. Now, editorially, we wish to answer a number of printed slurs and private inquiries. As Mr. Judd is away, we speak for him, and say we are sure he has never desired, or sought for the office of Commissioner, and we believe he would refuse it if forced upon him. He has too long been at the head of a far more powerful and vastly more useful "Department" than that at Washington, to take an inferior position. Besides this, he could not afford to hold any office in Washington, from that of President, down to that of the head of the Department of Agriculture.—Snarlers will please be quiet on this subject.

Blackberries.—For those wishing that really charming new blackberry, the Kittatinny, there is yet ample time and opportunity, as may be seen by noticing Mr. Phoenix's advertisement in this number. From samples shown at this office, as well as the very liberal price and offer Mr. P. makes, we can heartily recommend them to the notice of amateurs and planters, who would keep up with the times and enjoy the fruit next year.

Abortion in Cows.—The N. Y. Legislature, at its last Session, made provision for a commission to investigate the subject of abortion in cows. They made an appropriation so disproportioned to the talent to be engaged in the work, that we are ashamed to say how much—or rather how little—they did appropriate. Prof. John C. Dalton, M. D., has been appointed commissioner, than which no better appointment could he made, and the whole subject is sure of a thorough search. Doct. Dalton has secured the services of Docts. Carnalt, Haigh, and others, known for their devotion to animal physiology, and we await their report with much interest.

Tight Boxes, Barrels, Pails, etc.—Macferran & Co., 721 Chestnut-st., Philadelphia, manufacture a style of hooped ware with an arrangement whereby the upper hoop may be instantly and powerfully tightened by means of a lever, thus fastening the head in, air-tight. These vessels are of various sizes, and useful as fur cases, sugar boxes, slop barrels, milk and butter pails, meat barrels, etc. For these purposes, they are obviously most excellent. In regard to the churns with heads on this principle, we can, at present, only say they are exceedingly convenient.

Benedict's Time Tables, issued monthly by Benedict Bros., 171 Broadway, at 25 cents per copy, contains a Map of the City, and gives in convenient form the time tables on all the Railroads and Steamboats leaving New York for American Ports.

Fuller's Small Fruit Culturist.—Though too late for those who wish to plant this Spring, this work, which is a "Culturist," will be useful to all who grow fruits. We have heretofore had no work especially devoted to small fruits, and certainly no treatises anywhere that give the information contained in this. It is to the advantage of special works that the author can say all that he has to say on any subject, and not be restricted as to space, as he must be in those works that cover the culture of all fruits—great and small. It is not possible for Mr. Fuller to follow in the track of another, and in the present work he gives his own experience and his own views with the freedom that characterizes all his other writings. He will win the esteem of all true lovers of horticulture by the searching criticism he has given to varieties, while those who believe in names rather than things, will of course be offended. The work is especially valuable for the sifting it has given the varieties of Currants and Raspberries, and if it were for this alone, it would be a valuable addition to our horticultural literature. But besides these, it treats of all the small fruits, including several kinds generally slighted or passed over by other authors, and describes the propagation and culture of all in his usual clear and vigorous manner. The chapter on gathering and packing fruit is a valuable one, and in it are figured all the baskets and boxes now in common use. The book is very finely and thoroughly illustrated, and makes an admirable companion to his Grape Culturist; about 275 pages, sent by mail for \$1.50.

Fruit Preserving Solution.—This compound, advertised in another column, was tried last year by one of the editors, and was much liked. Fruit put up with it kept well, had no unpleasant taste, and, being cooked less than is usual in other methods, retained much of its flavor.

Electricity — Lightning. — Electrical phenomena are so strange, and so little understood by the general public, that they stand ready to accept electrical action as the cause of any obscure occurrence. Electricity is the great refuge of the would-be scientific, who say that this and that is due to electricity, and that ends all further questioning. A western writer on pruning, in the *Gardener's Monthly*, will not have the terminal buds cut from the trees in pruning, because they act as "prime conductors" of electricity, which is a very "scientific" way of talking profound nonsense. We have before us two curious illustrations of the way in which electricity is treated. One upon the pear blight, in which the writer refers this malady to the effect of lightning upon the leaves, and another, by a lady, who considers the potato-rot due to the absence of sufficient lightning in certain years. The last named writer accompanies her article by observations, which show that, in her section of country, the years with the most lightning were the freest from the rot. Now, as the rot is a well-known parasitic fungus, brought, comparatively recently, from abroad, and, as in this country, before this unwelcome guest was introduced here, we probably had years quite as deficient in lightning, as we have since had, we cannot regard this view as at all satisfactory. If those who are so ready to ascribe this and that to electricity, would just take the trouble to first study some of the elementary laws of this branch of physics, they would be less apt to run into speculations respecting the influence of electricity.

Storm Signals during Harvest.

The following plan to aid in preventing injury to grain and hay crops from storms during harvest, is presented to the readers of the *Agriculturist* by A. Watson, Esq., of Washington, who has placed himself, extensively in communication with reading farmers through the newspapers. The subject is one of importance, and needs the practical thoughts of the agriculturists of the country. He estimates the extent of the damage as one-third the value of the crops, and proposes that all the County Seats throughout the land should be connected by telegraph lines, (which would require the construction of but few new ones,) and that cannons should be fired at the county town, in a way to make known, accurately, the distance of every telegraphed storm, and the rapidity of its approach. Our contemporaries, whose comments upon this plan we have seen, seem to overlook the fact that thunder showers and storms, which do a great part of the damage, are exceedingly local phenomena, extending, often, over but a few miles in width, and soon exhausting their force. The regular "North-easters" might very well be telegraphed, for they pursue a somewhat regular and known course, from south-west to north-east, along the coast, and directions somewhat varying from this at different parts of the country, inland, we believe.

There may, also, be other well defined classes of storms, whose approach might be announced, and which might be avoided by the use of the telegraph. The firing of cannon at the county court-houses, by county officials, is entirely impracticable, at present, but as there is a telegraph office at almost every railroad station, there might, and should, be a Storm Bulletin at every station, and every person going to and fro should carry the news of approaching storms to his neighbors.

At the Smithsonian Institution in Washington, the meteorologists, aided by able observers in all parts of the country, and by the officers of the telegraph companies, keep a very close watch of the storms, at the time they are in progress. The real problem to be solved, then, is—how to convey the information thus gathered to the farmers. We think it may be easily and simply done, and would earnestly recommend the officers of our railroads to move in this matter, and, as soon as possible, co-operating with the Smithsonian, to have a thorough meteorologist appointed, whose duty it should be to learn the movements and character of storms throughout the country, and communicate definite information along all the lines of railroad telegraphs in the country, which information should be immediately and clearly bulletined at the various stations, by the railroad or telegraph employees. This may be done at once, and the result would doubtless pay the railroad companies thirty-fold for their small expenditure in the increase of agricultural wealth.

Draining for Profit, and Draining for Health. is the title of a new work on this most important subject, by Col. Geo. E. Waring, Jr., published by Orange Judd & Co., which will be issued early in the present month. The theory and practice of thorough draining has, within a few years, made great progress, both on the small scale involving the freeing of a few acres only from superfluous water, and opening the sub-soil to the benign influences of air and moisture, and warmth together, and also in enterprises of great magnitude, affecting the sanitary condition of whole districts of country. The progress made has been chiefly in Great Britain, and on the Continent. Col. Waring's work

is compact, fully illustrated, very clear, both in its arguments and in its directions for practice, and, throughout, readable. We are confident that it will be at once recognized as the standard American authority on this subject. It is thoroughly American, and tells what everybody wants to know, (omitting those things which people generally know, or which are of little service,) in regard to thoroughly draining the land. It is needless for us to allude to the extraordinary qualifications of Col. Waring for writing such a work. He has been, practically, very successful as a draining engineer, and few, either in this country, or abroad, have such monuments of their skill to point to as has he, the most important of which is the New York Central Park. In this book he embodies and condenses the studies and results of many years. Our book-list, page 205, gives the price at \$1.50.

The Poultry Book, by W. B. Tegetmeier, F. Z. S., with pictures by Harrison Wier, printed in colors by Leighton Bros., 356 pages, Royal Octavo. Cloth, gilt edged. Geo. Routledge & Sons, London, 1867. —This work which we have been receiving and admiring in numbers for a year is now complete, and issued in very attractive style. Instruction by the eye, through accurate and beautiful engravings, is vastly more impressive and better retained in the mind of the learner or reader, if the subject be adapted to pictorial illustration, than if language be used alone. In this work not only are all the more valuable breeds of useful and ornamental poultry most beautifully represented by large colored lithographs, having the effect and richness of oil paintings, but the letter-press gives very full accounts of each breed, together with excellent instruction in regard to the rearing and care of poultry, their breeding, use, diseases, etc. The engravings are chiefly from the very accurate pencil of Mr. Harrison Wier, whose drawings every poultry fancier is more or less familiar with, from the very free manner in which they have been copied by almost every writer on this subject. One of the most valuable parts of the book is the Appendix, which contains the "Standard of excellence in exhibition birds," which is received, very generally, as the guide of judges at Poultry Shows in Great Britain. We have this elegant work on our table for sale at the moderate price of \$9.

Cider Vinegar.—"H. F." The quickest way of making it, is the process by which the cider may be most exposed to the atmosphere. The cider should have passed through the alcoholic fermentation. The harder it is the better. Manufacturers on a large scale have a platform covered with oak-shavings over which the cider runs slowly from one vessel into another. Do not attempt to make cider vinegar out of anything else but *apple juice*. "First catch your hare." The tongue is a good enough test of the strength of cider vinegar for domestic uses.

Plant Lice.—"Charlie," Medina, Mich., writes: "Mother has a rose-bush, which is being devoured by thousands of lice. What shall she do?" The answer to this will be a reply to many similar letters. Kill the lice. But how?—We have told how ever so many times, but we will repeat it.—Use tobacco smoke. As Charlie is probably a good little boy, and does not use either pipe or cigars, we must teach him the horticultural use of tobacco, and advise him, at the same time, not to learn any other use of it. Put the plant under a barrel or box, and then take a few live coals in a convenient dish, put some tobacco-stems, or other tobacco on them, and place it under the barrel or box, so as to fill it with smoke. Take care that there is not enough fire to set the tobacco in a blaze, or you will kill the plant. Our way with house plants is simply to make a cone or tent with a newspaper, and put it over the plant, light a little tobacco in the bottom of a pipe, and then fill up the pipe with tobacco. Introduce the bowl under the paper covering, and blow through the pipe-stem. Most copious clouds of smoke will fill the paper cover, and in a few minutes every aphid can be shaken off. Give the plant a good showering, and it will not mind the treatment.

Hair for Manure.—L. A. Wiekey, York County, Pa. Hair may be used in composts which undergo fermentation. It is a very powerful manure, nearly as much so as Peruvian guano, more lasting in its effects if applied in its raw state, but if composted first with anything that will cause its decay—as horse manure, or a muck and lime compost—it will quicken the action of the manure almost as much as an equal quantity of guano. It is valuable for its nitrogen (ammonia), but does not supply phosphoric acid. Two cts. per pound is not dear for it.

Black Birds vs. Robins.—"H. W. T.," Canandaigua, N. Y., writes: "I have watched the progress of public sentiment relating to birds with some interest. While the law punishes the killing of a robin, it gives no protection to the blackbird, and for years no epithet has seemed sufficiently severe to apply to the

brute who would injure the favorite. The blackbird is constantly destroying the enemies of the fruit, and is therefore a valuable friend. I have watched the robin carefully for twenty years, and have never perceived, in a single instance, a worthy act of his in this direction. He will destroy the harmless angle-worm in countless numbers; but if any other worm or insect, I have not been able to detect it. On the other hand, there is not so pestiferous an enemy to the fruit grower, even the curculio, as the robin. First—He takes the strawberries—every one his keen optics can spy. Next he gormandizes upon the raspberries, as long as they last. Then the cherries fall a prey. Then the grapes vanish through his insatiable maw; and a large portion of the delicious Bartlett pear falls picked and ruined by this omnivorous pest. A glimmering of better times is seen in the changed tone of our fruit growers' societies."—[This indictment of cock-robin must stand upon its own merits. There is a great difference of opinion about the habits of this bird. There is no doubt about the damage he does among the fruit. It is a question if he does not destroy insects enough to pay for this damage. We want more facts to determine this point, and shall be glad to hear from any of our correspondents who have carefully studied his habits to ascertain his food.—Eds.]

Keeping Eggs.—"Down East" and others. There is always some risk in keeping eggs a long time, and those not absolutely fresh will never sell well. When eggs stand long in one position the yolk gets down against the shell, and if there is any evaporation it soon either adheres to the shell or the air gets to it, and it decays, or becomes tainted a little. Eggs may be greased, and packed in oats in barrels headed up tight, kept cool and dry, and rolled or inverted or both every few days; thus they will keep, and when wanted for market must be rolled in bran or meal to get the grease off, and perhaps dipped in lime water to give them a fresh look. How long they may be kept thus we do not know, but several months at least. Eggs will keep in lime water, but it is difficult to turn or roll the barrels, and so the yolks get against the shell, and besides the shells look very chalky, and their sale is hurt. The best way is probably to pack the fresh eggs in barrels with meal or bran, setting them on end, using no grease, for the meal absorbs it and it turns rancid. Head up the barrels and invert once a week, and keep in a cool dry place.

How to Use Fish Guano.—This article is reckoned among the concentrated fertilizers, and is very rich in ammonia. It is to be used with the same precautions as Peruvian guano. It will destroy seeds, if brought in immediate contact with them. If applied in the hill, it should be mixed with the soil. It may be sown broadcast, and plowed or harrowed in, with safety. If applied as a top-dressing, it should be intimately mixed with ten times its bulk of loam, peat, or muck, and be allowed to remain in bulk ten days or more.

Oil Cake.—"Kentucky." This is the residue left after expressing the oil from Linseed, (Flax seed), and is in the form given it by the cylinder of the press—much like a thin cheese and very hard. When ground, it is called oil meal. It is simply Flax seed less the greater part of the oil.

Record of Horticulture and "Independent" Criticism.—Messrs. Woodward, of the *Horticulturist*, have put out a neat volume of 125 pages, (price \$1.00,) called the *Record of Horticulture*. The editor is Mr. A. S. Fuller, who gives his notes on horticultural progress, reviews books, and contributes several valuable articles. The book is strongly individual, and, as Mr. Fuller is a known enemy to all shams, many authors and pretenders of various kinds will feel that their toes are trodden upon. Mr. Fuller is a genuine horticultural iconoclast, and we are glad that we have at least one horticulturist, who has the courage to strip off the borrowed plumes from over-rated writers, and overpraised fruits. He may not always be right, but he evidently means to be, and for that we honor him, and always welcome any contribution from his pen, as we are sure that it will be practical and vigorous. One of the most useful portions of this *Record* is the chapter on the propagation of Bulbs. Mr. Rand's work on Bulbs is singularly deficient in directions to the novice on the subject of propagation, and this *Record* is an almost indispensable supplement to that work.... The "Independent" of May 2d contains a most remarkable article on this "Record."—We do not call it criticism, out of respect to critics. The *Independent* has the reputation of being a religious paper. We occasionally read its *Farmer's Column*—upon the principle that the deacon always read the theater bills, that he might keep posted as to what the devil was doing. After we have read the "Farmer's Column," we are satisfied—just as Mrs. Squeer's boys didn't want any breakfast after their brimstone and molasses—and

have no desire to see what the rest of the paper may contain. The Independent's notice of the Record of Horticulture is too long, or we would reproduce it, in order that our readers might see what stuff a "religious" paper can publish, and the number of direct and inferential—what-you-may-call-'ems, that can be put into a column. Half of the article is devoted to showing that this is not a fit book for a farmer, and gives the Independent's views on farmers' books in general. Now, Mr. Fuller did not write this book for farmers, but for horticulturists. If he did write a book for farmers, it would not be of that character that would have to lie over a year, before he could find a publisher so regardless of the good of the community, as to publish it. The Independent says: "Well, what do we find within these pretty covers, costing \$1.50 of the farmer's hard earned money?" The price "\$1.50" is within one-third of the truth, which is pretty good for the Independent. Farther along in the article we get a clue to "what's the matter." Mr. Fuller, in his Record, gives a justly severe castigation to the "Reviser" of Bridgeman's Gardener's Assistant. The Independent says: "As he has made some false statements in which our integrity is assailed, it is proper to explain the matter in this place." We, for the first time, learn, that that book was revised by the Independent. We supposed it was done by a chap, who took it as a job. Was it done by Mr. Henry C. Bowen, the "responsible man," by Theodore Tilton, or some subordinate? No clue is given in the article—the editorial "our" leaving us quite in the dark. We read: "The publisher of Bridgeman's Gardener brought the wood cuts, ready made, to the reviser, before he commenced his task; a portion of the illustrations were purchased by the publisher of other publishers. The reviser had nothing to do with the illustrations, only to insert them in their proper places." Now, here is a direct statement, which must be either true or false. The publishers, Messrs. William Wood & Co., say, that they know nothing of the source of at least 20 of the illustrations of Bridgeman's Gardener. We believe Messrs. Wood tell the truth, but then the Independent is a "religious" newspaper, and what does it tell? Certain cuts which appear in Bridgeman's book, were originally drawn and engraved for the *Agriculturist*. We never sold, gave away, or loaned them to Messrs. Wood, who knew nothing of them, until they saw them in the book, and these, certainly, were not the illustrations "purchased by the publisher of other publishers." We do not know how these cuts transferred themselves from the engraving room of the *Agriculturist* to the pages of Bridgeman's book. The Independent calls it "purchasing;" other people have a different name for it. Mr. Fuller's statements in regard to this book are none too severe, except in the fact that they are true, but this case would show that the way to get a hint from the Independent is to tell the truth. The Independent may be gratified to learn, that the publishers of Bridgeman's Gardener's Assistant, finding that its revision of that originally excellent and useful work has been quite as severely criticised by the horticultural and agricultural press, as it has been by Mr. Fuller, in his Record of Horticulture, have concluded to have the work done over again. The Independent calls Mr. Fuller's book a book of "slanders." We have no name to apply to the paper that can so unfairly treat a valuable contribution to our horticultural literature.—But then what does the Independent know about horticulture.

The State Sheep Fair.—The Third Annual Fair of the State Sheep Breeders' and Wool Growers' Association opened at Anburn, Wednesday, May 8th, but, owing to a fierce north-east storm, little was done until Thursday P. M. There were numerous entries of fine woolled sheep of middle wools, and a few of fine wools. The storm was a severe trial to the faith and patience of the exhibitors, and of the multitudes who were waiting for better weather, to see the flocks. Among the noticeable sheep at the show, were "Kilpatrick," and "Blincher," fine wools, owned by W. R. Sanford, of Vermont, the former valued at twelve thousand dollars in gold, and the latter at ten thousand in currency. Mr. Freeman, of Bemis Heights, had a "Dew Drop" glistening in one of the pens. Mr. Lynch, of Monroe County, had a ram of "Frank" manners, with five other South Downs and lambs, very good animals. The ram was two years old, and weighed 260 lbs. J. Bowers, of the same county, showed good, fine woolled sheep. J. D. Wing, of Washington, Dutchess County, showed the best lot of Cotswolds we have ever seen, three yearling rams, and three two year olds, "Ottawa" and "Golden Fleece." These very fine animals were recently imported from England, having been selected by Mr. Wing from the best flocks in the Cotswold district, without regard to cost, with a view to establish a purely bred flock. This breed is said to make grade wethers, that will weigh two hundred lbs., dressed. On Friday, there was a comparatively large attendance of spectators, and many of the finest sheep were sheared, and, on the whole, this fair, though the weather was of the ugliest

type, brought together many of the best breeders of the State, and will give a new impulse to this very important branch of industry. We are indebted to Hon. H. S. Randall, the President of the Association, for numerous courtesies, which we are happy to acknowledge here.

National Trial of Plows, Harrows, and Cultivators.—This trial, announced in our last issue, to come off at Utica, May 7th, under the auspices of the New York State Agricultural Society, was necessarily postponed for a few days, on account of the weather. Three days of incessant rain made plowing hopeless. We found the most of the judges present, and a large number of competitors for the prizes, possessing their souls with exemplary patience. There had been thirty entries on the first day of the show, and ample arrangements had been made by the Society to have the implements subjected to the most thorough tests. In the character of the gentlemen, who have consented to act as judges in this important trial, the public have the assurance, that, when a decision is reached, it will be impartial and worthy of confidence. Eleven points are submitted as the tests of a good plow. 1. Pulverizing power. 2. Non-liability to choke in stubble. 3. Lightness of draft, considered in connection with pulverizing power. 4. Ease of holding. 5. Durability. 6. Cheapness. 7. Excellence of mechanical work. 8. Excellence of material. 9. Thorough inversion and burial of weeds. 10. Even distribution of wear. 11. Regularity or truthness of turning and carrying the furrow slice on sod.—To procure all the data, and accurately determine these points, will, necessarily, involve a good deal of time and labor. We look forward to the decision as an important event in the history of agricultural improvement.

Address of J. Stanton Gould on retiring from the Presidency of the New-York State Agricultural Society.—We had the pleasure of listening to the address of the retiring President of the N. Y. State Agricultural Society, and have since read it with renewed satisfaction. It abounds in good common sense and valuable suggestions. The State would be richer by millions, if these hints could be heeded by our farmers.

The Rhode Island Horticultural Society.—This Society will hold its 23d Summer Exhibition at Providence, on June 26th and 27th. The list of premiums is evidently prepared with great care, and the amounts are liberal. The President, Hon. Jas. Y. Smith, offers several liberal premiums, among which are two for children. But few persons outside of Rhode Island know how wide-awake its people are in horticultural matters, and while we remind all Rhode Island readers, and those in the adjacent "suburbs" of Massachusetts and Connecticut, of this exhibition, we take the privilege of one of the "fathers" of the society, to invite horticulturists from elsewhere to visit the exhibition, and be astonished at what little Rhody can do in the way of fruits, etc.

Horticultural Show in Queens Co.—For once, the Queens Co., N. Y., people have allowed us to know that they intend to hold a show, and we take pleasure in making the announcement, as we should have done many times before, had they given us the data. The Agricultural Society will hold a Horticultural show on June 21st, at Mineola, on the L. I. R. R. The Society has remarkably fine grounds, offers a large list of premiums, and several special premiums, by gentlemen interested in horticultural matters, are announced.

Catalogues.—Our acknowledgments of these have been crowded out from month to month, until the list is too long for us to give it room. We could not publish some, and leave out others. We thank those who have sent us these documents, and shall accredit them all in the next year of our Annuals. We may as well say here, that we wish to give in our Annuals the name of every dealer in implements, plants, seeds, and the like. Those who send catalogues or cards will be recorded. Those who do not take pains to make themselves known, must not complain.

American Short-horn Herd-Book.—Hon. Lewis F. Allen, of Black Rock, Erie Co., N. Y., informs us that he is now at work upon the 8th Volume of this publication. He expects to put it to press soon, and will receive pedigrees for insertion during the present month. Every breeder of pure Short-horns should see to it at once, that all his stock worthy of use as breeding animals, have their pedigrees recorded. It adds essentially to their value and to that of their progeny. The seventh volume contained upwards of 3,500 approved pedigrees, and the present volume is likely to exceed its predecessor. Breeders of Short-horns in the United States and British possessions should send to Mr. Allen, for Cireolar, with terms, etc.

Household Recipes.

Of late we have not given our usual number of recipes, though we have many in type. We present here an instalment of these, to let those who are so kind as to send them know, that their favors are not unappreciated.

Webster Cake.—Take 1 cup butter, $\frac{3}{4}$ cup molasses, $\frac{3}{4}$ cup sugar, 3 cups flour, 1 gill sweet milk, 1 teaspoon saleratus, 2 eggs, add currants and citron, and spice, cloves and nutmeg.—Mrs. L. P. C., New Haven, Mo.

Silver Cake.—Take the whites of six eggs, two and one-half cups of flour, one and one-half cups of sugar, half cup of butter, two-thirds of a cup of cream or sweet milk, half teaspoonful of cream of tartar, and a little soda.

Corn Cake.—Three cups of corn meal, one cup of wheat, two tablespoonfuls of sugar, two teaspoonfuls of cream of tartar, one teaspoonful of salt. Mix well together; while dry, add one teaspoonful of soda, dissolved in warm water. Mix the whole to a thin batter with milk or water, and bake in a quick oven.

Tapioca Pudding.—Four tablespoonfuls of tapioca, 1 quart milk, 4 eggs (leaving out the whites of two for icing); sweeten to taste and flavor with vanilla. Soak the tapioca over night in a little water, boil the milk and pour over the tapioca; when it is lukewarm, add the sugar and eggs, well beaten. Bake about one hour; ice it when cool.—Mrs. H. H. McL.

Brown Bread.—By Mrs. Evans.—3 small pints of cornmeal, 3 small pints of bran flour, 1 pint of molasses, 1 tea spoonful of salt, 1 tea spoonful of saleratus, 1 quart of milk, pour into a three quart bucket with tight fitting lid, which has been well greased, and set it into a pot of boiling water, and boil four hours.

Ginger Snaps.—One cup of molasses, one of sugar, one of shortening, one egg, one tablespoonful of ginger, one of vinegar, one teaspoonful of saleratus.

Molasses Cookies.—One cup of molasses, half cup of butter, half cup of water, four eggs, one teaspoonful of soda, one of ginger.

Lemon Butter for Tarts.—"A. M. H." One pound pulverized white sugar, whites of six eggs and yolks of two, three lemons, including grated rind and juice. Cook twenty minutes over a slow fire, stirring all the while.

Cooking Cauliflower.—"D. W." This is very much improved by being boiled in a large quantity of water. Some add a little grated nutmeg to the drawn butter, and use only cider vinegar.

Pickling Beef and Tongues.—Carolus. Rub the beef hams slightly with fine salt, and let them lay 24 hours then cover with the following cold pickle: For hundred pounds of meat, 6 gallons of soft water, 6 lbs. fine salt, $1\frac{1}{2}$ ounces of saleratus, 3 ounces saltpetre, and $1\frac{1}{2}$ lbs. of sugar. Beef for drying to be left in this brine for 9 days, tongues 3 weeks. This is the Burlington recipe.

Tomato Vinegar.—"C. H. P." No great skill is required to make the article. Express the juice, and put in any clean vessel exposed to the air in a warm place and it will soon become vinegar. It will make a stronger vinegar if molasses is added to the juice.

To Preserve Furs.—Wrap them in paper of several thicknesses or in cotton cloth, early in the spring, before the moth miller begins to fly. It is only necessary so to secure them that no moth can get access to them. A tight box, with paper pasted on where the lid covers it, is equally effective.

To Remove Tea Stains from Table Cloth.—"Nannie." Lay the cloth in an earthen crock, or porcelain kettle, and cover with clean, cold, soft water. Put the kettle on the back of the stove, where it will heat slowly to a scald. After an hour or more lift out your cloth and wash with soap in the usual manner.

Carrot Juice in Butter.—M. Alden. This is sometimes added to butter to give it color, but cows fed on oats and clover hay ought to make butter of good color without it. The juice will not improve the keeping qualities of the butter, unless fed to the cows.

Best Kind of Cucumbers for Pickling.—"R. F. G." We have never been able to detect any difference in the flavor of cucumbers after they were pickled. They are mainly a sponge to hold vinegar, and the best kind is the most fruitful. The White Spine is good enough, but in the pickle districts they raise their own seed, and improve them by selecting the fruit of the third or fourth blossom from the root. This whole subject was thoroughly discussed by Timothy Bunker, Esq., in vols. for 1865 and 1866, which see.

Farm Fences.

Every man needs some fences upon his farm; a permanent one surrounding his garden, at least, and movable ones, or hurdles, for confining stock, or for forming lanes where animals are to be driven near to tempting crops.

The preservation of the timber in fence making is a great desideratum to all who build fences. We believe no cheaper, or more effectual, way can be pursued than the plan recommended after numerous, carefully conducted experiments by different persons, of painting the slats, and soaking the posts in hot coal tar, and, after allowing all to drip off that will do so in a few minutes, to thoroughly sand the timber, and let

Fig. 1.—PICKET FENCE.

Fig. 2.

it get so dry, before using, that hammering will not jar it off. It is best to have a few slats unpainted, to be used if necessary to saw any, and these might be painted subsequently. The labor of protecting thus both the above-ground and the underground parts of the fence, is so considerable, that only the bottoms of the posts and underground sills of gates are usually thus protected. It is, however, very important that those parts of the posts, slats and pickets, which come in contact, should be coated with coal tar, so that water shall not find in these spots an opportunity to soak and rot the wood.

PICKET FENCE.—G. J. Greene, of Hudson, N. Y., writes: "I like picket fences for these reasons; they do not take much lumber; they make a closer fence, especially at the bottom; they are easier kept in repair; and cattle will not so readily interfere with, or break them down, as other kinds of fence; a steer that thinks nothing of jumping over a rail fence five feet high, can scarcely be driven over a picket fence four feet high. Fig. 1 represents a section of picket fence. I herewith send you a rough sketch of a fence, which, I think, has some good points. As the posts are the foundation of the fence, I have given them more attention than the rest. No good posts should be split; if the timber is large, it should be sawed, 4×5 inches square at the bottom, and 2×4 inches at the top. They are neater, more readily used, and make a better fence. If the timber is six or seven inches in diameter, I would saw them through, as represented in fig.

Fig. 3.

Fig. 4.

2, making two good posts, each with a straight side, out of timber which would otherwise have made but one. I set posts thirty-two inches deep; three feet would be better. Half the ills that a fence is heir to, arise from the posts not being set deep enough. Figure 3 represents a post as I would like to set it. Near the bottom, two notches are cut in the opposite sides; after the post is placed in the hole, and the dirt filled in to the notches, two short pieces of board, or stones, are placed in the notches against the posts, and the tops of them are crowded or pounded into the solid

earth with a rammer, as shown; the hole is then filled up. The post will not be thrown up by frost, will not readily sag over, and if the part which enters the ground be thoroughly coated with coal tar and sand, as described on page

Fig. 5.—BOARD FENCE.

94 of the *American Agriculturist* for 1866, I believe there will be no occasion to replace it during the present century.

Fig. 4 represents a board sawed into pickets. Boards ten inches in width, and twelve feet long will make twelve pickets, three inches wide at the bottom and two inches at the top.

The bottom bars may be let into the posts or nailed upon them, and the top bars either nailed upon the tops of the posts, which should be sawed off even, or they may be nailed upon the sides of the posts. A strip half an inch thick, and two inches wide, nailed, as a batten, over the pickets at the top and bottom bars, will prevent their being knocked off, and will add much to the appearance, and but little to the cost."

BOARD FENCE.—A. A. Gauer, Albion, Iowa, sends the description of a fence common there,

Fig. 6.—PORTABLE FENCE.

and a neat looking one for a fence of such simple construction, (Fig. 5). It is made of boards. The lower rail is six inches wide, the other two horizontal rails, five inches, and the two that cross, three or four inches wide. This is a simple and attractive variation of a plain board fence, and requires but little lumber. Posts 2×4 at the top, and 4×4 at the butts, would be abundantly strong if well set, and protected from rotting by paint or coal tar. Battens over the strips at the posts would add both to the looks and durability.

PORTABLE FENCE OR HURDLE.—Contributed by H. A. Hawkins, Vinden, Ill.—I inclose a sketch of a portable fence, which is a favorite hereabouts. There are two uprights of hard wood to each length, and upon them the horizontal strips, of any light, durable lumber, are nailed, and braced by a diagonal brace strip. The ends of the uprights are rounded so as to enter two-inch, round holes in a cap or yoke. By these caps the lengths are united, and the fence is kept upright and firm by being placed zigzag or worm-fence fashion. [Figure 6 represents what might be a modification of this fence, one and a quarter, or one and a half, inch soft wood boards being used as posts, and the rails morticed and pinned into them. It was made to illustrate the fence described, and the discrepancy was unnoticed at first. However, this idea may be of account to some one.]

FLOUR AT TWENTY DOLLARS A BARREL.—Flour at twenty dollars a barrel argues the need of more wheat growers. Probably no man anticipated, twenty years ago, that Califor-

nia would be shipping wheat to New York, and that grain would form part of the Western freight of boats on the Erie Canal. Yet such are the facts. The land that received so largely of our products during the early days of the gold fever is now returning them in kind, and the good people of interior New York are eating bread made of California flour! All bread stuffs are unusually high, and yet we have untold millions of acres in the sea-board States, that are lying idle, or, at least, producing a scanty crop of grass, for want of willing hands to till them. And if we look at the West, whole townships and counties are waiting for the coming settlers, to turn up the virgin soil, and put in the seed. Why should not the multitudes at the East, struggling for a bare living, take possession of these acres, erect their cottages, and live independently upon the prairies? They would soon support their families in comfort, and keep wheat, henceforth, at living prices.

A Remedy for Strikes.

These endeavors of mechanics to force capitalists to pay them higher wages are becoming very common in our cities and villages. These efforts are about as rational as to force the sun to give more heat,—the clouds to give more rain. The rain generally falls because it cannot help it, and wages come down for the same reason. If there is great competition in the manufacturer's business, he is forced to sell his products at a less price, he makes less profits and must reduce the price of labor or stop his business. As a rule, capital gives what it can afford for labor. If there is great demand for woolen goods, there is great demand for hands to make them, and the manufacturer will give wages enough to induce hands to work. Multitudes rush into the business and it is soon overdone. Wages are reduced by manufacturers, and the operatives strike to resist the fall, or to secure higher wages. This is the cause generally of strikes in all the trades. They are greatly overdone. Too many people are crowding into them for a livelihood, under the mistaken idea that it is easier and more respectable to live in a city or village, than to live in the country and till the soil. Almost all business pursuits in the city suffer from this cause.

Political economists will differ somewhat about the remedy for these strikes. Near all agree that their tendency is evil, inflicting upon the mechanic great loss of time, and prejudicing the employer against his hands, by attempting to force him to give wages that his business will not justify. Some advise mechanics to associated effort, and thus become their own employers. But this is no remedy in a business that is already overdone. In some kinds of business it may be a help. But the real difficulty that underlies these strikes is the over-stocking of all mechanical pursuits. The farm is deserted for the work-shop, and the artisan suffers. Rents are made high by the multitudes that crowd into the city to compete for dwellings, and food is made dear by the desertion of the farm. The remedy is found in a return to the tilling of the soil, where rents and food are cheap, and labor is well rewarded. There is no danger that this business will ever be over-crowded. We could spare thousands of our working population with mutual advantage to the city and the country. There are some who will always cling to cities, no matter in what poverty they may live, but many others would be glad of a rural life, could they only find means of transportation.

The Black Snake.—(*Bascanion constrictor*.)

The Black Snake is the largest of our common snakes, though there are stories of other species occasionally equalling its largest size, and from its active habits and fondness for cultivated land, it is well known to farmers and farmers' boys. It is perfectly harmless, yet has such a threatening way of resenting an attack, and so often turns and gives chase to a fleeing enemy, that it is regarded not only as an enemy, but often with a sort of terror. It will never stand to fight, but gets away marvelously quick after the first blow is dealt, unless it be effectually detained. This snake is 4 to 6 feet long, the tail being about one-fifth. The head is small, the teeth numerous, and all about of a size. It has no fangs and no venom. The scales of the back are diamond shaped. Its color is bluish black above, light slate color beneath; chin and throat white. The young are speckled, black and white above. The snake lives upon toads, frogs, lizards, small birds, and eggs of birds,—for which it climbs trees of considerable height,—mice and their young, as also the young of larger quadrupeds when it can get them. It does little harm in the hay and grain fields, for if cut open, its belly will be often found to contain several mice. Still it probably does not discriminate well between shrews and mice, and the former are voracious insect eaters. It destroys also many toads which are among our best friends, and it would be hard to tell how many birds, including young and eggs, a single black snake annually destroys. On the whole, then, it is an enemy, and though innocent of ability to harm man, it is hardly worth while to attempt to conquer our repugnance to "the form of the serpent," and save the lives of these animals when we can, on account of any good they may do us.

THE MILK SNAKE OR CHICKEN SNAKE.—This beautiful serpent (*Ophibolus eximius*) is the familiar representative of its genus through-

out the northern and middle States, extending into Ohio and probably further westward. The back is thick; head and tail short, and eyes small. It is of a greyish ash color, "with a dorsal series of upwards of fifty transverse,

BLACK SNAKE—(*Bascanion constrictor*.)MILK OR CHICKEN SNAKE.—(*Ophibolus eximius*.)

elliptical, chocolate blotches, and with two other alternating series on each side." The length is from two feet to three and a half. It is very familiar in its habits, being frequently found about the foundations of barns and cow stables, spring houses, etc. Its food is such small birds and animals as it can overpower, and it is said to be very fond of milk. The idea that it will milk a cow is as absurd as the one, so universal

The Garden Toad—and Tree Frogs.

The Batrachians are cold-blooded reptiles, destitute of scales; their young are usually hatched in an immature condition from eggs laid in the water, and undergo several changes before becoming perfected animals. To this class belong Toads, Frogs, Tree-toads, etc., which fall under the subdivision of tailless batrachians. We present a representation of the common Garden Toad, (*Bufo Americanus*), of the Green Tree-frog of the South, (*Hyla viridis*), and of the Squirrel Tree-toad, (*Hyla squirrella*), also of the South, but found occasionally in the Middle States. There is something about toads, even tree-toads, which excites disgust, and they have been almost universally despised

and persecuted. The fact is, they are among the most faithful friends of the gardener and orchardist. Living upon insects, they do much towards reducing the number of those that attack cultivated plants, and should be carefully preserved in gardens, and shielded from harm. The common toad is covered with warts from which, and especially from two large glands behind the head on each side, an acrid fluid exudes,

which, while it causes smarting to tender skin, and makes a dog drop the toad and often froth at the mouth, and appear in great distress, is really harmless, neither producing warts nor other evil. If the toad has a jewel in its head, as it was once believed to have, that jewel is its tongue, for by it, darting it out to a considerable distance, it draws the unsuspecting flies and beetles into its mouth. This motion of the tongue is so rapid that it can scarcely be followed by the eye. Toads lay their eggs in the spring, in shallow pools, and while thus engaged,

SQUIRREL TREE-TOAD.

GARDEN TOAD.

in Europe, that a bird much resembling our Whip-poor-will sucks goats. The Milk-Snake is entirely harmless, but shares with its kindred the aversion with which these graceful and beautiful creatures are almost universally regarded.

their note—a prolonged trill—may be heard both day and night. The eggs are enclosed in jelly, which holds them in clusters, and protects them from fish, and the young, when hatched, are the little dark-colored tadpoles or polli-

wogs with which we are all so familiar. These, as we all know, have, at first, tails, but no legs, then hind-legs, then fore-legs, then the tail is absorbed, and the little toads come up from the water, often in great numbers. Tree-toads and frogs undergo the same transformations. The common northern tree-toad, (*Hyla versicolor*), lives chiefly in open woods upon decayed mossy trees, the color of which it closely resembles. The ends of its toes are flattened into roundish disks, with which, partly by means of the pressure of the air, but chiefly by a sticky secretion, it is able to walk upon the under sides of smooth substances. All these animals are not properly amphibious, but live in comfort only in a moist atmosphere, resorting to the water only at breeding time. On moist days and evenings they are most active, and the tree-toads are especially noisy when a rain storm is approaching.

Walks and Talks on the Farm.—No. 42.

In making out my income tax, the Assessor demurred to the large sum I had expended for labor. He is himself a farmer and "could not understand," he said, "how so much money could be spent."

"I have not spent quite \$8 an acre, and if I could have afforded it, and could have got the right kind of men, and could have bestowed the necessary supervision, I would have spent double the amount."

"Well," he replied, "I can't allow it. I never heard of such a case. Mr. Black sold \$3,600 from his farm last year, and only deducts \$300 for hired help."

"How large a farm has he?"

"One hundred acres."

"His own labor and that of his children would be worth at least \$500 in addition to the \$300; and this brings it up to my figures, or \$8 an acre. This farm is probably the most favorable one for your purpose that you can select. The small farmers, taking their own time into account, really employ more labor than the large farmers—and this is one reason why their farms are more productive. I confess, however, that I am unable to see how a man can, on a farm of 100 acres, get such large returns, and expend only \$300 for hired help."

"He has a splendid wheat farm. Not an acre of it that is not naturally underdrained. He grows large crops of clover and plows them in for wheat, and this is better than guano or phosphates. You can spend all the money you like on your farm, and never make it as good as his."

"That may be, but I think I have a legal right to spend it, and if I do spend it, I do not see why you should not allow it. Everybody can not have the best farms. Some of us must take the poor ones, or let them remain untilled and unproductive. And the man who takes a run down farm, and endeavors to bring it up, injures no one but himself; and it is hardly fair to tax him for every little improvement that he makes, or subject him to ridicule and abuse."

In my case they do both. If I set out a few evergreens and ornamental shrubs around the house, and raise grass and a few flowers under the dining-room window, instead of potatoes and cabbage, they call it fancy farming and a great waste of land, and yet at the same time put an additional thousand dollars tax on the farm.

It would seem as though the farmers themselves, the local Assessors, Railroad Companies, and the Government itself, were all opposed to improved agriculture. Last year I ordered a ton of raw-bone phosphate from Philadelphia,

and the Erie Railroad Company charged me \$22 for freight! I do not know, but I presume they would have carried a ton of whiskey or tobacco for half the money. Of all improvements most needed in American agriculture, underdraining confessedly stands at the head, and yet it is this very improvement that the Government specially singles out as one which cannot be deducted from the Income tax. According to John Johnston's experience, he sometimes got the whole of his money back in one year, and always in two, and it would certainly be wise in the Government to encourage the practice of underdraining, by allowing money so expended to be deducted in making the returns of income. If a farmer spends \$1000 in underdraining, and the profits, as Mr. Johnston states, are \$500 a year, the Government in ten years would get \$250 in additional tax. If put into Five-Twenties, the Government would get \$50 the first year and *that would be all*.

One would think that when wheat brings \$3.25 a bushel, people would begin to realize the importance of fostering agricultural improvement, and stimulating production. In England, manures are allowed to be transported free of toll, and many of the landlords pay for all the tiles that their tenants will lay in underdrains. And even in Canada, agricultural papers are allowed to go through the mails free of postage.

But a truce to fault-finding. The man who has once commenced to underdrain, will stick to it, tax or no tax. I have been laying some *brush drains* this spring, in low, mucky land, where I thought tiles would fill up. Mr. Messenger, of Long Island, who drained a twenty-acre swamp ten years ago with brush drains, informs me that the drains still work to perfection; and a correspondent of the *Irish Farmers' Gazette* says he has some brush drains still effective on his farm that were laid forty three years ago. The way to lay them is to secure the outlet with stones, or in other words, to lay a foot or two of the drain with stones, where it discharges into the main ditch. Lay the brush on the stones with the but ends extended up the drain. Keep on in this way, extending the brush two or three inches each time, so that the thick stems will be on the bottom of the drain, and the bushy branches will rest on the top of the others. Trample them in firm until they are lower than the plow reaches, and then cover them with soil.

Ditching on low, mucky land, is very pleasant work. There are, as the men expressed it, "not stones enough to clean the spades," and it is easy work to dig a rod in an hour, 2½ feet deep. One man dug seven rods in an afternoon, and finished it all ready for the brush. In my case, I am troubled to get a good fall, and I make it a rule to have the drains cut so that the water will follow the ditches up into the land to be drained. Where brush is used, there may be two or three inches of water in the bottom of the drains, without damage. Being cut deeper than is necessary, any loose soil that may work through the brush can settle on the bottom, and still leave fall for the water. In the spring and fall I expect the water will set back occasionally in the open ditches higher than the drains are laid, but as it passes off, I think the drains will work again. In fact, there are cases where underdrains laid three feet deep discharge into a water course dammed up, so that the water is two feet above the tiles, and yet the land is effectively drained. Of course, in this case the "water-line" would be only a foot below the surface, but the water for two feet below that, until it reached the tiles, would be con-

stantly changing, and this is said to be just as good as if all the water was removed. It is *stagnant* water that is injurious. In a dry season, when the surface soil absorbed the water from below, the water from the main ditch would flow up the tiles into the land, and in rainy weather, when the "water-line" in the land became higher than the water in the ditch, the tiles would discharge. In either case, stagnation would be avoided. Of course, it is absolutely necessary that the main ditch should be kept clean, down to the tiles. If stopped up with dirt, they will be useless. There are thousands of acres of such land, now producing nothing but rushes and coarse grass, which, if they could be drained in this way, would make the most productive meadows. And it will pay. Take my own case. There is a stream running through the south part of the farm, which, at high water, is fifteen or twenty feet wide, and four or five feet deep. In the summer season it is not over a foot deep. Now, even supposing the land to be not over a foot higher than the surface of the brook at high water, there is still a chance for drainage. Mark out the ditches in the spring or fall during high water, when you can see the lowest land, and the next summer cut a main ditch through the land, nearly or quite as deep as the natural stream. Cut it, in fact, so that the water will follow you, unless you find, as you probably will, that you have more fall than is needed. Let this ditch be six feet wide at the top, and two feet or so at the bottom. Sow grass seed at once, on the sides, to prevent the soil from washing in. Then cut your brush drains at right angles to this main ditch, 2½ feet to 3 feet deep, through the lowest parts of the land, and I feel confident that the water will find its way into the brook, and the land, from being little else than a swamp, will become the most productive meadow on the farm. It may be necessary, and probably will be, to scour out the main ditch every summer, so as to keep it free down to the drains, but the expense will be little compared to the advantages. The water will set back when we have a flood, as it does now, but instead of remaining on the land until the middle of summer, it will pass off rapidly, as the water in the brook declines, and even in the meantime there will be a constant change of water in the soil, and thus we shall get rid of the injurious effects of stagnation, and the exclusion of atmospheric air.

The expense of draining forty or fifty acres of such land is little, as compared with the expense of draining the like extent of rolling upland, the knolls of which, in this section, are usually full of large stones. And then, what a grand chance there is to irrigate! Much of this low land can be irrigated at a very trifling cost. And those who have never witnessed its effects, will be astonished at the immense crops of grass that can be produced by irrigation. But of course, you must drain before you can irrigate. In other words, you must get rid of stagnant water. You can not well have too much water early in the spring, provided it is constantly moving over the land. Irrigating may be done in a very simple manner. Dam up the water in the brook until it will overflow the banks. This will show you the level. Then cut a shallow ditch into the land, as high up as the water will follow you and overflow, if dammed up. It should, however, be deep enough to convey the water to a more distant part of the land, and sub-conduits should be cut to distribute the water on all parts of the field that are low enough. A little experience will soon enable

any one to do this in a simple manner. The water itself is the best teacher. *Only commence*, and you will soon have a system of ditches that will distribute the water all over the land.

"Floating up," as it is called, was practiced in England many years ago with considerable advantage, but it was found that irrigation produced much better results, and the former practice has been pretty much abandoned. "Floating up" is simply damming up a stream till the water overflows on the land. The water is allowed to remain on the field only four or five days, as a longer period makes the grass coarse. The weir is then raised, and the water allowed to flow off. There are places where this practice can be adopted with advantage, but irrigation is much better. What is meant by irrigation is conveying the water in a main ditch along the highest portion of the meadow, and then distributing it in small gutters on the land below, in such a way that the water will run all over the grass, half an inch or so deep, being careful that it never settles in pools or becomes stagnant. The more rapidly the water passes off, provided it does not wash away the soil, the better. Of course there are a great many little details to be attended to, but when the general principles are understood, the details of the system will easily be carried out by any intelligent farmer.

Mr. Howard, in his lecture on Things in America, says: "The grass of America has nowhere the splendid, rich green of our English pastures. Whether this arises wholly from the climate, I have some doubt. I think want of care in preparing the land, selection of seed and subsequent stocking have something to do with the miserable condition and appearance of American pastures." I think he is right. If we took as much pains with our meadows, as they do in England, we should raise as large crops. I am astonished at the effect a little top-dressing has on meadows. Even a little soil alone, spread on the grass, will impart a rich, green color. I suppose it acts as a mulch. Our clover is frequently *better* than it is in England, and our permanent meadows are brown because they are permanently neglected.

The main difficulty in all our agricultural improvements is the high price of labor. And yet, compared with the cost of living, the men do not get exorbitant wages. The trouble is, that we do not provide steady employment. We hire extra help by the day, and pay high wages. But the men are out of employ one third of the time, and it consequently follows, that a man who gets \$1.50 a day and loses one third of his time, receives no more in a week than the man who has steady employment at \$1.00 a day. One works four days at \$1.50 for each day, and the other six days at \$1.00 per day.

This spring, work was rather slack, and I employed several men at \$1.00 a day. As they board themselves, I thought this cheap, and made a point to furnish them steady work. Last Saturday night they told me that they could work no longer at this price, that every one else was paying \$1.25. I agreed to pay it. On Monday it commenced to rain, and at noon they asked me what they should do. I told them they could keep on spreading manure. "But it rains too hard." "I am sorry for it," I replied, "but I cannot help it; I have no in-door work I can afford to do at \$1.25 a day." The consequence was, they had to go home. They lost another day during the week. And the result is that to-night, (Saturday, April 27.), instead of paying them \$6.00, I only paid them \$5.31. They got

less money, and I lose a day and three quarters work. I had plenty to do, and this loss of time is an injury to me, and no advantage to them. There is so much work to be done in this country, and so few, comparatively, to do it, that we can, as a community, ill afford to waste time. But as long as farmers continue to pay such high rates for occasional day-work, the men dislike to engage by the month at fair wages. I am satisfied that this is one of the greatest evils of our present American system of farming.

I have lost another horse. He was old and not very valuable, and had he seen fit to have departed last fall, I should not have regretted it so very much. But having given him plenty of hay and grain all winter, and not demanded much labor in return, it is very unkind in him to give me the slip just as the busy season is coming on. Yesterday he was plowing in a three horse team, and was apparently well when he came home. The man watered him before putting him in the stall, (a bad practice), and in half an hour he was taken with violent pains, and only lived till 3 o'clock in the morning. I am having him skinned and opened, to see if we can ascertain what was the trouble. I acted on the supposition that it was a severe attack of spasmodic colic, and gave him injections of warm water and soap, with a dose of laudanum and ether, two table-spoonfuls each, in a pint of water. I repeated every two hours, with an ounce of ether in the interim. I find this almost invariably a cure for colic. It seemed to relieve "Old Dick," but did not cure him.

Abortion in Cows.

In inquiring into the causes of this scourge, for such it really is, in some sections of the country, it is very important to take note of such considerations as are presented herewith by our correspondent, as well as to consider that there is such strong nervous sympathy among cows, (though, perhaps, it is a peculiar influence, due to odor or something of that kind), that when one cow in a herd "slinks" her calf, one or two others are very apt to do the same. This subject is attracting the attention of distinguished physiologists, and of our State Agricultural Societies and Boards of Agriculture, so that we hope some light may be thrown upon the hidden cause, or causes, of so much trouble. We would be very glad of facts which will help to a better knowledge. "M. A. C.," in the article which follows, though "only a woman," as she says, writes forcible common sense in a way to surprise those, if any there be, who hold woman in as light esteem as some of them seem to hold themselves.

"I see you say that Abortion in cows, and Hog-cholera are on the increase. I am 'only a woman,' and as a matter of course, women are not entitled to much consideration, but I have been living on a farm from childhood, and have seen more or less of the diseases common to the cow family. My father farmed for thirty years, and kept from eight to twenty cows. All that time, he superintended his affairs himself, and but two cows and one steer died in all those years. One cow and a steer died from the effects of eating too much clover. In the last twenty years, since I have been large enough to know anything about a cow, we have had but two cows sink their calves, and these catastrophes were both caused by the unruly horn of a malicious cow belonging to the herd; they were both young cows, and neither of them were ever unfortunate again, although retained until they

were old cows, and I think if those gentlemen who have so much trouble with their cows, will keep a sharp look out, they will find, as I have, that a heavy boot or brogan on the foot of some ill-tempered hireling, or the horn of some unruly member of the herd 'planted' in the side of their cows, is the cause of a great amount of the disappointments and trouble they experience. Of course I would not say that such is the cause in all cases, but it is in a great many. One of my neighbors was all the time complaining of his cows in the same way, and could not imagine what was the matter. I happened to pass his stable one day, and saw a German he had hired, kick a cow unmercifully, for no reason but that she was afraid him, and when he came into the stable she jumped around and set her foot on his toes. As a matter of course that was not the first kicking she had received. All the cows in the stable were in a continuous uproar, when this man was about. I thought I had found the secret of at least one stable besides my own."

New Manner of Dissolving Bones for Farming Purposes.

We have received the following translation of an article by Prof. Ilienkov, Moscow, Russia, from a friend in Washington. The process is not altogether new, but as the success of such operations depends often upon minute details, we are glad to publish it. Prof. I. says: "It was a matter of importance with me to discover a method by means of which every farmer might be enabled to prepare bones for his meadows and fields. As great masses of salts are accumulating in the ashes of every household, and most of them with those burning wood, I used alkalis in connection with unslaked lime, which soon dissolved the bones. To my friend and pupil, Mr. Alex. Engelhart, to whom I communicated my discovery, belongs the honor of having introduced a new and convenient process for gaining manure for agricultural use. I give it in an extract:

'Suppose you have 4,000 pounds of bones, you need 4,000 pounds of ashes, (averaging 10 per cent. of carbonate of potash), 600 pounds of unslaked lime, and some 4,500 lbs. (55½ gallons) of water. Dig a hole some two feet deep, large enough to receive the bones and one half their volume besides; parallel to this, you dig another one, 25 per cent. larger, both being filled with bones. First, slake the lime and mix with your ashes, covering 2,000 pounds of the bones in the smaller one. Then it is filled with water, and left. When it gets dry, add, continually, water enough to keep it wet. When the bones crumble in your fingers, then take the whole mass out, and spread it over those bones in the second hole, leaving the decomposition to go on. When this is done, let the mass dry; and to make it fit for use, add *peat powder* or *mellow garden soil* until it is well dried and powdery. Let it be shoveled over several times, and then apply to your fields.

'Thus you get a fertilizer averaging 12 per cent. of phosphate of lime; 2 per cent. of alkalis, and 6 per cent. of nitrogen.'

[The pits used in this process must of course be dug in soil, to a great degree impervious to water. Clayey soil will answer, if first sprinkled and then pounded, or clay may be "puddled" in a basin in any soil, and a water-tight pit be made. If the bones are tolerably fresh, there will be very little loss of ammonia. We have known the softening of the bones to be complete on a small scale.—Ed.]

Fig. 1.—ELEVATION OF BARN.

Good Farm Barn.

The accompanying plan of a barn is presented in compliance with the often expressed wishes of readers of the *Agriculturist*, that we would give less elaborate and expensive plans than some which have been presented heretofore. Here is one for a barn 40 × 55 feet, with a large shed for cattle attached. It is, on the whole, a good plan, but not nearly so philosophical and labor-saving as the one in the *Agricultural Annual*, neither is it so expensive. This plan, like that, is susceptible of modification to accommodate a smaller farm, or a smaller number of animals, as we will explain. First is the 15-foot barn floor—of good medium width—if wider, the room would not be wasted. On the left are the horse stalls, 5 feet wide. There might be five stalls 4 feet wide, but for a large horse, the width ought to be about 5 feet. The whole space given to horses is 15 × 20 feet. Then the floor widens 7 feet, and the rest of the left side is devoted to cattle stalls—25 feet, giving room for six cow and ox stalls, and two passage ways, one of which may be closed and made a stall for a cow. The 7-foot space affords abundant room for hay-cutter, feed-box and accompaniments, located close to both cattle and horses, and if cattle are fed in the shed on feed prepared in the feed box, a passage at the rear

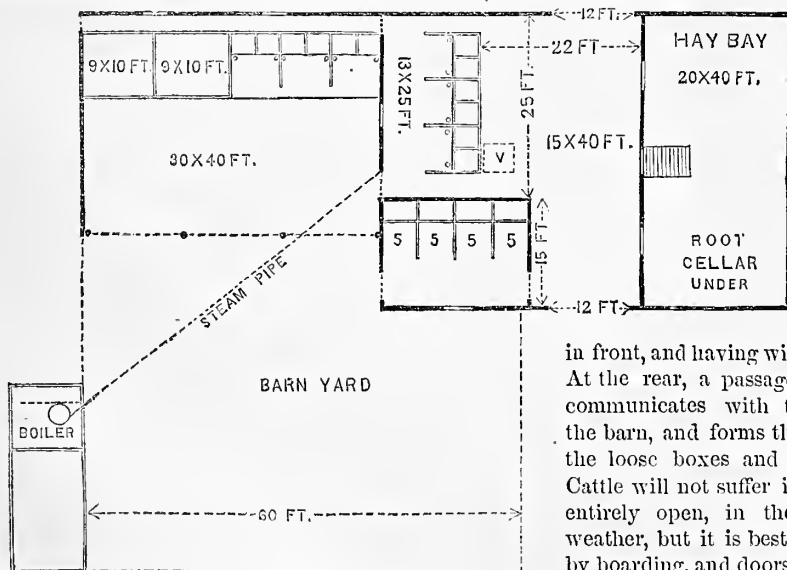

Fig. 2.—PLAN OF BARN.

conducts conveniently to their mangers. A three-foot square trunk extends from over the 7 × 25-foot space in front of the cow stalls to the roof, securing abundant ventilation, and affording a shute, through which hay, or straw, may be readily dropped from the mow, or corn cobs, and other matters, from the granary.

The right side of the barn floor is occupied by a hay bay. There is a tight ceiling of

matched boards over the stables, at a height of 8 feet. The posts are 16 feet to the eaves. The roof is what is usually called half-pitch, more lasting than if flatter. A substantial, tight floor is laid upon the straining beams of the roof. This may be extended, if desired, through the entire length of the barn, or only from one end to over the barn floor. In it is a large trap door directly over the threshing floor; and a small gable with a door in it, over the great doors, affords communication with the front of the barn, so that grain in bags or barrels may be raised or lowered as well here as through the trap door. This floor is the granary or corn loft—easily made rat-proof, and close under the roof, and consequently very hot in sunshiny, autumn weather. Corn in the ear is easily hoisted by horse-power from the wagons; and, if spread on the floor not more than a foot thick, will cure much sooner and more perfectly than if in cribs. This grain floor is reached by a stairway from the floor over the stables; under the stairs is a shute or shutes for conducting the shelled corn, etc., to the feeding floor. This arrangement requires strong posts and roof-framing, but not stronger than for a slate roof of a less pitch—and such a roof will support double the weight likely to be placed on such a floor—for not only is it constructed to bear the weight of the slates, but of 2 feet of snow, and the force of high winds in addition. The weight of grain will only give increased steadiness, a large part being borne by the posts—the floor preventing all racking. The shed is 30 × 40 feet, with 12-foot front, and 8-foot rear posts; open in front, and having windows in the back. At the rear, a passage way 4 feet wide communicates with the cow stable in the barn, and forms the feeding alley to the loose boxes and stalls in the shed. Cattle will not suffer in such a shed, left entirely open, in the severest winter weather, but it is best to close the front by boarding, and doors, having large windows for light and air. The hog pens are placed contiguous to the barn-yard, so that the swine may be allowed the free range of the compost heaps, at least in their own corner. In the hog house is a steam boiler; and a pipe, boxed and packed in sawdust, and laid underground, crosses the yard to the feeding floor, for steaming and cooking the fodder for the cattle. By this arrangement the hogs are located at a considerable distance from the granary and root cellar, but this is not a serious inconve-

nience, and it is best to remove any source of danger from fire as far away as possible. The root cellar is 7 feet deep under the hay bay, on the right side of the barn. There are two shutes from the floor to the cellar, and there is a stairway as indicated. Besides, access is had by a cellar-way on the eastern side. We think this plan will please many of our readers. It may be easily reduced, making it, say 30 × 42 feet. The floor, 13 feet; bay, 15 feet; 4 horse stalls, 18 feet, and 4 cow stalls, 12 feet, in a line across the left side; the floor being 15 feet wide in front of the cow stable, and other contractions made on the same principle. The manure will be, of necessity, only in part under cover. The sheep barn and yard will be on the east side, accessible to the root cellar. It is not represented in the plan given.

Decker's Plover Clevis.

Mr. J. W. Decker, of Orange Co., N. Y., invented, sometime since, the simple contrivance which we figure, for the purpose of regulating at will, and without stopping, the depth of the

Fig. 1.—PLOW WITH CLEVIS ATTACHED.

furrow in plowing. His success, as he reports to us, was complete, so much so that the clevis was soon adopted by his neighbors. A plow with this attachment was exhibited a few years since at the Orange County Fair, where it attracted considerable attention, and elicited general commendation. Mr. Decker thinks, though he does not wish to take out a patent for his invention, that it is worthy of being more widely known and generally used. He allows us, therefore, to illustrate it, and present it to the readers of the *American Agriculturist*. See figure 1.

The construction of the Clevis may be seen from fig. 2. The draft-rod is a piece of wrought

Fig. 2.—CLEVIS.

iron, similar to a common clevis, but much longer, with three notches for the ring, and fastened well back on the beam, by a bolt passing horizontally through it. This is set for the deepest plowing when against the bottom of the beam, and it is depressed for lighter work by drawing upon a light chain attached to a lever which moves two cast iron cams. There are thin plates of iron of a form indicated by drawing a circle touching the sides of a square, and cutting off three corners of the square to the line of the circle. These plates have square holes near the angle, and fit upon a bolt having a cylindrical body with square ends, to which they, together with the forked lever, are fastened tightly by means of a nut.

INDIAN CORN IN DRILLS.—Is the practice of growing this crop in hills sustained by good reason? Flat culture is much the best practice, even when rows both ways are retained. The advantage of cultivating in two direc-

tions no longer remains, when the plow is exchanged for a cultivator that will run astride the row, and disturb the soil so near to the corn, that there is no use for the hoe after the first weeding. On the contrary, it is a waste of labor. Planting in drills, secures a more even distribution of the crop upon the ground, so that each plant has its fair share of the soil and sunlight. The growth is more symmetrical, more ears set, and they are more perfectly filled. Carefully conducted experiments claim a difference of more than twenty-five per cent. in favor of drill planting. If there is this difference, we can hardly afford to continue the usual practice.

FLEECE FOLDING TABLE.

Folding Fleeces.

Wool is a bulky article, and it is essential to fold and compress it into small compass to get it to market. The usual practice of rolling and tying is strongly objected to by the manufacturer, but it is difficult to find another convenient way. Fleeces may be rolled, and not tied, and thus packed in bags, but this method interferes with inspection by buyers and their agents. Farmers are now hardly prepared to follow the advice of one of our largest wool buyers—though we doubt not it is sound—viz.: to remove the flank wool and all the coarser parts, and then, to roll carefully the fleeces and pack in bags, placing all the tags and flanks in the mouths, to mark the bags with their own names, and sell either to traveling buyers, or, as many do now, put the wool in the hands of good commission houses. In this way, the annoyance of strings would be avoided, and the name and reputation of the flock would go with the wool to the manufacturer, who would be very likely to order the clips of such-and-such farmers, year after year.

An Ohio subscriber sends us a plan of a neat folding table used in Erie Co., which we publish with his drawing, which makes it clear.

FLEECE-FOLDING TABLE, by "*Western Reporter*."—A good machine for folding and tying up fleeces of wool is a capital thing; it saves much time, and the work is done so much easier and better than it can be without one, that it will pay for itself in a very short time.

The Table I describe is much used in this vicinity, and is considered the *very best* of all like contrivances. Any person, handy with tools, can make one in a short time. Take three boards, plump one inch thick, and four feet long, one eight, the other two fourteen inches wide; fasten them together with table-buts, put on the same as on a common table—the 8-inch one being in the middle, as seen in the drawing. Then take a block eight inches long, six wide, and five thick, bevel off one edge until two sides are nearly obliterated, and hollow this bevel so that the block will be of the form shown, one and one-quarter inches at one edge, but somewhat triangular. Then cut three small notches in one edge, two inches apart, and half an inch

deep. Fasten this block on one end of the eight-inch board, the hollow side in, with heavy serews. Now, get a heavy piece of harness leather eight inches wide, and three feet long. Sew, in one end, with a waxed-end, a half-inch iron rod, with an eye bent in the middle and three links attached; cut three long slits in the leather, corresponding to the notches in the block, two inches apart, to within six inches of each end; and now fasten the other end to the 8-inch board, close up to the block, and bore three holes through the board one foot from the block, and directly under the slits in the leather. Fasten the table to a frame made of 5×3 scantling, just high enough so that one can stand up to it and work conveniently and comfortably.

To use it, draw the ends of the twine up through the holes in the bed piece, through the slits in the strap, and up over the block, letting the ends hang down about six inches; lay the fleece inside down, shoulders towards the block; crowd the wool close together; fold in the sides until it is about the width of the strap. Then raise the leaves, hook them together, and taking hold of the end of the strap, bring it over the wool to the front end. Fasten the chain to the hook on the lever, and with your foot upon it, fetch it down snug, and fasten it. Tie the twine over the fleece; unhook the leaves and let them down; then loosen the lever, unhook the strap, and throw it back on the table, take hold of the fleece, draw it over to the front, so that the twine will lie in the notches of the block, cut loose, and you are ready to fold another fleece in one half of the time it takes to tell how. If pains is taken to roll in the ends and sides well, the fleece, after it is tied, will be as round and white as a snowball.

Fig. 1.

Basket Making.

"A Subscriber," of Peoria Co., Ill., writes us a letter in German, describing his method of making a *Half-Bushel Basket*. It is, in most points, clear, and as our former article on basket making set so many people thinking, and weaving willows, we publish this to give them some new ideas on the same subject. The willow rods are worked either peeled, or with the bark on, and soaked so as to be thoroughly flexible. Our correspondent writes:

"We begin by taking seven pieces of willow, $\frac{3}{4}$ to $1\frac{1}{2}$ inch thick, and 14 inches long. Four of these are split in the center, and the three are passed through the middle, as shown in figure 1. Then we put in by their tips, two willows (A above, and B below,) as shown. A is drawn down at the angle F, turned under B, brought up at C. B is bent up at F; down at C; passed under the four rods; bent up at D, and so car-

ried around twice. Then we spread the seven rods apart, as in fig. 2, and weave the willows between them. When B, in fig. 1, becomes too short to weave further, we bend the but down and put in another willow beside it, and continue with this until A becomes too short, then supply it by another in the same way, and continue. The willows are held by the left hand, while the right does the weaving. The willows used for the center of the bottom need not be so thick as those towards the outside, and in weaving, all are laid in by the tips, and the buts

Fig. 2.

are left sticking down (outside). When we have woven a few inches, we place the bottom on the knee and press the center upward, to take the form shown in fig. 3. We then weave on, using four willows instead of two. At the last round on the bottom, the willow is cut off, bent, and stuck in horizontally, as shown at G, fig. 2, and all the ends cut off. This finishes the bottom of the basket.

We now take 28 willows (H, fig. 2), sharpen the buts, and stick them in, one on each side of the frame rods of the bottom, as shown. They are bent up and tied together at the tops. We now take 28 weaving willows (I, fig. 3), not so stout as the upright ones (H), and insert them in the bottom, in the same manner (see fig. 3); with these we weave around the basket, with each one passing two uprights, both in weaving out, and in, until all the 28 are inserted; then we weave, passing on the outside two, and inside one upright, twice around. When this is done, it is best to take a piece of wood, and, holding it upon the weaving, strike it with a hammer, to settle all firmly together. After this, we weave on until the willows I are exhausted, but out and in over one upright. Then we take off the strings, and 28 willows are again taken. They are laid so that the buts will stand out 3 or 4 inches from the inside, which enables one to cut them off easily. We weave these simply

Fig. 3.

out and in, using other sets, if necessary, until the basket reaches the height of 8 inches. (Three

sets will probably reach.) Before proceeding further, four willows, (*M*, figure 4), are woven around once, and beaten together. Figure 4 shows how this set is woven in.

In topping off, one upright (*II*) is bent inside to the right, around two others. It is bent down hard up on the weaving. The second, third, fourth, and fifth, are thus bent. Before bending down the sixth, the end of the willow first bent down is drawn within the basket, having passed inside around two and outside around three. (The course of the willows is shown in fig. 3, 4 being the first bent down, and 2 the sixth.) Then the sixth is bent down; the second is woven in, and the seventh is bent down, and so on, until the top is finished, when the ends are cut off, outside and in.

Fig. 4.

Fig. 5.

To finish off the bottom, we again take 28 willows, (*N*, fig. 3), and insert them in the bottom (as before, with the *II* and *I* willows). Then these willows are laid down and woven in precisely as the top was finished off.

To make the handles, we take for each a stout willow stick, (*O*), bend it, sharpen it at both ends, and insert it, as shown in fig. 5. Then take two long willows, (*P* and *R*), and twist them. *P* is inserted on one side, wound around *O* three times, stuck through the rim, and drawn tight; it is then wound back around *O*, again drawn through the rim and the end secured. *R* is proceeded with in the same way, until the handle is finished. Beginners should have a good basket before their eyes to guide them."

When to Sell Hay.

The high price of this article, \$30 a ton, and upward in the markets of the sea-board States, makes many farmers anxious to sell, and suspicious of the wisdom of the old maxim, "Never sell hay, but feed it all out on the farm." This is the true policy for farmers who depend upon the resources of their own farms for manure. But for those who are located near cities and villages, or near the sea, hay may be sold with advantage to the farm. The economy of selling depends mainly upon the facility of procuring good manure. After the land is in good heart, the making of this crop costs much less than most other farm crops. With improved tools, the mowing machine, the horse-rake, loader, and pitch-fork, it will not cost over \$3 a ton to cut, make, and store. It costs still less if the hay is sold to be delivered directly from the field, as the labor of one handling is saved.

Hay shrinks about one-third in weight between harvest and the following spring, and the price may be regulated accordingly. The quantity of hay that may be produced upon an acre depends chiefly upon the application of manure. With no very large outlay, the farmers indicated may bring up their fields from an average product of one ton to the acre, to two. The shore farmer has an inexhaustible source of fertility in the sea, and has no excuse for a small hay crop. Fish are a very cheap manure, whether applied fresh or after the oil is extracted. Rock weed, kelp, cel-grass, and mud from the creeks, will pay for carting a long distance. We have taken mud from salt water ditches and spread it, after a few weeks' exposure upon the bank of the ditch, directly upon mowing land, and seen nearly as good results from it as from a similar quantity of stable manure.

The price of stable manure in cities and villages varies from nothing to \$12 a cord, according to location. It is highest, generally, where there is the most demand for it by gardeners and truck farmers. It will not pay for the hay crop at the highest price, perhaps not at \$6 a cord, unless the price of hay remains very high. But in most places it can be had for less than that. Night soil can often be had for the carting, and in manufacturing villages there are factory wastes that make excellent fertilizers. The farmer's market wagon or cart should never come home empty. Hay may be sold freely where manures obtained away from the farm are applied still more freely. One advantage of this crop is, that on most soils the land need not be plowed to keep up its fertility. By top dressing alone the grass may be maintained for years in the greatest luxuriance. Some farms are favorably situated for irrigation, and by this means alone produce satisfactory grass crops. As a rule, *sell hay only when all the money you get for it may be immediately re-invested in good manures.*

Breeding Pure, Grade, and Cross-bred Stock.

"Is a pure-bred female injured for the future bearing of pure stock by having half-blood young?" It is certainly very undesirable, as a general thing, to lose the service of a valuable cow or other animal for one year—for by breeding a pure-bred cow to a scrub or grade bull, she is made for one year no better than any other cow. Her value above common cows is, in that she may bear full blooded calves, and as she can not ordinarily be expected to bear more than eight or ten in her life, the loss is considerable. Aside from this, there is a wide-spread opinion prevailing, strengthened by much that has been written on this subject, that if a heifer be covered by a bull of a different breed or by a scrub (or "native") bull, not only will her calf be an inferior "grade," but she, liable to take an *impression*, which will never leave her, or which will last for many years, and will cause her subsequent calves to bear some resemblance to the first one, or to its sire. This is accepted by many people as true, and though it is very hard to prove a negative, we must say we have no evidence to convince us of its truth. We can, moreover, cite numerous instances, one of which occurred in one of the best Short-horn herds in the country, in which no such effect was observable, though a well-bred Short-horn heifer had a calf by a little, dark, scrub bull, and her subsequent calves by superior sires were most closely scrutinized; and another, in one of the

best flocks of Merino sheep,—many pure ewes, young and old, being accidentally crossed with a South-down buck—equally without effect. If a single case can be named, which will bear investigation, in which it is shown that such an impression has probably been made on any cow or ewe, we would be glad to know it.

There is another influence, which in the opinion of many breeders, effects the young—though very seldom operating disadvantageously—or observably in any way. We refer to the effects of association, or those circumstances which act upon the mind of the dam, during pregnancy. Careful breeders are so suspicious of these effects that they advise keeping female animals of different breeds separate, allowing choice animals to associate only with fine specimens of their own kind, and especially advising to keep breeding females from associating with deformed or crippled beasts of any kind.

When a "grade" animal is spoken of, it is always inferred that pure males have been used upon females of mixed or uncertain or grade blood. Thus, the first progeny of such breeding is a half-blood; the progeny of this half-blood with a male of the same breed as its sire, is a quarter-blood; and so we may go on in a *gradation*, always approaching the pure-blooded, so that we often speak of grade animals of seven eighths, or fifteen sixteenths pure blood. By "crosses" or "cross-bred" stock, is meant such as result from breeding one full-blood upon another—thus inferior cows of one breed are frequently bred to bulls of another breed in the hope of uniting the good qualities of the two breeds. Thus, among the Short-horns, are often found deep milkers, and the Jerseys almost uniformly give very rich milk, thus crossing the two breeds either by using the little Jersey bull with the big Short-horn cow (which would be most sensible, usually,) or the reverse, we might expect to raise a deep milker, giving rich milk. Such cross-bred animals, if males, are worthless for breeding purposes; if females, should be bred to one or the other of the original breeds. There are many cows of pure blood and unexceptionable pedigree among even the best herds, which are not up to the standard of excellence which every good breeder adopts. Such are low in value, and very properly subjects for experiments in cross-breeding. This explanation will satisfy those inquiries prompted in a recent article on crossing Jerseys and Ayrshires for milk cows. The breeder who experimented thus probably had cows of imperfect record or of inferior points which he chose to use in this way.

The Influence of Tobacco Upon Other Farm Crops.

Many a farmer's golden visions from the tobacco crop are growing dim. The crops of 1865 and 1866, in the Connecticut River Valley and, to a large extent, elsewhere, are mainly now on hand, and a proposition is made to the cultivators to grow no tobacco this year, in order to sell the old crop at high figures. There has manifestly been an overproduction, induced by the high prices during the war. It is a good time for the growers to pause and consider both the moral bearings of the crop, and its influence upon other products of the farm. The current of opinion as elicited at the last meeting of the Connecticut State Board of Agriculture, at New Haven, was decidedly against the crop, on economical grounds. It is not denied that a large sum of money may be realized by it, from a small plot of ground. But the general confes-

sion is that it ruins all the rest of the farm, by leading the cultivator to neglect it. It demands large quantities of manure, and all he can make goes to the tobacco patch, and he buys a good deal besides. The meadows run out, the pastures become barren, the orchard fruitless, and if the cultivator accumulates funds in the bank, as he may, it is by the ruin of his farm. Ten acres may be splendid, but the other hundred have gone to mulleins and hardhack. The influence of this crop upon the community is quite as disastrous as it is upon the farm. The tobacco growing district grows poorer. Other farm crops decrease in quality and quantity. Less stock is raised, less beef, pork, butter and other necessities of life. The lands are all the while decreasing in agricultural value, and less capable of sustaining a thrifty population. If a man makes money by the crop, sells out, and goes to the city, the community loses by the depreciation the farm has undergone. The value of its taxable property is all the while diminishing, we apprehend, under the influence of this crop. Other crops, as a rule, bless the farm, and tend to make it more productive. They help to sustain animal life, and if consumed upon the soil, return more to it than was taken from it. But tobacco is a blight upon the land that raises it.

Comparative Production in Good and Bad Farming.

J. Stanton Gould, in his address before the N. Y. State Agricultural Society, stated that the average production of winter wheat in this State in 1865 was 13.36 bushels to the acre; oats, 17.16 bushels; barley, 16.27. corn, 28.44; potatoes, 98.86; hay, 0.91 tons. The production upon the farm of James Geddes, and six of his nearest neighbors, was: of winter wheat, 26 bushels to the acre; oats, 50 bushels; barley, 38.12; corn, 45; hay, 2 tons to the acre.

This shows a difference of nearly one half in favor of good farming, which consists mainly in drainage, deeper plowing, more manure, and more thorough cultivation. The largest item is manure, and this pays the farmer better for his labor, and increases the value of his farm. Statistics show, that the average production of farm crops decreased from 1855 to 1865, with the exception of wheat, corn, and potatoes. The crops on the farms of Mr. Geddes and his neighbors, show an increasing average. If the farm crops of the State should be brought up to Mr. Geddes' standard, the yearly increased product would be worth 75 millions of dollars. Good farming would soon pay our national debt.

FIREWOOD ON THE PRAIRIES.—The impression, once entertained, that trees would not flourish on the prairies, is found to be erroneous. Wherever young trees have been planted and cultivated, and protected from the ravages of vermin and cattle, they grow with astonishing rapidity. It is now calculated that a prairie farmer need wait only five years to grow wood enough from the seed and from transplanted seedlings to supply his own fire perpetually, and to keep up his fences. In a few years longer, the trees will give him abundance of timber for his own use, and to sell. A few trees recently measured in Iowa gave the following results: No. 1, planted 20 years, measured 16 inches above the ground, 91 inches in circumference, and is estimated to contain 1½ cords of wood. No. 2, planted 16 years, measured 76 inches, and will make a cord of wood. No. 3 measured 3½ inches at 21 years of age. No. 4, 75 inches,

and No. 5, 80 inches. It is estimated that some single acres of prairie-planted forest, 20 years out, will now cut 300 cords of wood to the acre. Facts like these account for the change that is taking place in public opinion in regard to the value of these lands. It is found in practice to be much easier to get wood upon the prairies than to get cleared fields in the timbered districts. The labor of clearing a farm upon heavy timbered land is immense, and many of the stumps linger through the first generation.

Labor Essential in Agricultural Colleges.

MESSENGERS. EDITORS:—In the article on Agricultural Schools in your January number, objection is made to making such institutions "manual labor schools," and to requiring of the students more labor than "enough to learn how to perform all kinds of farm labor." The italics are mine. If the writer means that the work on the farm should be for the student's instruction and not for his own profit (money) or the school's, I agree with him; I only urge that *for this purpose, much labor is essential*. I remember when a boy, to have seen a shoemaker bristle a thread hundreds of times, and I thought I *knew how* to do it, but *when I tried, I couldn't*. Are there not enough schools now that send out young men and women who *know how* to do almost everything, but who, when put to the test, *can do nothing*? The commercial colleges advertise their actual business departments as their chief attraction, medical student's dissect, law students plead, midshipmen do the work of sailors as well as officers, young chemists work many hours in the laboratory for practice, and with all these the longer and harder the drill, the better. 'Tis a pretty race of farmers we educate(?), who walk out with kid gloves, cane, and sun umbrella, to witness the operations of farming, and *learn how*. In sober earnest, is it safe to let our young farmers taste the sweets of idleness, to let their muscles grow soft and their bones weak through inaction? Farmers must work with their own hands. Where is the college graduate who has any pursuit requiring manual labor? In their long course of study they have lost both taste for it, and strength. Is it worth nothing to retain habits of industry and strength? Is three hours too much time for healthy exercise, too much for learning how to do all the operations of the farm, and practising upon them until all be *both well understood and easily done* in the best manner? I have it from the best authority that many of the graduates of the Michigan Agricultural College are proving themselves to be good practical farmers. They labor there three hours per day. G. W. J.

Encourage the Boys.

A lad from Iowa writes us, that he thinks farmers' sons ought to have a chance to earn something for themselves, to be allowed to make little ventures in stock-raising for pocket money, and to keep them contented at home. We think so too. We suppose a great many farmers do this, certainly the great majority of our readers do. But many work their boys with as little consideration as they work hired men. They take no pains to make farm life attractive, and the boys are off at the earliest opportunity. They have no joyous memories to bind them to the spot that ought to be the dearest on earth. To learn the worth of money they must have money as the result of their labors. To form habits of faithfulness, carefulness and economy,

these and other virtues must be rewarded. They should have responsibilities put upon them while they are very young, and be encouraged to make money and to save it. Give them a hen, a goose, or turkey, a lamb, or pig, and let them have all they can make by good care and feeding. A boy of ten or twelve years of age, with a little instruction, can manage the poultry. Let him take it on shares and see what he can make out of it. Give him a patch for a garden, and, if near a market, let him sell what he can raise. Give him a half dozen apple trees or pear trees, teach him to graft them, if they need it, and let the fruit be his. Give the boys an interest in your business, and make them intelligent in it, and they will not be in haste to leave the homestead. Encourage them to read agricultural papers and books, and the appetite will grow by what it feeds upon. The farm will be the scene of cheerful, well rewarded labor, and will always be loved.

To Prevent Ruts in Roads.

The art of road-making is yet in its infancy in this country. The roads are not laid out, made, or repaired with reference to economy of draft in using them. Deep ruts are soon worn in them by the common vehicles that pass over them; and these grow worse and worse, until they are almost impassable in spring. Broad cart tires are a partial remedy for these. Longer yokes, both for oxen, and for double horse wagons and carts, compelling the teams to walk in the same line with the wheels that come after them, would be a still better remedy. On most country roads there are two toe-paths and two ruts, and it is noticeable that the toe-paths are always in much the better order. Longer yokes would bring the paths and ruts together. The feet of the teams would break down the sides of the ruts, and fill them as fast as they were formed. This would improve the road bed, and make the draft of loads easier. We cannot shorten the axle trees without increasing the danger of upsetting, but we can lengthen the yokes with safety. Legislation is needed.

DECREASE OF POPULATION IN AGRICULTURAL DISTRICTS.—The census of 1865, in Rhode Island, shows a decrease of population in five years, in the four farming counties, of 3,878, and an increase in Providence co., made up of the city of Providence and suburbs, of 14,223. To be sure, these were years of war, but the draft upon the country for soldiers was no greater than upon the city, and the decrease can not be fairly attributed to this cause. It is another indication of that unhealthy public sentiment, which prompts men to abandon the slow gains and the substantial comforts of rural life for the rash speculations and unwholesome excitements of the city. The same process is going on in all the older States. The only increase of population is in the cities and villages. If people could better their condition by the change, nothing could be said against it, but this is rarely the case. Ninety-five in a hundred who undertake business in the city fail. On the farm, comparatively few fail, and the failures are usually traceable to moral, rather than commercial or natural causes. Society must be in an unhealthy condition where production does not exceed consumption. Rhode Island, with its unrivaled facilities for sea manures, aside from the stable, the best and cheapest in the world, ought to feed its own population and show a substantial increase in the farming districts for generations.

[COPYRIGHT SECURED.]

MOUNTAIN SHEEP. (*Ovis montana*).—FROM STUDIES BY WM. H. BEARD.—Drawn and Engraved for the American Agriculturist.

The Rocky Mountain Sheep or Big Horn. (*Ovis montana*.)

This is a giant sheep, one of the Moufflons, and closely allied to the Argali of Siberia, (*Caprovius Argali*), but not so large, and to the Aoudad or Bearded Argali of Northern Africa. It is found in the Rocky Mountains, and is of a solitary disposition, being not often found in larger flocks than 12 or 15, although sometimes perhaps as many as thirty may be found together. The male is remarkable for its immense horns. The writer of this has seen a pair measuring 3 feet 4 inches in length, and used as rockers for a chair. They are of great strength, presenting an appearance as if they were transversely grooved. These animals jump from great heights, and are said to land on their horns. Old hunters affirm this to be true, and are ready to swear that they have seen them do so. The writer has seen them jump, and thinks it may be so. At all events, the horns always present a decidedly battered appearance, which, however, may come from their conflicts with one another.

They are very difficult to approach, and upon the first appearance of danger, the one first perceiving it utters a peculiar cry, sounding like a whistle, when they all scamper off to their hiding places in the rocks, from which they can not be hunted out. They frequent the most inaccessible places, and never come into the valleys to feed, preferring to crop the small tufts of grass and herbage to be found upon the crags. Their wool or hair is short and thick, and would hardly be profitable for any manufacturing purpose, even if it could be obtained in large quantity. The flesh is excellent, being considered far superior in flavor to the finest mountain venison. Their color is variable, changing with the season, from nearly white to a yellowish brown. The largest one ever seen by the writer, was nearly 3 feet 6 inches in height at the shoulders, but this is an unusual size. They have been known to weigh as much as 350 pounds, but one of 225 to 250 pounds is about the average. The female differs from the male in size, and in the shape of the horns, which are small, and resemble a goat's horns going straight back in-

stead of curling, like those of the male. Our engraving is composed, by permission, from sketches recently made by one of our first artists.

Fremontia Californica.

The English and other European horticulturists were last year much pleased with the flowering of one of our California shrubs, the *Fremontia*, and—as we wish to keep our readers advised of whatever is receiving attention at home or abroad—we arranged to have it engraved. A Boston Horticultural journal has recently brought out a figure, purporting to be the *Fremontia*, accompanied by an article “adapted” from a French periodical, which gives so incorrect a representation of the flower that we are induced to publish our engraving, which we intended to reserve until some of our nurserymen should announce that plants could be had. Why a journal styling itself “American,” should go abroad for an account of an American plant, discovered by an American explorer, first described by one of our own botanists, in one of

FREMONTIA CALIFORNICA.

VARIEGATED ASTILBE.

our own publications, we are at a loss to understand. Boston people stand preëminent in horticulture, but they have hard work with their botany. Hovey's Magazine will persist in calling things by wrong names, and gets properly called to account by the Gardener's Monthly, and now this "American" journal gives us an engraving which must be a puzzler to any one who wished to make out the structure of the flowers. We will not assert that nature *could* not produce such a flower as they figure, but we can safely say that she never did. The engraving we present is from the original specimen, brought home by Gen. (then Col.) Fremont, and was not discovered in his expedition to the "Rocky Mountains," but in that made some years later to California. It grows along the sides of the Sierra Nevada, and upon the Coast Range, being rather unequally distributed. It may be properly claimed as a shrub, but it sometimes forms a small tree from 20 to 30 feet high. We have a section of a trunk of *Fremontia*, 5½ inches in diameter, with very hard and close grained wood. The form of the leaves is shown in the engraving; the older ones are often 3 inches in diameter, green above, and of a rusty color on the under side. The flowers, which are of a bright golden yellow, are succeeded by a downy capsule, that much resembles that borne by the common Rose of Sharon (*Hibiscus Syriacus*). The shrub was first described by Doct. Torrey, in the Smithsonian Contributions in 1850—and properly bears the name of one to whom we are so much indebted for a knowledge of the vegetation of the far West. Although this shrub has been so long known to

botanists, as is usually the case with American plants, it first appears in cultivation in the gardens of Europe. We hope it may soon be found in those of this country, and prove hardy.

A Variegated Astilbe.

In a notice of *Astilbe Japonica*, (*Spiræa Japonica* of some catalogues,) given in January last, (page 22,) allusion was made to a variegated leaved form. Mr. Peter Henderson has recently afforded us an opportunity to see this variety in great perfection. We were so pleased with the plant that, notwithstanding the difficulty of adequately representing its beauty in black and white, we give an engraving of a single leaf. Imagine golden lines in place of the white, and a dark green instead of the black, and a tuft of such leaves a foot across, and some idea may be had of this most beautiful production. The plant will doubtless be hardy, and we hope that it will soon be abundant enough to become accessible to all, as it is one of the most beautiful of what the gardeners will persist in calling by the absurd name of "foliated plants."

The Horticultural Value of Cats.

Puss has a bad name among our fruit-growing friends, and a still worse name among the little birds that seek shelter in our gardens and orchards, if they had a chance to speak their sentiments. If they could hold a convention and assert "bird's rights," puss would either be banished, kept in close quarters, or furnished

with a bell necklace to warn all useful birds of her stealthy approach. The ostensible use of cats is to keep rats and mice in check. When well trained, they do this. But a great many cats of low breeding, or spoiled in education, fail in this essential point. They will not attack even when the rat squeals, as Mr. Deanagon would say. They are dainty, aristocratic animals, that have forgotten what they were made for, like certain bipeds of a higher order. They eschew rat sirloin and affect chicken, and feathered game in general. The sparrows, thrushes, wrens and martins that make constant warfare upon insects, are kept in mortal fear by puss. She runs her long claws into the boxes where they build their nests, climbs into the trees and gobbles whole broods of young robins. Cats with kittens are especially ravenous and destructive among the birds. They depopulate the garden, and wander off to distant meadows and woods after the tender, half grown game. One eat will readily destroy two hundred birds in a single season. It is easy to see how much cats may do to destroy the balance of nature, and leave insects to multiply without let or hindrance from our useful feathered friends.

We cannot in all cases get along without cats, but we may do much to keep their increase within proper limits, and much to protect the birds against their attacks. The birds that breed in boxes, like the martins, wrens, English sparrows and blue-birds, may have their homes isolated on poles, or in other ways, so that cats can not get at them. A piece of sheet iron or old tin, a foot wide or more, around the body of a tree a few feet from the ground, will be

proof against pussy's claws, and make the birdlings in the branches above secure. The robins sometimes build in the wall, or on fences very near the ground, but will build in trees if they have them. Evergreen trees are favorite breeding places for several kinds of birds. If the old tin is not convenient, pare pussy's nails occasionally. The tin is the least trouble, and if you put it up to shield the nests, you will have your reward in abundant bird songs all through the summer, in fewer insects, and more fruit.

CONNECTICUT.

Grape Trellises.

Many persons who have planted vines, will this season, for the first time, put up trellises, and we have many letters asking what kind shall be made. We have published so much upon this subject that it seems like repetition to introduce it again. Mr. Knox's trellis, of wooden slats, was figured in April, 1863, p. 116. Mr. Fuller's trellis, of horizontal wooden strips at top and bottom, and vertical wires, was figured and described in August, 1863, page 244. In April last, we gave Dr. May's illustrations of the trellis of horizontal wires, most in use in the West. Of course the form of trellis will depend much upon the system of training. Where the double arm and spur system is followed, Mr. Fuller thinks that he demonstrates the superiority and cheapness of vertical wires. But this is not the system adopted in the large vineyards of the West, and there they use horizontal wires, and the hints of Doct. May will be found useful. In small vineyards, where horizontal wires are used, it will be found convenient to have a contrivance for tightening them. A screw swivel, such as is often used for tightening the frames of wood saws, can be easily adapted to this purpose, and a person, with a little ingenuity, can be relieved from all trouble from the sagging of the wires. There is one advantage in the vertical supports of Messrs. Knox and Fuller,—the one using wooden slats, and the other upright wires. There is not that constant strain upon the posts at the ends of the rows that there is when horizontal wires are employed. They also admit of a saving of timber, as short locust posts can be put in the ground, to which uprights of less durable wood can be spiked. An inspection of the trellises of both these vine-growers, shows that the plan of either is perfectly practical, according to their modes of training, though in the method of training followed at Hammondsport, and other large grape-growing regions, where the long-arm system is not followed, they consider it better and cheaper to use horizontal wires.

Wanted—A Horticultural Society.

For once, we write a local article. We need a Horticultural Society, just here in New York, the commercial emporium, the center to which everything that is transportable and worth selling, tends. We would not ignore the valuable services of horticultural associations elsewhere, but one is needed here. We have only that anomalous association, the Farmers' Club, which will give a remedy for itch, with the same facility that it discusses the latest pear. It will have a Strawberry Show this month, to which we hope all our readers within reach will contribute and make a visit. All these things are well, and it is well to offer liberal premiums for the best quart of this and that variety of fruit.

The prizes will be very welcome to those who

get them, and the public will be gratified by the sight of a fine display. We ask for more than this—a society whose mature judgment on a new fruit or flower, shall outweigh all dollars—whose simple certificate shall be more valuable than green-backs. Who cares to know who can raise the largest quart of *Triomphe de Gand*?—any one can do great things if he coaxes properly. What we do want to know is this; is this new fruit or flower, so praised, worth buying; is this a new thing or some old one with a new name. Then again, as many meritorious things have died for want of proper notice as there have been miserable ones puffed into undue notoriety. Let us have a society to settle things. It needs some money, but more brains. It needs a class of men with knowledge, and without any interest in the mercantile aspects of the matter.

Have we these?—New York can not be so badly off as to say no! Good Mr. Greeley tried to do something when he offered premiums that must have dissatisfied as many as they pleased, no matter how they were decided. Under proper advice, such liberality might have produced some good result. Now, it is interminable bickering. Are there not enough pomologists and florists in and around New York to give us such a society? We don't mean those who always want to say "I," and make their own little patch the criterion for the rest of the world, and talk the thing to death, as other societies have been killed—but good, zealous horticulturists, who believe that horticulture is something beyond dollars—that it is an important element in our National prosperity, that it is a great humanizing influence, now often perverted, and that it belongs to the great city of the Union, which has liberally provided for other elevating arts, to do something for horticulture.

This is a subject that we have long had under consideration, and are induced to speak now by looking over Fuller's *Small Fruit Culturist*, and seeing—to use a vulgarism—the "perfect slathering" the author, with the aid of Mr. Downing, gives the nursery names of currants. We can not expect that such work will be done by private individuals at their own expense, nor that the decision of individuals, however eminent they may be, will carry the weight of the dictum of a society—such a society as we hope to see sooner or later established.

Picking Berries for Market.

The success of small fruit culture depends upon several other things than the choice of suitable soil and productive varieties. There must be ready access to market, and abundant labor to gather the crops, just at the right time. So perishable are most of the small fruits, that a day's delay in either picking, or in transportation, may seriously reduce the returns. Both forethought and capital must have been employed in providing an abundant stock of baskets, crates and other packages—enough to allow the grower to go on with gathering in spite of any delay in returning packages. As many hands are needed to gather the berries, the cultivation of small fruits must of necessity be carried on in thickly settled communities. In the great berry regions, picking time levels social distinctions, and the poor and well to do, young and old, black and white, find plenty of work, at paying prices. The season begins with strawberries, then come raspberries, which, followed by blackberries, prolong the season through several weeks. A shed or shanty is erected in the field for "headquarters," where empty baskets

are to be had, and to which the fruit is brought. Each picker has a basket stand or tray, which is a shallow box with a handle, and large enough to hold from 6 to 12 baskets, according to the size. A row or bed is assigned to each picker, who is expected to gather all the fruit, good or bad, that is ripe at the time. Assorting is done by the picker, who reserves one or two baskets for the inferior berries, and puts only good ones in the others. This is found to be much better than assorting the berries after they are brought in, as it saves one handling. The baskets are rounded up, in order that they may be at least level full when they reach the consumer. When a picker has filled all the baskets, she (or he) brings them to headquarters and receives as many tickets as there are full baskets, fills up the stand with empty baskets, and starts anew. The baskets are put at once into the crates, (the inferior berries being kept separate,) which, as soon as full, are fastened up, and are ready to go off. When the picker accumulates tickets, (representing each a basket,) enough to amount to a half dollar or a dollar, they are exchanged for one of these denominations. These larger tickets are redeemed by the proprietor. In some places they pass as currency at the stores. The price paid varies from two to five cents a quart, and the pickers earn from \$1.50 to \$3 a day. Those who live within an easy distance of market, find it much better to send fruit by their own conveyances than to forward it by rail.

Picking commences as soon as the dew is off, and the fruit is started for market in time to reach its destination early the following morning.

Garden Irrigation.—2d Article.

BY "TESUQUE," NEW MEXICO.

Those who have their gardens laid out for irrigation, as described in the March number, will soon begin to use the water; and in the month of May, in climates such as New Mexico, will use it pretty freely.

Parsnips, carrots, beets, radishes, and all root crops should have water, and have the beds well filled with it, at most, five or six days after being sown. By watering them at this time, the ground is well soaked, and, besides giving the seed an early start, it obviates the necessity of watering the plants when just appearing, and when, very likely, there are frosty nights; and at such times very young plants are more or less injured, or at least put back.

Early peas *should get water often*, and always be watered two or three days before picking for market, if you wish them to fill well.

Turnips will speak as plainly as any vegetable need, when they require water, and in dry climates do not leave them any longer without it, after the leaves begin to call for it, than you would your best cow; don't put it off for a day or two, or you may insure a crop of pithy, strong flavored roots, entirely unfit for the table.

Cabbages, cauliflowers, broccoli, and the rest of the cabbage tribe, should be transplanted into beds well watered overnight; and the day after transplanting, another slight watering is necessary; after the plants are well established they are not apt, in an ordinary season, to need irrigating oftener than every two weeks, until they commence heading, and then, every ten days. If lice are found on any of the plants in a bed, pull the plants up previous to irrigating, as the lice are liable to wash from one to the other.

When the lice have commenced on plants that are not higher than the borders, by filling the bed so that the plants are immersed for a

few minutes, and then letting the water off rapidly at the opposite side, into the ditch that is not being used, one can often thoroughly cleanse the bed of these pests. Onions need water about as often as cabbage, but not so much at once. Spinach should be watered over night, when picking for market, and immediately after, in hot weather. Lettuce, we transplant in wet beds, and irrigate in all respects as directed for cabbage. Cucumbers need water in this climate, at least once a week, but not heavy waterings.

Celery, in trenches, must have a sink at the end of each trench to serve as explained in the March number, and when hilling up the plants, leave each side of the trench lower than the center, until you are on a level with the surface; by this means you can run the water on without covering the hills, for if you allow water to go down into the heart of the plant, for a few times, it will cause your celery to rot; throughout the growing season celery will require water nearly as often as cabbage.

Pepper: water often until it has attained the growth at which you expect it to mature, then give it but very little, as it retards the ripening.

Tomatoes need more care in the watering than any other vegetable; when the plants are first put out, they should be transplanted into wet beds, as for cabbage; then see that they are erect before irrigating, and let on the water slowly, taking care not to cover the crowns of the plants; and at no time let over two inches of water on your plants, or they will either wither, or stop growing entirely; tomatoes need water often to get an early crop, but in very limited quantities.

And now, supposing that your garden is able to wait a day or so, and that there is nothing that can be hurt by so waiting, then, the best times for irrigating are: cloudy days, and moon-light nights; but if the plants really need water, irrigate them at any time.

It is well, with your crops that have to be thinned, to take them in rotation; and the beds of carrots, beets, etc., which you intend to thin next day should be watered the night before; or even better, early the same morning; by this method you can work among them much easier, as you can pull out those which need removing without injuring the rest.

Hot-beds can be irrigated as soon as the plants are up, by cutting a hole in the back board of the frame, the bottom of which should be on a level with the soil; by spouts from the ascequia you can water many hot-beds while you would be sprinkling one. The above remarks as regards time between waterings, etc., must not, in all cases, be closely followed, as difference in climate, soil, situation, etc., will cause a difference in the need of water; I have shown here as nearly as possible what is required in this section of country, but it is a thing in which every man must rely on his own judgment, taking care, in a dry climate, never to miss seeing his whole crop, at least every two days, as plants that to-day look fresh and appear to be doing well, may to-morrow show signs of distress. It is well for beginners to rather overdo their irrigating than to err on the other side, and to bear in mind that the great cause of cabbage lice, and many other troubles to the gardener in all climates, is—drouth.

BEDDING PLANTS, such as Verbenas, Lantanas, Gazanias, etc., make a much better show if pegged down. Hair-pins, hooked sticks, etc., are used, as well as a strip of bass matting put over them, with both ends thrust into the ground.

Flower Garden Experience.

If persons, instead of writing us essays on the beauty of flowers and the pleasures of gardening, would tell us their experience and the circumstances that led to their success or failure, we should print more of their letters than we do. Miss O. M. Luke, Trumbull Co., Ohio, gives us a clever bit of flower garden experience, from which we extract the following, with the remark that her plan of protecting seedlings with leaf mold is an excellent one, and followed by some of our best growers.

"I have always been a great lover of flowers, and have tried various experiments on some of them, marking, with the greatest pleasure, each new feature, which my experiments produce.

"Sweet Williams and Pinks are my hobbies now. Some seeds of these were sent to me by a friend, two years ago last August. Two weeks after I received them, I had a bed made about 8 feet long, and 1 foot wide, upon which I spread one peck of leached ashes, one of stone-coal cinders, and about the same of well rotted chip manure, being careful to have them all raked through the soil. Then, after sowing my seeds, I covered them very slightly by raking the compost over them. The plants came up very thick, and grew about two inches before winter. I thought best to protect them during the winter by a covering of leaf muck from the woods. In the spring, after removing the muck from their tops, they looked very green. I watered them during the summer season about once a week with soapsuds.

"They grew thriftily and needed very little weeding. The second winter, I protected them by a covering of brush and straw, removing it in the spring, and last June they blossomed. I wish every reader of the *American Agriculturist* could have seen them. The Sweet William stalks were all about two-and-a-half feet high, and measured about two-and-a-half inches around. Such a variety of colors I had never before seen. They were ringed, streaked, speckled and plain, of almost every shade; some were double, others measured an inch-and-a-half across each flower, with a fine deep fringe around their edges. There was one stalk with three different varieties of colors growing on the same stem; but on different little branches. Every one who saw them said they never had seen any thing like them before."

Transplanting Seedlings.

There will be much transplanting done this month, in both the kitchen and flower garden, and with varying success. There are some who seem to do the work very roughly and always succeed, while others appear to be very painstaking and have bad luck. A plant, in its removal from the seed-bed, will lose more or less of its root fibres, and as all the leaves usually remain, the present surface of the leaves is all out of proportion to that of the roots, and unless in a very damp time, the plant will wilt from the loss of moisture by evaporation. It is always preferable to do the work on a damp day, not so much on account of the moisture in the ground as of that in the air. The few last hours of day-light are to be preferred, as plants set at that time have a chance to recover, in a measure, during the cool night. The soil in which the plants are to be placed should have been recently worked, so that only fresh and mellow earth can come in contact with the

roots. Water the seed-bed thoroughly, and take up the plants with care, and set them out as soon as possible. Much of the success depends on bringing the soil in close contact with the roots. Where a dibber is used for making the holes, an unskillful workman is very apt not to properly fill the hole made by the dibber, and as a consequence, a portion of the roots are surrounded by air instead of earth. For this reason, those who have but little transplanting to do, and are not practised in the use of the dibber, had better make broader holes with the point of a garden trowel, and when the plant is set, fill the earth in carefully, and crowd it down firmly. Always have the ground marked off beforehand, so that no time need be lost in looking out for the proper distances; besides the work will be more regular.

In larger operations, there is a division of labor; one carries a basket containing the plants, which are kept thoroughly wetted, and drops them at the proper places, and another sets them.

When plants are brought from a distance, and must be put out without waiting for favorable weather, it is best to make rather large holes with a trowel, fill each with water, and set the plants. By a division of labor it may be done much more rapidly than one would suppose. In a very light soil, in a hot, dry time, we have practised this without the loss of a plant.

Seedlings that are to be kept out of the ground for any great length of time should have their roots puddled, by mixing up a thin mud of loam, and enveloping the roots in it.

A Fruit Critic Criticised.

The farmer of Edgewood, in a recent number of the *American Journal of Horticulture*, advances some very sceptical and heterodox notions in pomology, calculated to discourage improvement in this fine art. He says: "I doubt very much if the finest flavored fruits can be grown as easily as the grosser tasting ones." And again, "in the pear line, it is quite possible that, with great nicety of treatment, both in garden culture and in the ripening process, (which last counts for a great deal,) a higher and finer flavor may be given to the Beurré Diel, or the Flemish Beauty, or the Beurré d'Anjou, or even the Duchess, than belongs ordinarily to the Bartlett. But put the Bartlett in comparison with either, under fair average treatment, and upon ordinary garden lands, and I think two luscious Bartletts will present themselves, to one of either the other names." The idea here advanced, that the finer kinds of pears require specially nice treatment in order to succeed, is mischievous, and is certainly not sustained by facts. The Seckel, the highest flavored of all pears, is even more hardy than the Bartlett, and will bear good fruit in almost any soil that is adapted to the pear. It is improved in size by high cultivation, but that is true of all pears—and of the Bartlett as well. We do not think the flavor of the Seckel is improved by its size. The Flemish Beauty and the Beurré Diel, upon ordinary garden lands, and with the fair average treatment, have always borne as well as the Bartlett, in our experience. The Beurré d'Anjou is a newer pear, but it is notoriously a good grower and bearer, and may prove itself adapted to as wide a range of soil and climate as the Bartlett. The Duchess is more fastidious about its soil, but where it finds congenial aliment, it is as easily raised, ripens as well, and keeps better than the Bartlett. We found four large, well grown trees, upon pear stock standing in a

common meadow, three years ago, in Westchester County. They have never had any special care, apparently; they stand in sward land, and yet for three years in succession, they have borne abundant crops. A cow-pasture seedling could not be more hardy, or bear with more uniformity. This variety, we are told, does very well at New Haven, and is comparatively worthless at Hartford. This depends, we suppose, not at all upon treatment or culture, but upon the original character of the soil. The *Paradise d'Automne*, the *Muskingum*, the *St. Ghislain*, pears of exquisite flavor, are quite as successful with us as the *Bartlett*. In soil that suits them, without any special manipulation or culture, we think they can be grown with as much uniformity and in as large quantity. This, we think, is true of many other pears of the first quality. Farmers, and beginners in fruit culture, should not be discouraged from trying to grow the best varieties, by the idea that they require specially nice treatment. They will do better with this than without it, as the *Bartlett* will, but they are quite as likely to succeed with ordinary care. The best are quite as likely to succeed in your soil and climate as inferior varieties.

Therefore, plant them. A great deal of horticultural writing is an account of local experience, valuable as far as it goes, but it should be distinctly stated that they are only individual opinions. No one man is able to lay down rules for the whole extent of this vast country.

Propagation by Layers.

Many plants are multiplied in this way more readily than in any other. Indeed, there are some plants that will make natural layers without any help, as they put out roots whenever the joints of the prostrate branches come in contact with the soil. Among our herbaceous plants, the *Verbena* and *squash* are familiar illustrations. Most of our climbing plants are readily multiplied in this way, and one can increase his stock of *Wistarias*, *Honeysuckles*, etc., very rapidly, to say nothing of the *Grape*, a plant notoriously of easy propagation by layers. With many of our shrubs, such as the *Wiegela*, the present season's growth may be layered as soon as it gets firm, as may that of roses and many others. Give well prepared soil, and if there is likely to be suffering from drouth, put over a mulch. Moss is excellent for this purpose, and a large flat stone is not bad.

The necessity for making a cut in the part layered, will depend upon the facility with which the plant forms roots. If a cut is to be made, let it be on the upper side of the branch, and not on the under side, as is recommended in the older works. The hint we got, long

ago, from our contemporary of the *Gardeners' Monthly*, and have practiced it so successfully, that we wonder we did not think of it ourselves.

in widely separated countries, have a reputation as "Snakeroots." Some tropical species, with very large flowers, are grown as curious ornaments of the Green-house. The writer discovered in Napa Valley, California, a new species, which is called *Aristolochia tomentosa*, in the report of the Mexican Boundary Survey. It is a very vigorous climber, with downy leaves, and very large flowers. We hope some of our many subscribers in that beautiful Valley, will be so kind as to send us some roots or seeds of this species.

Zinc Labels and the Ink.

Zinc labels, marked with an ink containing a salt of copper, have long been in use, and have great durability. The old ink consisted of sulphate of copper, sal-ammoniac and lampblack, mixed with water. The only use of the lampblack is to make the ink visible at the instant of writing. Our friend, Horticola, whose hints we have before presented, sends us a specimen of a zinc label written with his ink, which seems to be as legible and as indelible a label, as one could wish. He is very curious in the way of inks, and has tried all that have been proposed. He has finally settled down upon a formula, which, reduced to convenient quanti-

ties to order from an apothecary, is: Sulphate of copper, 6 grains; water, 1 ounce; dissolve, and add sal-ammoniac, 3 grains, and sulphuric acid, 20 drops. This may be used with a quill or gold pen, or even with those steel pens that have a coating of copper or similar metal on them. Zinc, and all other labels, should be tied in a manner that will not constrict the growing limb. Lead wire answers very well. Horticola is very much pleased with his experience with a peculiarly dressed leather for tying, known among dealers as lace-leather.

RED PAINT IN THE GARDEN.—In looking over the proofs of Mohr's work on the grape, we notice many little practical hints. Among others, he recommends that the handles of pruning knives and all other implements liable to be lost, be painted of a bright red. The handles of knives and other small tools are usually of a color so near that of the soil, or that of the branches of trees and vines, that it is not easy to find them, if carelessly misplaced. He also recommends the same color for wires used for low trellises for vines, etc., as wires of the ordinary color are not readily seen by strangers.

SEEDS OF WILD PLANTS.—Those who wish to introduce the early flowering wild plants into their grounds, should look out for seeds as soon as they ripen, and if it is desirable to remove the roots, put a mark of some kind near the plant, so that it will be seen when the foliage is dead.

THE DUTCHMAN'S PIPE (*Aristolochia Siphocampylus*.)

The Dutchman's Pipe.—(*Aristolochia Siphocampylus*.)

This is a climber that we very much admire, for a fine specimen of it is among the earliest plants we remember. Though a native of our Northern States, and one that is very valuable for covering a moderate space with copious foliage, it is very little in use in this country. The vigorous growth of its twining branches, and the luxuriance of its foliage—the heart-shaped leaves being often a foot across—make it a valuable plant. Its remarkable flowers, though not showy, will attract the attention of the curious. They have a brownish-purple color, and a shape so singularly like that of a pipe, as to suggest its common name. The readers of last year's *Agriculturist* will recollect that the flower of this plant was cited by Professor Gray among those in which the fertilization must, of necessity, be effected by the agency of insects.

The engraving gives a very good representation of the flower of the natural size, and of the young leaves. This species is found from Pennsylvania, southward and westward, but is hardy in most parts of New England and Northern New York. Though it is readily multiplied from cuttings of the partly ripened wood, our nurserymen charge 75 cents a plant, which is more than they do for many exotic things. A low species, about a foot high, is *Aristolochia Serpentina*, the Virginia Snakeroot, which formerly had a reputation as a remedy for the bite of poisonous snakes, and it is a little remarkable that species of *Aristolochia* growing

THE HOUSEHOLD.

Fig. 1.—OUR RUSTIC SEATS.

Stumps, Quilts, and Counterpanes.

PRIZE ESSAY BY MISS EVA M. COLLINS.

Jennie and I have spent the morning among the hemlocks. We started out after breakfast with knives and baskets, for moss, with which to decorate our stump. An old sugar maple, standing by the south dining-room door, had been dying by inches for years;—with the exception of the year it was struck by lightning, when it took a long stride in its process of decay. Its size sensibly diminished as its dead branches were one after another cut away, while the size of the hollow in its trunk was as visibly augmented, (Fig. 2,) until it would admit almost any of us but father. Last fall we discovered a number of new fissures through to the outside, and that it had become so open that Jennie could no longer hide there; it was but a shell, and the first frost proved a feather too much in its cap, and one morning we found it scattered about on the ground in particles, somewhat larger than those of the "One-hoss shay," of poetic fame. Father spoke once of having the roots dug out, but the majority exclaimed against the measure, and triumphed as usual. It was such a beautiful stump, of historic fame! All that was left of the very tree into which our great, great grandmother climbed, when she was a little girl at home alone, to hide away from the unfriendly Indians, whom she heard coming, and who killed her dog, that now lies buried under the tree, and stole all the hams; and no one knows what might have become of her had she made a lisp of a sound. It reminds us too of the wolves she was so courageously driving away with fire-brands, when she was boiling sugar, in the night, but which turned out to be our great, great grandfather, from over the creek, who was merely testing the bravery of the pretty maiden, and had come through the woods—a meadow now—to sit up and watch the group with her. Oh! the stump tells us many a

was left of the very tree into which our great, great grandmother climbed, when she was a little girl at home alone, to hide away from the unfriendly Indians, whom she heard coming, and who killed her dog, that now lies buried under the tree, and stole all the hams; and no one knows what might have become of her had she made a lisp of a sound. It reminds us too of the wolves she was so courageously driving away with fire-brands, when she was boiling sugar, in the night, but which turned out to be our great, great grandfather, from over the creek, who was merely testing the bravery of the pretty maiden, and had come through the woods—a meadow now—to sit up and watch the group with her. Oh! the stump tells us many a

Fig. 3.—PATTERN FOR QUILT.

tale of the past, and it seems almost like sacrilege not to cherish it still. Soon after the tree fell

Ralph filled the bottom of the stump with earth and muck, and carefully transplanted a wild honeysuckle there. The flowers are now filling the air with the sweetest fragrance. This spring, he drove in a strong, branching stick for a support for the Ivy, which used to run wild over the tree, and fastened rude seats among the roots. Katie has planted a rose tree on the other side, and Jennie and I have added our gift of moss. The stump is already a pleasing rustic ornament, and has the present appearance of Fig. 1, and promises to be a favorite family retreat in the warm summer days to come, and an eloquent stump speaker of the past.

I had been saving paper rags all winter, having in view a white spread for my bed. The idea has prevailed with us that patchwork quilts alone were suitable in rooms that were commonly used. A patchwork quilt is a perpetual annoyance to me. The three that I pieced myself before I was five years old, my only ones indeed, were stored away on a shelf in the upper hall closet—carefully folded wrong side out, because I could never bear to see a feature of one of them—until the Sanitary Commission absorbed them. I only hope their presence afforded as signal relief to some poor soldiers, as their absence to "a friend." However, I totally relinquished my purpose of buying a spread, the first time I had an opportunity to price them, and let the rags go for tin as usual, but did not renounce my intention of having one nevertheless. We have some coarse, heavy, double-width sheets, which Charlie had at College, but which have been used

Fig. 4.—THE QUILT COMPLETED.

very little since, on account of being so heavy. I thought the groundwork of the counterpane I was examining, was not very unlike Charlie's sheets, barring the price; so I told our storekeeper "I would not take any to-day," and hastened home to see what could be done with one of them. After

Fig. 5.—HOW IT LOOKS.

spreading it over the bed, and looking at it from all sides, I removed it to my large work table—the floor—and, bearing in mind the dimensions of the bed, with a large bowl and small meat-platter, drew a design in dots, and worked in double candle wicking with a darning needle over a smaller table, like that shown in Fig. 3. The wicking is merely drawn once through the cloth at each dot *, and the ends are trimmed off about a third of an inch in length. It was some trouble to make it, and when finished it looked as in Fig. 4. It took all my leisure time for three or four days; but it pays capitally,

because I am so well satisfied with it, and it looks so nicely on my bed, (Fig. 5). Mary says she has

Fig. 6.—WHIPPING IT OUT.

seen wick spreads before, and that they will wash. It is only necessary to fasten them strongly with clothes' pins to a high line, Fig. 6, and frequently whip them out while drying. Katie and Jennie are thinking of making one for their room, but say they shall improvise a prettier pattern than mine.

Leaves from the Diary of a Young Housekeeper.—No. IV.

PRIZE ESSAY BY MRS. LAURA E. LYMAN, STAMFORD, CT.

June 10th.—Mother has been passing a week with me. She seemed very much pleased with all my household arrangements. I took a deal of pride in showing her that the efforts she had made to teach me the art of housekeeping, had not been fruitless, and that the maxims she used to inculcate were not forgotten in my economy. How many thousand times I have heard her repeat: "A place for everything, and everything in its place;" "A time for everything, and everything in its time;" "Once well done is twice done." I took her into my linen closet and showed her my sheets, snowy white and faked nicely, with sprigs of lavender between. I gave her a peep into my cedar chest, where my woolens, furs, and winter clothing were stowed away, secure from the moths; and showed her my bags, hanging each upon its own proper nail, with a label stitched upon it; one with all my paper patterns in it; another filled with pieces of silk; another with new calico pieces, and another with old; my two rag-bags, one for white and the other for colored; my barrel, in which all woolens destined for rugs and carpets are kept; my button bags, and all the series so arranged, that in the darkest night I can lay my hands on everything in the house which can possibly be called for; my old linen pieces clean and tied up in a roll ready for bandages or sore fingers; my woolen pieces for patches and my worn domestic for linings. All these little evidences that I remembered the lessons of thrift, order, and economy she had taught me, were exceedingly gratifying to her.

In exploring the attic, she discovered two or three old-fashioned, rush-bottomed chairs, the frames of which were still sound as ever, though the rushes had long since disappeared. These, she said, could, with a little ingenuity, be covered, and with a coat of varnish, do service for another generation. So we carried these specimens of a past age down into the kitchen, and stitched over the seat a piece of strong canvas which we covered with some furniture calico, and I have three new chairs in my kitchen which afford decidedly the most comfortable seats in it, except my sewing chair. The coat of varnish which I put on them makes them look like new.

Mother was very much pleased with my milk room, and said it would answer admirably for all the months, except the hottest. Her father was an old-fashioned New Hampshire farmer, and she was brought up to wash and pick wool, card, spin and

weave, and go through all the routine of household industry on a farm. She could bake and brew, scour and dye, and she is very proud of repeating almost the only compliment that my Puritan grandfather ever paid her. She had been away three or four months teaching a district school, at nine shillings a week, and upon her return the old gentleman quietly remarked: "Now, Hannah's got back, and all the dye pots will be going." Father was a merchant who kept a cow and a horse, and lived in a snug way, so we children knew little of mother's farming accomplishments.

I am sure we modern housekeepers cannot be too grateful to the inventors of the Cotton Gin, the Spinning Jennies, and Power Looms, for relieving us from the endless task of manufacturing all the domestic fabrics, and giving us so much more time for the improvement of our minds and the elegant accomplishments of modern society.

We have quite a flock of sheep that were clipped a short time since, and mother suggests that before the wool is taken to market, I look it over and select a few of the coarsest fleeces and all the ragged and unsightly ends, to make me a wool mattress for next winter. This laid upon the shuck mattress, which Jeanette and I manufactured last spring, will give me another excellent bed, almost as luxurious as a feather bed, equally warm, and more wholesome. By winter, my six geese will have yielded feathers enough for a bolster and pillows.

June 12th.—My poultry has been interesting me a good deal of late. I have three broods of chickens now, one, three, and five weeks old, and another hen will be off in a few days. Sue finds her pastime in egg-hunting, and her sagacity amuses me. I believe she knows the cackle of every individual biddy on the place, and from which one every egg comes. My oldest chickens, two or three of them, began to have the gapes, and farmer Jones' wife, who has a genius for raising chickens, told me to give them black pepper, and the worst cases to treat with a pretty strong dose of black pepper and sweet oil. She always mixes pepper with their meal, and never loses any, she says, from gapes. I tried her remedy and have lost no chickens yet, except one, that a weasel caught.

June 20th.—Such a lively time as we have had. A day or two after mother went home, cousin Eliza and her husband paid me a visit. They live in New York, and while John was off fishing, an amusement which he pursued with wonderful zest, Eliza and I were comparing city with rural housekeeping. She was very much, and very favorably, impressed with the abundance of eggs, butter and milk, which, in the city, are so expensive, but with us are matters of course; and she was constantly remarking the immense advantage I enjoyed in confining all, or nearly all, my work to one floor. Whether one has servants, or does the work herself, this is a grand desideratum. In the former case she can look after them so much better, and know how everything is going on; and in the latter case, she is saved so many trips up and down stairs.

While Eliza enjoyed the abundance of eggs, cream and butter, and their compounds, John was particularly delighted with my brown bread. He says he can't get used to baker's bread, or learn to like it, or even consider it wholesome; but none of their city domestics know how to make good bread, and he has been enjoining upon Eliza to take lessons of me in the sacred art. I have taught her especially how to make Boston brown bread and Graham, and no doubt, the use of these plain, but palatable and nutritious compounds will add years to John's life, as well as money to his Bank account.

He kept the table supplied with trout and perch while he was here, and Edward killed a fat wether. I never liked mutton till now, and I think Edward's way of butchering accounts for the difference in flavor between this and all I have ever eaten. As soon as the animal is dead, he makes all haste to eut him open and remove the entrails, and then to take off the skin as quickly as possible. The sheep have been ranging in a wild and rocky pasture on the back part of the farm, which probably accounts for the very fine flavor of the mutton. John said it tasted almost as good as venison. I find the best

way to cook mutton is to bake it. I generally cut little gashes in it, and fill them with bread crumbs, moistened with milk and spiced with garden thyme.

After reading a good deal on the subject in the books Sue White lent me, we have decided never to butcher a calf or a lamb for our table. Veal is said to be the most indigestible and least nutritious of all the meats, and my author says, the young of any animal is less wholesome and far less nutritive, than when it has attained its growth.

My investigations in this department of knowledge have led me to these conclusions: That venison is the most perfect of all meats, being the easiest of digestion, and at the same time the most delicious and the most nourishing. Next to this ranks good mutton, and for mutton, wethers are the best. Third in value for the table is beef; tender roasting pieces and broiled sirloin steaks being the choice parts. Turkey and chicken are very highly esteemed and their flavor is delicious, as is especially that of partridge and quail; but they are not so readily digested as the first three.

June 27th.—The memorable litter of pigs that Jenny and I took so much pains with last spring, has suffered a division. Edward had promised five of them to one of our neighbors, and he came today for them. They have been running wild for two months in the pasture, and it was no easy task to catch them. Edward has some pleasant surprise in store for me I know, by the way he speaks of those pigs. He is duly alive to the fact, that Jenny and I saved him at least fifty dollars by our assiduous care and devotion to that interesting family.

I have learned something new about butter lately, from an old farmer's wife. Now I weigh my butter before salting, and allow an ounce of salt to a pound of butter; I roll my salt, and dry it thoroughly in the oven before putting it into the butter. I find, too, that a little crushed sugar and saltpetre, worked in with the salt, improve the flavor and preserve the butter. I have a fifty pound firkin nearly full, and I am very ambitious that in market it shall rank as "prime." The firkin is of hemlock, a wood that imparts no taste, and it was perfectly new. I rinsed it with scalding hot water, and placed it in the sun until it was entirely dry. Next October, I mean to try for the prize in butter at our County Fair. Edward thinks he'll take one on these Chester White Pigs.

June 30th.—To-day I have been busy all day in putting up strawberries. Sue picked several quarts, having a fine flavor, though they were not large, in a pasture which has recently been cleared. These I preserved, allowing pound for pound. Those which I gathered from our strawberry bed, being large and very fine looking as well as delicious, I put up "in their own juice." I allowed three-quarters of a pound of sugar to a pint of water, and when it was boiling, put in my strawberries and let them scald through; then skimmed them out and put them into glass jars, placed in my tin boiler with water in it, which I raised gradually to the boiling point to prevent the jars from breaking. When I had filled each jar, I poured juice enough in it to cover the berries, and then put on the rubber cover which had a screw in it, which I turned until the mouth was perfectly sealed. Mother has kept strawberries in this way for two years.

Fashion Gossip.

BY AN EXPERT.

The authority that prophesied walking-dresses were to be a short lived caprice of Gothamite fashionables, has proved at fault. "Cleanliness is next to godliness," sayeth wisdom, and this virtue of the new mode must compensate for its want of grace and style. Gray, Bismarck, and green poplins or Alpacaes, are pretty for this month, and serviceable for travelling suits. We advise short dresses for country wear. Muslins, with saques or peplums to match, will look simple, neat and rustic. Suits have been adapted for carriage costume. They should be enriched with effective trimmings. The most casual observer must have remarked that for elegance, evening dresses, and a toilet for any ceremonial occasion, require trains and the peculiar flow of drapery produced by the fashionable gored skirts.

Gored robes are destined for such a lengthened exist-

ence, that one need not hesitate about cutting up even the richest materials in this style. The idea is certainly more economical than a preponderance of folds about the hips, which in no wise added to the symmetry of the figure. Much less material is required, and a plain surface will outwear one that has innumerable creases. A walking-dress is not complete without its accompanying peplum, but a well provided wardrobe should have a cloak of black silk for extra times. Make fine qualities into loose saques, deeply dented, or otherwise cut around the bottom, and trim profusely with jet gallions and lace. Jet embroideries are more *distingue* than *passementerie*. Amber is not sufficiently chaste and elegant for mantles. Satin folds and piping form a new and beautiful ornamentation. Superb shawls, for Park riding, are made of black Cashmere or Ahmure cloth, trimmed with jet and Cluny. Amber *bijouterie* can be worn by brunettes, but never by blondes. Mention has been made of the re-introduction of cameos. Stone cameos are always valuable, and having nearly as much prestige as pearls and diamonds, descend as heirlooms through families of note. Each successive era of popularity, however, adds its variation of appearance. To-day we have engravings fine and transparent as mists, and shapes all stars, angles and parallelograms, with a pearl or diamond glittering upon every point. Mosaics of a very beautiful order are also set in this way. Jasper silks are new, and adapted for suits or *demi-toilette*. The foundation color is dark, and overshot with scintillations of purple. Black and white striped silks are festooned with jet ornaments over gray silk petticoats. Later, *pique*s and muslins will be used as substitutes. Organdies are fresh, fair, and lovely to look upon. A most effective design simulates a tunic caught up at intervals with vines of roses trailing from the belt. Knots of blue flowers and grasses form a border upon the lower part of the skirt. The waist is all white or sprinkled with tiny bouquets. White organdies for dinner toilet are made with *bouillons* divided by narrow straw braids. The under slip should be of *taffetas*. Lace peplums are pretty over low corsages. Very wide sleeves are not so well for thin materials as half close shapes, because with a little wear, the stiffening is lost, and they are apt to look "stringy." Tulle sleeves with wide silk ones should be puffed lengthwise or crosswise as the fancy may dictate. Maltese lace is more worn than Cluny. It makes beautiful ruffs for the throat and wrists. We saw the following new spring patterns at Mme. Demorest's: The "Nicola Dress," to be made of French poplin in two choice shades of green. The under skirt should be the lighter, and trimmed around the bottom a finger deep, with black braid set on obliquely. The upper skirt is dented, and finished with black cable cord, which is formed in the same shape up a seam on each side. These side dents are connected across the back breadths by chains of cord, fastened with loops and tassels. The waist is plain, of the color of the upper skirt, and tastefully decorated with cord. The "Vicky dress" is of orange chambray. The skirt is divided into shallow scallops by two narrow rows of black braid. Below, it is closely barred with horizontal stripes of the same. The waist is trimmed to simulate a bodice. The sleeves are half close. This dress is accompanied with a graceful saque, scalloped around the bottom and the edge of the flowing sleeves, and ornamented with black braid. The "Cluny dress" is made of blue *taffetas*, with oblique bands of black forming a border. A Gabrielle finished with narrow ruffles of Cluny is worn with this. One of the prettiest of wide sleeves is named the "Juvia." It is opened in three diamond shapes upon the outside, each being separated by a full rosette. A design full of grace and character is called the "Rosa." The bottom is intersected by deep notches, which are filled with rich loops of ribbon, attached by jet or silver buckles, or, if preferred, rosettes of straw. If the latter is used, straw gimps must be employed as waist and skirt trimmings.

For young ladies especially, rosettes are more dressy for high bodies and belt fastenings than buttons or clasps.

Many coat sleeves, variously distinguished with bows, plaitings, or rows of braid fancifully arranged, are retained in vogue. The "Fadette" is most popular. Four rows of braid or velvet form a cap at the top and a cuff. Two similar sections extend half way across at the elbow. Jet buttons separate each band.

Gold and silver embroideries appear upon parasols. Flower patterns are pretty, also Grecian borders. Crimped fringe and lace serve as a finish. It is noticeable that often in a single toilet, fringe, lace and satin pipings are used as trimmings.

This is not good taste, strictly speaking, and it is very bad, when one mantle is thus martyred. French taste has disfigured in this manner some of the costliest importations. Short circles have been adopted by very young ladies, instead of saques or basquines. The last named should be half fitting, with flowing sleeves. It is a matter of individual caprice whether the side pieces shall be as long as the front and back, or finished out with flounces of lace.—Long sash fronts are exceedingly modish.

BOYS & GIRLS' COLUMNS.

The Doctor's Talks.

Perhaps you think I am to talk again about pollywogs. That is quite a mistake; I don't intend to confine myself to any particular subject, but say, now and then, a word

Fig. 1.

Fig. 2.

about animals, plants, stones, or any common thing that will teach you to use your eyes, and see that there are plenty of things worth the trouble of looking at closely.

Have you watched the trees this spring, and seen how the naked branches soon became clothed with leaves that now, in this warm June, cast a pleasant shade? You hardly noticed the trees when they were bare, but you admire them now that they are in full leaf. Did you ever think how all this came about, and how much work the trees did, beforehand, to prepare for this spread of foliage you now enjoy so much? Next winter, if you look at the trees, you will think of this, and notice the plump buds on the ends of the stems, and the smaller ones along their sides. Buds do not look very interesting, but those of most of our forest trees in winter already have, within them, the leaves that will so delight you in summer. I have had drawn, figure 2, a bud of a Horsechestnut tree, or Buckeye, because that is a large bud, and was handy. In winter, it looks as in the engraving, a scaly knob, all covered with a water-proof varnish. If you pick it open, you will find within it the very delicate young leaves, and these are very curiously packed away in a mass of cotton-like hairs, so as to perfectly protect them from the cold. As soon as the weather is warm enough, the scales fall open and the stem upon which the little leaves are placed pushes out; the leaves themselves rapidly enlarge, and soon the tree has its naked limbs hidden by the green covering. Figure 1 shows the shoot just pushing. Most of our forest trees make their growth in a very short time; the new shoots push rapidly in spring and unfold their leaves, and then remain quiet. But what is the tree doing all the summer? It is doing several things, and among the most important of these, it is preparing a very great number of buds for the growth of another year. At the ends of the branches

and at the points where the leaves join the stem, there are quietly and slowly forming these curious buds. The buds are within and without composed of leaves, and the scales which look so dark and unlike leaves, are only leaves formed in a particular way to serve a particular purpose. In the Buckeye, in figure 1, we can see, in early spring, that, while the outer scales are very unlike leaves, the inner ones have a slight leaf-like look, and so along up to perfect leaves. Is not it strange that the tree should seem to know that something would be needed of it next spring and work away during summer to pack up carefully the young leaves, so that they will be protected from the rains and frosts of winter?

Do Cats Love Music.

Several incidents which have been communicated to the *Agriculturist*, seem to prove that cats enjoy sweet sounds, although they make horrid work when they try their own voices. One writes, that when the ladies of the family sing, the household cat will at once jump into the lap of one of the party and remain there until the music ceases. Three persons in different parts of the country have written that their cats have been detected running over the keys of the piano, apparently enjoying the sound. It would be a rare performance for one to be taught to play a tune, but we think that can hardly be expected.

Respect the Aged.

"Take my place, sir, if you please," said a boy, rising from the seat he had occupied in a crowded street car, and addressing an old gentleman who had just entered. "Thank you, my boy, but I'm sorry you should have to stand," was the reply.—"I shall not mind it, sir; and I'm sure you need the seat more than I," returned the youth; and the old man took his place, a look of weariness, that had been noticed in his face when he came in, leaving it as he did so. It was a little thing for the boy to do, but it was a kind, respectful act, and some of those who saw it felt that it promised well for the boy's future.

Another old man was walking down the street some days later, when another boy came by, apparently in great haste. "Come, hurry up, old '76, or you'll never get where you're going;" were the rude words he spoke, as he rushed by. The old man made no reply, but looked sadly after the boy, and moved slowly on. "I should never speak like that," my young reader will say, and perhaps with a feeling of indignation against this boy. Well, I trust you would not. There are very many ways in which the young may show respect for the old, or rudeness to them. When you see an aged man or woman, never forget what kind of treatment they may rightly expect from you. Remember that they were young and strong and merry once like you. But that was long ago. For them the busy day of life is nearly past, and night is near. Try to make them happier. You will be glad some day to remember that you did so. UNCLE PAUL.

"Baby Ned," though not two years old, eats his dinner at the table with the family; and his mother finds it very difficult to keep him still long enough for "the blessing." One day, after much training, he folded his little hands and sat very quietly until just at

still, he suddenly called out "at 'ill do (that will do) papa, pass plates now." Of course there was a smile.—H.

A Pattern Building.

The accompanying figure shows one of the hundreds of buildings, which may be made with Crandall's improved building blocks, noticed in a previous number of the

Agriculturist. It is here given as a pattern for some of our young friends, who have procured a set of the blocks to work by. No doubt, some of you could build a more tasteful structure, and if you succeed in making one that looks better, and will send a drawing or photograph of it, we may have it engraved, and call it the model building, until some one else succeeds in showing something more elegant. This will exercise the ingenuity and taste of all who may make the trial, whether successfully or not.

New Puzzles to be Answered.

No. 267. *Word Puzzle*.—Mace, Nutmegs, Raisins, Rice, Sugar, Tea, Salt, Lettuce—half the letters in these words, with half a letter added, will name a well-known newspaper. What is it?

[COPYRIGHT SECURED.]

THE FIRST LESSON.—FROM THE ORIGINAL PAINTING BY MERLE.—Engraved for the American Agriculturist by J. L. Langstaff.

Knowledge gives pleasure, but the way to get it is not always easy. The child in the picture "don't want to learn its letters;" boys and girls usually like to *know*, but they do not often like to study. How many wish that learning could be done like breathing, without work, and because one could not help it. But that would not be the best way. *Study makes the mind strong*, just as work with the hands gives a stouter grip. It is not an easy thing for a little beginner to learn the alphabet; his mind has not been trained to attend, to observe, and to remember; but in a few years, by having daily fixed his thoughts upon some task, he will readily see through problems he can not now understand. Let those who can not learn quickly, and who find school duties hard, take courage by remembering that every resolute mastery of a lesson adds

vigor to the brain-power, and helps make a mind that no difficulty can withstand. Those who learn easiest, and carry away all the honors and prizes at school, are by no means always the most successful in life; but the boy who schools himself to conquer laziness, and trains his mind to severe application, whether he stands at the head or the foot of his class now, will by and by gain *power* to be prepared to take the front rank in any calling.

Spanish Puzzle.

Take six checker-men, three of each color, (pennies or buttons will do), and place them thus:

● ● ● ● ● ●
The space left between the two colors should equal the diameter of a checker. The puzzle is, by moving and jump-

ing, to put the white men where the black men are, and *vice versa*. Commence by moving one of the men that are next the middle, towards the opposite color. Suppose you begin by moving *Black* towards *White*. Then jump *White* over *Black*, and so on. There will never be but *one* open space, across which to move, or into which to jump. It is not allowed to jump or move a man backward—that is, each color must always advance towards the opposite side. The men must be kept in line, and a mark made at the ends, to show the limit beyond which the men must not go. The men of the same color, that is, all the whites, or blacks, are placed touching each other, although the engraving represents them as separated by a short space. To explain the puzzle, in giving an answer, the men may be numbered 1, 2, 3, etc.

(Business Notices \$2.50 per Agate Line of Space.)

The
**Howe Machine
Co.'s Sewing
Machines,**
699 Broadway,
Cor. Fourth-st.,
New York.
For Families and
Manufacturers.

**These World-Renowned Sewing
Machines**

Were awarded the highest premium at the World's Fair in London, and six first premiums at the N. Y. State Fair of 1866.

These machines are made under the immediate supervision of the President of the Company, ELIAS HOWE, Jr., the original inventor of the Sewing Machine.

The Stitch invented by MR. HOWE, and made on this Machine, is the most popular and durable, and all Sewing Machines are subject to the principle invented by him.

FRED. F. MAYER, Chemist,
Has removed his Office to 53 Cedar-st., New York.

SILVERS' CELEBRATED PATENT EXCELSIOR BROOM,

WHICH HAS TAKEN THE FIRST PREMIUMS AT THE NEW YORK, OHIO AND KENTUCKY STATE FAIRS, is unequalled for durability, lightness, elegance, and elasticity, and universally acknowledged the most beautiful Broom in the world. It is the only one accepted for

THE PARIS EXPOSITION.

The ladies pronounce it THE MOST VALUABLE IN USE, when applied to Tapestry, Wilton, Brussels or Ingrain Carpets. Housekeepers proclaim that it sweeps with the least effort, and does not wear out the carpet one-fourth as fast as the old-fashioned broom, therefore, MONEY and TIME are saved by its USE.

In the short period this broom has been before the public, it has received the highest commendations from people of all classes, and there is now no reason to doubt that in a short time it will entirely supersede the old-fashioned tied-broom as a household implement.

We present the following testimonials as evidence of the value of this invention:

[From the Hon. Horace Greeley.]

OFFICE OF THE TRIBUNE, NEW YORK, May 3, 1867.

Messrs. C. A. CLEGG & Co.: Your broom is a good implement, and will, to a very large class, be acceptable and useful. To be able to renew a broom in ten minutes and at a few cents cost, will be to many at once convenient and economical. I PREDICT YOUR SUCCESS. Yours,

HORACE GREELEY.

[From the American Agriculturist, after 3 Months' Test.]

SILVERS' PATENT BROOM.—This is a novelty, certainly. By means of a cap and screw, the brush can be removed at any time. We have no broom corn at hand to test the removal of the old brush and the putting in of new, but we do not see why it can not be readily done by any one, and farmers thus raise a little plot of broom corn and make their own brooms, after buying a patent handle. The one we are using has a superior elasticity.

[From the New York Weekly Tribune, of May 28, 1867.]

PATENT BROOMS.—Within a few years several patents have been issued for improved brooms. The end aimed at by all has been to make a broom which could be renewed at small cost by inserting a new brush. To combine this quality with elasticity, lightness, durability, and beauty, was difficult and seemingly impossible. An Ohio inventor conceived a plan which it was thought would answer, but a brass cap such as his broom required was declared impossible to make. One thought differently. A skillful worker in brass was employed, who after eight months' study and labor produced the cap now used on Silvers' Patent Broom. With the improved cap we shall not be surprised if this broom becomes popular among housekeepers in city and country.

For cut of Broom and valuable testimonials, see full column on page 7, of February No. *Agriculturist*.

TO FARMERS—AGENTS WANTED.

The Brass Metallic parts will be sent to Farmers (where we have no Agents) with full instructions for making their own Brooms, by mail or express (pre-paid), for \$1.50.

Agents wanted in every city and county in the United States, to whom exclusive right of sale will be given, without any charge for Patent. Send for Illustrated Circular.

Over 200 Agents are already engaged in selling this Broom exclusively, and are making from \$5 to \$20 per day.

Address, stating first, second, and third choice of Counties, C. A. CLEGG & Co., No. 205 Broadway, New York.

HERALD OF HEALTH.

To Merchants and Peddlers Everywhere!

A New and Good Thing for Every Family.
DOTY'S EVERLASTING CLOTHES-PIN!

[Patented March 26, 1867.]
Ingenuously constructed of a single piece of non-rusting, elastic wire, so shaped that it ADJUSTS ITSELF TO ANY SIZE LINE.

ADVANTAGES OVER OTHER CLOTHES-PINS:

I.—CANNOT BE SHAKEN OFF THE LINE.

II.—WILL NOT FREEZE CLOTHES TO THE LINE.

III.—WILL NOT MARK THE WHITEST FABRIC.

IV.—WILL NOT SPLIT, ROT, RUST, OR WEAR OUT IN A LIFE TIME.

Although their first cost is greater than the common wooden pins, their purchase is TRUE ECONOMY, being serviceable for longer, and more convenient.

Housekeepers, who have had fine garments lost in snow, or dabbled in mud by the wooden pin working loose and shaking off, or who have, on bitter cold days, had to thaw or wrench from the line, clothes frozen fast by the dampness held by wooden pins, will appreciate the merits of "Doty's Everlasting" pins.

Retail Price, 30 cents per dozen. Three dozens, boxed and mailed, POST PAID, for \$1.20. Send two red stamps for sample pin and wholesale terms and circulars.

DOTY'S CLOTHES-PIN CO.,

32 Courtlandt-st., New York.

THE UNIVERSAL

CLOTHES WRINGER,

Cannot be surpassed or equaled by any other Wringer for durability, till the expiration of the patent for the "COG-WHEEL REGULATOR" or "STOP-GEAR." No other Wringer is licensed under this Patent. It being now universally conceded that Cogs are necessary to prevent the Rolls from being broken or torn loose, many attempts have been made to get a Cog-Wheel arrangement which shall equal the UNIVERSAL, and yet avoid the "Stop-Gear" patent, but without success.

Any Cog-Wheel Wringer having Cogs, whether at one or both ends of the roll, which can play apart and fly out of gear when a large article is passing through, is COMPARATIVELY WORTHLESS, as the Cogs are then of no aid when most needed, and an arrangement of Cog-Wheels in fixed bearings, the upper one acting on a roll in movable bearings, must prove a mechanical failure in use, and we warn all persons not to purchase such Wringers as an "improvement on the Universal," which they are sometimes represented to be by the salesmen.

Many who sell the UNIVERSAL WRINGER, keep also the

DOTY

WASHING MACHINE,

which, though but recently introduced, is really as great a LABOR and CLOTHES SAVER as the Wringer, and is destined to win public favor and patronage everywhere.

It washes perfectly, without wearing or rubbing the clothes at all.

Those keeping the Wringer for sale, will order the Washer for customers, if they have not got a supply on hand. On receipt of the Retail price, from places where no one is selling, we will send either or both machines from New York. Prices—Family Washer, \$14. No. 1½ Wringer, \$10. No. 2 Wringer, \$8.50.

A supply of the Wringers and Washers are always kept on hand in Chicago, Cincinnati, Cleveland, Janesville and St. Louis, boxed ready for shipment, at about New York prices.

Circulars, giving wholesale and retail prices, sent free.

Large profits are made selling these machines. Exclusive right of sale given, with no charge for the patent right.

A NEW WORK. SMALL FRUIT CULTURIST.

By ANDREW S. FULLER,

PRACTICAL HORTICULTURIST, RIDGEWOOD, BERGEN CO., N. J.

A new work, and the only one devoted to Small Fruits. Special treatises of this kind have the advantage that the author can more thoroughly discuss his subject, and go into greater detail, than in a work embracing both large and small fruits. The work covers the whole ground of Propagation, Culture, Varieties, Packing for Market, etc.

CONTENTS: INTRODUCTION—I. BARBERRY—II. STRAWBERRY—III. RASPBERRY—IV. BLACKBERRY—V. DWARF CHERRY—VI. CURRANT—VII. GOOSEBERRY—VIII. CORNELIAN CHERRY—IX. CRANBERRY—X. HUCKLEBERRY—XI. SHEPHERDIA—XII. PREPARATION FOR GATHERING FRUIT.

We predict that this work will bring Mr. Fuller many enemies, as he has given his opinion about varieties without reserve. On the other hand it will the more strongly endear him to all true lovers of horticulture, as these wish to have the merits of fruit given without reference to the persons who introduce them.

While very full on all the small fruits, the Currants and Raspberries have been more carefully elaborated than ever before, and in this important part of his book, the author has had the invaluable counsel of Charles Downing. The chapter on gathering and packing fruit is a valuable one, and in it are figured all the baskets and boxes now in common use. The book is very finely, and thoroughly illustrated, and makes an admirable companion to his Grape Culturist.

A NEW WORK ON APPLES.

AMERICAN POMOLOGY.

APPLES.

By Doct. JOHN A. WARDER,

PRESIDENT OHIO POMOLOGICAL SOCIETY; VICE-PRESIDENT
AMERICAN POMOLOGICAL SOCIETY, ETC.

293 Illustrations.

To pomologists a work by Dr. Warder will need no commendation. Though a citizen of Ohio, he is so sure to be at any pomological gathering, be it East or West, that the whole country claims him, and if any one has a right to entitle his work *American Pomology* it is certainly Dr. Warder. The present is the first instalment of a work intended to cover the whole ground. In it the author has attempted the difficult task of bringing apples into something like order.

This volume has about 750 pages, the first 375 of which are devoted to the discussion of the general subjects of propagation, nursery culture, selection and planting, cultivation of orchards, care of fruit, insects, and the like; the remainder is occupied with descriptions of apples. With the richness of material at hand, the trouble was to decide what to leave out. It will be found that while the old and standard varieties are not neglected, the new and promising sorts, especially those of the South and West, have prominence. A list of selections for different localities by eminent orchardists is a valuable portion of the volume, while the Analytical Index or *Catalogue Raisonné*, as the French would say, is the most extended American fruit list ever published, and gives evidence of a fearful amount of labor.

This differs from any fruit book heretofore published in this country, in its complete classification of apples. The author gives the principal European systems and modestly puts forth his own to be tested by practice. He divides apples into four classes, according to their forms. Each of these classes is sub-divided by other obvious characters, and it would seem that any apple described in the book might be easily identified. We trust that this will prove a great help to the pomologist.

Fruit-growers will welcome this book as a valuable and long-wished for addition to pomological literature, and it will be found equally useful to the novice and the experienced orchardist. The work has 293 illustrations, is printed on good paper and well bound.

ORANGE JUDD & CO., 41 Park Row.

The Miniature Fruit Garden,

**OR THE CULTURE OF
Pyramidal and Bush Fruit Trees.**

BY THOMAS RIVERS.

Nothing is more gratifying than the cultivation of dwarf fruit trees, and this work tells how to do it successfully.

Dwarf Apples and Pears

are beautiful ornaments, besides being useful in giving abundant crops of fruit; they can be grown in

Small Gardens and City Yards,

and be readily removed. The work also gives the manner of training upon walls and trellises.

Root Pruning

is fully explained, and methods of protection from frosts are given.

Dwarf Cherries and Plums

are treated of as are other dwarf trees. Directions are also given for growing

Figs and Filberts.

This little work is full of suggestions to the cultivator, and like all the writings of its venerable author, bears the marks of long experience in the practice of fruit growing.

ORANGE JUDD & CO., 41 Park Row.

**My Vineyard at Lakeview;
Or, Successful Grape Culture.**

To any one who wishes to grow grapes, whether a single vine or a vineyard, this book is full of valuable teachings. The author gives not only his success, but what is of quite as much importance, his failure. It tells just what the beginner in grape culture wishes to know, with the charm that always attends the relation of personal experience.

It is especially valuable as giving an account of the processes actually followed in

Celebrated Grape Regions

in Western New York and on the shores and islands of Lake Erie.

This book is noticed by a writer in the Horticulturist for August last as follows: "Two works very different in character and value have just been published and seem to demand a passing notice. The better and less pretentious of the two is 'My Vineyard at Lakeview,' a charming little book that professes to give the actual experience of a western grape grower, detailing not only his successes, but his blunders and failures. It is written in a pleasant style, without any attempt at display, and contains much advice that will prove useful to a beginner—the more useful, because derived from the experience of a man who had no leisure for fanciful experiments, but has been obliged to make his vineyard support himself and his family."

SENT POST-PAID.

PRICE \$6.50.

ORANGE JUDD & CO., 41 Park Row.

ENDLESS AMUSEMENT

FOR

BOYS AND GIRLS.

Crandall's Improved Building Blocks, described in April number of the *American Agriculturist*, page 147, furnish a most attractive amusement for children. They are very simple in construction, will stand years of childrens' handling without breaking, and give renewed pleasure daily.

CHURCHES,

DWELLINGS,

BARNs,

MILLS,

FENCES,

FURNITURE, etc.,

in almost endless variety, can be built with them, and when finished, the structure remains firm so that it can be carried about without falling to pieces.

For developing the ingenuity and taste of children they are unequalled. Having given these blocks a practical trial in their own families, the publishers of the *Agriculturist* were so well pleased with them, that they consented to take the general agency for their sale.

They are retailed at *Two Dollars* per set, of one hundred and thirty pieces, put up in a neat box, and accompanied with a card giving various designs of buildings. A liberal discount will be made to dealers. Address

ORANGE JUDD & CO.,

41 Park Row, New York.

The Best are the Cheapest.

The MASON & HAMLIN CABINET ORGANS are acknowledged to be the best instruments of this class in the world. It is the policy of these makers to produce *none but the very best work*. They aim at success, not by using poor material and economizing in workmanship, so that their instruments can be sold at a little less price; but by producing the most durable, reliable, and in all respects the best work possible, and selling it at the very lowest rates at which such work can possibly be afforded, and at the same prices to all.

They now manufacture more than sixty different styles of Organs, varying in price from \$75 to \$1,000 each. These instruments contain all the latest improvements, some of which are to be found in other instruments, the right to their exclusive use having been purchased by M. & H., in some cases at very large expense.

MASON & HAMLIN have been awarded several times as many highest premiums, at Industrial Fairs, as any other maker, having received fifty-six within a few years.

They present in their Circulars the printed testimony of a large majority of the most eminent Organists, Pianists, Singers and Composers in the country to the superiority of the instruments of their make.

It is certainly economy in purchasing an instrument of this class to *get the best*, although the first cost may be a little more, as a poor instrument will soon get out of order and become comparatively worthless.

It should be remembered that the recommendations of dealers are not always reliable, as there is great temptation for them to recommend those instruments on which they can make the largest profit; and makers of inferior work can afford the largest discounts. Mason & Hamlin have fixed their retail prices so low that they can afford only very small discounts, at wholesale, and hence the temptation to dealers to recommend and sell other instruments is great.

Circulars with full descriptions, illustrations, and prices of the different styles, with hints on what constitutes, and how to select a good instrument, sent free to any one desiring them. Address

MASON & HAMLIN,
596 Broadway, New York,
Or, 154 Tremont-st., Boston.

5 MORE GOOD AGENTS WANTED TO SELL
"Taylor's Patent Door Bells." See page 227.

SPEAR'S PRESERVING SOLUTION

Will effectually prevent fermentation or decay, and preserve all kinds of fruits, vegetables, cider, milk, &c., in a perfectly fresh and wholesome condition, without sugar—and without air-tightening—hence a saving of sugar, and from 50 to 75 per cent. in the cost of jars.

The solution is warranted to contain nothing injurious to health.

Fruits preserved by it are equal to the best "canned" fruits, while its use admits of keeping the fruit, &c., in large vessels, and using them at long intervals when opened.

It will preserve milk sweet from 12 to 36 hours longer than it will naturally keep, causing it to furnish more cream in hot weather.

Give it a trial and be convinced of its merits and great advantages over all other methods.

One bottle will preserve 125 lbs. of fruit, or 43 gallons of cider, or 125 gallons of milk. Full directions for using with each bottle. Price, \$1 per bottle; 6 bottles for \$5, or 12 bottles for \$9. Good discount to dealers, ask your Merchant for it, or form club and send price for 6 or 12 bottles, and receive it by express from the nearest one of the following Wholesale Agents: John M. Mavis & Co., and Johnson, Holloway & Cowden, Philadelphia; C. W. Burgess & Son, Baltimore, Md.; Shephard, Attwood & Co., Boston; Burnham & Van Schaack, Chicago; A. B. Eaton & Son, Cincinnati; Valentine Gezber, St. Louis, Mo.; Elliott & Co., Berrien Springs, Mich.; Roe, Whitman & Co., South Bend, Ind.; Johnson & Bro., New Haven, Conn.; Young & Lyons, Providence, R. I.; or to

THE GREAT AMERICAN TEA COMPANY

(Established, 1861).

Is commended by the leading newspapers, religions and secular, in this and other cities, viz.:

AMERICAN AGRICULTURIST, Orange Judd, Editor.
CHRISTIAN ADVOCATE, New York City. Daniel Curry, D. D., Editor.
CHRISTIAN ADVOCATE, Cincinnati, Ohio. J. M. Reid, D. D., Editor.
CHRISTIAN ADVOCATE, Chicago, Ill. Thomas M. Eddy, D. D., Editor.
CHRISTIAN INTELLIGENCER, E. S. Porter, D. D., Editor.
EVANGELIST, New York City. Dr. H. M. Field & J. G. Craighead, Editors.
EXAMINER and CHRONICLE, New York City. Edward Bright, Editor.
INDEPENDENT, New York City. Wm. C. Bowen, Publisher.
MOORE'S RURAL NEW-YORKER, D. D. T. Moore, Editor and Proprietor.
THE METHODIST, Geo. R. Crooks, Editor.
TRIBUNE, New York City. Horace Greeley, Editor.

We call attention to the above list as a positive guaranty of our manner of doing business; as well as to the hundreds of thousands of persons in our published Club Lists in former editions of the leading papers of the country.

THE IMMENSE PROFITS OF THE TEA TRADE GREATLY REDUCED.

The Proprietors of "THE GREAT AMERICAN TEA COMPANY," became fully convinced, several years ago, that the consumers of Tea and Coffee were paying too many, and too large profits on these articles of every day consumption, and therefore organized THE GREAT AMERICAN TEA COMPANY, to do away, as far as possible, with these enormous drains upon the Consumers, and to supply them with these necessities at the smallest possible price.

To give our readers an idea of the profits which have been made in the Tea trade, we will start with the American houses, leaving out of the account entirely the profits of the Chinese factors.

1st.—The American House in China or Japan makes large profits on their sales or shipments—and some of the richest retired merchants in this country have made their immense fortunes through their houses in China.

2d.—The Banker makes large profits upon the foreign exchange used in the purchase of Teas.

3d.—The Importer makes a profit of 30 to 50 per cent. in many cases.

4th.—On its arrival here it is sold by the cargo, and the Purchaser sells it to the Speculator in invoices of 1,000 to 2,000 packages, at an average profit of about 10 per cent.

5th.—The Speculator sells it to the Wholesale Tea Dealer in lines, at a profit of 10 to 15 per cent.

6th.—The Wholesale Tea Dealer sells it to the Wholesale Grocer in lots to suit his trade, at a profit of about 10 per cent.

7th.—The Wholesale Grocer sells it to the Retail Dealer at a profit of 15 to 25 per cent.

8th.—The Retailer sells it to the consumer for *all the profit he can get*.

When you have added to these *eight* profits as many brokerages, cartages, storages, cooperages, and waste, and add the original cost of the tea, it will be perceived what the consumer has to pay. And now we propose to show why we can sell so very much lower than small dealers.

We propose to do away with all these various profits and brokerages, cartages, storages, cooperages, and waste, with the exception of a small commission paid for purchasing to our correspondents in China and Japan, one cartage, and a small profit to ourselves—which, on our large sales, will amply pay us.

COUNTRY CLUBS, Hand and Wagon Peddlers, and small stores (of which class we are supplying many thousands, all of which are doing well), can have their orders promptly and faithfully filled, and in case of Clubs can have each party's name marked on their package and directed, by sending their orders to Nos. 31 and 33 Vesey-st.

Our friends are getting up Clubs in most towns throughout the country, and for this we feel very grateful. Some of our Clubs send orders weekly, and some not so often; while others keep a standing order to be supplied with a given quantity each week, or stated periods. And in all cases (where sufficient time has elapsed) Clubs have repeated their orders.

Parties sending Clubs or other orders for less than \$30 had better send Post-Office drafts, or money with their orders, to save the expense of collecting by express; but larger orders we will forward by express, to collect on delivery.

We return thanks to parties who have taken an interest in getting up Clubs; and when any of them come to New York we shall be happy to have them call upon us and make themselves known.

Hereafter we will send a complimentary package to the party getting up the Club. Our profits are small, but we will be as liberal as we can afford. We send no complimentary package for a Club less than \$30.

Complimentary Letters from Clubs.

Pittsfield, Ill., March 20, 1867

Great American Tea Co., 31 and 33 Vesey-st., N. Y.

Gents: The package of Tea came safe to hand in good order, has been delivered, and gives general satisfaction. Many thanks for complimentary package. I expect to order a large club in a few days, and if it gives as general satisfaction as the one just received, you will have the entire custom of the Tea consumers in this neighborhood.

Yours with respect,

W. C. HEMPHILL, Pittsfield, Ill.

Potsdam Junction, March 7, 1867.

To the Great American Tea Co., Nos. 31 and 33 Vesey-st., N. Y.

Gents: The package of Tea and Coffee (55½ lbs.) ordered by me from your House one week ago to-day, by M. U. Express, came to hand yesterday in best of order, and proves very satisfactory. Also receipt for \$64.30, in payment for above, came by mail to-day. Please accept thanks for complimentary package. You may expect another order before many days.

Yours truly,

JAMES L. MONTAGUE.

White Haven, Pa., March 28th, 1867.

To the Great American Tea Co., Nos. 31 and 33 Vesey-st., N. Y.

Sirs: The Tea I sent for has arrived in good condition. We are well satisfied with it, and do not hesitate to say that it is, at least, as good a quality of Tea as we ever tasted. We could have done no better for ourselves, had we been at your Store and made the selection, than you have done for us. When this supply is exhausted, we shall, no doubt, send for some more.

Yours most respectfully,

JAMES M. SALMON.

Cedar Rapids, Iowa, March 12, 1867

Great American Tea Co., 31 and 33 Vesey-st., N. Y.

Gentlemen: I have received my first box of Tea, \$4.25, and with pleasure inform you that it has given the purchasers a feeling of old times, as they have experienced in drinking Tea before the war; satisfying them the Company is not a "Humbug." I send to-day my second order, \$121.40. Please forward to me with bill for collection.

A. C. MESSENGER.

Woonsocket, R. I., Feb. 4, 1867.

To the Great American Tea Co., Nos. 31 and 33 Vesey-st., N. Y.

Gentlemen: I now send you my 5th order for Teas, which I hope will be as good as heretofore; it is just one year since I sent my first order of \$20, which I think was the first order you got from here as a club. During the year, I have sent you upwards of \$400, and I have not heard a complaint yet from any one, but all speaking well of your Teas, and are well satisfied. Accept my thanks for the complimentary package. Inclosed you will find \$134.35 for this order. Hoping you will forward as soon as possible, I remain,

Yours respectfully,

JAMES WOODHOUSE.

Direct the Teas for me, Woonsocket, R. I., by Earl's Express.

Geneva, N. Y., Feb. 14, 1867.

The Great American Tea Co., Nos. 31 and 33 Vesey-st., N. Y.

Gents: We have now been receiving Tea from you about one year, and find, in footing up our books, we have received of you Tea and Coffee, to the amount of \$7,911.25 for this small village and vicinity. The public have perfect confidence in your Tea and Coffee, and the misrepresentations against you which we had to contend with at first, are now harmless. We congratulate you on the general success of your enterprise, hoping the hitherto pleasant relations which have existed, may continue between yourselves and

Yours respectfully,

LUM & SON.

Treasury Department, Third Auditor's Office,

March 2, 1867.

Great American Tea Co., Nos. 31 and 33 Vesey-st., N. Y.

Gentlemen: I have the pleasure of enclosing you our second order, \$130.13, which is more than double the first one, and the next one may increase proportionately, if these give as much satisfaction as the first.

You will please forward as before, by the Adams' Express Company, C. O. D.

Very respectfully,

Your obedient servant,

H. C. HILL.

Angola, N. Y., Feb. 16, 1867.

The Great American Tea Company.

Gents: Your Box sent me by Express has been received. Your bill was paid on delivery. I found no mistakes, and I am glad to inform you that the Tea is giving good satisfaction. I had to make some effort to raise the club I sent you, but as the ice is broken, and nobody drowned, you may expect soon to receive a much larger club order from this place.

Yours truly,

JOHN M. SLATER.

Olivet, Mich., Jan. 29, 1867.

To the Great American Tea Co., Nos. 31 and 33 Vesey-st., N. Y.

Sirs: The goods which I ordered for Olivet Tea Club, No. 1, were received in due time, and have given good satisfaction. Really the exhilarating power seems to be contagious, for most of the fair matrons in our neighborhood are inquiring when I send again. Enclosed I send O. T. C. No. 2. I shall probably send again in a few days. Mrs. Ingersoll, who was principal mover in Club No. 1, sends her respects for the complimentary package, and says she drinks her tea with more relish than she has for many years before.

Very truly yours,

E. I. INGERSOLL.

COFFEE DEPARTMENT.

Our Coffee Department is very extensive—the largest, perhaps, in the country. We run three engines constantly, and sometimes four or five, in roasting and grinding our Coffee. Our Coffee buyers are experts, who examine most of the Coffees imported, and select the best and finest flavors for our trade. We employ the most experienced and skillful roasters, who exercise the greatest care that it shall be cooked in a perfect manner. It is always fresh, for our orders crowd our facilities to their utmost capacity. A considerable portion of the Coffee put upon the market of late years is picked while the pods are green, and subjected to artificial heat, to open the pods. This is not so good as that which ripens in the natural way upon the plant. Our Coffee buyer thoroughly understands this business, and can readily distinguish the naturally ripened from the artificially cured; and he only buys the Coffee which is naturally ripened. We examine the cargoes as soon as they arrive, and our trade is so large that it requires all the finest lots. This is what gives our Coffee a superior flavor to many others, and the same flavor it used to have in days long gone by. It is a common saying that most Coffee does not taste as well as it formerly did. The reason for it is, that a considerable portion of it is picked before it is fully ripe. We sell none but the fully ripe, rich flavored Coffee.

GETTING UP CLUBS.

Some parties inquire of us how they shall proceed to get up a club. The answer is simply this: Let each person wishing to join in a club, say how much tea or coffee he wants, and select the kind and price from our Price List, as published in the paper or in our circulars. Write the names, kinds, and amounts plainly on a list, and when the club is complete, send it to us by mail, and we will put each party's goods in separate packages, and mark the name upon them, with the cost, so there need be no confusion in their distribution—each party getting exactly what he orders, and no more. The cost of transportation, the members of the club can divide equitably among themselves.

The funds to pay for the goods ordered can be sent by drafts on New York, by Post-Office money orders, or by Express, as may suit the convenience of the club. Or, if the amount ordered exceeds thirty dollars, we will, if desired, send the goods by Express, to "collect on delivery."

We publish a small Club to show how it is done and a matter of reference.

After the first Club we send blanks.

Direct your orders plainly, THE GREAT AMERICAN TEA COMPANY, Nos. 31 and 33 Vesey-st., Post-Office Box, 5,643—as some parties imitate our name as nearly as they dare do.

The Company have selected the following kinds from their stock, which they recommend, to meet the wants of Clubs. They are sold at Cargo Prices, the same as the Company sell them in New York, as the list of prices will show.

PRICE LIST:

YOUNG HYSON (Green), 80c., 90c., \$1, \$1.10, best \$1.25 ½ lb.
 GREEN TEAS, 80c., 90c., \$1, \$1.10, best \$1.25 ½ lb.
 MIXED, 70c., 80c., 90c., best \$1 ½ lb.
 JAPAN, 90c., \$1, \$1.10, best \$1.25 ½ lb.
 OOLONG (Black), 70c., 80c., 90c., best \$1 ½ lb.
 IMPERIAL (Green), best \$1.25 ½ lb.
 ENGLISH BREAKFAST (Black), 80c., 90c., \$1, \$1.10, best \$1.20 ½ lb.
 GUNPOWDER (Green), \$1.25, best \$1.50.

COFFEES ROASTED AND GROUND DAILY.

GROUND COFFEE, 20c., 25c., 30c., 35c., best 40c. per pound. Hotels, Saloons, Boarding-house keepers, and Families who use large quantities of Coffee can economize in that article by using our FRENCH BREAKFAST AND DINNER COFFEE, which we sell at the low price of 30c. per pound, and warrant to give perfect satisfaction.

Parties getting their Teas from us may confidently rely upon getting them pure and fresh, as they come direct from the Custom House Stores to our warehouses.

We warrant all the goods we sell to give entire satisfaction. If they are not satisfactory, they can be returned at our expense within 30 days, and have the money refunded.

N. B.—All villages and towns where a large number reside, by *clubbing* together, can reduce the cost of their Teas and Coffees about one-third by sending directly to us.

BEWARE of all concerns that advertise themselves as branches of our Establishment, or copy our name either wholly or in part, as they are *bogus* or *imitations*. We have no branches, and do not, in any case, authorize the use of our name. The numbers of our House are advertised above.

TAKE NOTICE.—Clubs and quantity buyers only are furnished from our Wholesale and Club Department.

Post-Office orders and Drafts, make payable to the order of Great American Tea Company. Direct letters and orders to

THE PRONG-HORN ANTELOPE OF THE GREAT PLAINS.—From studies, by J. E. Hayes.

This beautiful and spirited animal is found in immense herds along the base of the Rocky Mountains, from Mexico to the River Saskatchewan, and eastward to the Missouri River. They are larger than a common sheep, exceedingly agile, fleet, and of a graceful carriage. Their flesh is valued, as a change from buffalo beef and salt pork, by the traveler and hunter, but it is not very good. The hair is coarse and brittle, and the pelt valueless. The horns are black, firm, and might be useful if obtained in

sufficient numbers. The color above is yellowish brown; the belly white, as is also a square patch on the rump; other markings are somewhat irregular, but prevailing, as shown in the engraving. The herds of these animals are often many miles in extent, and, from an elevation, appear like the shadow of a moving cloud, as they pass over the prairie. They live and thrive upon the dry prairie grasses, and, like the buffalo, are more or less migratory—moving with the supply of pasturage. The variety of horn "pat-

terns," so to speak, among the antelopes, is very great. That no two should be alike would be expected, but the cause for such great dissimilarity in the horns of animals, so much alike in nature and habits, it is impossible to know. Some are very straight, some curve outward, some backward, some inward, some are twisted, others spiral, like a corkscrew; some have prongs, and others curious crooks and bends. There is but one other American antelope, and that is known as the Rocky Mountain Goat.

AMERICAN AGRICULTURIST.

NEW-YORK, JULY, 1867.

The weather—how much depends upon the weather! Millions of dollars' worth of hay will be exposed to damage from rain; millions of bushels of grain will be in condition to suffer likewise. The lack of rain may bring a blight, if not a failure, to other crops. By the blessing of Heaven we are in little danger from a general famine in this broad land, with its diverse soils and different climates, bound together, not alone by a Constitution, but by potent and ever strengthening net-works of railways and of commercial interests. The plenty of one section quickly supplies the want of another. How to judge beforehand of weather probabilities, and how to shape his plans so that protracted storms, or even hard showers, shall do little damage to crops, and cause little loss of time to himself and his hands, is a study to which the farmer may well give considerable thought. One thing we may certainly do, namely: always have work for our regular hands on rainy days. It is more difficult to find work for teams. We have no doubt that the time is not distant when the coming of all great storms will be told by telegraph, so much in advance, that wide-awake farmers, in neighborhoods receiving a daily mail, may easily prepare for their approach. The habit of closely watching the clouds and changes of the wind, and the indicated currents of the air, high above the earth, is a valuable one. The barometer, taken in connection with other indications, is a very important premonitor of approaching storms. So also are thermometers and hygrometers, the one indicating the temperature, and the other the amount of moisture in the air. No one of these is of reliability alone, and all indications must be weighed with the judgment which experience gives. It is great folly for a farmer to buy a barometer, and think he can tell when a storm is coming, by its ups and downs. As well might he go by the wind alone, much better might he be guided by the clouds. All the signs should be taken together, the energy of the indications considered, and past experience, after all, taken as the surest guide. To gain experience, no way can compare with that of keeping a record of observations. See basket note on weather. The labors of this month are at all times severe. The facilities for using horse-power, in securing the bulky summer crops, are every year greater, yet human muscle is not dispensed with, but only made more efficient. Nevertheless, every year the farmer's success depends less on *brawn*, and more on *brain*.

Hints About Work.

Animals.—Cows at pasture must not lack pure and fresh water—stagnant pools are a poor source of supply. No stock ought to be forced to drink from them, and, least of all, milch cows. Calves are better pastured by themselves with other stock. Young horses often get the bad habit of running after, and striking them, if they feed together. An old horse will take care of himself among cows, but colts, of one or two years old, are heedless, and, if pastured with cattle, may be hurt by their horns, without any real malice on the part of cows. Working stock should not lie over night in the pasture. It is very well for them to have a few hours, in which to graze, during some part of the day, but both cattle and horses work better on good hay, and some provender, corn and oats, rye-shorts, and the like. The amount of feed may be graduated in accordance with the average amount of work required, but it should be uniform. All animals, not at pasture, should have some green feed—perhaps one-third of all they eat. This should be cut, wilted, and brought to the yard or stables for them, and be ready when the day's work is done.

Harness and Yoke Galls.—Wash with castile soap and cold water, and, if possible, bind on a piece of sacking, wet with water, to remain over night. Relieve pressure upon the sore spots by shifting the harness, or by padding, and protect from flies with grease and pine tar mixed, during the day.

Sheep are distressed by the gad-fly this month and next, and should be protected by tarring their noses. Daub the tar on their noses, extending up, where they will not rub it off in feeding. The fly lays eggs in the nostrils, which hatch, and the worms ascending, cause the "grub in the head."

Hogs.—Provide swine with roomy pens, to work over all the litter and weeds that can be gathered, besides sods, muck, etc. The amount of excellent manure made, as noted on another page, is enormous.

Weeds.—Suffer none to go to seed, is easily written, but very hard to carry out. Still, the nearer we can live up to this injunction, the easier will it be to carry it out, year after year. Many weeds, pulled or cut up in blossom, will ripen seed while dying, but few, the seeds of which are not fully mature, will survive the hog pen, in root or seed. It is never too late to pull docks in the mowing. Canada thistles, cut a few times below the surface, will disappear. Carrots are biennial, and, perhaps, in a few cases, will live a third year, if they cannot blossom the second; and we have strong faith, though not positive assurance, that the seeds will not germinate after the third year. So, two years' cultivation will almost always clean them out.

Mowings.—If grass lodges badly, cut it without reference to fitness. Timothy is fittest when it is just out of bloom; orchard grass and clover bloom at the same time, and should be cut when the latter is in fullest flower. Cut all grasses before the seed will shell after curing. The best time to manure grass is just after mowing; the best manure fine muck compost, with a modicum of ashes, bone dust and plaster. Spread with a shovel from the cart, and go over the land with an iron toothed horse-rake, to spread and knock the lumps to pieces, and work them into the sward. See hints of last month.

Grain Harvesting.—Barley should become nearly ripe before it is cut, and it ought to be bound and shocked the same day, and protected from dews and rains as much as possible. Thus the brightest and most marketable grain is obtained. Oats ripen so unevenly that it is often best to cut them while many are hardly out of the milk, to save those that are getting too ripe. The best time is when the kernel is in the dough state. What is lost by early cutting, in the grain, is gained in the straw. Wheat ought to get nearly ripe, according to the latest doctrine, to give the greatest weight of grain and the best quality. The happy medium between sufficient ripeness and liability to shell out is the point to be sought in determining when to cut. The older and perhaps safer theory, favored cutting while the grain was in the dough. Make all preparations early, engage extra hands to be ready to cut, and harvest at the right time; have sharp and good tools.

Hay and Grain Caps.—The cheapness of fabrics will now permit the economical use of caps for hay cocks and shocks of grain. Four feet square is a good size, and loops for pins at the corners are the best fastening. Once using sometimes pays the cost.

Hoeing.—Hoe to kill weeds, to stir the soil, to replace earth washed off by rains. The stirring of the soil is a great security against the effects of drought. It enables the plants to get the full advantage of showers and dews. It enables the air to circulate freely through the upper stratum of earth, and to penetrate lower, taking moisture with it, and depositing it in the cool soil below the surface. Work the soil as deeply as convenient, and not disturb the roots of crops. As a rule, avoid raising hills, either about corn or potatoes. Perfectly flat culture requires, however, deeper soil than we ordinarily have on all fields.

Turnips after Corn.—With the last hoeing of corn, if the soil be tolerably deep, and the culture flat, turnip seed may be sown and hoed in lightly. (A potato hook, or "claw hoe," is the best thing to hoe corn with, especially the last time, if there are not many weeds to cut up. It leaves the surface in excellent shape.) The corn is cut up and removed when the kernels are glazed, and the turnips often make a good crop, having 6 weeks to grow.

Turnips Alone.—Turnips may be sown any time this month. On tolerably mellow soil, it is best to sow in drills, and give as much cultivation as other

cares admit of. Rutabagas will make a good crop sowed before the 15th or 20th—better for the table than if sowed earlier. They do best in drills, too, thinned to 6 or 8 inches apart. In sowing turnips broadcast, use as little seed as possible. One pound to the acre, if it can be evenly distributed, is better than more, though two pounds is the usual quantity. Sod land, or newly broken up land, should be plowed repeatedly and harrowed, to rot and kill sods and weeds, then freshly harrowed before the seed is sown.

Buckwheat is a valuable crop, especially as a weed killer. Three pecks of seed is enough for good land; more is required on poor. Sow about the middle of the month, and see article on page 253.

Tobacco.—The cultivation of this crop adds greatly to the cares and labors of July. Not a weed must be allowed to grow. Missing plants, and those destroyed by the cut worm, may be reset during the first part of this month to advantage. Every plant and leaf even must be examined for leaf worms, and topping should commence as soon as plants begin to run up. Break the tops off or pinch out the "button" just above the broad leaves. It may be done as soon as the flower stem can be taken hold of without injury to the upper leaves. The "suckers," or axillary branches, will start, after this, at once, and must be kept pinched off.

Cabbages.—Set out cabbages on land left vacant by early potatoes and peas, or on fallow ground well worked, limed and dunged. Keep well hoed.

Soiling Crops.—Corn, sorghum, peas and oats, etc., may be sowed, for soiling, any time this month.

Butter.—If the feed is good, the butter may be equal to that made last month, provided the dairy is cool, or, rather, of the right temperature, which is about 58° to 60° Fahrenheit. If the pastures are short and dry, feed green fodder freely—corn, sorghum, etc. It may be necessary to increase the salt in the butter a little in the hottest weather.

Ditching.—Times of unusual, or even of usual, summer dryness, may often be most profitably employed in ditching and draining swamps, cutting the bogs, and drying and burning the same.

Orchard and Nursery.

The promise for fruit is everywhere good; even **Peaches**, so often a failure, bid fair to be abundant. Old trees, that have not borne in years, are now well set with young fruit.

Thinning is now of the greatest importance. A well grown peach or pear is better, and will bring more in the market, than three half developed ones. It is often advisable to take off from one-half to three-fourths of the young fruit. Not only is the present season's crop all the better in quality, but that of the next year is more sure.

Insects.—The whole army of tent-caterpillars, borers, currant worms, pear slugs, and the like, is to be fought perseveringly. It is unnecessary to repeat the remedies given in the preceding months.

Pruning may still be done, according to the hints given last month, and on young trees future pruning avoided by rubbing off superfluous shoots.

Budding will commence with the cherry and plum. The time varies with the season and locality. When well formed buds can be obtained, and the bark of the stock parts readily from the wood, the operation may be performed.

Layers may be put down as soon as the present season's growth gets firm. Very good grape vines may be made by carefully laying the shoots of the present summer. Do not do it to excess.

Young Orchards, when root crops are not grown between the rows, should be thoroughly cultivated, unless the ground is regularly mulched.

Grafts should be looked after, all robber shoots be rubbed off, and if any of the shoots on the graft are too rampant, they should be stopped by pinching.

Seed-beds will need the shading and care suggested last month, and

Seeds collected as they ripen. Cherry pits are to be washed clean and preserved in sand.

Fruit Garden.

Picking of the small fruits will now occupy much of the grower's attention. That which is to be marketed must be picked before it is "dead ripe," while that for home use may be allowed to reach full maturity before it is gathered.

Blackberries are generally allowed to have their own way too much, and they become very difficult to work amongst. The new canes should be stopped by pinching or cutting, when they get $3\frac{1}{2}$ or 4 feet high, and when the side branches are 18 inches long, these should be pinched in the same way.

Raspberries.—As soon as the crop is off, cut away the old canes, and keep down all suckers not needed to furnish a stock of new plants.

Currants are to be watched, and the bushes dusted with white hellebore, if a late brood of worms appears. See that the branches of those in the tree form do not break down from the weight of fruit.

Dwarf Trees will need to have the fruit thinned, especially varieties producing that of a large size. Treat insects as heretofore directed. The red spider is often injurious to pear trees, and they should be drenched with strong soap suds on its first appearance. Control the form of the tree by rubbing out shoots not needed to form branches, and by shortening the growth of others.

Grape Vines.—Do not allow young vines to overbear. A desire to taste the fruit of one's own vine is usually too strong to allow one to remove the first clusters. As a general thing, a vine should never be allowed to bear the first year. Upon the first appearance of mildew—whitish spots upon the leaves—use sulphur freely. Pinch off bearing shoots at the third leaf from the last cluster, and pinch laterals to one leaf. By all means, have one of the many excellent works on grape culture as a hand book for frequent consultation.

Kitchen Garden.

These notes are written during the usual cold and wet spell early in June, when the ground is soaked by cold rains, and within doors a fire is not uncomfortable. Early sowings, if the plants were up, have escaped, but seeds that were already in the ground, if at all delicate, will come slowly, and, in some cases, may rot altogether. It is not too late to replant many things, with a fair prospect of a crop, and to those who for any cause have been deprived of early vegetables, the late ones will be welcome.

Transplanting of the late crops of cabbage, cauliflower, celery, etc., will be done this month. See hints given last month on page 221. Occupy the

Vacant places with quick growing or late maturing crops, as recommended on page 256.

Asparagus.—The cutting has greatly exhausted the roots, and the aim should now be to promote a growth of tops, to give them strength for another season's effort. Manuring will pay now as well as at any other time. If the beetle appears, a small black beetle and black grub—there will be no difficulty in recognizing them—cut and burn, if it takes the whole crop of tops. You will lose your own crop at any rate, and it will be a satisfaction to know that you have done your part in preventing the pest from spreading to the gardens of your neighbors.

Beans.—Plant string varieties for succession and pickles. Keep the running sorts, such as Limas and other pole varieties, at a moderate height. Six or seven feet is high enough.

Beets will make a crop if sown now, unless an unusually dry spell should occur. The thinnings of beets, at any season, make capital greens, and are by many preferred to any others. Collect and wash, and they will keep good for several days.

Cabbage, Cauliflower, and all their relatives, that have been sown in open ground for a late crop, may now be transplanted. It is said that a plenty of lime on the land will prevent club-foot. In transplanting, put out only perfect plants. It often happens that plants from the seed-bed have diseased roots or malformed tops. All such should be rejected. If slugs are troublesome, as they often are

in wet seasons, use lime, or turn the ducks in among them.

Celery.—There are many who prefer to grow in trenches. Such should gradually earth up the plants. The crop for winter is best set this month. In the flat culture, practiced by our market gardeners, they put out the plants by the middle of this month, in rows three feet apart, and the plants six inches distant. The earthing up of these plants is done later in the season.

Carrots need only to be kept clear of weeds until the tops become too large to work amongst.

Corn.—Every one who loves sweet corn should provide for a late supply. Seed sown even now will give ears for late use, and to dry for winter.

Cucumbers.—Select good specimens of the early sorts for seed, and if seed be sown now in well manured soil, there will be a good supply of pickles.

Egg Plants.—These warm-blooded fellows need all the coaxing that can be given to them. Sometimes a plant will content itself with producing one fruit, and its next neighbor will bear a half dozen. Hoe as often as may be, and give liquid manure when the weather is not very dry. Keep the fruit from contact with the ground by a handful of mulch of some kind. Near the coast we use salt hay for this purpose, but any other material, even a shingle or tile, will answer as well.

Endive.—The main crop of this desirable late salad may be sown. It is treated, as far as sowing and planting are concerned, just like lettuce, but before it is used it must be bleached, by exclusion of light. This is done by tying the leaves together, by covering the separate plants with a flower pot, or by putting a board over a whole row.

Herbs.—The time to cut these is just as they come into flower, as at that period of their growth they are in full perfection. Our market gardeners, however, pay no regard to the flowering period; they have seed beds of Thyme, Sweet Marjoram, Summer Savory, and Sage, from which they take plants during the present month, and set them in rows a foot apart each way. Keep well cultivated.

Lettuce.—The Silesian will give a fair crop, if sown in a partially shaded place.

Melons.—Cultivate the soil as long as the vines will allow of its being done. More fruit is usually set than will ripen. Take off the late fruit and thus improve the quality of the rest.

Onions.—Thin if crowded, and keep thoroughly weeded. If one has not the force to properly attend to the crop, he should not attempt to raise onions from seed on the large scale.

Peas.—Sow seed from the very best. A late sowing may be made for a venture, but we have never been very successful with late plantings of peas.

Potatoes.—Dig the early sorts. Their tops make capital manure for late turnips, if buried in the rows as they are dug. Cabbages, turnips, late peas and beans, or spinach, may follow the early crop.

Rhubarb.—Cut off every flower stock as soon as it shows itself. Now that fruit is plenty, the bed should have a rest.

Seeds.—Gather as soon as they ripen. Cabbage, cucumbers, peas, and others, should have been harvested by this time. Save the best of everything for seed, if you raise your own seed. If you can not do this, buy seed for sowing every year.

Sweet Potatoes.—At the North it is not advisable to let the vines root; at the South these roots from the stems form potatoes. We have to get our potatoes from the main plant. Our climate does not allow us to make layers. Hence our advice to move the tops while the plants are growing. Keep the ground well worked, and free from weeds.

Squashes.—Every one who grows squashes, to any extent, will have Mr. Gregory's work on his favorite subject. They will find there set forth the necessity of high manuring the whole ground for the running varieties, keeping this clean as long as possible, and then allowing the vines to root at the joints. Insects, of course, must be killed as they appear. The more bugs the fewer squashes.

Tomatoes.—Except in nice garden culture, we can

not look for any systems of training. Something to keep the fruit from the ground, be it brush or rails, is all that the farmer will attempt. Those who are able to give much time to the matter, can get a great deal of amusement out of the tomato, as it bears cutting to any extent, and may be trained in whatever manner that suits any one's fancy.

Weeds.—There is no specific for destroying weeds, and the only remedy is frequent working of the soil. Use the rake among recently set plants, the scuffle hoe among seedlings, and, later in the season, the hoe fork is an admirable implement. All of these are better than the common hoe, yet that is so much better than nothing, our advice is to scratch the soil frequently with whatever implement is at hand.

Flower Garden and Lawn.

There is much to do, yet it can all be summed up in the injunction to keep everything about the garden neat and orderly. The beauty of the

Lawn will depend upon frequent mowing and rolling. If the work is done often enough, the cut grass need not be raked off. With newly seeded grass, it should always be left to serve as a mulch. Wherever grass borders a road or bed, keep the

Verges or Margins neatly trimmed. This may be done tolerably well with a sharp spade, but it is better to have a regular cutter, like a chopping-knife on a hoe handle, and cut to a line.

Bulbs—the spring flowering ones, such as Hyacinths, Tulips, etc., will now need attention. As soon as the foliage begins to fall down and turn yellow, take up the bulbs and stack them until the leaves are quite withered; then pull the leaves off, and put the bulbs in paper bags, and store in a dry and cool place, away from rats and mice.

Neatness is, in a great measure, secured by the use of sticks and strings. Plants that are sprawling, and of unpleasant aspect, may be converted into objects of beauty by proper staking. Use as inconspicuous sticks as possible, and tie with bast, bark, or other soft material.

Dahlias will especially need care in tying, and, if large side branches are allowed to grow, they must also be supported by stakes.

Shrubs, of most kinds, may be propagated by making layers of this year's wood. Some can only be propagated from cuttings of young wood, with the aid of bottom heat, in a hot-bed, or otherwise.

Annuals must be transplanted from the seed bed, and make late sowings of the quick growing kinds.

Roses will need especial care. The rose bug must be shaken off. Pick off the leaf roller, and drench the slug with solution of whale oil soap. Keep the climbers and pillar roses well tied up.

Bedding plants, at least those of low growth, like Verbenas, make a better effect when pegged down; and even those of a naturally upright habit, like Ageratum, may be treated in this way.

Seeds should be saved as fast as they ripen, and of most herbaceous perennials it is best to sow them at once, as they are more sure to germinate, and a stock can be raised for flowering next year.

Green and Hot-Houses.

All plants left in the house should be properly cared for, as to watering and shading. The latter is necessary with even tropical plants. An inside screen of muslin may be used, or the glass may be coated on the outside with ordinary whitewash, or a mixture of whiting with glue water. Either of these will usually last the season, and be washed off by autumnal rains, when they are no longer needed. With proper attention to watering, shading and ventilation, many things do better in doors than if put out.

Insects must, of course, be looked out for, whether the plants are in doors or out. Plants set out of doors should be put on a foundation impermeable to worms. A layer of coal ashes is excellent for this.

Potted plants, set out, must not be allowed to be

whipped about by the wind, burned up by the sun, nor suffer for want of water.

Alterations and Repairs may now be made, as well as at any other time, and new buildings be erected.

Cold Grapery.

The things to be attended to are roots and shoots. As to the former, sufficient moisture should be provided; mulch the outside borders, and, if this does not avail, give very weak liquid manure. The shoots should have already been shortened to the third leaf from the last bunch. Their welfare as to temperature must be regarded, and the house not allowed to get hotter than 90° to 95° at midday, and this should decrease to 85° during the night. Pinching the laterals and thinning the berries will afford the grower an abundance of pleasant work. Thinning of the berries on the bunch should be done with slender scissors, made for the purpose. One-half of the berries set, or even more, according to the variety, should be removed, to allow those that remain to attain their proper development. Mildew will often appear upon the leaves. At the first manifestation of mildew, stop sprinkling the vines and keep the house as dry as possible, and scatter sulphur abundantly over the floor of the house.

Apiary in July.—Prepared by M. Quinby.

The season through the spring months has been so backward, that it is doubtful if bees will have done swarming, in many places, by July 1st. This alone should be no cause of discouragement. Their prosperity should be measured by the advance of the season, not by the day of the month. Bees collect honey as they have opportunity during the blooming of any set of flowers. The first harvest of much account, in spring, is from fruit blossoms, dandelions, etc. If the weather be unfavorable, they pass out of bloom, and the bees gain nothing. Thus, if there be good weather, it makes but little difference whether apples blossom the 10th of May or 1st of June. So of clover and basswood. It is late only when the flowers are gone, and the bees have, for any reason, failed to keep pace. Swarms may be considered early two weeks after apple blossoms are gone, and late when issuing after basswood blossoms disappear. At any time, except late in the season, one good, first swarm contains all the bees necessary for profit. If two unite, and are hived together, put on surplus boxes at once, or (if in the movable-comb hive), divide as soon as combs are made. It has been recommended to give a comb containing brood, to prevent absconding, but this must not be relied upon. As soon as the hives are full, divide or put on surplus boxes. A hot day may force a few outside, when not very much crowded. This point can be determined early in the morning. The best surplus honey of the season is generally obtained this month.

Take off boxes as soon as full. If honey is being obtained plentifully, the boxes may be set down by the hive, for the bees to creep out; if it is scarce, the bees will rob them of the honey, to prevent which, put the boxes in a barrel or box, and cover with a thin cloth. The bees will collect on the under side, and, by turning it over a few times, they will fly off, and cannot return to carry away the honey. Always keep the combs vertical, and out of the sun, and avoid sudden jars.

Loss of queens will be frequent this month. Swarming hives of black bees will often indicate such loss by their troubled actions, running about morning and evening for two or three days. The Italians seldom manifest these signs. When a loss of queen occurs, and they have the means, they rear twice the number of queens that others do. When a queen has been lost, first endeavor to supply a fertile one, next, a queen cell ready to hatch; lastly, give brood. If a stock is reduced, give combs taken from strong stocks filled with sealed brood.

More moth worms appear this month and next than at all other times. Small young stocks and weak old ones suffer most. The Italians are seldom disturbed. Catch moths in shallow dishes of sweetened water, set among the hives at night.

Pick out and feed to the chickens. Split elder stems, scrape out the pith, lay pieces under and around the hives, and twice a week kill the worms in them. Any very weak stock that cannot be strengthened, should be broken up, and the combs saved from the moths. A hive that does not breed bees, must not be allowed to breed moths.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the *American Agriculturist*, show at a glance the transactions for the month, ending June 14, 1867, and also for the same month last year:

1. TRANSACTIONS AT THE NEW-YORK MARKETS.

RECEIPTS.	Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.
26 days this month	142,000	213,000	1,541,000	24,000	83,000	457,000
26 days last month	131,700	224,000	1,566,000	4,700	89,000	34,000

SALES.	Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.
26 days this month	175,000	329,000	1,765,000	24,000	246,000	169,000
26 days last month	284,000	1,087,000	3,369,000	525,000	41,000	

2. Comparison with same period at this time last year.

RECEIPTS.	Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.
26 days 1867	142,000	213,000	1,541,000	24,000	83,000	457,000
26 days 1866	252,000	283,000	1,686,000	47,000	81,000	518,000

SALES.	Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.
26 days 1867	175,000	329,000	1,765,000	24,000	246,000	169,000
22 days 1866	271,000	807,000	2,133,000	174,000	43,000	

3. Exports from New York, Jan. 1 to June 14:

	Flour.	Wheat.	Corn.	Rye.	Oats.	Barley.
1867	189,797	35,060	3,933,186	135,501	98,120	860,226
1866	437,917	138,552	3,149,852	171,826	747,553	
1865	567,614	330,601	268,405	141	44,142	

4. Receipts at head of tide water at Albany, each season to June 14:

	Flour, bbls.	Wheat, bush.	Corn, bush.	Rye, bush.	Barley, bush.	Oats, bush.
1867	17,100	21,700	592,100	28,200	28,200	276,500
1866	34,300	317,300	2,090,700	64,300	44,700	893,700
1865	94,100	547,900	731,800	51,000	114,300	1,941,300

5. Stock of grain in store at New York:

	Wheat, bush.	Corn, bush.	Rye, bush.	Barley, bush.	Oats, bush.	Malt, bush.
1867	578,279	217,796	117,257	69,613	379,865	16,311
June 14	578,279	217,796	117,257	69,613	379,865	16,311
May 15	731,330	201,092	156,804	145,706	688,494	16,161

Gold has been unusually steady in price, since our last, having been in full supply and moderate demand, closing tamely at 137. Much more liberal receipts of Breadstuffs have been reported, during the month, making holders, especially on speculative account, quite eager to realize, and thus depressing prices very seriously. The demand has not been anything like active, and has been wholly insufficient to absorb the available offerings. The reduced foreign quotations, and the highly encouraging crop news, have tended to influence the market, most adversely, for the interests of sellers. Toward the close, there was a partial rally in corn, in consequence of the slightly improved figures reported from Liverpool, but in

other kinds of breadstuffs, trade was dull, at drooping rates....Provisions have been in better supply, and lower in price, on a restricted inquiry....Cotton has been heavy and lower, but closes with more firmness, on a livelier demand....Hay has been in better supply, and quoted down, decidedly. The inquiry for it has been moderate....Hops have been quiet, but steady....Seeds have been very dull, and quoted lower....Tobacco has been in active demand, closing steady at our revised rates....Wool has been quiet. Fine grades, having been scarce and in some request, have been held with more firmness. Low and medium grades have been offered freely, at easier and irregular prices, but have been very quiet.

Beef Cattle.—By reference to the above figures, it will be noticed that the supply of beef fluctuated from 5,800 to 4,200, the extremes being on the two consecutive weeks ending May 21 and 28. The small supply on the latter week brought prices up, increased the number of beeves a little, and the first week in June a few very choice beeves sold in market at 20c., estimated dressed weight, while 17½c. represents about the average that week, poorest stock bringing 15c. @ 16c. A marked increase in the supply the next week, (the last we report), and the feeling that settled warm weather was upon us, brought prices down, and now we quote extras, 19c., average, about 17c., poorest, 12c....**Milch Cows** have been in little demand, and unless exceedingly good or fair beef, sell low....**Calves.**—The supply has been about equal to the demand, and prices have changed but little for those of good quality, while, as the weather grows warmer, thin calves sell very slowly. 12½c. @ 13 lb live weight, is the usual price....**Sheep and Lambs.**—The supply of really good mutton is very light, but the number of poor, thin, worthless sheep, very large. The former sell quickly at 8c. or more, per pound, live weight, while there are grades quoted between 8c. and 6c. @ 7 lb.; below this, sheep sell by the head, often at barely enough to pay transportation from Ohio. Why will not farmers hold on to such stock, and give them three or four months good pasturing, when they would be fair mutton? Now, butchers are afraid to buy, or do it on the sly, because the mutton is liable to be seized by the health police, as diseased or unhealthy meat....**Swine.**—The supply has fluctuated considerably, and prices have had their ups and down. As we go to press, the market is rather short, 4,500 less than last week, and prices have advanced fully ½c., and are at present, 7c. @ 7½c. @ 7 lb., live weight, for the general run, 7½ cents for choice.

Weather Observations.—It is interesting to watch the weather, and this interest is increased and made useful by keeping a record of Appearances, of Temperature, of the Barometer, and of the Hygrometer, for one's own reference. Though it is rather humiliating practice for any one to write down his translation of daily weather indications, and then see how his prophecies turn out, it is nevertheless useful; and in this way, almost any one will become a very accurate judge of the prospect of fair or foul weather. In keeping a record of the Barometer or Thermometer, rule off a sheet in quarter or half-inch squares. Write the days of the month at the top of the sheet, above each column of squares, and let each row of squares, or each line rather, down the sheet, stand for tenths of an inch of the Barometer, or degrees of the Thermometer. The record is kept by simply making dots in the squares, to indicate the day and about the time of the day when the observation is made, and the height at which the mercury stood. It is enough to examine the Thermometer at 7 o'clock A. M., and 9 o'clock P. M. The Barometer's record being made at the same time, and at 12 o'clock noon, also. An idea of how to keep such a record may be gained more fully by reference to each number of the *American Agriculturist*, for the first half of the year 1864. If the dots, as they are made daily, be finally connected by a line, the fluctuations will be seen at a glance. This is precisely on the plan of the tables showing the fluctuations in gold, or any particular kind of stock or merchandise. Similar records may be kept of the amount of moisture in the air, and of the relative amount of clouds in the sky. In the latter case, the most convenient way is to establish the numbers 0 to 10, to indicate relative degrees of fairness and cloudiness—

0 being used to indicate a perfectly clear sky, and 10, one as black and stormy as possible.

Containing a great variety of Items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Chances Yet for the Premiums.

—The present number begins the last half of Vol. 26. Any of the premiums may yet be obtained. One lady took a second *Gold Watch* last week, which is the fifth premium she has received, and for which she commenced canvassing the last of April. Quite a number of subscriptions ran out with the last month. If they subscribe again, remember, their names will count on another premium list, the same as new subscribers. Please continue your efforts, and send in more subscribers as fast as obtained, stating whether or not the back numbers are wanted. All subscriptions received after this date, will commence with the July number, unless otherwise ordered. Back numbers will be furnished, if desired.

Registered Letters.—We would remind our subscribers that by the new registration system, which went into operation June 1st, *prepayment of the registry fee of 20 cents, in stamps, is required*, in addition to the regular postage. Post office orders, drafts, checks, and inclosures in registered letters, may be sent us at our risk. We thus answer repeated inquiries.

Deceptive Circular.—A "Washing Compound" manufacturer, sends out a circular containing, among other "puffs," an extract from "The Agriculturist." No such article as this "puff" has ever been published in this journal, wherever else it may have appeared. Nor do we know of any paper of the above title. The extract is well calculated to deceive, especially as we understand that in answering letters of inquiry, the proprietor refers to a number of this paper.

The Crops.—The promise of June is rarely to be relied upon, yet it is a great satisfaction to begin the season with pleasant anticipations. From our correspondence and other sources of information throughout the country, we have very favorable reports of both grain and fruit crops, on the whole. Wheat and all the small grains are looking very well, corn is backward for the season, and a large part was not even planted by the first of June, yet this indicates no failure, and but little danger to the crop. Potatoes rarely looked better, though they lay long in the ground. Fruit prospects are generally flattering, also, and, as we write, the market is fairly flooded with strawberries, which are decidedly above the average in quality. It is hardly time to speak with confidence of the apple crop, and pears, though generally promising well, are a partial failure in some localities, where a severe cold North-easter blasted the bloom before the fruit was fairly out. There are a few localities, an extensive one in Missouri, where hail-stones have done serious damage, but the coldness of the season, it would appear, has not been favorable to hail, which usually occurs, we believe, in times of great heat. The reports of the grass crop, which is, indeed, the most important crop of the country, show more variation than those of any other. At the East, the crop is excellent. At the West, the promise of hay and present condition of the pastures appears to be not quite so good.

A New York Poultry Club.—A call has been issued by several amateur poultry breeders, of New York and vicinity, for a meeting of amateur and professional poultry breeders, to which all interested are invited, to organize a Poultry Club. The meeting is to be held July 10th, at Room No. 24, Cooper Union Building, Eighth-street and Fourth-avenue. We cordially wish the movement distinguished success.

Birds and Eggs—Ornithology and Oology.—Nichols & Noyes, of Boston, have just published a work on the Birds of New England, by Edward A. Samuels. The title page states that it comprises "a complete history of their habits, times of arrival and departure, their distribution, food, songs, times of breeding, and a careful and accurate description of their nests and eggs." To a very satisfactory extent the book (which is an 8vo. of 583 pages,) fulfils the promise of its title page. Mr. Samuels shows that he has been a close observer, his style is familiar and easy, and he quotes freely from standard authors. The observations indicating the value of birds to man are the most satisfactory we ever met

with. The good and the evil done, directly or indirectly, by all our common birds, are carefully compared in a very unprejudiced way. The engravings of the eggs are remarkably fine—they are wood cuts, but the effects produced seem to us superior to anything that could have been done on steel or stone. Some of the small engravings of birds are fair, but many of the full page cuts are execrable in execution, yet doubtless accurate as regards markings of plumage, and other characteristics. There is a plain edition, one with the eggs colored, and one with all the plates colored. It is a useful and needed book.

Do You Want a "Time-keeper" for \$3 ?—J. Birch & Co., Williamsburgh, N. Y., are benevolent people, they send out "time-keepers," "gentlemen's breast-pins," etc., for the very moderate sum of \$3.30. As such liberality as this should be known, we give them the benefit of an advertisement. A friend of ours received the following:

PRIZE CERTIFICATE.

On receipt of this certificate with \$3.30 to pay for postage and package, we will send to your address, by return mail, one

MAGNIFICENT GOLD CASED TIMEPIECE,
MARKED \$50.

Elegant Engraved Patent Gold Cases, regular action, bridge balance, and warranted a good timer.

If this article does not suit, you can change it for any other article of the same marked value on the list.

Address J. BIRCH & CO.,
Williamsburgh, New York.

He sent the money, \$3.30, and received his "time-keeper." That others may see what a valuable article it is,

Fig. 1.—TIME PIECE.

we give an engraving of it of the natural size. A toy sundial, with a compass that points nowhere. Then, the "engraved patent gold case" is worthy of an illustration, which we give, in figure 2. A pasteboard box, covered with the cheapest kind of gilt paper. This is

Fig. 2.—GOLD CASE.

about a fair specimen of the articles sent out by these gift enterprises, if they send anything at all. Messrs. J. Birch & Co. finding that they were dealing with one who would expose them, returned Mr. C. the money he sent them, supposing he would keep quiet. The whole sell is a very neat one. The "time-keeper" with its gold case must have cost, altogether, at least 30 cents.

Sundry Humbugs.—The number of letters in reference to these has been, of late, very large, and much time has been consumed in investigating them. A. A. Kelley's First Grand N. Am. Gift Concert, which was advertised to take place at the Wabash Avenue Rink, Chicago, Ill., but was postponed, as Mr. Kelley says, because he was not allowed to go on, is now advertised to take place in New York, "and is really the greatest enter-

prise ever inaugurated in the world," so says the circular. The Pacific Rail Road enterprise dwindles into insignificance beside this wonderful Gift Concert. Kelley was arrested on June 12th, and taken before the Police Court on a charge of selling lottery tickets, and admitted to bail. "He is said to have cleared a fortune by his dazzling scheme," and says himself that he has plenty of money. The ministers usually say, in making their appointments, "Providence permitting," but Kelley says, "Under any circumstances the Concert will now be given, as above stated, in good faith." We have examined the circulars, tickets, etc., of this concern, and do not see that it essentially differs from the hundreds of others which have, from time to time, been shown up in the *American Agriculturist*. We have never found a single person so stupid as to imagine that the public was ever benefitted by such enterprises, and very rarely an individual, while we have thousands of complaints from people who have squandered their money, and seek advice when it is too late. We invite all parties to inform us of the results of their investments in this and other lotteries, if they will try them in spite of all our previous warnings. A. A. Kelley & Co. have another enterprise, Kelley's Weekly, and on the circular we find: "On Saturday, August 10, 1867, we will distribute half a million dollars of the profits in shares, including \$100,000 in greenbacks, to our patrons, from a subscription amounting to \$1,500,000." Please notice, they will distribute \$500,000 of the profits from a subscription list amounting to \$1,500,000. We think this would exceed in immensity "the greatest enterprise ever inaugurated in the world." A million and a half for subscriptions to a weekly paper before August 10, 1867, would be one of the wonders of the world, too wonderful to be comprehended by common mortals. . . . Clark, Webster & Co., Bankers. "The Bankers and Merchants Grand Presentation Entertainment. Capital, \$1,237,148." They don't deal in round sums like most large companies. We have visited this banking establishment. The usual appurtenances of such institutions are not to be seen there. No Gold, no Greenbacks, no Government Stocks, or even stamps in sight. No big books, no paying or receiving tellers' signs. They told us they would sell 100 tickets at 40 per cent. discount, and when we inquired who some of the "New York bankers and merchants" were, who had formed this immense company, the man who understood that part of the business was out. We asked for references, and three were given, neither of whom knew Clark, or Webster, or Co. We inquired of ten of the prominent bankers in Wall street and vicinity, and none of them knew Clark, Webster & Co., bankers, not even the runner boys. Is it possible that people send their money to these bankers? . . . Wright, Bro. & Co. send out tickets, and offer watches at \$30 to \$100, either for \$10. We have seen the watches, and don't want them at half the money. Buy watches and all other things of regular, established dealers, and pay a fair price, for if you send money to buy articles represented to be worth four or five times the price asked, you will surely be cheated. . . . T. R. Dawley & Co. propose to sell 5,000,000 newspapers, @ 10 cents each, make \$50,000, and distribute it among their patrons, all in greenbacks, in sums of \$1 to \$10,000. This will do for the Japs or Celestials. We have this month letters from more than a score of different parties, all of whom desire to sell tickets for distribution—lotteries—of various articles, valued at prices from \$1 to \$75,000. Tickets are sent, in many cases, with the circulars, and all you have to do is to send \$2, \$5, or \$10, and get articles of five or ten times the value of the little currency forwarded. Now all the probabilities are, that one will get nothing at all, but in some cases things are sent. We have just visited C. H. Garland & Co.'s (Todd) place, and presented a package of tickets, paid our \$5 on one which assured us of a "Fine Silver Hunting Case American Watch," and we got it. We wish all our readers could see this chronometer. It looks very like our grandfather's old iron tobacco box, opens and shuts with the same kind of grating sound that makes one involuntarily grate his teeth. It will not keep half as good time. This watch is like Paddy's, which took "a dale of a while to knock off an hour's time," and as for silver, a distinguished dealer tells us there is not a particle in it. The only indication of where and by whom it was made on case, face, or movement, is London, Cooper. We shall hang it up for a show, and callers can see \$45 worth of Gift-Enterprise-Concert-Distribution-Lottery property, and we consider it a fair representation of all schemes for raising money, from Soldiers' Homes up to professional gambling, which is what it pretends to be. Beware of all sellers of rights of any kind; see that they are authorized by well known business houses before making purchases. A fellow in Ohio takes *old* feathers, and proposes to bring back new ones, but don't. People careless enough to trust such a person deserve to be swindled, and it may do them good. Look out for sellers of hay-lifters, reapers, and horse powers—a large number of honest farmers have been sold by them. . . . A. D. Bowman & Co., C. L. Van Allen, A

friend from Massachusetts writes: "I have seen a circular from A. D. Bowman & Co., in which they refer to Mr. Judd as one that knows them." We do, and have seen him; that is, we have seen a man who told us in presence of witnesses that he was A. D. Bowman. We have seen the same man again, under similar circumstances, and he told us that he was C. L. Van Allen. Perhaps his *oil*, at 48 New street, and his *ink*, at 48 Broad street, are the same—who knows? or who cares to? Knowing him, we don't *very* strongly recommend him.

Bowen's Single Lens Microscopes.

—These have been extensively advertised at 50 cents each, and, as the circular and advertisement give people to expect a useful instrument, we think it only fair to show—as Mr. Bowen has failed to do it—just what may be expected for the money, even though we do give Mr. Bowen the benefit of an illustration and an advertisement. The "powerful lens" consists of a globular glass bead, and

the "neat and simple setting" is a bit of the size and shape of the engraving, rather roughly cut out of a piece of a cigar box, or similar wood. We can not see what possible use such an implement can be to any one. If our readers think differently, they can get one of them for 50 cents. They probably do not cost 3 cents.

The Grape Vine Flea-beetle.—At the time of our writing, the season is very backward, and it is not possible to give any estimate of the "set" of the grape crop. This year there is less complaint of the insect that attacks the buds than there was last year. This insect is the Grape Vine Flea-beetle, (*Haltica chalybea*), which has the unpleasant habit of perforating the buds of the vine, and thus impairing their vitality, if not destroying them altogether. The engraving shows the shape of the little beetle, but it is enlarged about four times beyond the natural size. The color is variable, it being steel blue, deep green, or even violet. They begin their depredations in April, and continue them through the month of May. Shaking them from the vines, and crushing them, is the best way of disposing of them.

Metcalf's Early Strawberry.—People who originate new things are often very slow in making them known. This strawberry is an instance. It originated in Michigan. A concern in that State has the control of the stock, and yet they have never sent us a description or a berry. Yet, in spite of their neglect, we have tried to keep the run of it, and—no thanks to them—we are glad to say that it is a really early berry. It ripened with Mr. Doty 10 days before the *Agriculturist*, and Mr. E. Williams, of Mont Clair, N. J., sent us a box of ripe berries on June 12th. We have had one of these berries engraved, which we shall present, with other new strawberries, at the proper time. It is a berry of fair size, rather sour, but of good flavor. It will be valuable, if it proves to be only 5 days earlier than any variety we now have. As we write for the people only, we don't care whether the Michigan folks like this notice or not. If they have a good and early berry we want it.

A Use for Sumach Berries.—Everybody knows the "Shoemaker's bob"—a cluster of small dark red berries, that grows upon the common Smooth Sumach. These contain a great amount of malic acid, and have often been used for an acid drink in fevers. The Rev. E. G. Hofland, has discovered that an infusion of these, with a proper amount of sugar, when fermented, makes a "wine," and "Rhms wine" has become an article in trade, and has the countenance of physicians, who ought to know better than to lend their names to anything. The process of making this wine has not been communicated to us. The article is about like that from rhubarb, or "wine plant." What we consider of more importance is the vinegar made from the same source. Should the Sumach prove to be a valuable vinegar producing plant, it would be less of a nuisance than it now is.

Horse Radish.—The article in our Horticultural Annual, on the cultivation of horse radish, by Mr. Henderson, has brought out many letters of inquiry, which we must answer in a lump. Mr. Henderson's cs-

timates pre-suppose ground, in the highest possible condition, as to manure and deep tillage, and his prices are those of the New York market for the last few years. We do not know who has any sets for sale—those who have will probably advertise them in season. It is not practicable to raise the plants from seed. Although it flowers freely, we never knew it to produce seed in this country, and it very seldom does so in England.

Commercial Enterprise.—Among the many things for which New-York merchants are famous, is the magnitude of their enterprises, and the far-reaching character of their ventures. The operations of the present-day throw those of a few years past quite into the shade, and often equal those of a similar kind in the commercial marts of the Old World. The recent large operations by the Great American Tea Company have taken the trade by surprise, and are rather a novelty in this market. The taking up of two cargoes within a week, comprising 12,331 packages Black, and 22,849 packages of Japan, for immediate consumption, at a cost of about a million and a half of dollars, indicates the extensive nature of the Company's business, and deserves a passing notice at our hands. The consumption of tea in this country is largely on the increase.—*Shipping and Commercial List*, N. Y., May 15th, 1867.

Bees—Queens from Italy.—It is some time since we have heard of an importation of Italian bees, but recently had the pleasure of seeing three little colonies, each with its queen-mother, in fine condition, just received by Rev. E. Van Slyke, through Rev. G. Kleine, of Hanover, Germany, from the shores of Lago Maggiore, in Northern Italy. They came from the famed establishment of Dr. Blumhoff, and are now at the apiary of Mr. Quinby, whose property they are. Their progeny will help decide the question of the deterioration of Americo-Italians. We do not believe that Italian bees deteriorate, if bred pure. If Italian queens breed with black drones, we are inclined to think in opposition to the opinions of most bee-keepers and writers, that their drone progeny will be more or less tainted. There is, however, another question for bee-keepers to study upon. May not bees be improved by breeding, as sheep or swine or cattle are, by careful selection, and so by sufficient care may we not beat the Italians themselves by and by?

Diseased Peach Leaves.—F. T. Foster, Preble Co., O. The leaves sent are affected with "curl." It is a general impression that this is produced by a plant louse or aphid, but there is room for doubt on this subject.

Soap on Oil Stones.—F. S. P. writes that an oil stone, on which the oil has become so hardened as to render the stone useless with oil, may be made all right by the use of soft soap. This reminds us that we have long used soap, instead of oil, upon a fine "oil stone," with great satisfaction. The soap may dry upon the stone, and when wanted for use it needs wetting only.

Special Advertising Agency.—As most of our advertisers are aware, matters relating to that department have for several years been under the immediate superintendence of Mr. W. A. Fitch, one of the Associate Editors. As a matter of convenience, to those desiring to extend their advertising beyond the columns of the *Agriculturist*, he has arranged to receive advertisements for other journals at their regular rates. His experience in this line, and knowledge of the best mediums, give him excellent facilities for conducting such business satisfactorily, and thus to save much time and correspondence required in arranging with different parties.

A Good Piano.—In company with musical experts of high authority, we have examined the Mathushek Piano, advertised on another page, and believe it to be well worthy the attention of those desiring to secure a good instrument. One of the party present, the musical editor of the Weekly Review, a leading authority in such matters, speaking of the smaller-sized piano, said, "It can speak with such power and sonority that we must look at the thing, in order to believe it possible. Throughout the whole scale the tone is even, very full, sonorous, brilliant, and melodious." All were greatly pleased with its performance, and gave high testimonials.

The Flowering Almond as a Wall Plant.—Miss O. M. Luke, Trumbull Co., Ohio, writes an account of her training of a Flowering Almond: "Five years ago last spring it was a little slip, one foot high. I set it close to the east side of the house, having the soil previously enriched with leached ashes, leaf muck, etc. Father said I was not giving my shrub any room to branch. That was just what I intended not to do. I pinched off all side shoots at their first appearance, and kept it trained to the house, in the same manner as a

grape vine. The third year, I let two branches grow each way. I have continued training my Flowering Almond each year, and now I have a beautiful climber, a little over twelve feet high, and three inches around. The three branches on each side are two and a half feet long, and a little over one inch around. It blossoms about the 10th of May, long before other plants bud."

Sailed for Europe.—On Wednesday, May 29th, on the Steamer Tripoli, Orange Judd, Esq., wife, and three children. We have since heard of the safe arrival of the steamer.

Married.—At Munson, Mass., on June 15th, Mr. A. W. Roberts, Superintendent of the Engraving Department of the *American Agriculturist*, to Miss Ida Beattie.

Perseverance and Pianos.—We have had the pleasure of presenting a magnificent Steinway Piano to Mrs. Annie Flagg, of Bloomington, Ill. This lady commenced canvassing about the 1st of October, 1866, and allowed nothing to discourage her in her attempts to earn the prize. On May 4th she was here, selected a piano, and expressed her entire satisfaction. A beautiful little two-year old, who accompanied the mother all the way from Illinois, showed that it was not a trip to while away time, but a real business transaction, with a view to adding new attractions to a pleasant home, that stimulated this successful operation. \$650, earned in seven months, besides attending to the cares of a family, are indications of the kind of stuff we should be pleased to see more of in the world. Mrs. Flagg's judgment in working for the **Steinway Piano** we can approve most heartily, as each of our partners has one of them in his own house, and desires no better instrument.

Still More Grape Literature.—"Mead's American Grape Culture and Wine Making." By Peter B. Mead. New York: Harper & Brothers. It is a very handsome volume of some 480 pages, and very liberally illustrated. When we have perused it, we shall be able to say something of its contents. Vineyard Culture, by Du Breuil, with notes by J. A. Warder, is another work soon to be issued by Robert Clark & Co., Cincinnati. Du Breuil is high authority, and the value of the work to Americans will be greatly enhanced by the copious notes of Dr. Warder. We have the specimen sheets only, and must defer a more extended notice until the work is out. It is beautifully printed.

Mohr on the Grape Vine.—The translation of Mohr's work, by "Horticola," is now ready, and forms a neat little work of 129 pages. It is a very plain discussion of the structure of the vine, and the principles involved in its pruning, training and cultivation generally. As the propagation of American varieties is different from that pursued in Europe, the translator has given an account of our methods, and added some brief notes on the leading American varieties.

Tennessee Lands.—The advertisement of Mr. Dodge will be an answer to many letters asking where southern lands can be bought. Mr. D., well known as an artist before he became a fruit grower, is on account of the ill health of a member of his family, prevented from returning to his estate, from which he was driven by the fortunes of war. We have no personal knowledge of the property, but from the references he gives to those who have seen it, and the fruit we have seen from it, we think it worthy of the attention of those who are seeking a location in the Southern States.

Notes of Travel—Crops, Use of Lime, etc.—One of the Editors, traveling in Pennsylvania, writes us, from the Valley of the Lehigh, as we go to press, "that the crops are everywhere looking very finely, and it is admitted, on all hands, that the grain harvests were never more promising. The country, all along the line of the railroad, from Easton to far above Catasauqua, is a succession of wheat and rye fields, and blooming meadows—very encouraging to people who have been paying \$35 dollars a ton for hay. Wheat is quite as generally grown in this section as rye, and many of the fields are so rank in growth that the straw is lodged in spots. The prevailing rock is limestone, and the practice of liming the land, once in four or five years, is almost universal. This, and the turning in of green crops, is the main reliance for keeping the ground in good heart. All the manure that is made is applied to the land, but a much greater breadth is cultivated than can be fertilized by this method. Indian corn is much more largely cultivated than on the sea-board. It is not uncommon to find 30 and 40 acres raised on a two hundred acre farm, with about as much in wheat or rye. It is much more a grain than a grass region. As the lime is generally quarried, and burnt, upon the farm, and always in the immediate vicinity, it makes a very cheap

dressing for the land. It is rarely more than ten cents a bushel at the kiln, and the quantity, when slaked upon the field where it is used, is about double. Thirty bushels to the acre is considered a fair dressing, though much more than this is often used. Whatever the philosophy of its action upon the soil, its beneficial effects are everywhere apparent, and its influence, upon fields underlain with lime rock, is quite as apparent as upon the adjacent districts, where another rock prevails. Liming the land is a cardinal doctrine with every farmer in this region."

To Officers and Members of Horticultural Societies.—We are desirous of being able to furnish early as complete and accurate a list as possible of the Autumn Fairs, and, besides, wish for our Annals a list of the officers of all the principal agricultural, and kindred societies, in North America. We take the liberty, then, of asking to have the *circulars, posters, reports, or marked newspapers*, containing information about such societies, which will be of value to us, sent to the address of the *American Agriculturist*. In case such printed information can not be obtained, please drop us a line. Advertisements and notices in county papers, etc., are likely to be overlooked unless distinctly marked. As this item may not meet the eye of officers, a private member, or any one interested, in any particular society, will do us a great favor by giving the information at as early a day as possible.

Gregory on Squashes.—We have just published a treatise by Mr. Jas. J. H. Gregory, of Marblehead, Mass., on the Culture of Squashes. We have a liking for these books on special culture, as the author has a chance to say all he has to say on the subject. We can not see how Mr. Gregory could have treated the matter more in detail. The title of his work is "Squashes and How to Grow Them," and he not only tells how to grow them, but gives all the details of harvesting, storing and keeping, marketing, saving seed—in fact, all that a practical man who wields a vigorous pen can tell on the subject. We announced this work some time ago, but the illness of Mr. Gregory, prevented its earlier publication. We would inform certain parties (see page 258.) that this work was written by Mr. Gregory, and not by one of our Editors, and shall keep the manuscript for some time, to satisfy any stupidities who may attribute this work to other than the author. Until we read this work we had no idea of the importance of the squash crop, but it would seem that it ranks next to the potato, and that it will pay every farmer to cultivate squashes, rather than the comparatively valueless pumpkin. About 70 pp., paper covers, 30c.

Silver-leaved Maple.—J. W. B., Bonaparte, Iowa, asks if "what the nurserymen sell as soft, or white maple, are one and the same." The silver-leaved maple is *Acer dasycarpum*, and is often called white maple. The name soft maple is at the East usually applied to *Acer rubrum*, the red or swamp maple. The silver-leaved maple, a common tree at the West, is one of the most valuable for planting in belts, and it is of rapid growth, does not throw up suckers, and is useful as fuel.

Where can I get it?—A large number of our letters may be condensed into "Where can I get this, that, or the other thing?" If the thing inquired about is out of the usual way, we take a little pains to find out, and write the party thus inquiring, but when it is for common nursery or seed stock, we cannot notice their letters. Every nurseryman or seedsman has or can get from his neighbors all the usual articles of trade, and it is useless for us to say that common articles may be had at any particular place. If one has a good thing to sell, he knows enough to advertise it, and there is little danger of any dealer keeping long in obscurity. The demand for new breeds of animals of all kinds, including fowls, is something wonderful, and it is the same with plants. We do our best to answer these queries, but we cannot satisfy those who ask us where many common things can be had. We suppose that we have had fifty inquiries this season for tree seed. The best that we can do, is to send the letter to a reliable dealer, with the request that he will forward his catalogue to the writer.

More Grape Vines.—Some parties, we notice, have already begun to advertise their stock of vines for the fall trade, and others are preparing to do so. Judging from the indications, the number propagated this year will be large, though not, we think, in excess of the demand. Every spring thus far has shown a scarcity of the leading kinds, and grape growing in this country has only fairly commenced. There is an advantage in securing vines for planting early; the first comers can select from better stock, and, as a rule, prices have also been higher in spring than in the fall.

Grape Queries.—G. F. C., Atchison, Kansas, writes: "I have a small, prosperous vineyard, of

200 vines, (Concord and Hartford Prolific,) now one year old, and would like to know (1.) whether it is best to give them an annual coating of manure, and cultivate them during the season, or (2.) whether it is best to give them a permanent mulch of saw dust. In cultivating them, the spade or plow will cut off some of the surplus roots. Does this (3.) injure the vine? They made a vigorous growth of from 10 to 14 feet last season, (1 cane.) I cut them back to about three feet, and will grow two arms this season, for training to trellis. Is it best (4.) to let them bear fruit this season? If so, how much, without injury to the vine?" *Answer.*—1. In proper grape soils but little manure is needed, and, as the vines were manured at planting, we should say no to the manure, and yes to the cultivation. 2. Saw dust is not advisable as a "permanent mulch," as it soon begins to decay, and be infested by troublesome fungi. 3. Use a hoe-fork, and keep the surface loose. 4. That depends upon the strength of the vine. In the long run, it is best for the vineyard not to bear until it is three years old.

Hungarian Grass.—If a farmer is likely to have less hay than his necessities require, we recommended Indian corn, sown in drills, cut, and well cured, before the kernels fill on the ears, as the best substitute; yet, as this requires a good deal of manure, or land in good tilth and heart, Hungarian grass may be used with great satisfaction and on poorer soil. It needs thoroughly drained land, and if the soil be mellow, and in fair heart, even though corn or potatoes would suffer from drought upon it, this crop will probably do well. It is best to sow between the 15th of June and the 15th of July. Half a bushel per acre is enough. Cut when just out of blossom. The hard shell of the seed, and the bristly husk of the ripened grain, are said to injure horses; hence cut early. It is cured and stored like hay.

What France Sends to England.—France exported to England from January, 1866, to October, 1866, eggs to the value of \$7,100,000; butter and cheese, \$13,200,000; poultry, \$400,000; feathers, \$2,400,000. Why cannot the United States help to supply poor John?

Mixing Manure with "Live" Ashes.—"M. A." This is never advisable, and can only be done with safety where there is a large quantity of muck, charcoal or loam present to absorb the ammonia that is released by the mixing of the manure and ashes.

Quinces.—P. H. Perrin. Angers is best for pear stocks; it is distinct from the Orange or Apple Quince, and we cannot find, that Thomas, in either his old or new work, says, that they are the same.

Aeration in Churning—A new Churn.—New churns are too common. Good ones are rare. The *quick* churns usually make poor butter—pale, soft, and lardy. The article advertised as "The Dasher Churn," has been put through its paces, and for the last six weeks has reigned supreme in our small dairy. The butter comes, almost every time, before the churner knows it, say in five minutes, or less, waxy—firm, sweet, odorless. The milk and cream are well taken care of, the cow's feed is good, and the mistress of the dairy understands her business. Therefore the reason that we have so good butter is not *all* in the churn. The distinguishing feature of this churn is the admission of a constant current of air at the axle, which is dashed through the cream, and passes out of pipes in the cover. It is as simple and easily managed as any churn we ever used, and is well and durably made.

The Moove is the distension of the rumen of cattle by the gases, produced by the fermentation of food. The effects eating too freely of red clover are often of the most serious character. The production of great quantities of gas in the paunch inflates it and the animal, like a bladder, and all efforts to reduce it sometimes fail. Great care should, therefore, be exercised that fences are strong, and that cows, or other cattle, or sheep at pasture, can not break into a clover field. When clover is to be fed off, the usual way is to accustom animals to it, gradually turning them in an hour or two daily for a few days, then leaving them in altogether. This is right, but it is not absolute security. Experienced farmers believe that there is little danger after a few days, provided the cattle are well salted, or have, constantly, access to salt. "An ounce of prevention is worth a pound of cure." Relief is often quickly afforded by tying a small, firm hay rope, rather tightly, through the mouth, and over behind the horns, or over one horn and behind the other. The animal's effort to shake off the rope, permits an escape of the gas, which will, ordinarily, not form again if a dose of soda or hartshorn be administered. One to one and one-half ounces of either may be given, in a pint of water.

The Miner Plum.—A call for information on this variety has brought out a number of replies—all too long to publish. We have three histories of its origin, all different, but all agree in their testimony as to its health and hardiness. Mr. N. C. Goldsmith, Middletown, N. Y., sums it up as follows: "The fruit is not of exquisite flavor, and the skin is a little tough. The tree is hardy, healthy, thrifty, long lived, ornamental, regularly productive, and begins to bear two or three years after transplanting; the fruit almost uniformly fair, good size, good flavor, retaining its firmness and flavor, and never injured by the enurelio." It is but right to say that, while we have a number of letters in favor of this plum, we have two letters by those who say that it is only the common Wild Plum. We hope those who offer to send us specimens of the fruit will remember it next autumn.

Wasted Thunder.—The London Gardeners' Chronicle criticises the taste of a catalogue of one of our seed venders, and says: "We question whether any respectable English firm would have the bad taste to issue such an advertisement as that we subjoin, and which is taken from a trans-Atlantic seed catalogue." Now, it happens that the catalogue in question is published by one who was born and brought up in England. He showed his good taste by coming to this country, and perhaps after a while he will forget the things brought up to, and not again offend his former brothers.

Pears in Maine.—The Maine Farmer advises farmers, and fruit growers in general, to abandon pears and plant apples instead. It says: "You can buy, in a few years, from the product of the apple trees, more pears than you can possibly raise by setting out pear trees, and do it, too, at a much less expense." But if fruit growers, in general, do not raise pears, in what market shall the Maine Farmer buy or exchange? Is the case really so discouraging?

Orchards on Gravel.—J. C., Sacramento Co., Cal., writes: "In the January number an 'Old Subscriber' asks, 'What can be done with a piece of land, formerly good, but now covered 4 feet with creek gravel?' If the gravel is not too coarse, why not set fruit trees on it? Most of the best orchards about Placerville, Eldorado Co., are set out on ground formed by laying in a brush dam and stopping the tailings that run from the miners' sluice boxes, which is nothing but slum, or sediment and gravel. It invariably makes fine trees."

Asparagus.—"Subscriber," Woodbury, N. J., asks: "Why will Long Island and Pennsylvania asparagus bring more in market than that from New Jersey? In Philadelphia, last week, the one was selling at 25 and 30 cents per bunch, (retail,) and the other at 50 cents. I am aware that in Pennsylvania it is cut near the surface of the ground, and Jersey asparagus is cut as far below as possible, the first looking green, the latter of course mostly white." Our correspondent is one of those rare querists who answers his own questions. Every one who knows anything about asparagus, will pay twice as much for the green as he will for the white. Blanching is a very good thing for celery, but a very poor one for asparagus.

Soap and Candles.—A useful book of 193 pages, 12mo., on the Art of Manufacturing Soaps and Candles of all sorts, by Dr. Ott, has just been published by Lindsay & Blakiston, of Philadelphia. Though it contains many valuable and interesting facts, and would give a novice a pleasant insight into these arts, yet it strikes us as being adapted to be most useful to practical soap and candle men than to others. In the minor matter of language, there occur several rather funny blunders. The reader will be surprised to see, for instance, that "Potassa" (potash) "is called in commerce," among other names, "hydrated protoxide of potassium," and the soap boiler, in his apron and paper cap, will hardly recognize himself under the title of "Savonnier." However, we must say the book gives evidence that the author has pretty thoroughly "read up" on the subject, and condensed many valuable facts in a neatly printed and well illustrated volume.

Patent Brooms.—Broom corn brush furnishes an admirable material for house brooms. The hair brooms of Europe disappear before them, or are retained only for special uses. The desirableness of some contrivance which shall do away with the necessity of transporting and marketing the long handle is obvious, as also of one which shall enable any person, who can raise or obtain the brush, to fill his own brooms as they wear out, with fresh brushes. That gross impositions have been practised in vending patent brooms and "rights," we doubt not, and have been the more cautious and thorough in investigating the merits of a new one. Silver's Patent Broom, so far, is the best brought

to our notice. It consists of a "loop" of maleable iron, terminating in a shank with a screw thread cut upon it, a brass cap, and broom stick, or handle, with a ferruled end. Into the loop the thin shaved stems of the brush are thrust from one side and the other, until it is full; over this the cap is drawn, the screw shank protruding; this is screwed into the handle, and holds all fast. The brooms have been tested by several months' use in our families, and the writer has, without instruction, and with entire ease, prepared the brush and filled the brooms to his perfect satisfaction. The ladies pronounce the brooms much superior in elasticity and durability to the old ones, and they are adopted as a family institution. For other information, see advertisement.

Temperature for Churning.—J. L. Phillips. In cold weather the cream should be about 65°, not higher, when you begin churning. In warm weather 62° is about right, for in the course of the operation the temperature will rise, but should not get above 67°. Avoid adding much of either hot or cold water to secure the proper degree of warmth.

Patent Broom and Dust Pan.—Mr. J. S. Clough has done a good job for housekeepers, and they will all rise up and call him blessed as soon as they add these to their household furniture. These two articles, so wont to pull apart, are happily wedded, and hang by one ring upon the nail. The handle of the brush is a little longer than the handle of the tin pan, through which it passes, and the twain are one, for hanging up. The pan is improved by a lip, bent down a little, making it easier to gather up the dust.

The Patent Blacking Brush Holder. is another bright idea by the same inventive genius. It is a tin cylinder box, about three inches in diameter, and seven or eight inches long, fitted to hold boot brush and blacking. This is a nice traveling companion, and also very "handy to have in the house."

Mutual Exchange.—C. R. Do farmers ever think of the vast amount they might gain annually, by a system of general exchange of fruits and flowers with their near neighbors, (and distant ones by mail?) I speak more particularly of small fruits. Suppose one farmer had an abundance of one kind of fruit only, (say Lawton blackberry). By exchanging it with a half dozen others, who possessed some of his "heart's desire," he would find himself far better off, and no money spent either, but a trifling amount in postage, at the rate of eight cents per pound. I think farmers should make known their wants through the press, stating, at the same time, what they could exchange for the same.

Milk Cows and Dairy Farming.—The receipt of a copy of this excellent work from the publishers, indicates that their presses are running again, to supply the demand. The binding is modern and neat. We have it as a standard work on our list.

To Separate Honey from Wax.—Mrs. L. A. Muller. Put the honey, comb and all, in a tin pan, on, or in, a moderately warm stove, adding to each pound of honey a tablespoonful of water. Stir it occasionally with a piece of wire; if anything large is used there will be an accumulation of dirty, cold wax continually added to the hot mass. When the contents of the pan are perfectly liquid—it must not boil—set it where it can cool undisturbed. Then take a knife, and pass it carefully around the pan, to detach the cake of wax, etc., on the top, and rapidly, with great care, lift off the cake. Don't let it drain into the pan an instant, but place in another utensil. Any one thus clarifying honey will find, on putting aside the cake of wax, that every particle of impurity, that would have to be strained from the honey, will have adhered to the cake of wax, and nothing remains beneath but the golden-colored honey, clear as water. If the honey should, in time, candy, heat it again with a very little water and white sugar. Keep in jars, tied up, in a cool place. Break up the wax cake and wash in cold water till cleansed from the honey. Then melt and strain it. To bleach the wax, boil it, after straining, for an hour, in plenty of water, in which use a few drops of chloride of soda. When quite cold, lift off the wax and leave it to dry and whiten in the open air.

Appleton's American Annual Encyclopedia.—The new American Encyclopedia is well known. From the time of its completion, about 1860, its publishers have issued an annual volume in similar style—large double columned octavo pages, in fair type, containing 800 pages, more or less, in each volume. These are a general history of the most notable things which come to pass in the world for the year, and from an American and popular stand point. The range of subjects is

limitless, but such are chosen as are of most general interest and importance: wars and political changes, education, philanthropy, religion, science, art, manufactures, mines, obituaries, literature, law, medicine and philosophy, in short anything that affects the history of the day. Many of the most important United States public documents are given in full, and, as a contemporaneous history of our own country, the Annual Encyclopedia has, and will have, great value. The volume for 1866 is just out.

Tightening the Screws on Dogs.—Massachusetts has amended her dog law, making it \$15 fine to keep an unlicensed dog; \$5 to go to the informer, and making it incumbent on police officers to kill all such dogs. Sheep will stand some chance in the old Bay State.

Rat Premiums.—An Ohio County Agricultural Society offers a premium of \$10 for the greatest number of rat tails, not less than one thousand strong, on a string. The rats to be caught by one family between March 15, 1867, and the time of the fair. We like this idea, and commend it to the attention of our agricultural societies. The depredations of these animals are a heavy tax upon our farmers, amounting to millions every year. The premiums would stimulate the boys to great activity in destroying them. The Norway rat was a terrible pest to this country.

Sheep as Lawn Mowers.—In a recent ride through the Central Park, we were struck with the exceeding beauty and freshness of the large lawn near the Mall, where scores of South Downs were quietly feeding, adding picturesqueness to the scene, while they pursued their utilitarian labors. Downing quite early called the attention of rural improvers to this use of sheep. They would not, perhaps, in any case, entirely save the use of the mower, but after two or three cuttings in the early summer, they would keep the lawn in passable condition for the rest of the season. But this is only one item in their use. They return to the soil what grows upon it, with important additions, and would save the expense of all other top dressing. Sheep will keep good land constantly improving. They also form an element of beauty in any landscape, and when they have done serving the eye, they go to serve the table.

To Keep Meat Almost as Good as Fresh for a Long Time.—Mrs. L. A. Muller. Take enough water to cover the meat, make it moderately salt, and to each bucketful of water—the common wooden bucket—take one large tablespoonful of sulphite of lime, and one teaspoonful of saltpetre. It is all-important to keep every particle of meat under water by a press. Soak the meat in fresh water over night, before using it, and it will be almost as good as fresh. I found veal kept in this way, at the end of six weeks, as good as when first butchered, and beef, at the end of ten weeks, fresh enough to make excellent soup and roasts. As the season advances, and the heat increases, use more of the sulphite.

Re-packing Salt Pork.—W. Williams. Exposure to the air was undoubtedly the cause of the spoiling of the meat in removal. We would not have pork five minutes out of the brine, if we could help it, before it is cooked. In changing from one vessel to another there is a good deal of exposure. The only safety for pork is in packing it in good, clean barrels, with plenty of salt, as close as possible, and in keeping it covered with brine till used. Pork is often spoiled through the carelessness of servants. Keep a board and weight upon it constantly, and do not fail to look at the barrel every time you visit the cellar, if you want sweet pork. If the brine is not strong enough, add more salt on top. We always keep two or three inches of coarse salt on top. The bottom will always take care of itself.

Sowing Barley Early.—J. S. C., of Vt., objects to this practice, and says that he sowed May 1st, and got 4½ bushels to the acre, while that sowed June 10th yielded 25 bushels. One swallow does not make a summer, and Vermont, though a great State, is a little too far north to be a rule for the whole country. It is quite possible that late sowing may be advisable in colder climates. We shall be glad to have any facts which our correspondents may have, bearing upon this point.

Chess Again.—"M. N.," Annapolis, Ill., wishes us to say something about the conversion of wheat into chess, or cheat. We have only space to briefly sum up the subject: While chess often appears in places where wheat was expected to grow, there is not the slightest proof that the one changes into the other, and, as far as negative evidence can go, all the authentic experiments to convert wheat into chess have proved failures. When we can be shown anything like a transition, a plant that is part wheat and part chess, we shall be willing to discuss the subject, but, until then, we can use our space better,

Comparative Nutritive Value of Different Kinds of Corn.—In response to several inquiries, we answer: That the nutritive value may probably be come at with considerable accuracy, by weighing a carefully measured, well shaken down bushel. This will not give accurately the fattening value, which depends in a good degree upon the amount of oil contained in the corn, but by no means wholly upon this. Different varieties vary greatly in the oil which they contain. The Dent corn contains generally less oil than the Flint, the Flint less than the little Pop corn.

Cost of Getting Crops to Market.

—It is estimated by an intelligent Iowa farmer, that it costs fully eighty per cent. of the value of the wheat crop to get it to an Eastern market, which always determines the producer's price; pork, 25 per cent.; beef, 15 per cent.; and wool, 4 per cent. This is a pretty strong argument for raising sheep, and killing dogs on the prairies.

Shall we Milk Before Calving?—

"G." writes: "I have a fine heifer which has just dropped her first calf. Her bag got very large and felt hard some days beforehand, and I am still afraid that I am going to have trouble with it. A man who keeps many cows told me I ought to have milked her when it first filled with milk. My nuele, last year, milked a cow a fortnight before calving, taking as much as a pailful a day. Is it the best way? Is there danger if it is neglected?"—It is not to be recommended as a general practice, if it can be avoided, but if the bag swells and feels hot, by all means draw the milk, and knead the bag when empty, washing it with warm soap and water, and perhaps greasing it to prevent inflammation or garget.

Duty on Imported Breeding Animals.

—The wise provision in our Revenue laws, admitting breeding animals duty free, is frustrated in a measure, by the very absurd, illiterate, and unjust decision which decides that *birds* are not animals, and hence that fowls and poultry of all kinds imported for breeding purposes, are subject to pay duty. If birds are not animals, what are they? and what are animals? Webster defines animal as "an organized body, endowed with life, sensation, and power of voluntary motion," and that is the common acceptance. The humblest forms of animals are distinguished from vegetables, by having distinct mouths and stomachs. An oyster is an animal as truly as a man, and a bird as truly as an ox. This matter ought at once to be tested in the Courts, if the Treasury Department continues to beg the question, and allow its employees in the Custom Houses to interpret plain English to suit themselves. It is fair to suppose that Congress meant animals when it used the word in an important law—and that if our law-makers had intended to admit free quadrupeds only, they would have said so.

"Big Things"—Monster Hogs.

Ivory Lord, of Saco, Me., writes: "Zero of Egypt desires to see the 'big things' reported, so as to know how to proceed this year in order to beat them. Well, try this, O': March 7th, 1861, Richard S. Rogers, of South Danvers, Mass., killed a hog 34 months old, the live weight of which was 1,108 lbs., and dead weight 984 lbs. The last 16 months he was fed all the Indian meal and milk he could eat. He could stand and walk to his last day, and of his own accord walked up an inclined plane into a cart to be hauled to the butcher. Mr. Rogers estimated the cost of this huge grunter at 25 cents per lb.; he received 8 cents per lb. for him. This is the greatest weight of a porker that has ever come to my knowledge." [In 1833, December 21st, Benj. Rogers, Mansfield, Burlington County, N. J., killed a hog which weighed 1,611 lbs. In 1863, A. H. Benham, McLean, Tompkins County, N. Y., had a hog which weighed 1,335 lbs., which was exhibited in our office, and killed in New York, December 19th, weighing, alive, 1,273 lbs., dressed, 1,174 lbs.—Ed.]

Horse-Racing at Fairs may far better be Broken up than Permitted.

—F. K. Phoenix, of Bloomington, Ill., writes: "Last year our County Fair managers determined to do without horse-racing. The sporting people prophesied and threatened, but the result was *very much the best Fair, and the best receipts* ever known in the Society's history—and that too, in despite of some very unfavorable weather. I think we shall hear no more in favor of connecting the two in our Society—the issue has been made and victory won."

Cure for the "Gapes in Chickens."

—J. H. Mabbett writes: "Take a four or eight ounce vial and fill it with *large grains of wheat*; then fill the vial with turpentine and let it stand, corked tightly. When you see any of your chicks begin to droop and gasp, catch them and give each one grain of the wheat. If in the morning, give another at night. If in the after-

noon, give one the next morning. I have never found this to fail in my 'family.' Handle them gently, and don't, for mercy's sake, put a feather down their windpipes."—[The turpentine kills or paralyzes the worms, which are the cause of gapes, and they are coughed up.—Ed.]

Potatoes Under Straw.—This method of growing potatoes seems to answer well in some places and not in others. We have given the experience of those who have failed and those who have succeeded. The following from J. Cass, Sacramento County, California, will interest those who live in a similar climate:

"For the last three years my potatoes have invariably run to vines and set no potatoes. Last year I tried the covering with straw and I had splendid potatoes; the ground kept moist all Summer, and we could get a mess any time by rooting in the straw with our hands. I planted as follows: Old ground that was in assorted vegetables the year previous, was ploughed in, and half potatoes, cut lengthwise, dropped 15 inches apart, in every third furrow, and put about 8 inches of old wheat straw on them; it seemed to check the growth of vines and made the potatoes set."

Suffolk Pigs.—We have frequent inquiries for this excellent breed, many of them from the West. Berkshires, Yorkshires or Seftons, and other pure breeds, are also in more or less request. Breeders of valuable kinds of stock would do well to advertise.

Cure for Lice on Cattle.—Isaac Schaubert, Saratoga County, N. Y., says: "A few applications of good elder vinegar along the back bone, on the head, and other places where the lice gather, will soon finish them."—It will give them a check, which cleanliness and good keeping will make more or less permanent. It is, however, a safe and convenient application.

Plastic Slate Roofing.—We are constantly receiving inquiries in regard to this material. The fact is, we know very little about it. What we do know, is favorable. The claim of the venders, that it reforms stone, is absurd; but the slate flour mingled with the gas tar remains suspended in it, and the tar is said not to separate and run, as do most tar roofs, when they are exposed to great heat of the sun in summer.

Over-Cropped Land.—What is the best plan to recuperate land that is still rich, but from frequent cropping with wheat fails to bring remunerative crops? G. P. S.—The land wants a rotation of crops, and clover turned in the summer before wheat is sown. If the clover does not grow stout enough, sow a little plaster early in the spring. The clover is a good manure for wheat.

Comparative Value of Hay and other Food.—According to experiments conducted in France and Germany, 100 lbs. of good hay is equal in alimentary value to

400 lbs. of green clover,	45 lbs. of wheat.
275 " green Indian corn	54 " barley.
374 " wheat straw.	50 " oats.
442 " rye straw.	57 " Indian corn.
195 " oat straw.	62 " sunflower seed.
400 " dried corn stalks.	69 " linseed cake.
275 " carrots.	103 " wheat bran.
54 " rye.	83 " dried oak leaves.

Farmer's Fruit Cake.—Contributed by Mrs. E. Smith, Plymouth Co., Mass. Soak 3 cups of dried apples over night in warm water; chop (slightly) in the morning, and then simmer 2 hours in 2 cups of molasses. Add 2 eggs, 1 cup of sugar, 1 cup of sweet milk, $\frac{1}{2}$ cup of butter, $\frac{1}{4}$ teaspoonful of soda, flour to make a rather thick batter; spice to suit the taste. Bake in a quick oven. Republished by request of a subscriber.

Fire and Water-proof Wash.—"A. S. K., of Fitchburg, Mass., sends us the following recipe, of which he says: "For roofs of houses, barns and other buildings, or for brick-work, this preparation is unequalled." Dry-slake common stone lime in a close vessel, and when cool, pass eight quarts through a fine sieve; add to it one quart of fine salt, and two gallons *pure water*. Boil and skim. Then, to every four gallons of this mixture, add one and a quarter pounds of alum, three-fourths of a pound copperas, half a pound potash, and five quarts fine beach sand. The wash will now admit any coloring matter that may be desired, and may be applied with a paint or whitewash brush in the same manner as oil paints. He adds: "It looks better than any other kind of paint, will stop leaks in roofs, prevent moss from growing, and, when laid upon brick-work, will render it impenetrable to rain or moisture." [The "Chemistry" of this wash is not quite obvious, but as really good washes for out-door work are rare, we give it publicity on our correspondent's authority.]

Housekeepers with Small Children and Smaller Help.

A lady correspondent at the West, puts the following question:

"In your reply to the Southern lady who had determined to do her own work—after speaking of the arranged kitchen—you add: 'Fitted out with these appliances, a woman in good health and without small children, can often do her own work with less worry without a servant than with one.' Now, here let me ask: What would a woman do with very few of these appliances, and six or eight small children—say under ten years old?"

In those essays I have met with a good many things that coincide with my experience, my thinkings, plannings, and doings—and yet when I have read them through, I have felt as though there was something wanting. A wish came up that some one who had six or eight small children to *care for* and *do for*, in addition to her other duties, would write on the subject.

It seemed to me I might learn many a lesson. I wish to make my system of housekeeping as good as I can under my present circumstances.

But for want of such a paper, I intend to make the most of those published."

As the woman with eight small children is likely to be busy for some time, we will answer for her, for this case demands immediate consideration. Eight small children and no help! It is a hard case, and requires considerable philosophy, and some piety, to get along with it smoothly. *Do not despair.* Your case might be worse in two particulars; you might have no children at all, and you might have more. We know of a woman who has twenty-five, all comely and doing well. The saddest people we know of are childless husbands and wives, and the most cheerless homes are those where there is no cradle to rock, and no playthings to put up when evening comes. Better a dozen than none. You need the education which will come of training them to thrifty and virtuous habits. Do not doubt for a moment that they will live, grow up, and be useful and happy, and that they will all rise up and call you blessed. The kind Providence that has given them being, has a work for them to do, and will in some way provide for their training. *Do not worry.* Worry kills a great many more people than work. There must necessarily be a different standard of attainment in such a home, from that which prevails where money and servants are plenty. There can not be so many or so fine dresses, playthings, books and amusements. They can not be kept in such absolute cleanliness and order, as if each child had a nurse, and a governess devoted her whole time to their education. If you do the best you can under the circumstances, duty is discharged—a matter of thanksgiving.

Look at the Sunny Side.—There is such a side in every lot in life. Most children grow up in homes where there are no servants, and turn out passably well. Men and women of the highest culture and social position, more often than otherwise, began life in this condition, and the early habits of self help and industry there formed, determined their characters and success. To be born in affluence is generally a calamity. The children of the rich are most appropriately objects of compassion. What shall be done for such, to make them useful and happy, is a much more difficult problem to solve than the proper training of the children of the poor. The men who make our laws and mould public opinion, as a rule, grow up under the necessity of labor. Their mothers filled the offices of nurse, cook, and laundress in their homes, and to this day it is the honest conviction of these distinguished men, that their mothers were the best women and the most savory cooks in the world.

Cultivate Self-Help in your Children.—Mothers sometimes err in excessive tenderness and devotion. Children love occupation and will have it. The passion for dressing dolls may as well be turned to dressing something more substantial. A little girl can soon learn to dress and wash herself, and then to perform these offices for her younger brothers and sisters. Play should never be forestalled, but

it may be so judiciously mixed up with healthful labors that the toil will not be irksome. The boy may as well pull on his first boots, as have another do it for him. If he is taught that it is manly to help himself and to keep his clothes and person clean, he will glory in the use of brushes for the hair, the teeth, the clothes, and boots. He will soon learn to measure manhood by usefulness, and not by the amount of dirty work other people do for him. Some people indeed, get too much out of their children, but that is not the tendency or peril of American Society. They can be made much more helpful with pleasure and profit to themselves, and to the world.

Buy Labor-Saving Machines.—A large part of the labor in the family can be saved by them, and they pay for themselves many times over every year. It is difficult to see how a housekeeper can get along without them. Most people are too poor to do without them. They save what is more precious than money—health and life. We forbear to say more, lest there should be nothing left for the woman with the eight small children to say. We yield the floor until she speaks.

Experience with French Fowls.

We have published several articles concerning the important additions made to our poultry yards, in the introduction of French breeds, but more particularly referring to the Crevecoeurs and Houdans. This has produced testimony for and against these breeds, from those that have them. That they are non-sitters can hardly be held as a disadvantage. Moreover, it is said that the Crevecoeur is not as hardy as the Houdan. This appears from the following extract from a letter of Mr. J. L. S., of Cincinnati, one of our most successful amateur poultry raisers: "My yard is in a thriving condition, excepting the Crevecoeurs, and they, wretched chickens, are trying to see how fast they can die. No disease comes amiss to them, be it old and common, or new, and, what renders this more strange to me, is, that my young ones are large, better feathered, and, up to a certain age, easier to raise than any chickens I have. I began the season with fourteen 'Creve' hens. I now have five left. They average about an egg and a half a day. They do not bear confinement well." Our impression is that Crevecoeurs suffer from dampness, and this is strengthened by the fact that in Holland, a damp country, the breed does not thrive. A dry bank, fully exposed to the south, would suit them best.

Another party gives his experience as follows: "I am greatly pleased with my Crevecoeurs, having made two importations, and have not as yet lost a bird. When the first lot arrived, 3 of them were sick with roup; one hen seemed a hopeless case, but by good care she recovered, and is now presenting her egg per day with great regularity, and all are thriving. With decent care, I see no reason why they should not prove entirely satisfactory as to hardiness. Fifty-five of the young chickens are coming on finely; have lost none by disease. My second importation of hens laid all the way, and are at it yet."

A third party, having both the Crevecoeur and Houdan, is of opinion that both will succeed well, judging from his own trial thus far. It is, however, too early to form any decided opinion. Several seasons must elapse before the point of hardiness can be determined satisfactorily. The reputation for early maturity, large size, excellence of flavor, and fecundity, gained by these breeds, in France and England, seems to be sustained here thus far.

The Houdans are preferred to the Crevecoeurs by Mr. Turhorst, one of the oldest and

most experienced of poultry breeders in Great Britain, who declares them a most valuable addition to the poultry yard. Mr. John Baily, one of the contributors to the poultry columns of the *Journal of Horticulture and Cottage Gardener*, says, Aug. 17, 1866: "I have never had a case of illness with a Houdan, and believe them to be hardiest of fowl." And again, April 25th, 1867, "We have kept them for many years; they are very hardy, more so than the La Fleche and Crevecoeurs. They bear close confinement.

A National Tax on Dogs.

Among the 16,000 articles taxed by our Solons at Washington, it seems strange that so large and important an interest as dogs should have escaped notice. A more legitimate object to raise revenue from can not be found in the whole list. Our Government very properly taxes luxuries, with a view to bring the burdens of taxation upon those who are best able to bear them. Among these luxuries are brandies, wines, silks, gold watches, gold and silver ware, carriages, pianos, etc. Dogs are a luxury, as we see in the white-haired poodle, that rides out with his mistress and sleeps in her boudoir upon the softest of cushions, and has his hair daily perfumed with the choicest extracts of Lubin. They are considered the appropriate appendage of every genteel establishment; setters and pointers for sporting gentlemen, whether they fancy hunting or not; and the big speckled dog under the carriage, the admiration of small boys, and a terror to all evil doers among smaller dogs. The Government also taxes nuisances with a view to abate them. Dogs are a nuisance of the most troublesome and expensive kind. We have in the nation, according to the best statisticians, one to a family, or about 7,000,000. We think a hundred thousand of these may be occasionally useful and ornamental—well bred dogs—that pay their way. The rest are pests and abominations. They run mad and bite multitudes of men, and every season we have deaths from that dreadful disease, the hydrophobia. The public health suffers every season in all our large cities from apprehensions of mad dogs, and the city authorities have to make open warfare upon the race. They are a burdensome pest, costing the nation at least seventy millions of dollars to support them, a very large tax upon an over-taxed people. They are a very destructive pest—killing at least a half million of sheep every year, worth at present prices at least two millions of dollars, and ruining others to the value of a million dollars more. They make sheep raising so insecure, that large tracts of land lie waste for want of this stock to crop them, and every man has to pay a heavy tax in the shape of dear wool and mutton on account of dogs. But for these wretched curs, our forty million of sheep could be doubled in a short time, and cheap wool and mutton be made the heritage of every American citizen forever. If our legislators want to tax luxuries and abate nuisances, they will accomplish both objects in taxing dogs.

Another object of the Government should be to afford incidental protection to home interests. A heavy tax on dogs will help several important interests. It will give us a better race of dogs. Of course, only the best breeds will be spared, and the best specimens of their kind, and the canine race will be perpetuated in these lines—purely bred—well trained—well cared for—used legitimately, and a nuisance to nobody.

It will also give us cheap wool and mutton, two very great blessings for any nation. Whatever the tariff may be on foreign wools, we can compete with the world on any kind of wool, if the Government will only clean out the race of curs. We have untold acres that are lying waste for want of sheep, and men dare not invest in them, for fear of the dogs.

Other Governments very wisely legislate against dogs, both to abate a nuisance and to protect the wool grower. Great Britain lays a tax of twelve shillings (three dollars) on dogs, and derives a handsome revenue from this source. In Bavaria, the canine population has been very much reduced by taxation. In Baden, the dog-revenue amounts to a hundred thousand thalers. France has a dog tax, and on this point Bismark agrees with Napoleon. At the International Congress of Veterinary Surgeons, in Vienna, in 1865, the subject was discussed, interesting statistics of hydrophobia were presented, and a resolution was adopted favoring taxation, and recommending that the tax be as high as possible. The foremost States of Europe appreciate the relation of dogs to wool and mutton. In most of our Northern States, laws upon this subject have been passed, and in Massachusetts and Connecticut, which have the best laws, the number of dogs has been greatly reduced, and a corresponding security given to sheep. It is demonstrated not only that dog laws are needed, but that wise legislation will be sustained by public opinion, and accomplish its object. National laws need not interfere with State laws, or supersede them. Properly drawn, they would work harmoniously with them, and by making curs expensive luxuries, help to exterminate them. Perhaps the only thing needed is a tax of three dollars.

This course would infringe upon no man's rights. We concede to the American citizen the largest liberty consistent with the public good. It is the undoubted privilege of the citizen to keep panthers if he fancies them, but he should keep them in a cage, and not in his neighbor's barn-yard. We have as good a right to raise calves as he has panthers, and he must take care of his wild beasts, or we can not get along peaceably together. He may keep rattlesnakes, if he pleases, but he should keep them where he can have the exclusive enjoyment of their musical rattle. We do not like the music too near—sudden death by poison is not pleasant. He may have dogs if he likes. We concede that it is none of our business whether he has a legitimate use for them or not, whether he can afford them or not. But he must not compel us to board them on sheep that cost a thousand dollars a carcass, and that are more valuable to us living than dead. If dogs are worth having, pay for them and take care of them like a man. Sheep raisers have rights as well as dog owners. Let us have fair play in this matter, and a national dog law that will give us both cheap wool and cheap mutton.

Wool Grower's Associations, State and County Agricultural Societies, and Farmer's Clubs should move early in this matter, and demand suitable legislation at the next session of Congress. Whatever reluctance there may be among Congressmen to offend dog owners who have votes, they can not withstand an enlightened public sentiment. The friends of cheap wool and mutton are in the vast majority in this country, and they have only to make their wishes known by united action to secure the needed legislation. Whatever measure ought to be carried, can be, by the activity of its friends.

The Puma.—(*Felis Concolor*.)

The Jaguar of South America is the largest of the Leopard family of cats, being also the most beautiful in its marking. The Puma approaches it in size, and is also closely affiliated to it. The geographical range of this animal is very great, probably greater than that of any other cat in a wild state, being from Canada to Patagonia. It rejoices in more titles than is quite fair in this hemisphere of republican ideas, and it is hard to say which is the most correct common name. No less than three Latin generic names have been given to it, *Felis*, *Leopardus* and *Puma*, but Linnaeus' name, *F. concolor*, is now accepted by the best authorities. We know the animal in books and newspapers as Puma, Cougar and American Lion; in common conversation as Catamount, Panther and Painter.

redations are extended to farm yards, where it slaughters many more than its needs require. The men of any region thus visited promptly turn out for a "Painter hunt." The hunters should go in couples, for, though easily killed if noticed, unseen a panther is dangerous.

with undulating dark bands; below on each side is a band of green, surrounded with black. This little animal lives altogether upon insects, and in order to take them, has to be exceedingly agile in its motions, not being provided with a long glutinous tongue.

PUMA.—(*Felis Concolor*.)

Lizards and Tritons.

People generally make no very accurate distinction between the Newts, Salamanders, and Tritons, and those animals of a finer organization properly called Lizards or Saurians. In the accompanying engraving are represented three quite similarly formed, yet very different animals. The upper one is the PINE LIZARD or BROWN SWIFT, (*Tropidolepsis undulatus*), a liz-

snaky heads, covered with thin angular plates, and flat, notched tongues, and there is little difference in size between the neck and the body, at the abdomen. From this point there is a gradual taper to the tip of the tail. They are well toothed, but not venomous, though they bite severely. The Red-headed Skink of the Southern States passes popularly under the name of Scorpion. It closely resembles this one, but is considerably larger. The length

of the Blue-tailed Skink is about 8 inches; its head is bluish-black, its body striped with six straw-colored lines, and the tail is of a beautiful ultramarine blue. The throat and belly are white. These are also insect eaters, hence, our friends.

The spotted creature in the foreground of this group is the TIGER TRITON, (*Triton tigrinus*), and may represent the numerous class of tailed batrachians. It is not properly a lizard at all, but much more nearly related to the frogs and toads. Its eggs are laid in the water, and the young pass through a state

TIGER TRITON.

PINE LIZARD.

BLUE-TAILED SKINK.

ard of the Iguana family. It resides in pine woods, dwelling chiefly in the trees, yet frequently found upon the ground. It is about 7 or 8 inches long, covered with pointed scales, gray upon the back and sides, marked above

of existence similar to the tadpole condition. It is about 6½ inches long, bluish-black above, marked with brilliant lemon-colored blotches of irregular outlines; below it is ashy with paler blotches. It is found in New England and the

Its usual mode of taking its prey, in wooded districts, is, to conceal itself among the branches of a tree overhanging deer paths and springs, and drop or jump upon its victims. The form of the panther is admirably shown in the above spirited engraving from one of Wier's drawings. Its color is tawny or brownish-yellow on the back, and ashy-white beneath. Its weight sometimes reaches 150 pounds; it is 4 to 4½ feet in length, exclusive of the tail, which is over 2 feet, and tipped with black, but not tufted. A subscriber in Claremont, N. H., sent us recently a photograph of a large Cougar taken near there last winter. A Cougar is not long in making its presence known in any district. Calves and young cattle in woody pastures are usually its first victims, but its dep-

Middle States, and is amphibious. This, also, is entirely innocent. A peculiarly interesting characteristic of the Tritons is the ease with which they *break*, and the facility with which the wounded part heals, or is *replaced*. Amputated tails or limbs will grow again, and if these are cut off they will be soon replaced by others.

Tim Bunker on the Eight Hour Law.

BIG FERMENT IN HOOKERTOWN.

MR. EDITOR.—We have been having considerable doings up here lately, and as you wanted me to keep you posted on Connecticut news in general, and Hookertown in particular, I send you some notes I took on the Eight Hour Convention. It was got up by Cicero Smith, and a few of the fellows that work with him, when they do anything, which is not often.

Big posters were stuck up on all the sign posts in town, calling upon mechanics and working people in general, to meet in the town hall, and assert their rights, just as if somebody had been trying to take away their rights. There was a full house. Shadtown was well represented by the fishermen, and the White Oakes turned out strong. Kier Frink and the coal men came down in their carts, and Hookertown-street has not seen such a collection of broken down wagons, and gaunt, raw-boned horses, in many a day. It reminded one of the early days of the war, when they were holding big meetings to drum up recruits.

Judge Loring was appointed chairman, and Cicero Smith introduced a long string of resolutions, recommending eight hours as a legal day's work, and pledging the meeting to vote for no man that was not in favor of an eight hour law. He said the time had come for the heavy burdens of labor to be lifted from the working classes; that they now did all the work, got poor pay, and had to live in humble abodes, on scant fare, and endure all the ills of poverty. They were ground down by capital to the lowest depths, and had no time for the cultivation of their minds, and for social enjoyments. He hoped to see the day when the men who did the work should have the money, and the fine houses, and the fast horses, and enjoy life like human beings. He was in favor of paying the laborer as much for his eight hours as he now received for ten, and if that was not enough, he would go as far as the farthest in relieving his wants, and meeting his wishes. The only true foundation for a State was to glorify labor.

Seth Twiggs said he should like the latter part of the gentleman's speech better, if he would illustrate it in his life. If any body got one hour's work out of Smith, it would be so much clear gain. "There is as many as two ways of glorifying labor. One is to make stump speeches to working people, and the other is to pitch in and work yourself." He thought a man who held a plow, or chopped wood all day, honored labor enough sight better than a man who was everlastingly talking about work and doing nothing. He didn't value the working of the jaws near so much as some other parts of the body.

Uncle Jotham Sparrowgrass said he didn't know as he understood this eight hour movement, but as far as he did, he didn't think much of it. "It ain't anything new. It was tried over on the Island more than forty years ago. There was a set of fellows then trying to get rid of work, and they come nearer to saying what they meant than folks did now. They wanted

to divide up property equally all round, and said nothing about working for it. When I was a boy, folks who got ahead any, used to get up early in the morning and work as long as they could see, and milk the cows in the dark. If they got the chores done by nine o'clock and got ready for bed, they did pretty well. They hadn't much time to feel abused and talk about their rights. The main pint was to get a living and get ahead in the world. They may have carried work a little too far, but arter all, they were firs-rate people, and better neighbors I never expect to find in this world." It seemed to him that the question was whether folks should work and thrive, or try to get a living without work. For one, he was in favor of work, and if he could find any thing to do that paid, he shouldn't be particular about the hours.

George Washington Tucker said he was glad there was somebody to consider poor folks. He had always worked hard and had nothing to show for it. He never owned a foot of land, and couldn't expect to without some change of times. He wanted more pay and less work, and he thought the eight hour plan was the best one that had ever been tried to relieve poor folks.

Jake Frink said he was a good deal bothered about the question. "Heaven knows I've hard work enough to git along. I've been trying to pay for my farm this thirty years, and hain't made it out yit. And I've worked like a dog a good part of the time. But how working eight hours instead of twelve is gwine to help me, I can't exactly see. I rather guess there would be less corn in my bin, and pork in my cellar in the fall, than there is now. I have to hire some help in summer, and if a man quits in the middle of the arternoon, and leaves me to git up the hay and grain, I don't see how I'm gwine to be benefited. It looks considerable like a humbug. I bo't some patent manure onc't."

Dea. Little said he didn't like the looks of this question. "They tried the same thing in Sodom, and it didn't work well. The land was rich and produced big crops, and they had nothing to do but look on and see 'em grow. They come very near getting rid o' work, and took to serving the devil so that no decent man could live among them." Work was a good thing for sinners, and he never expected to live without it. He thought if his friend Tucker would pull harder at the hoe handle, and not so much at the bottle, he would be able to own land and a house, and to be quite comfortable. Idleness clothed a man in rags in Solomon's time, and he didn't expect to see a lazy man's wardrobe improve any in our day. "If you want any thing, work for it, and if you work long and hard enough, you are pretty sure to get it."

Rev. Mr. Spooner said he was troubled about the moral aspects of this movement. It was nothing new that men tried to escape the curse of toil. Nothing hascalld forth more ingenuity, but the curse still remains, and he doubted if man would ever be able to repeal the law, 'Six days shalt thou labor.' Eight hours was not a day's work under this law, whatever the civil statute might make it. The average length of the day was about twelve hours. Men were able to work more than eight hours, and did generally, without injury to health, and with much advantage to their fortunes. That was pretty good evidence that they ought to work more. Some people, he supposed, worked too long and too hard, but there was a fir larger number who were ruined by idleness, and the vices that grew out of it. He thought the great want of the country now was more labor. If

this measure was made a practical thing, it would take one-fifth from all the labor in the country, and that meant, when we come to sift it down, a deduction of one-fifth from every man's income. It was labor that gave value to capital. Men who had money could not loan it unless its use could be made productive by labor. The country was not ready for any such reduction of production and of income. The agitation of the question he thought was mischievous, and would only tend to embarrass the relations of capital and labor.

Last Sunday, Mr. Spooner preached a Sermon from St. Paul: "Neither did we eat any man's bread for nought, but wrought with labor and travail, night and day, that we might not be chargeable to any of you," in which he laid out the eight hour law in its grave clothes. Paul was a gentleman and believed in paying his way, which the eight hour folks don't. If we are going to have any thing besides victuals and clothes, we've got to work more than eight hours for it. Quitting work the middle of the arternoon in laying time won't go down. Even Jake Frink can see the bearing of that nonsense.

Hookertown, Conn., } Yours to command,
June 15, 1867. } TIMOTHY BUNKER, ESQ.

Raise Your Own Wheat.

With the best brands of family flour at \$20, and a large importation of wheat from California, it becomes the farmers of the sea-board States to inquire if they cannot get their flour cheaper at home. We know some farmers can do better than to raise their own flour, even at the present high prices, but the great majority cannot. Wheat, at \$2 a bushel even, would pay as well as anything else they raise, if they would only prepare the soil properly. On many of these farms wheat has not been raised for the last 30 or 40 years, and the present owners have come to regard it as an unprofitable crop. Yet these same farms formerly produced fine crops of wheat, and this grain was a prime article for export in all the sea-board States. The soil and climate have not changed, and the winters, as meteorological records clearly show, furnish about the same amount of cold and snow as they did a hundred years ago. With a suitable preparation of the soil, these old fields and meadows will produce this grain as well as they ever did. It is not true, as is too often supposed, that we must have a new soil to produce this crop to advantage. In England, there are farms that have grown wheat for a thousand years, and the yield is as bountiful as ever. There they have a regular rotation, and bountiful manuring, and get 40 bushels to the acre. There are some farmers at the East that keep up the good old custom of making their own breadstuffs, and thrive by it. We visited such a district at the east end of Long Island, where, as a rule, the farmers grow wheat enough for the supply of their own families, and the crop is found to be about as sure as anything they can raise. Their soil is not particularly rich, or better adapted to wheat than other sections. Their only advantage is ready access to sea manures, especially fish guano and the refuse of the oil factories. But with any other good manure, wheat may be raised to advantage. Try a simple acre, and make yourself independent of the West for your flour. Do not sow upon poor exhausted meadow, and fail, and say it is impossible to grow wheat. If your soil is not already rich enough to produce 50 bushels of corn to the acre, manure with fine compost. Get the

best seed and prepare it with brine and lime, and sow early, and put it in with a cultivator two or three inches deep. Upon soil, naturally or artificially, well drained, it will stand the winter and give you a good crop. There is great satisfaction in growing your own wheat. You get it in the best condition; you can have it fresh ground, and not be troubled with sour, musty flour, and poor bread. You can have it unbolted for Graham bread and biscuit, and furnish the raw material for the enamel of your children's teeth. The dentists may suffer for lack of custom, but you "will put money in your purse" and health in your bones.

Fatal Accidents from Mowing Machines.

The great number of serious and fatal accidents which are reported every year as arising from carelessness in handling mowing machines, or from drivers being thrown off from their seats in front of them, has led to much thought, both on the part of conscientious manufacturers and others, to prevent such occurrences. Some mowing machines are peculiarly liable to throw the driver off on going over rough ground, or when the cutter bar strikes a fixed obstacle. They should be avoided by purchasers, as one would any treacherous dangerous thing. When accidents occur and are reported in the papers, the name of the machine should always be given. We should like to publish a list showing the number of each machine in use, and number of accidents to those using them, could a fair one be made out.

Some years ago a lady of Burlington, N. J., invented an arrangement for throwing the knives out of gear the instant the driver's weight was taken from the seat. We never knew of its being put to use. There have been several other guards contrived, generally, however, not applicable to all machines.

We have received a suggestion in a letter from Mr. J. S. Hammond, of Scarsdale, which we regard as eminently practical and sensible, and believe it will be the means of saving many lives and limbs. He writes:

"As the mowing season is rapidly approaching, I desire to make known a simple device, which I have employed during two seasons, to prevent being thrown from my mowing machine. It is well known that serious accidents have been thus produced. It is this: I take a strong leather strap, about 30 inches long, and, passing one end between the bars on the left side of the seat, (generally of open iron work,) buckle, so as to make a loop. Put the left arm through this loop. Let the loop be long enough to allow free use of the arm in driving, and at the same time to steady the body. The right arm must be free to work the machine. Should the machine strike any hidden obstacle, the strap will prevent the rider from being thrown to the right side, or forward, upon the knives, and will in most cases enable him to keep his seat. Properly adjusted it will not interfere with the management of the team or the machine.

Animals as Weather Guages.

"A. S. B.," writes: "I have observed this spring that the robins and some one or two other birds, (but especially the robins), seem to be building their nests higher than usual, and more on the outside of the trees, or further out on the limbs. The robin, as a general thing, builds its nest close to the trunk or main body of the tree, and I have known them not to build more

than 8 to 10 feet from the ground, and I may say generally they are not inclined to build much above the center of the tree, but this year the contrary seems to be their habit. I have noticed this fact to one or two others, and to a Doctor to whom I have noticed it, told me he had observed some two or three robins building higher and nearer the tops of the trees than he had ever noticed their doing before. I would ask, does it indicate a warm or cold summer, a wet or dry one, heavy or light winds? I had thought, perhaps, it indicated a cloudy, cold, wet, summer. I would like others to make some observation of this in their part of the country, and see if it is so with them."

It is quite common to forecast the season from certain indications among animals, and many people, intelligent in other respects, have abiding faith in these signs. Thus, when partridges and quails have their feathers very low down on their legs, it is said to indicate a severe winter, and when muskrats build their nests very high, it will be a wet winter. These signs are very numerous, but being of a skeptical turn, we do not believe them. If our correspondent's observation is correct, it might indicate that the cats in his neighborhood had been more active than usual, and the birds were anxious to get out of the way. It has always seemed to us that the robin was very loose in its notions of locating its nest, and studied small fruits rather than the weather. If a strawberry bed were near, we have noticed that cock-robin and his bride pitched into the first red cedar, apple tree, or fence corner, at hand, where there was a little screen from observation. If the cherry trees were tall, they would not object to a tall berth in the neighboring spruce or maple. Men know very little about the coming seasons, and birds and beasts still less. We shall be glad to receive any facts in regard to the location of birds' nests this season—whether they sustain our theory or magnify bird forecast.

Large vs. Small Cotton Plantations.

We have received from a gentleman in Georgia, a communication to prove that cotton cannot be grown profitably henceforth upon large plantations. The argument, condensed, is this: It cannot be done, first, because under the slave system, the planter's chief profit was the increase of his slaves. This being gone, no money can be made with free labor. Second, compulsory labor was more reliable than that of freedmen. Third, cotton was grown at a loss last year. Fourth, capital invested in tools, stock and machinery is too insecure to tempt large capitalists. Fifth, the freedmen will be a tax upon the production of cotton. They will be henceforth full consumers and only partial producers, instead of full producers and partial consumers. Sixth, the small farmer will have an advantage in laboring with his own hands, and in the more intelligent direction of the few hands under him. He corroborates his own argument by the detailed cost and profit of working two cotton plantations in his vicinity, which we give in full:

PLANTATION NO. 1, BARNWELL DISTRICT, S. C.

Employing 18 laborers, cultivating 320 acres, viz.: 180 in corn, 140 in cotton, the planter furnishing land, stock, implements, etc., etc., and furnishing each laborer with shelter, 150 pounds of bacon and 12 bushels of corn, and allowing the laborers one-third of the produce raised. This plantation overlooked by the proprietor.

140 acres may yield 50 bales cotton, weighing 500 lbs. each, and may yield the planter 20 cents per lb., free of charges, making.....	\$5,000 00
180 acres in corn may yield 10 bushels per acre, worth \$1 per bushel.....	1,800 00
22,000 lbs. blades, worth \$1 per 100 lbs.....	220 00
1,500 bushels cotton seed, worth 20 cents per bushel.....	300 00
Gross yield.....	\$7,320 00
Deduct one-third, being laborers' share.....	2,440 00
	\$4,880 00
Deduct 2,700 lbs. bacon at 17 cents.....	\$459 00
Deduct 216 bushels corn at \$1 65.....	356 00
Provisions furnished laborers.....	815 00
	\$4,075 00
Deduct for interest and insurance of 9 mules, costing \$150 each, equal to \$1,350 at 20 per cent. per annum.....	\$270 00
Deduct for wear of gin, gin house and gear, screw, implements, wagon, cart, etc., at 20 per cent. on \$700.....	140 00
	\$3,665 00
Deduct planter's share of corn, blades and cotton seed, which must be reserved as outfit for next year.....	1,547 00
	\$2,118 00
Deduct rent of land, or interest on its cost, estimated as equal to one-sixth of what it will produce.....	1,320 00
Planter's profits.....	\$798 00

Being his return for his individual services, and with this sum he must pay State and local taxes, purchase flour, coffee, sugar, clothing, etc., and pay the doctor's charges.

PLANTATION NO. 2, BURKE COUNTY, GEORGIA.

Employing 15 laborers in number, regarded by proprietor as equalling 10 good operatives; cultivating 225 acres, viz.: 100 in corn, 125 in cotton, and overlooked by an agent.

Cotton.....	\$5,000 00
Corn.....	1,250 00
Blades.....	250 00
Cotton seed.....	300 00
Gross yield.....	\$6,800 00
Deduct wages paid in money.....	\$900 00
Do. provisions furnished laborers.....	662 00
Do. interest on stock and implements.....	431 00
Do. salary and rations of agent.....	491 00
Do. outfit of corn, blades and cotton seed for next year.....	1,900 00
Deduct rent of plantation, estimated at one-fifth of its production.....	1,360 00 - 5,504 00
Proprietor's net profit.....	\$996 00

1. As to the first argument, it is what the logicians called a non sequitur. There is so much difference between slave and free labor that it is quite difficult to reason from one to the other, especially in a community where free labor has not yet had a fair trial. 2. When this trial has fairly been made, we have no doubt that planters generally will concede that free labor is both more reliable and more economical. At present the freedmen labor under two very great disadvantages. The carelessness and idleness resulting from their former slaving, and insecurity of payment. When the dollar is made certain, the work will be. The stimulus of the dollar is much more effective than that of the lash. Labor in the free States is much more secure, and more profitable, than it ever was in the South, and it is owing to this fact, mainly, that land is worth so much more in the North. Under the working of freedom a reliable class of laborers will be trained in the South. If the planter has the capital to pay his hands every week, there will be little trouble about the work. 3. Last year was exceptional, as all admit, yet, with all its disadvantages, nearly two millions of bales of cotton were raised. Had the season been favorable, the product would have been double, or fully up to the average of cotton production before the war. This is quite as much as could have been expected. We think the results of last year, under the circumstances, are encouraging, both to the large and the small planter. We may fairly prophesy from it five millions of bales, as the annual crop within three years. 4. The insecurity of capital invested does not arise from the use of free labor. On the contrary, it is made more secure by it, as the history of all free labor communities proves. The only hesitation that capitalists now have in investing in cotton plantations, arises from the unsettled state of the country: There is a fear of mobs, of regulators, of social

ostracism, but none of free labor. These apprehensions, we think, will soon be removed. 5. No doubt the freedmen will be much better consumers than they have been. As fast as they earn the means they will want land and cottages of their own, better furniture, clothing, and food, books and papers. This will be no tax on cotton growing, but by these they will be made more industrious and skillful laborers, and so will produce cotton at less cost per pound. Nothing pays so well as skilled labor. This kind of labor will manage the new tools that are soon to come into the cotton field, and diminish the cost of production at least one half. The freedmen will be better consumers, and for that reason better producers. 6. Small planters will, no doubt, greatly multiply in the South, but it will be for the want of capital rather than because large capital can not be made to pay. With capital enough one could get a better interest from fifty hands than from five. The production would be quite as large per hand, and the cost of overseeing much less.

The tables of expense and profit, we think, are fairly open to criticism. When cotton is 30 cents a pound the planter will receive more than 20 cents a pound nett. In these estimates no manure is included. This should be used, so that the product will be at least one bale of cotton to the acre, and 30 bushels of corn. If he should apply, say, one ton of fish guano to the acre, costing \$35 delivered, and should get thereby one bale, instead of one-third of a bale, it would make a great difference in the look of the balance sheet. The cost of cultivation would not be increased. A little extra would have to be allowed for picking, baling and transportation. Our premium essays on cotton will show this fully.

Fig. 1.—FISH-STAIRS AT LOWELL, MASS.

Re-stocking our Fresh Waters with Fish.

We are glad to learn that this good cause is making progress. There are not nearly as many fish in our rivers as formerly, and from many of them the salmon has entirely disappeared, and shad are not caught in sufficient numbers to pay for setting nets and seines. Commissioners have been appointed in five of the New England States, two from each State, to act jointly in this matter, to arrest destruction by improvident methods, and to provide for the re-stocking of the rivers. H. A. Bellows, of New Hampshire, is Chairman, and Theodore Lyman, of Massachusetts, the Secretary of this Commission. The causes of the destruction of fish, as set forth by these gentlemen, are as follows, namely:

1. Impassable dams. Over these, fish-ways may be built with little waste of water.

2. Pollution of water by lime, dyes, soap, sawdust, and other mill refuse. Much of all these should not be thrown at all into the water.

Fig. 2.—FOSTER'S FISH-WAY FOR SMALL STREAMS.

As to the dirty water from wool or cloth washing, it may be confined to one side of the river by a plank screen placed opposite the race-way.

3. Destruction of young fish by mill-wheels, which may be avoided by a lattice placed across the mouth of the canal, or flume above the mill.

4. Destructive modes of fishing, among which we may include gill-nets, weirs, very long seines, pots, set-hooks, fire-fishing, and fishing through the ice; all of which should be forbidden by law.

5. Fishing too much, and at wrong seasons. For migratory fish, certain days in each week should be "closed,"—that is to say, no fishing should then be allowed; and the taking of trout on their spawning beds should be rigorously interdicted.

Massachusetts and New Hampshire have already passed laws for the opening of the Merrimack and the Connecticut to sea fish; and for the encouragement of the breeding of valuable fresh water fish. Fish-ways have been erected upon the Merrimack, and many thousand salmon eggs have been planted in its upper waters. We regard the impassable dams as the greatest hindrance to the multiplication of the migratory fish. The rich manufacturing companies that profit by these dams should be compelled by law to provide fish-ways over them. The times when the fish wish to use them are generally times of abundant water, so that the interests of manufacturers would suffer little from loss of power. As to the second cause, much of the mill refuse is valuable as a fertilizer, and should not be run into the river, but into the compost heap. We earnestly commend this object to the favor of our readers. In many ways the people may aid it, especially by demanding suitable legislation to help it. We should like to, and now even hope, that we may see the day when fresh

salmon will be the poor man's dish again, instead of a luxury hard to get at a dollar a pound.

Fish-ways, fish-stairs, Salmon-steps, etc., are names which convey distinctly the object of the various structures, which are erected for the purpose of allowing fish to pass over dams to spawn. Figure 1 represents the fish-stairs at Lowell, on the Merrimack, in Massachusetts. They consist of nine tanks, in which the water stands one foot deep, and through which it flows, falling from each, one foot into the one below. The tanks are of heavy plank, bolted together, and placed upon substantial masonry. An opening in the flush-boards of the dam permits a suitable stream of water to pass down the stairs, to afford the fish an easy passage to their breeding grounds. Figure 2 shows "Foster's" fish-way,

which is better adapted (so say the Commissioners), to small streams, as it uses little water. On a basis of masonry, a straight, sloping flume conducts the water, from the flood-gate on the dam, to the still water below. The

water, in its course through this flume, or trough, is interrupted by a series of "cross bulk-heads," extending alternately from one side and the other, nearly across. They have an upward slant, and thus, repeatedly, check the flow of the water, dam it back, and make a series of still pools, with a constant flow of deep water between

them. Both these stairs are known to be sufficient for the passage of Salmon and Alewives, but Foster's, it appears, have not been thoroughly tested for shad, which are the most fastidious.

Using Three Horses Abreast.

People, who have tested it, agree very well that it is a fact, that three horses working abreast, will pull, if well harnessed or "yoked," much more than if drawing in any other way. The usual method of arranging the whiffle-trees and "eveners," is that shown in fig. 1, and when the team is used for hauling logs, or any similar work, it is very well. When used to draw a cart, the center horse works in shafts, while the horse on each side is attached to an independent whiffle-tree, hooked upon an outrigger, with a chain running back to the end of the axle outside the wheel. In backing or turning, there is a great advantage in this arrangement, for one or both of the side horses may be taken around and made to pull back, thus turning or backing easily, except in very cramped places. The side horses are guided by a short rein, fastened to the lames-ring of the horse in the shafts. See figure 2.

Fig. 1.

In plowing, the advantage of three horses is, perhaps, more apparent than at any other work. Experienced plowmen are strenuous advocates of this practice, but agree that much depends upon the correct proportions of the whiffle-trees and eveners, and upon the length of the traces.

This system of whiffle-trees is shown in fig. 3. If the three horses are of about similar weight, and of medium size, the whiffle-trees may be 24

Fig. 2.—THREE HORSES ABREAST BEFORE A CART.

inches long, the simple evener 30 inches, and the irregular one 45 inches—that is, measuring between the draft-points. This will bring the horses very close, too close, if they are not driven with long traces; but it will allow them to draw very directly, and it is the only way, we know, in which the off horse can be made to walk in the furrow. If the high horse is a strong one, and may be made to do a little more than his fair share of the work, this will make it better all around, for the pair can be worked on a longer evener, and the irregular evener may be hitched to the plow, so as to favor the

pair, and bring the off horse into the furrow. (A, is the furrow; B, the land; C, the furrow-slice.)

In arranging eveners for a horse at one side to pull against two, evenly, as in fig. 3, the draft-band, or elevs, should be placed exactly one-third the distance between the draft-point, at which the two horses draw, and that at

Fig. 3.—PLOW DRAWN BY THREE HORSES ABREAST.

which the single horse is attached; and when, as in fig. 1, the middle horse pulls against two, the same arrangement should be observed with reference to the two unequal eveners.

Left-hand Plows.

How true it is, that the mingling of men of different habits and different notions is productive of good to all concerned, provided always we choose the good and eschew the evil. This is one great value of such a journal as ours. It touches many people, and stirs them up to cast in their ideas into the common stock. It is a sort of mill, where ideas are taken in, winnowed, screened, ground, bolted, and thrown out upon the market in the best shape the millers can put them.

We confess, we never have been able to see any real advantage in left-hand plows, and regarded their use as simply a habit, until a recent letter from an Indiana subscriber, Mr. Delos Wood, throws light on the subject. In New England and the Middle States, so far as we know, the term "leader" is applied to the front horse, in what we have heard called a "three-cattle team," that is, either a pair of oxen or horses, with one horse before them. So, sometimes since, when a western correspondent advocated left-hand plows, because the leader could go in the furrow, we dissented, saying, that in no case should the leader walk in the

LEFT-HAND PLOW—NIGH HORSE IN THE FURROW.

furrow. Mr. Wood shows us that the western plowman, who drives with one line, calls the nigh horse, (to which the rein is of course attached,) the "leader." The advantage of driving with one line is great. We think this is demonstrated by the discussions on driving horses to plow, which lately appeared in our columns. If then the nigh horse can be driven in the furrow, great additional accuracy is secured.

To illustrate this, we figure a bird's-eye view of a pair of horses plowing with a left-hand plow, driven by one line attached to the nigh horse; he, walking in the furrow, and the off horse being guided by a "joeky stick" from the hames-ring of the other, and by a short rein between the heads.

Whither and How to Emigrate.

We have frequent inquiries as to the location of cheap lands, and the best place for an emigrant to go to. This depends so much upon the character of the man and his circumstances, that no one rule can be given that will meet the

wants of all. The old style of emigration was for every man to look out for himself. He thought everything depended upon cheap land, and he pitched his tent or log cabin in the wilderness, without much reference to neighbors or surroundings. He left behind him the comforts of civilized life, church, school, mills, roads, bridges, laws, and with his wife and children, lived alone in the clearings for years. This led of necessity to much hardship, and often to prolonged suffering and death.

In modern times, we emigrate into new regions in large companies, and if a man is under the necessity of going alone, he goes into a place where much of the pioneer work has already been done, and he will find some of the comforts of civilized life. As a rule, it is much better for one who wants to emigrate to join some good company, and east in his lot with them. This gives, at once, the very great advantage of cheap lands without the loss of the privileges of civilized life. It provides at once for the division of labor, and necessitates no violent change of business or of habits. A company should always be organized with reference to the wants of their future location. The trades and the professions should be represented, with a large proportion who draw their support directly from the soil. If the emigrant and his family are people of social cultivation and refinement, they will find cheap lands a poor compensation for the loss of the comforts of their old homes. "Man shall not live by bread alone." We want church and school privileges, and good neighbors, quite as much as food and clothing. There is something more than acute suffering in the loss of these things. There is mental and moral deterioration. There is no doubt that emigration upon the old plan tends to barbarism. Children grow up healthy and vigorous it may be, but with uncultivated minds and hearts, ignorant, boorish, and often vicious. The single emigrant, or a few families going together, we think, will do better in the older and more densely settled States, than to push out into the wilderness.

There are still wild lands in many of these States, and cheap lands in them all, waiting for willing hands to till them. They have been cleared and have some improvements upon them, cheap houses and barns, that will answer until better can be built. These improvements can generally be purchased for much less than they have cost, because the owners, for various reasons, want to sell and go further. It is an expensive process to clear heavily timbered land, and still more expensive to settle upon the prairie and buy all your fuel and building material. In the Northern States, church and school privileges will be found within reach of cheap lands, by which we mean those that sell

for twenty dollars and less. At Columbus, Ohio, they have a fashion of reporting the destination of emigrants who are going west. Of a recent company of 610, 163 were for Ohio, 160 for Ind., 131 for Mo., 87 for Ill., 39 for Ky., 21 for Wis., and 9 for Iowa. In all these States there are good openings for emigration.

The prospects for Emigration to the Southern States are rapidly improving. The indications now are that civil government will soon be in a settled condition, and the people there will give a cordial welcome to immigrants from all lands. For men accustomed to the varied husbandry of the Northern States, we think the prospects in Virginia are exceedingly inviting. For those who are accustomed to market gardening, the region around Norfolk, and the mouths of the James and York Rivers, presents strong attractions. It is within twenty-four hours of New York, and "garden truck" and fruits can be put into Washington Market, in about as good condition as if raised in Jersey, or on Long Island; the season is two or three weeks earlier, and the prices more than double.

New Mole, Rat, or Gopher Trap.

A subscriber sends us by mail, an ingenious contrivance, which we figure, not so much as a sure mole trap, for we have some doubts of its efficacy, yet, on general principles, as a good trap. Moles are much more suspicious than

Fig. 1.—TRAP.

other quadrupedal vermin, and would be quite likely to turn their galleries around such an object. We have no doubt rats, gophers, squirrels, and other small animals would enter it readily. The construction is evident from the cut. A stick is formed or made hollow, having a uniform bore, of a size to accommodate the animal. (Half a 2-inch drain pipe would do well). The ends are squared, and a groove is cut close to each end. On the side which is to be uppermost, three small holes are bored, one at each end, entering the grooves, and one in the middle. Beneath the middle one a piece is cut out of the tube as shown in fig. 1. The trap is set by placing in each groove a noose of cord or wire, passing through the holes in the top, and connected by a cord in which a fast loop, (a common bowline), is tied. To this loop a spring pole is attached by a cord, which, being continued down, enters the hole in the middle of the trap, and is there secured by a tapering plug set in from below. This arrangement is clearly seen in section in fig. 2. The plug must be of such size and so inserted that while it will considerably obstruct the bore, and will hold the cord firmly, it will be loosened with the least touch. The size of the trap must be calculated, so that an animal touching the plug will stand with its hinder parts beyond the noose, at one end or the other. The loosening of the plug will spring the pole and draw the nooses—while the trap may be jerked out of or off the ground, provided it is not fastened down.

Fig. 2.

Turnips—Their Place on the Farm.

The amount of turnips which may be raised upon an acre of good land is very great, yet other crops may produce more nutriment, for a very large proportion of the root is water. Nevertheless, were the question to be, How may the greatest quantity of food be produced upon an acre *after the first of July?* we should hardly hesitate in saying, by sowing common turnips in drills, 14 to 20 inches apart, according to the soil. Turnips are always good to have, but their quick growth and our ability to sow them as a second crop—after taking off potatoes, grain, onions, or corn, (being sowed at the last hoeing,) etc.,—make them an invaluable aid to the farmer in supplying deficiencies in either grain, hay, roots, or any kind of forage. Superphosphate of lime is required as a specific for turnips, and on any tolerably good soil, 500 pounds will almost insure a fine crop. Lime, ashes, plaster, guano, bone dust, are each excellent in moderate quantities, harrowed in before sowing, or scattered broadcast, when the crop is hoed. On sward land it is best to turn under some fresh manure to insure fermentation and quicker rotting of the sod. Turnips may be sown at any time in July, and should be thinned to, at least, 6 inches apart. There are no better varieties than the Cow-horn, and Purple-top Strap-Leaf—the former long, the latter flat. Broadcast sowing gives poor results compared with drilling in the seed with a machine.

Walks and Talks on the Farm.—No. 43.

Farmers in this section are waking up on the subject of underdraining. The Rochester Brick and Tile Co. have sold every tile they had—culs and all. I wanted a load the other day, but not a tile was to be had. The fact is an encouraging one. Underdraining is the first step in improved farming, and the farmer who makes one drain is pretty sure to keep on till the whole farm is drained. And this is not all. Other improvements are sure to follow. He can, and will, plow earlier. The crops will be sown in good season. He will feel encouraged, and this in itself is a great point gained. The prospect of a good crop leads to renewed efforts. Weeds will be killed before they obtain full possession of the ground. The cultivator will be kept moving. The effect is soon seen on the crops, and their luxuriant growth cheers the farmer, and he will put forth an energy that will surprise none more than himself.

Some years ago we used to have what was then called "a lightning express" train from Albany to Buffalo. It made few stops and ran at great speed. Everything gave way to it. The engineer and conductor had a pride in making good time, and generally succeeded. But one day, when Henry Ward Beecher happened to be on board, something gave way about the engine, which delayed them half an hour. They lost the right of way, and he describes the changed aspect of passengers and officials in his own inimitable style: The engine was the same embodiment of energy and power. But instead of the proud and noble steed that commanded the admiration of all its fellows, whose coming was looked for with interest, and to whom all other trains respectfully stood aside, it moved on in an uncertain, sneaking sort of way, waiting at this station for a dirty cattle train, and at the next for a slow string of dingy coal cars. It was capable of great things, but had lost the right of way, and fell behind

later and later. The few minutes lost became hours. It was no use grumbling. The other trains were not to blame; they were on time. The trouble arose from the lost half hour. No effort could make up for this. It is just so in farming.

This spring I proposed sowing forty acres of barley and oats. The first half of April was delightful weather, and we got about a dozen acres of land in good order, and drilled in the barley on the 18th of April. I had eight acres more that were plowed last fall, that I thought of getting in without again plowing. But there were some potato heaps on the land which had been covered with manure. This we spread on the land, and we found that neither the gang-plow nor the cultivator would make a good job of it, and we were obliged to plow. This was on the 20th of April. But for this, we could have got in the barley, as the weather was splendid. On the 22d of April it snowed. The next day it rained, and the next. We managed to plow on sod for potatoes, but could not work the barley land. On the 28th of April we had ice half an inch thick. May came in with a severe rain storm, and it was only by watching our opportunities that we were able to get in the barley this week. After that it was rain, rain, rain! We were off the track. Had the land been all drained, and had we plowed more last fall, the barley and oats could have been put in during the fine weather in April. But we missed the opportunity, and no after efforts were of any avail. We had lost the right of way. The rains were not so bad. Had the barley been in, and the land drained, they would have done more good than harm. As it was, we had to give up all idea of sowing barley and finally of sowing oats. There was nothing for it but to plant the land with corn. Part of the field was sown and seeded down, and it is a serious inconvenience to plant corn on the other part, and not to be able to seed it down. It gives me more work than I had calculated for this year, and next year part of the land will be in grass and the other part in crops. And all this for want of a little underdraining. It is no use to complain about the weather. Better anticipate such seasons and be prepared for them.

But farmers *are* improving. There can be no doubt about it. They are underdraining more, and working their land better. At present prices, farm products will pay for good culture, and the prospects are favorable. I feel quite encouraged, and expect to see agriculture command the intelligence and capital which its importance demands.

The Doctor says he was talking, the other day, with one of the oldest and most experienced millers in Western New York, and he remarked that it was "surprising how the quality of our wheat was affected for the worse by the practice of manuring the land instead of plowing in clover." There may be some truth in this observation, simply from the fact that the manure we use is not worthy of the name. It is composed principally of straw and corn stalks, and what little plant food it originally contained is half washed away before it gets back to the land. But the idea that rich, carefully preserved manure will not produce wheat of as good quality as green clover plowed under, is contrary to sound theory and practical experience. The truth is, that too many farmers neither manure their land nor plow in clover, and of course there is a great falling off in the quantity and quality of the wheat. To make clover into hay and sell it, is one of the surest methods of im-

poverishing the farm. It is a good deal worse even than selling timothy hay or straw. It is almost as bad as raising turnips and selling them. Whether it is better to plow under clover or to make it into hay and return the manure, depends on circumstances. Plowing it under is the quickest method of enriching the land. But consuming it on the land by sheep, or making it into hay and returning the manure, accomplishes the same object in the end, and you get the value of the food in addition. There is a little loss, but not enough to affect the question.

I got a letter to-day from a subscriber of the *Agriculturist*, asking whether I still used True's Potato Planter, and whether I would advise him to get one to plant three acres. The Planter does the work as well as can reasonably be expected. Last year I planted three acres with it, and the remainder of the field by hand, and, if anything, that planted by the machine was the better crop, owing to the sets being larger. The machine cuts the potatoes, drops them and covers them, all at one operation, and it will plant five or six acres in a day. The objection to it is that you require round potatoes, and they should be all of the same size. When you have a good many potatoes to plant, and it is difficult to get extra hands, the Planter will prove very useful. I have just finished planting twenty acres of potatoes, but did not use the machine, not because it does not work well, but because I wanted to use smaller potatoes than it is safe to cut with the machine. Larger sized potatoes are doubtless better for seed, but I had a quantity of potatoes that were rather too small to sell well, and concluded to plant them. I think it better to plant good sized potatoes, but I was offered a dollar a bushel for all the marketable potatoes, and concluded to risk small seed. For a year or two at least, the yield of potatoes depends a good deal more on the richness of the soil, and on good culture, than on the size of the seed. Another reason why I did not use the Planter, was that it drops the seed in drills, and you can only cultivate one way. I think this not a serious objection, but it is easier to dig the potatoes when in hills than when in drills. And the great labor of the potato crop is in digging. A really good potato digger is much needed. I dug several acres with one last fall, but it did not work at all satisfactorily, and I have seen none that do. As a general rule, where you have only a few acres to plant, either of corn or potatoes, it is hardly worth while attempting to do it by machinery.

The best thing I have tried for sore shoulders in horses is crude petroleum. It seems to have great healing properties. I had been using it for paint, merely rubbing it on the wood with a rag, and was astonished how soon a sore, that happened to be on my hand, got well. Since then I have used it for sores of all kinds on animals, and am satisfied that it is excellent. I rub it, not merely on the sore itself, but for some distance round it. It has a slight exciting action on the skin for a few minutes, and, when rubbed on the parts near the sore, probably has a tendency to scatter the inflammation.

Petroleum, just now, is one of my hobbies. Dr. Eddy took out a patent for its use as a paint for preserving wood, and gave me a "farm right." If he would be equally generous with other farmers, I would advise every one of them to buy a barrel of petroleum at once, and use it freely. That it will preserve wood I have no doubt, although, of course, I have not used it long enough to ascertain the fact. It is just the

thing for painting wagons, and all kinds of farm implements and tools. On my farm it is particularly needed, for I find it next to impossible to get things put under cover, and the exposure to rain and wind, and sun, cracks the wood and opens the pores. Petroleum is better than ordinary paint, because it will penetrate deeper into these pores, and it seems to close them up, and makes the wood look firmer.

We are digging a ditch through the swamp. I thought it would be a slow, tedious job, and dreaded to commence, but it is not half the work I expected. This loose, mucky soil can be thrown out with little labor. I do not propose to finish the ditch at once. We cut down the brush and clear away the old logs, roots, &c., for a space of eight or ten feet, where the ditch is to be, and with potato hooks and spades make a course for the water, and then in dry weather we can make the ditch deeper. There are thousands of acres of such land, that could be easily drained, if the work was once commenced.

If I had any inventive talent, I would try and get up an implement for preparing heavy land for corn. It is now a difficult matter to get the "clay spots" sufficiently mellow for planting. Had we an implement something like Crosskill's Clod Crusher, that would take two rows at a time, and crush the clods to powder for a space of eight or nine inches, where the corn was to be planted, it would be just the thing. It would consist of two narrow rollers, with iron teeth, three or four inches long, like sheep's claws. Being so narrow, and sufficiently heavy, it would cut into the hardest ground, and crush the clods. The rollers, of course, should be set the same distance apart, as the corn is to be planted; and in order to keep the rows straight, I would go twice in a row, as it would then do its own marking, and could be guided so as to crush a space of sixteen or eighteen inches. It would give a mellow soil to plant in, and the first, and perhaps the second, cultivating should be done with side blades, or shares, set so as to draw away the soil from the plants, so that there would be no danger of smothering them with the clods. After two or three cultivations, the tramping of the horse, and the action of the center teeth, would break the clods between the rows. I feel confident that the thing could be done. Of course, if we had plenty of time, and the right kind of weather, it would be better to work over the whole land, and make it mellow, before planting. But as this is not often the case on such soils, an implement of this kind would be useful. It would get over six or eight acres in a day, and leave a foot or more of fine soil, in which we could plant at once. With our present implements it takes nearly as long to harrow, and roll, and prepare such land for corn, as it does to plow it. And then, by the time you have it all harrowed and marked both ways, we not unfrequently have a heavy rain, and the land has to be gone over again! Anything that will enable us to get the crops in rapidly, is an especial advantage in our short seasons. Once get the corn planted in a nice hill of mellow soil, and there is no difficulty in afterwards making the intervening space loose and fine, by the use of the cultivator. I was going to say that one cultivating in hot weather, is worth a dozen harrowings when the ground is cold and wet in the spring. But this is hardly true. One cultivating does comparatively little good; we need half a dozen. If you were making superphosphate from bones, and should smash up the bones with a hammer

into pieces an inch or so in diameter, you would do comparatively little good; because the acid could not "dissolve" them. But repeat the process long enough to make the bones into a fine powder, and you could then readily convert them into a good superphosphate. It is so with cultivating once or twice. It is better than nothing, but as the object of cultivating is to make the soil fine and mellow, anything which stops short of this is as unwise as it is to give a fatting pig only food enough to keep him alive. In tightening a bolt, the last turn of the nut is far more effectual than the first, and it is precisely the same in killing weeds and cultivating land. Unless you accomplish the object, you lose nearly all the benefit of your labor.

The Value of the Corn Husk.

A NEW INDUSTRY.

Everybody is familiar with husk mats, and it is well known that excellent mattresses can be made from this article, but a very small proportion of the crop is saved for these purposes. It is not generally known that the husk is applied in foreign countries to many other important uses. Some writers even assert that the value of the husk crop, if utilized, would be nearly equal that of the oat and barley crops of the country combined. We have seen most excellent husk letter paper, and it is said better paper can be made from it than from either linen or cotton rags; and, because it has great hardness and firmness, exceeding that of the best hand made English drawing papers, that it is especially adapted for pencil-drawing, water-colors, and short-hand writing, for which latter purpose it is extensively used. Its durability, it is claimed, renders it peculiarly valuable for documents, records, bank notes, bonds, etc.

Corn husks contain a long, straight, strong, flax-like fabric, which can be spun, like flax, into a thread, and the thread, like linen thread, woven into cloth of great tenacity and strength, which excels all the coarse materials in common use, in resisting decomposition. This will furnish an excellent substitute for coarse flax and hemp cloths, jute and gunny cloths, and bagging.

Again, in the course of extracting the corn fibre, long fibres are found at the bottom of the boiler in a spongy condition, filled with a glutinous substance, which, on closer examination, proves to be a nutritious dough. This may be dried and baked, and furnishes a good, wholesome, sweet bread, especially when mixed with wheat flour. It possesses the peculiarity, that it keeps perfectly sweet for months, although exposed to the air. It will not mould, and excels almost all known vegetable substances in its resistance to decomposition. Mixed with wheat flour, it would probably make a very good material for ship bread and crackers. Cattle eat it voraciously. Of this farinaceous substance there are 15 pounds in a hundred pounds of husks; of the long fibre, suitable for spinning, a hundred pounds of husks furnishes 25 pounds, while, at the same time, 20 pounds of paper is afforded from the 100 pounds of raw material—the entire valuable products being 60 per cent. of the weight of husks.

These interesting manufactures are chiefly conducted under the patronage of the Austrian government, and it is stated that the knapsacks for the Imperial army, wagon tops, floor cloths, fire buckets, and paper of all varieties, from the coarsest wrapping to the finest bank note paper used by the government, are manufactured at the Imperial mills. Beside these, there are two

private mills in operation near Vienna, conducted on an extensive scale, the owners of which, it is said, became independently rich in the two first years of their workings, their mills being several times extended and kept running night and day to fill all their different orders.

The importance of saving the husks will be fully appreciated, when it is remembered that they are simply incidental to the production of a most important cereal, everywhere cultivated, and that they cost nothing beyond the care attending their collection and preservation.

The chief reason of the inattention hitherto bestowed by capitalists on this article is traceable mainly to the difficulty of procuring a sufficient supply of husks. We are satisfied that the demand will abundantly warrant farmers in saving and storing all the husks they can. They are easily baled and marketed, like baled hay, and will bring a good price for mattresses alone.

Our friends, who contemplate starting the husk manufacture in this country, must not, however, wait for the farmers to accumulate husks, but appoint responsible agents who will contract for the material at the farms. Farmers are beginning to appreciate their value as fodder, and probably will not be disposed to sell them for less than the price of hay.

BUCKWHEAT.—This crop occupies a position in our farming which it would be very difficult to supply. Common millet is in some respects very much like it, especially as it may be sown in July, and a crop of hay or grain harvested, and as it also does well upon sandy soils. Buckwheat is a plant which makes the most of few privileges—a sort of self-made crop. If it has to struggle moderately, it does well. But if it has all its needs supplied, and especially if on freshly manured land, it is very likely to fail. It does not bear fermenting manure well at all, as it runs to tops and the seed blasts. It affords one of the most valuable green manure crops to be used on light leachy lands, for with 100 to 150 pounds of good guano, or 3 to 5 cwt. of bonedust, a heavy crop of manure may be produced on almost any soil. When sowed for the grain, it is not advisable to sow too early, as the first flowers are apt to blight in hot, dry weather. In cool weather, reasonably moist, the grain fills best, but frost is fatal. It is usual, in order to avoid extremes, to sow from the 5th to the 25th of July, according to latitude. The last of the month being preferred, where frosts hold off well. It is sown on sod without manure, at the rate of a bushel to a bushel and-a-half to the acre. It is best to prepare the land well by plowing some weeks beforehand, and harrowing to get a uniform surface. We have no idea how long the plant will continue to grow and blossom, if frosts hold off. It is customary to cut, and cure in small isolated gavels, as soon as the first seeds are ripe, before they will shell out in handling. The straw is as good sheep fodder as need be, and the grain nutritious and fattening.

THE JEWEL IN TOADS.—Shakespeare and other poets locate this "precious jewel in his head," but they cultivated the flowers of poesy, and were poor observers in the garden. Watching these ugly animals among the squash and cucumber vines, we shall discover the jewel in the stomach, in the shape of a healthy appetite for bugs and worms. The quantity they will devour is enormous. "Their big bellies with fat black bug lined," proclaim their virtues. Toads are among our best friends, and they should have the full freedom of the garden.

Fig. 1.—ADULT SHAD— $\frac{1}{4}$ NATURAL SIZE.—DRAWN FROM LIFE

Shad and Ale-wives.

These fish appear simultaneously in spring and early summer along our coast, and are the object of very extensive fisheries. The capital employed in the Delaware River and Bay, New York Bay and the adjoining Newark and Raritan Bays, in the Hudson and Connecticut Rivers, aside from that invested in Rhode Island, Mas-

Fig. 2.—YOUNG SHAD IN AUGUST.

sachusetts and New Hampshire, is estimated to amount to not less than \$5,000,000.

THE SHAD (*Alosa prestabilis*) is at present our most important river fish, for, though great numbers are taken in salt water, they are seeking the mouths of the rivers, which they enter and ascend as far as they can, or until they find, far above tide-water, in the smaller streams, suitable breeding places. When they enter the rivers they are very fat, and the females full of spawn. After laying their eggs, which is chiefly accomplished during the month of June, they return towards the coast, emaciated and

and more distinctly for several hours. In stale fish a striped appearance is noted. The size of the shad renders it unlikely for any one at all familiar with it to mistake an adult one, its congeners being all smaller. Shad vary considerably in size, weight, and appearance, so that those of different rivers are easily recognized by the fishermen and market men. The common size is 20 to 22 inches in length, and about 6 inches in depth. The weight varies from 3 to 7 pounds. Those of the Connecticut are broader backed than others, somewhat slimy, and, being heavier also, are regarded as superior to any others seeking the New York market.

The two smaller cuts represent the young shad; fig. 2, the fry during the month of August; fig. 3, one ready to seek the sea. Our knowledge of this interesting fish, after it leaves our rivers, and before it returns, heavy with roe, is very limited. It is even uncertain how long a time is required for it to attain maturity, and it is believed by some that the shad spawns but once, rarely, if ever, returning a second time to our rivers. It is doubtful also whether these fish eat anything after leaving salt water, as the stomachs are found empty, or containing only food which they obtained in salt water—though said to rise for gay flies in fresh. The rapid decrease of shad within the past few years has finally aroused the attention of the legislators

Fig. 3.—SHAD SEEKING THE SEA, IN SEPTEMBER.

weak, falling an easy prey to carnivorous fish, and being entirely unfit for the table. "Thin as a June shad" has passed into a proverb, although the shad that are late in ascending, (and many enter the rivers as late as July,) are among the fattest and best of the season.

The fine engraving at the head of this article was drawn from a large female shad taken in New York Bay, and is a very accurate representation of the fish. The color is dark-brown or brownish-black on the head and neck, the sides lighter and growing silvery along the belly. The irregular row of spots along the side, back of the large dusky spot behind the opercle, are very indistinct when the fish is just taken, but plainly visible when the scales are removed, and show through the scales more

of New England, and though repeated previous enactments have been made to foster and regulate the Shad and Ale-wife fishery, it would seem that they have been to a considerable extent inoperative, and it is to be hoped that more stringent laws, well carried out, will make these fish as abundant as formerly. The great necessity seems to be proper fish-stairs over dams, and we present in this number an article on them. The subject is quite as important to farmers as to any other class of our people, (except, perhaps, fishermen,) and should be pressed upon the consideration of their representatives.

THE ALE-WIFE (*Alosa tyrannus*) receives its curious name from the custom, prevalent in Europe, of old women peddling smoked herring from ale house to ale house, the herring taking

the name, and the customers taking "ale wives" with their mugs of beer or ale. They are caught with the shad, resemble them considerably, but are smaller, being only about 8 or 10 inches long, and more brilliant and silvery.

Raising Seedling Strawberries.

BY SETH BOYDEN, NEWARK, N. J.

[The writer of the following is a well known raiser of seedling strawberries; the Agriculturist, Boyden's Mammoth, and others, are the results. He says that he is about "retiring from the field," and gives the manner in which he produced such remarkable seedlings. — Eds.]

The strawberry plant is progressive, and with care and perseverance, will become a variety of fruit of much greater value than at present. The strawberry plant grows in almost every soil, but best in a moist, compact one. Much light stable or other manures put into the soil is an injury; plants set in such soil will make but few roots, and those that come in contact with the manure will soon turn black, while a plant set in compact soil will be vigorous, and have ten times the amount of roots. If the soil is in a low state of cultivation, it may be brought up by bone dust, liquid manure from the barn yard, poudrette, or well rotted manure, free from straw, well mixed in, and the soil finely pulverized and again pressed with a light roller.

The young plants should be set as soon as they have roots enough to sustain them. After the ground has become firm, they may be heavily top-dressed with coarse manure (though some varieties will not bear as much as others,) lightly applied near the plant, and profusely watered, (do not put the water on the plant, but on the manure a foot from it.)

There are two classes of strawberry plants, the perfect and imperfect flowered. The imperfect flower has no stamens, and requires the presence of a staminate blossom to complete its operations. The perfect flower has all the parts necessary for perfecting seed.

In selecting plants for producing improved varieties, take one or two varieties of the perfect flowered class, and also two or three of the imperfect flowered ones; these are to produce the seeds by crossing with the perfect flowers. Set them fifteen inches apart, top-dress and water freely. At the commencement of freezing weather, protect them with straw, leaves or tan.

It is desirable to gain a week or two in ripening the berries by putting a cold bed frame and sash over the plants in March. When the berries are ripe, select the best from the imperfect flowered plants. These are more eccentric and more liable to produce extra varieties.

VIRGINIAN LUNGWORT.

rain. When the plants are two or three inches high, and of sufficient size to determine which are the most thriving, they may be removed with a ball of earth to the prepared rows, top-dressed and watered. Allow each plant to make one or two runner plants. This will exhibit the character of the plant more accurately. Probably not one-third of the young plants will be worth moving to the rows. No inferior variety or sterile beds of the same variety should be near. They can not be too far off. The best variety, set with inferior varieties and neglected, will return to its primitive condition. Some specimens of good strawberry cultivation may be seen near Irvington, N. Y. The experiment of growing new varieties of strawberries is interesting amusement for those that have a little leisure time to fill

SHOWY LADY'S SLIPPER.

The seed from the perfect flowered plant produces progeny of nearly the same variety as the parent, but generally inferior in quality.

The strawberry seed, like many other seeds, remains until the following spring before they germinate; but, if artificial aid is applied, the strawberry seed may be brought forward and produce bearing plants for the next season. This of course saves a year in arriving at results.

Put the berries in a cloth and rub them until they are disengaged from the fruit, then wash them out and put them in ten times the quantity of fine dry washed sand, set them in a dry place a week, and stir them up a few times; now tie up the parcel in a cloth, and put it between two pieces of ice, change their position so they may freeze and thaw every day during a week or ten days. This has the effect of winter upon the seeds, and they are ready to germinate when brought into a genial temperature. Now keep them warm and wet for a week, and the seeds will be ready to plant. The bed must be prepared level, with a raised border, so that it can be flooded with water half an inch deep every day until the young plants begin to appear. Make the bed smooth, with a slight degree of firmness; distribute the seed and sand evenly over the bed, then sift light sandy loam on it to the depth of one-fourth of an inch, and commence the watering. Shade the bed from the midday sun, as the strawberry plant is a cool weather plant, making most of its growth in spring and fall. The surface of the bed should never approach dryness. If everything has been carefully performed, the young plants will begin to appear in eight or ten days. The watering may then be changed to sprinkling, like

up, and their cultivation produces an enjoyment rarely found in any other horticultural pursuit.

Our Native Lady's Slippers.

It is only those who ramble in the woods that know the beautiful things that their recesses contain. We never showed any of our native Lady's Slippers to a town dweller, that he did not express surprise that so curious a plant should grow wild. These plants belong to the genus *Cypripedium*, and are members of the Orchis family, remarkable alike for the beauty and singular structure of its flowers. In the Northern States we have in all six species of *Cypripedium*, some rarer than others, but all beautiful. Indeed, these natives of our woods are in Europe prized as rarities, and while they are almost entirely neglected here, they are there cultivated with the greatest care. Without going into the intimate structure of these plants, we may say that one of their striking characters is to have one of the petals very much enlarged, and formed into a curiously inflated bag or sac, much like the body of some huge spider. Perhaps the commonest species is the Stemless Lady's Slipper, *Cypripedium acaule*, found in evergreen woods in most of the Northern States. It has two broad leaves close to the ground, and from between them arises a naked stem about a foot high, bearing a flower nearly two inches long, of a pale purplish color and beautifully veined. Then we have two yellow species, *C. pubescens* and *C. parviflorum*, the latter fragrant and smaller than the former, which is without odor. Unlike the first

mentioned species, these have leafy stems, and are found in damp woods, especially in the Northern States. The most beautiful of all the genus is the Showy Lady's Slipper, *Cypripedium spectabile*, one of the most beautiful of our native flowers, and one that need not be ashamed to show itself by the side of those of any country. Our engraving shows the general aspect of the plant. The stem often grows to the height of two feet, and frequently bears three flowers. The sepals and petals are white, and the large lip is of the purest white, more or less shaded with a beautiful purple. These plants are well worth transferring from their native localities to the garden, and will grow well if given a peaty soil in a partially shaded place. The roots are generally very much matted, and may be taken up in a mass at almost any season, even when they are in flower.

Virginian Lungwort.—(*Mertensia virginica*.)

As spring flowers are coming on, we have rather more than the usual number sent for names. One of the most frequently sent, in former years as well as in the present one, is the Virginian Lungwort, or Virginian Cowslip, as it is sometimes called. We present a figure of it, which is from an English work published early in the present century. It is much prized in the European gardens, but like many others of our native plants, is only rarely seen in cultivation in our gardens. We have endeavored to cultivate a taste for our native shrubs and herbaceous plants, and have to a certain extent been successful, at least if we may judge from the in-

quiries as to where the things we bring to notice may be had. Some nurseryman or florist will yet find it to his interest to propagate our native plants and offer them for sale. It is only because people do not know where to find them that they are so seldom cultivated. The Lungwort was formerly called *Pulmonaria Virginica*, and is found in the Western part of New York and in most of the Western States. The root-leaves, not shown in the engraving, are from four to six inches long; the stem is from one to two feet high, and terminates by a cluster of trumpet shaped flowers of a very rich purplish blue color. It belongs to the Borage family, which includes the beautiful Forget-me-not, Heliotrope and several other choice garden plants.

SPARE CORNERS in the garden can be filled with something more profitable than the burdock, plantain, and grass, which are so frequently left to occupy them. A few radishes, half a dozen heads of lettuce, a cabbage, or a cauliflower can be put almost anywhere, and their being planted will give sufficient motive to keep the ground around them clean, which would otherwise be left as a nursery for growing weeds.

Some of the Less Known Pears.

As a people, we are as much in a hurry about fruits as we are with other matters, and many varieties have been condemned without a fair hearing. This is especially the case with pears, many of which, though condemned at first, have, by the good qualities they presented after the trees became old, commanded recognition. Mr. P. Barry prepared for our Horticultural Annual a long list of these reclaimed varieties, with illustrations. In the abundance of material at hand for that work, we were obliged to omit a number of these pears, and we give the en-

BEURRE BERCKMANS.—One of Bivort's new varieties; medium size, pale yellow, melting, juicy, sweet, excellent. Ripe in October and November. Keeps well. Tree very productive.

Fig. 2.—BONNE SOPHIE.

BONNE SOPHIE.—A new variety of much promise; medium size, melting, delicious. September and October. Tree an abundant bearer.

SOUVENIR D'ESPEREN.—An excellent late autumn or early winter pear, from Belgium, resembling the Winter Nelis, but the tree is a vigorous erect grower. Fruit large pyriform, obovate, tapering to the crown; color dull yellow, with a mottled red cheek. Flesh melting and vinous.

Making Manure in Summer.

With manure enough and labor enough, no man knows what may be the limits to the products and profits of the cultivation of the earth, in the garden or the field. We make most manure in winter, because then our stock is confined, and all the droppings, with the litter and waste of fodder, are readily accumulated. Cows yarded every night, leave their droppings and urine where they may be used, to compost with muck, litter, etc., to greater advantage, in summer than in winter, because the temperature of the season keeps the compost heaps in a more active fermentation. Thus, the value of the manure made in summer from a given number of cows, or other animals, may be nearly as great as in winter, though, if they are pastured, they may be in the yard less than half the time.

Swine used simply as pork producers or breeders, are oftentimes of profit, but on three-quarters of the farms west of the Alleghanies, if the value of the manure made by pigs were left out of the calculation, they would show a loss on the balance sheet of the farm. To employ them as manure makers to the best advantage, in connection with either private or market gardens, give them a covered yard, having a tight bottom, and open on the south for the sun to come in; give them also the free use of their rooting powers, until they are taken up to

fatten; feed them well, and supply them daily with sods, weeds, peat, bog parings, etc., and it matters little how much you give them, they will work up an incredible amount and make better manure of it than the best exposed barnyard manure you can make or buy. Every gardener, and not less every farmer, ought to begin the growing season with half grown hogs, not with a lot of little pigs. They should receive as regular attention as the rows of vegetables or plants, for they are preparing the raw material with which to produce next year's crop.

The accumulations in the hog-pen should be leveled off, and mixed somewhat by hand, but the hogs ordinarily do this themselves tolerably well. If left thus water-soaked, and trodden hard, the manure will be of the rankest, strongest character imaginable, and besides so tough and stringy that it can only be gotten out with great labor. It is best, therefore, to take time, some rainy day, about once a month, to clear the pen out, and lay the materials up in a compact compost heap, well trodden, and if possible, under cover. The action of the air will cause rapid and usually complete fermentation, and once or twice working over of the heap at times, to check excessive heating, will insure an abundance of fine and excellent compost.

About Horticultural and other Patents.

The greatest embodying of stupidity, (the Agricultural Department always excepted), is the U. S. Patent Office. In "Walks and Talks," Mr. Harris speaks of having the "right" to use petroleum as a vehicle for paint, given him. If we had a barrel of petroleum, we should use it as we pleased, and should like to see any jury of twelve honest men who would say that we had not a perfect right to mix it with any known substance. So with a patent for saving paint, that has been sent us with permission to use it. It is merely to fill the pores of the wood with some powder that will prevent it from absorbing the paint. We have known this to be done

Fig. 1.—BEURRE BERCKMANS.

gravings of some of them now, with Mr. Barry's notes upon their productiveness and quality:

Fig. 3.—SOUVENIR D'ESPEREN.

since we were a boy, to prevent wood from absorbing varnish. Can one make us pay for the

right to use a similar process with paint? How would you, reader, if you were on a jury give a verdict in such a case? The fact is, our patent laws are brought into contempt by allowing patents for the most trivial and frequently absurd things. Now, most of the patents issued, as far as concerns horticulture at least, though not so much in agriculture, are for the way of doing things. Any one who patents a *process*—after he has accepted the accumulated experience of years, and is unwilling to contribute his small mite to the general stock of knowledge, should be shut out of the community of true horticulturists.

Crops for the Orchard.

If a man would sit down to really *think* about his orchard, and study its needs and prospects, its expense to him and the returns he may reasonably expect, he would not be likely to blunder much in its management. The first thought might be, do I want fruit, or do I want grass, grain, potatoes, etc., the most? We suppose he wants *fruit* in his orchard; if so, he may reasonably ask if he can afford to expend the amount of labor necessary to maintain his fruit trees, and nothing else upon the land. from the time they are first set out. If one does this, plants trees only, and keeps the ground plowed and *clean*, for surely weeds are worse than even a corn crop—he will, if the land is in proper

condition, have good trees, but at a heavy expense for several years. He may rather revolve the question, What may I cultivate with least injury to the trees, and at most profit to myself, and thus make use of the otherwise wasted energies of the soil, manure and sunshine? This question cannot be answered off-hand, for there are many things to be considered. When we manure the soil of an orchard, we must apply more manure than the trees need, because they should find it wherever their roots wander; and these do not fill the whole soil. Trees probably draw most upon the fertility of the soil at the period of their most rapid growth. Hence, if we put a crop upon the land to use up the excess of manure, it is a poor plan to employ one, the roots of which will voraciously wrangle with those of the fruit trees for food and moisture, during this period. This will lead to the interdiction of corn and all grains, and seed producing plants, except buckwheat, for those all make their growth when the trees have a prior right to the soil. The same principle will allow the use of all root crops which gain considerable size only after midsummer, and mature later, even after the trees have ripened their fruit. Cabbages, etc., are in the same category with vegetables. Onions would seem to be an exception, but, though they require a good soil, they are not an exhausting crop, and may be used in young orchards, before much shade is cast.

As to grass—permanent grass—while the trees are growing, it is doubly injurious, first, in covering the ground so as to prevent its being worked, and preventing also the action of the sun upon it—a very important thing; second, in

taking plant food from the soil at all times, but most just when the trees are growing fastest. After the trees have attained their growth, if the space for several feet around them be kept clear, grass does little or no harm if well and frequently manured. The moderate check it exercises upon the trees making wood may promote a tendency to fruit. Even in old apple orchards, sward should not be suffered to lie many years without breaking up; at which time, lime or ashes should be liberally applied, with other manure, a crop of potatoes raised, and the land seeded down again without the use of any grain crop. The idea that grass seeding will not do well, unless it be made with some small grain crop, is absurd. Grain, of whatever kind, is usually an injury to the grass.

Drying Fruit, Hops, etc.

The prospect of an abundant supply of fruit in most sections of the country, has led many fruit growers to look about for means to pre-

Fig. 1—LONGITUDINAL SECTION OF DRYING HOUSE.

serve their surplus fruit by drying. Several have sent requests for plans for drying kilns or houses. In June, 1866, we gave plans for a small house, of a style much in use at the West.

Mr. W. H. Wilnot, of Lawn Ridge, Ill., finds the frame and sash of a common hot bed to answer excellently. The suggestion is not a recent one, but it may be new to many. He says: "Take the frames and glass used for hot beds, or 'cold frames,' and place them over a clean gravel bed; inside arrange shelves on which to place the fruit. After this you need not give

Fig. 2.—GROUND PLAN.

the fruit a thought, except to take it out when dried. It is secure from flies and other insects,

rains or dew, chickens and *small children*, nor can it be burned up. After once trying it I think no one would dispense with it." Of course, this would answer for a small quantity only.

Mr. A. W. Decrow, of Bangor, Me., sends us an account of a drying kiln which he built for drying hops, but which, he says, answers equally well for fruit or other articles that require to be dried by artificial heat. His kiln is not patented, and as he has taken some pains to give detailed plans, we are sure that our readers will be glad to see them. Fig. 1, gives a longitudinal section of the house; E F is the kiln, heated by the stove, N. The drawers, H H, hold the material to be dried by the hot air, which circulates as shown by the arrows, and finally passes off by ventilator, B. The platform, J, extends between the kiln and the store-room, A B, which, in the drawing, is arranged especially for hops, and has a movable platform, H G, upon which the hops are emptied from the drawers, and passed to the room below by tilting.

Fig. 3.

In drying hops, ventilators, shown at Z, are provided. In figure 2 is shown a ground plan of the houses, the store room, A, B, in fig. 1, being left out. The stove is shown at N, with the manner of arranging the pipe, to save all the heat possible.

Figure 3 gives the framing of the rear end, or end of the kiln room, and a similar construction is followed on the sides of the building. A, rafters; the outside ones being 4x6, and the others, 3x6. B, ventilator. C, posts, 4x4. D, studs, 2x4. E, braces, 2x4. F, sills, 6x9. G, place for exit of pipe, made of bricks or sheet iron. The drawers, H, in fig. 1, are 8 feet square and 13 inches deep. The bottoms of the drawers are of slat work, arranged as shown in fig. 4. The slats are 1 inch wide, 1/2 inch thick, and are placed 6 inches apart. Over the slats is placed a cloth of very open texture. The drawers, when in place, rest upon cleats, sufficiently far apart to allow of a free circulation of air.

Fig. 4.

The success of all those houses in which hot air is used for drying, depends upon keeping up a constant current of air, heated considerably above the ordinary temperature—hence there should be free opening for the air to pass out, and, what is too often neglected, an abundant supply of fresh air from without to the stove room.

WHITEWASHED OR WHITE PAINTED GARDEN fences may be neat and attractive in themselves, but for that reason they are unsuitable. Any surrounding of this kind, that draws attention from the living plants, is as impertinent as a gaudy bonnet over a pretty face. Carpentry and horticulture should not painfully strive for mastery. Green, drab, or other unattractive color, is suitable, and not abominable; white not to be mentioned. The same idea applies to poles, trellises, etc., used for supports, and to the still greater absurdity of whitewashing the trunks of trees. A tallow candle is a poor

model to follow in trying to improve the looks of one of the most harmoniously beautiful of nature's productions. Use colored washes.

A Hopeful Sign.

The census shows that N. Y. city made but little increase of population for the last five years. With all due allowance for the influence of the war and for the rapacity of landlords, we can but think that the attractions of country life are better appreciated. Rents for dwellings are unparalleled, and this cause has driven multitudes from the island. Once in the country, in the enjoyment of its independence and healthful breezes, they have learned to like it, and, as they say, would not go back to the city again for anything. To people who have always lived in the city, the hardening process is a little uncomfortable, but is soon over. It involves more labor to keep house in the country, but this does not necessarily come upon the housekeeper. Country life has its compensations, and we think the balance is decidedly in its favor. We do not have the Croton coming into every room in the house in the country, but then we do not have the water bills to pay for, and the plumber's bills, and the annoyance of bursting pipes, and flooded carpets and spoiled papering and plastering, and the endless list of bills to get things set right again. We do not have gas, but then we have the bliss of paying for just what light we get, and *no more*. We occasionally miss a good lecture in the country, but we have more than we can hear. In social advantages, in religious privileges, in schools, in all the means of rational enjoyment we are on a par with the resident of Fifth Avenue. We can beat him on eggs and vegetables, for we know the hens and the soil that make them, and have no occasion to take the word of the green grocer for their quality. We can beat him on dawns and sunsets, clouds and breezes, easy, and as to high art, he is just nowhere. We have the originals of the sublime mountains, the fine landscapes, the cattle and fruit pictures they make such a fuss about at the Academy exhibitions; and it costs us nothing to frame, hang and take care of them. We can but think these things are better understood than they used to be, and that the seed we have been sowing in the *Agriculturist* for the last dozen years or more is springing up. There is a good time coming.

VIOLA CORNUTA.—This old violet is attracting a great deal of attention abroad, and some of our own florists have made a trial of it. In planting an ornamental bed, we made use of this as an edging, and though not in full flower, it promises so well, that we are much pleased with it. If half what is said of it abroad should prove true with us, it will be a valuable addition to our gardens. We shall watch the behavior of our plants during the summer with interest, and probably our readers will hear more about it.

THE BLOOD-RED AMARANTH.—Under the name of *Amarantus sanguineus*, Mr. Peter

Henderson grows a variety of *A. paniculatus*, which, as a "foliage plant," is not excelled in brilliancy by any of the plants with colored leaves that we have yet seen. It grows 3 or 4 feet high, and has large leaves, is an annual, and has a pleasing habit. There is not a particle of green about the plant, and in a good light, it is a "foliage plant" of great brilliancy.

THE SORREL-TREE.—(*Oxydendrum arboreum*.)

The Sorrel-tree.—(*Oxydendrum arboreum*.)

When we state that this is a most beautiful native small tree, it is equivalent to saying that it is not commonly found in cultivation. Were it from abroad, and only to be had at five dollars the plant, it would be found almost everywhere. We shall keep "pitching into" you, Messrs. Nurserymen, until you take a little interest in our native plants—not that by any means we would have you neglect the foreign ones, only give our home-made things a chance to be known. This tree was formerly called *Andromeda arborea*, but when that large genus was divided up, this received the name of *Oxydendrum*, which means "Sour-tree"—and indeed it bears the name of Sour-wood in some parts of the country. The leaves of the tree have a remarkably sour taste; they are deciduous, have a bright shiny green color, and in shape, bear much resemblance to those of the peach. The engraving gives a representation of a twig at flowering time, and shows the form of the leaves as well as the loose panicle of

small white flowers. It is found growing wild in most of the Southern and Middle States, Pennsylvania and Ohio being its northern limits. It grows wild in rich woods, and in cultivation should have a soil with a good deal of vegetable mould to correspond to its natural localities. The tree flowers when quite small, but it attains when old the height of 40 to 60 feet. It seems to be quite hardy, as we have seen it endure the very cold winters near Boston and in Michigan.

Books, and How They Are Made.

We have heard several times of late that Mr. Fuller's Grape Book, and Mr. Henderson's Garden Book, were written by one of the editors of the *Agriculturist*. These allegations come so direct from people who ought to know better, that we feel bound to notice them, and if, after this disclaimer, we hear anything more on the subject, we shall mention the names of those who circulate these reports. In the first place, it is a miserable imputation upon both the authors and the editors. It implies that the authors cannot write, as well as that the editors are willing to allow what they write to be issued over another name. Now we distinctly repudiate both these charges. We have never published a work of which the author did not furnish the full manuscript. We exercise a critical supervision over all the works we publish, (would that others did the same,) but it is only to make the author say what he means, and in the best possible manner, that any corrections or changes have been made at all in not only these works, but any works that we publish. We would have certain persons understand that we publish only reliable works from competent authors, and that our books are not made against time and by the job, to fit certain furnished illustrations; that we are not in the "book making" business. We have, in our safe, the manuscript of more books than we can get out in many months, and some of them of great value, but

we must submit them all to editorial supervision. One rule is, to never accept a manuscript until we have read it. We have had some experience in the matter, and we never yet saw the manuscript that some one other than the author could not improve. So correct an author as Bancroft has his History put in type, and, before he prints it, he subjects the proofs to judicious friends. He means to be correct, and if some publishers of horticultural books, we know of, would take the pains to have their works properly edited, both the authors and publishers would fare better, and the public would be saved much nonsense.

YOUNG GRAPE VINES.—The great trouble with inexperienced cultivators is, that they will allow a young vine to have its own way. It is the inexorable law, that a vine cannot yield both fruit and wood. If the vine is grown for present satisfaction only, then let it fruit if it will, but if future crops are regarded, then remove all the fruit that sets the first year after planting, and pinch the laterals to get a good wood growth.

THE HOUSEHOLD.

Dashes at House-Keeping with a Free Pencil.

PRIZE ESSAY BY MISS EVA M. COLLINS, ROCHESTER.

TIDIES.

Untidy tidies are the occasion of all the animadversions heaped upon these articles in general, by the generality of gentlemen. Tidies half fastened in their places with pins, or tidies not fastened at all, hanging by the eyelids, ready to fall upon our

Fig. 1.—DIAMOND-PATTERN TIDY.

shoulders, or walk away upon our back, deserve everything that may be said of this failing in their mistress; but, at the same time, a fresh, pretty tidy, either white or in colors, agreeing with or harmonizing the prevailing colors of the room, adorns both the room, and also, as was remarked of a different ornament, not long ago in the *Agriculturist*, the mistress of the apartment herself. The first requi-

Fig. 2.—BLOCK-PATTERN TIDY.

site is that the tidy should be appropriate to its place. A plain, substantial, white tidy, that evidently not only may be, but is, frequently changed and washed, is far prettier in a common sitting room than the most elaborate article in colors

which can not be subjected to the same renovating process. I would that all the rooms in a farmer's house were common sitting rooms; at least, that there were fewer best rooms which scarcely ever see the beautiful sunlight—fewer parlors wrapped in covers, because too nice for use, and stowed away in the darkness and gloom of perpetual night. But this useless appendage, the dark parlor, is fast becoming obsolete.

Fig. 3.

Cheerful, open, light parlors, are superseding it, and soon, even in the most conservative regions, this prison room, in which every comfort of the

house is confined; where the sofas and easy chairs are too nice for the tired father to rest upon at noon; where the senseless birds and flowers upon the carpets are too exquisite for little boots to crush; where the elegant bindings of the books are their only merit, will be the exception, and not the rule. There is a great variety of patterns for tidies, so simple that any child can make them, and still pretty and serviceable. Any little girl who can knit a garter can make, with a very little assistance from mamma, or sister, a charming little tidy of this description, fig. 1. All that is required is a skein of red woolen yarn, one of white cotton yarn, and two knitting needles. The red yarn should be of a bright scarlet color, and the white should be of the same size as the red. Set up the number of stitches desired in the width of the strip—eighteen stitches is a very good width—and knit until the square is perfect, which will be about twenty-nine times across the needle; then exchange the red for the white ball, twist the threads together for a few stitches, and knit twenty-nine times across with the white. Knit the red and white blocks alternately until the strip will extend from corner to corner of the tidy in view, beginning and ending with the red. The strips upon each side of the central strip will contain two blocks less than that, and the next ones two less than those. If the little child does not knit very evenly, it is better to let the strips run directly across the tidy, fig. 2. A crocheted shell edge of either the white or red yarn, or both, forms a pretty finish, and will serve to give employment to many a dull afternoon. The strips should be neatly sewed together over and over, and pressed under a damp cloth.

A more showy tidy is made by knitting thirteen red and six white blocks of the shape shown in fig. 3. In knitting the first point, set up one stitch and widen the second stitch in each row; make the last point by narrowing the same. The blocks are sewed together in the form of a honey-comb, fig. 4. A white initial letter embroidered in the central block produces a happy effect, and a white crocheted plain border makes a nice finish, provided all the angles are accurately preserved; if the border can not be neatly crocheted, the tidy looks better without it. These tidies, figs. 4 and 5, may be made in triangular blocks, or diamonds, to accommodate different tastes, or different chairs. The beauty or merit of these tidies consists in their being bright and cheerful in effect, where bright colors are appropriate, and yet, unlike the usual worsted Afghan tidies, they will wash and look as well as new ones, when soiled.

Fig. 5.

Sometimes a heavy tidy looks out of place. A very pretty and delicate one is made on a square frame, as in fig. 6, made of pine sticks nailed together at the corners, with large-headed pins, or even common tacks driven in almost to their heads at intervals of half an inch, all around. Fasten one

Fig. 6.

end of a spool of white cotton thread, number eight, to a corner tack, and wind the thread upon the tacks, three times in a place, both diagonally and horizontally over the frame, each way, which will make such a net-work as this, fig. 7, held in its place by the tacks or pins. Then, begin again with

a corner tack, fasten the thread to it, and with a needle weave the thread three or four times at the first intersection, fasten the thread in the center, and slip the needle through to the next crossing of the threads. When every crossing has been fastened in this manner, cut the tidy from the tacks, leaving the ends of the thread to form a fringed edge. When this tidy becomes soiled, it should be basted between two pieces of old and thin cloth, and, protected in this way, it can be washed, boiled, and starched, as easily as a more substantial one.

Fig. 7.

Any pattern may be formed in crochet, by drawing the designs upon paper, and copying them as nearly as possible upon checkered paper, fig. 8. Paper properly ruled is sold for this purpose, but this is probably only to be had in large cities, and we country people must rule it ourselves, which is

Fig. 8.—DESIGN FOR CROCHET.

not a very difficult job. A little practice will render one expert in making designs for working.

Leaves from the Diary of a Young Housekeeper.—No. VII.

PRIZE ESSAY BY MRS. LAURA E. LYMAN, STAMFORD, CT.

July 2d.—I have been occupied for several days in protecting my house from flies. There came a rainy day when Edward could not work out doors, and he and the hired men fitted some light pine frames for my windows, and two or three of the doors, which I have covered with fly netting, and now I can have all the ventilation I wish, without the annoyance and discomfort of these household pests. A finer netting will keep out mosquitos as well. The door frames are on hinges, so we can go in and out with ease. This is so much better than fly traps and fly poisons, and now that they are made, they will, with care, last several seasons. In some houses that I have visited, I have noticed that the parlors are kept darkened all the time—but for my part, I believe in sunlight and free ventilation, both for health and enjoyment.

What was my annoyance in going to my closet yesterday, where I keep my preserves and cake, to find it infested with great black ants. I employed the speediest and most certain way of killing them that I could think of. Taking a large sponge, I saturated it with molasses mixed with a little water, and laid it on a plate in the closet, after removing every other sweet thing. They took the bait greedily, and when there were about a thousand of them reveling upon the sweets, and penetrating every pore of the sponge, I plunged it into a bucket of hot water. Their scalded carcasses floated on the surface, reminding one of the destruction of Pharaoh's host in the Red Sea. A few successive massacres of that kind have, I believe, nearly exterminated the tribe. This mode of destroying them is certainly harmless to every body but the ants themselves, and I prefer it to using red precipitate.

July 7th.—Living on an old place has a good many advantages as well as some disadvantages. Our predecessors were certainly fond of fruit, for we have cherries, currants, apples, pears, and plums, in abundance, a few quince bushes, and two or three grape vines that promise very well. So we shall, in all probability, have plenty of fruit.

The currants have occupied me lately. As soon

as they began to turn red we used them freely on the table, and yet there are a great many on the bushes that are growing dead ripe. Yesterday I picked several quarts of them, and made my currant jelly. I intend to dry some of the nicest and largest of them for cake, and the rest will make me five or six gallons of wine. I shall be certain, in offering wine of my own manufacture to my guests, that it contains neither logwood nor Elderberry, or any other dirty drug, and it will be perfectly harmless, as well as in the last degree palatable, if I succeed well. I have put up fifteen pounds of cherries. I prepared them in the Shaker style, taking out all the stones and boiling my syrup down until it was quite thick.

July 11th.—Yesterday afternoon I had my house full of company, and of course, took a great deal of pride in my tea-table. I have had so much plain cooking to do for the workmen, that it was a real pleasure to try my skill in cakes and custards. I find that good cake depends, first, upon the quality of the materials, then upon the order in which the ingredients are mixed, and then upon thorough combination. When Eliza was here she told me of a contrivance for sale in New York, for stirring cake and bread. If Edward goes down to the metropolis next winter, I guess he will buy one for me. It consists of a funnel-shaped, tin vessel, large enough to hold two or three gallons, and fastened securely in a hole in the shelf, or set in a block which is screwed to the shelf. In the middle, and fastened to the bottom, is a round piece of wood about the size of a broomstick, terminating in a handle at the top. A small as well as a large quantity can be stirred in this, and with vastly more ease, Eliza says, than can be done in the ordinary way.

I think that this, and all other labor-saving inventions in woman's department, should be patronized. The time and strength I could save by having such a bread and cake stirrer, I could invest in enterprises in and around the house that would repay the outlay. It is only within a few years that wringers, washers, sewing and knitting machines have been invented, but what a vast amount of toil they have already saved, and the movement of invention in this direction is still onward. When I get this bread-stirrer, we shall observe the difference in the quality of the bread, for kneading a long time is essential to good bread.

July 15th.—The weather is very sultry and oppressive, and I have had a great deal of trouble with my butter and cream. I find that when the thermometer is above 90°, it is very difficult to make a superior quality of butter without the best arrangements. So Edward suggests that during the remainder of this month, and the next, I make only enough butter for family use, and make the rest of the milk into cheese. I have no practical experience in this line, but fortunately our Irish dairyman has been familiar from boyhood with the process, as conducted in the old country. Edward has bought me a neat little press, and Farmer Jones' wife will let me have a rennet. It will impose some additional labor upon me, but Sue is doing a great deal of my housework, and I have an ambition to master every department of domestic industry.

July 17th.—Amid all my other engagements I have not been obliged entirely to neglect my flowers, and I am surprised to see how much can be accomplished in keeping a flower garden in fine condition, by a little labor every day. My mornings have been so occupied that I have devoted a few moments every evening after tea, to my roses and verbenas. I make it a rule never to pass a weed without pulling it up, and I have placed it as a reward for rapid kitchen-work, that Sue shall have a half hour in the garden if she will make time for it. With such girls as Sue, whose intentions are always good, is it not best to stimulate by rewards of this sort, as much as possible, and not discourage and dishearten them by constant fault-finding? I make it a rule to praise her whenever she does a piece of work rapidly and well, and be as sparing of censure as I may.

July 20th.—Sue reports that the cucumbers are big enough to pickle. I tell her that she may go out early every other morning and pick all that are

of the length of her forefinger; in that way I will prevent any from getting too large, and have my pickles of uniform size, which improves their appearance and their value in market. Those that accidentally escape her notice and reach a large size, we can use on the table, or let them ripen and make them into sweet pickle, for which my sister Emeline gave me an excellent receipt.

A few of them I shall pickle at once, but most of them will be put down in rock salt until spring, when we shall have abundance of vinegar, and time to prepare them for market.

July 22d.—I've been having some experience in sickness within a day or two. One of our workmen came in at noon, with a terrible headache from the heat of the sun, amounting almost to sunstroke. I made a pallet on the floor for him, in a cool, dark room, upstairs, put a cloth wrung from cold water, over his forehead and eyes, and left a basin of cold water beside him, to be used in keeping the cloth cool and moist. Perfect quiet and rest will restore him sooner than anything else. He was not very well in the morning, and ate a light breakfast, then, just before noon, he pitched on a big load of hay, with the thermometer at 96°. Poor fellow! I feel so sorry for him, and my sympathy seems to be as grateful to him as the cold water to his forehead. I have just carried him a glass of iced lemonade, which he received very thankfully. He says he has never been the same man since that summer at Vicksburg. Edward has told him not to worry about his loss of time, that a few days illness shall make no difference with his wages.

July 27th.—My patient is recovering. His headache and giddiness lasted two or three days, during which time I gave him gruel, toasted bread, soft boiled eggs, and lemonade. Now that the headache is gone, I have put him on a rich diet, for that is what he wants to build up his strength. We got three or four pounds of sirloin steak, which I keep hung in the well, giving him a nice cut of it, broiled, twice a day, with just as much Graham bread and as many boiled eggs as he will eat, and all the buttermilk he wants to drink.

Leaves from My Journal.—No. V.

PRIZE ESSAY BY MRS. B. McCLELLAN, OF OHIO.

While seated at our sewing this morning, I said to Lizzie: "I never told you of a visit we made to our friends many years ago. I don't often speak of it now, though in all its details it is as fresh in my mind as the events of yesterday. Mr. Frisby was worn with incessant business, and Alice, the pet lamb of our flock, was teething and delicate. We proposed to take our own conveyance, and thus at our leisure, visit friends scattered here and there in the beautiful Valley of the Connecticut. Carrie was now five, and for these two little ones, I had all a fond mother's pride and ambition. How unweariedly I labored by day and night, to have all in readiness for our outfit! I remember especially one afternoon, feeling really impatient, while hurrying to finish some garments, assisted by a sewing girl, when my husband came in and proposed that we should lay by our work and attend a church lecture. —Ah, how did the cares of this world choke the Word, till it became unfruitful! But everything being in readiness, and quite to my liking, we commenced the journey. It was in June. Golden days, transparent in brightness and beauty. The first drive brought us to a friend's where we purposed to stop a while. That night Mr. Frisby was taken sick, and for two weeks lay prostrate with disease. Alice, the while, needed tender care and nursing, so unlike her former playful self. When Mr. Frisby was able to ride, we started for my former mountain home. Its clear bracing air would cure both the sick ones, I said. But Alice still drooped, and after three weeks lingering, painful sickness, 'slept that sleep that knows no waking.' We robed her in the white muslin I had so carefully wrought, and which she had never worn till now, and laid her to rest by 'the graves of our fathers.' With sorrowing hearts we retraced our way. As we drew near home, the words of Naomi came to my mind:

'I went out full, and the Lord hath brought me home again empty.' Then looking at the dear ones still spared, I exclaimed: Oh no, *not empty, not empty!* The Lord hath dealt very mercifully with me. Blessed be His name.

Thus without long and weary pilgrimage,
Through devious paths of pain, and tears and sin,
Her little feet have reached the Home of Rest
And stand forever safe on Zion's hill."

Sabbath.—"Our Father" knew what these restless, grovelling, grasping natures needed, and gave us this sweet day, forever pointing from the dust and din of earth to heavenly mansions and immortal life. The sermon this morning was from those words of Jesus: "She hath done what she could." Precious testimony, to that grateful penitent, whose costly offering was esteemed a sacrifice of love. I saw the tears gather in Lizzie's eyes, and believe I read her thoughts. To the young housekeeper whose time and strength are taxed to the utmost in her own little circle, those ever recurring questions, "What shall we eat, what shall we drink, and wherewithal shall we be clothed," seem to be absorbing every other. Her life appears so barren of fruit to the Saviour's praise, that despondency may wrap its dark folds about her heart and shut out the bright light and hope of heaven. How little does she estimate at its real value the simple routine of her daily life! To make one more happy home in the land, one more center of healthful saving influence, from which may go forth "streams to make glad the city of our God"—are not angels even "ministering spirits" in such a work as this?

I passed a humble home to-day, and though entirely a stranger to its occupants, decided in my own mind that it was bright and happy within. That fine running rose, "The Queen of the Prairie," had been trained over one side of the house, till it had surrounded the chamber windows. It was loaded with roses. Every spot of ground was turned to the best account. Vegetables were more forward than I had seen before, with flowers here and there interspersed. Under an elm tree was a rude swing for the children; a martin box surmounted the wood-shed, while about the whole place was that indescribable air of order and thrift, which we so surely connect with true enjoyment.

We are having a heavy rain. I have had a feather bed and pillows put out on the grass. The feathers are getting heavy, the pillows somewhat yellow. If the rain is long enough, it will do them as much good as the corn in the meadow. They will need turning over two or three times, and take some days to dry, but will then be about as nice as new. Feather beds are out of date now, but for old people, in cold weather, they are a comfort, and, renewed in this way, and properly aired, need not be unhealthy.

Sour milk is an excellent bleacher. Place the garment in an earthen bowl or wooden pail, and cover entirely with the milk. Let it remain two or three days, taking pains now and then to shake it thoroughly. Then after washing and boiling, it will be found of the purest white. For table-cloths and napkins, that have become stained and yellow, this is a good cure. Iron rust needs more severe treatment, and can be removed with oxalic acid dissolved in water, and applied to the spot in the strong sunlight. It is a powerful poison, and will take the color out of anything on which it is carelessly dropped. Mildew I had supposed past remedy, but have tried the cure found in the *Agriculturist* for September, 1866. Stir $\frac{1}{4}$ lb. of chloride of lime in a gallon of cold water. After settling an hour, pour off the clear liquid, and soak the mildewed cotton or linen in it two hours; wash well and expose to the sun—and it works like a charm. I only fear that leaving a garment of delicate material so long in the solution of lime, may rot it; but of this I cannot yet judge. The same fear has been expressed in regard to the oxalic acid, but I have often used it without the least injury to the linen.

Green Corn Pudding.—Grate the corn off from 6 ears, and mix with $\frac{1}{2}$ pint sweet milk, $\frac{1}{8}$ cup sugar, 1 tablespoonful flour, 2 eggs beaten, 1 tablespoonful butter, and add a little salt.

BOYS & GIRLS' COLUMNS.

Instructive Experiments.

Take a wide-mouthed bottle—a fruit preserving jar will answer the purpose well—put it in a pail of water, allow it to fill, turn it upside down, and lift it partly from the water, but keep its mouth under the surface, so that the water will not run out from it. Have a tube, (a clean tobacco pipe will do); place the lower end under the surface of the water, and under the mouth of the jar, so that when you blow through it, the bubbles will rise up into the jar, and drive the water down and out. Take a long full breath, and hold it in the lungs as long as can be

done without inconvenience, and then blow through the pipe into the jar. Repeat this until the breath has filled the jar and expelled all the water from it. Be careful to keep the jar upright, with its mouth under water, so as to retain what was sent there from the lungs. Next, cover the mouth of the jar with a piece of thick, wet paper, such as a bit of an old book cover, and then carefully turn the jar right side up, when you can set it on the table or other convenient place; the wet paper, if it rests snugly on the mouth of the jar, will keep the contents from being mixed with the air, for a little while. Have a short piece of candle attached to a bit of wire so that it can be lowered to the bottom of the jar. Light the candle, let it down, and the flame will go out as suddenly as though it had been thrust under water. The experiment may be repeated several times without refilling the jar with breath. If the candle be placed in such a jar containing only common air, it will continue to burn. The experiment then proves that what comes from the lungs is different from air, as it will not support a flame.

2d Experiment.—Fill the jar with breath as before, and place it on the table. Light a short piece of candle and place it in the bottom of a glass tumbler. Pour the breath out of the jar into the tumbler, exactly as though you were filling the latter with water, and if the experiment be properly managed, the flame will be extinguished, although nothing can be seen to pass from the jar into the tumbler. This proves that breath from the lungs is heavier than air, otherwise it would not run out from the jar and into the tumbler like water.

Having performed these experiments satisfactorily, try and find out the reason for the flame being extinguished, and what breath is; at another time we may have more to say on the subject.

The Kind-Hearted Tanner.

William Savery, an eminent minister among the Quakers, was a tanner by trade. One night a quantity of hides were stolen from his tannery, and he had reason to believe that the thief was a quarrelsome, drunken neighbor, called John Smith. Next week the following advertisement appeared in the country newspaper:

"Whoever stole a quantity of hides on the fifth of this month, is hereby informed that the owner has a sincere desire to be his friend. If poverty tempted him to this false step, the owner will keep the whole transaction secret, and will gladly put him in the way of obtaining money by means more likely to bring him peace of mind!"

This singular advertisement attracted considerable attention; but the culprit alone knew who had made the kind offer. When he read it his heart melted within him, and he was filled with sorrow for what he had done. A few nights afterwards, as the tanner's family were about retiring to rest, they heard a timid knock, and when the door was opened there stood John Smith, with a load of hides on his shoulders. Without looking up he said: "Thave brought these back, Mr. Savery; where shall I put them?"—"Wait till I can get a lantern, and I will go to the barn with thee," he replied, "then perhaps thou wilt come in, and tell me how this happened. We will see what can be done for thee."—As soon as they were gone out, his wife prepared some hot coffee, and placed pies and meat on the table. When they returned from the barn, she said: "Neighbor Smith, I thought

some hot supper would be good for thee."—He turned his back towards her, and did not speak. After leaning against the fire-place in silence a few moments, he said in a choked voice: "It is the first time I ever stole anything, and I have felt very bad about it. I am sure I didn't once think I should ever come to what I am. But I took to drinking and then to quarreling. Since I began to go down hill everybody gives me a kick. You are the first man that has ever offered me a helping hand. My wife is sickly, and my children starving. You have sent them many a meal. God bless you! but yet I stole the hides. But I tell you the truth when I say it is the first time I was ever a thief."—"Let it be the last, my friend," replied William Savery. "The secret lies between ourselves. Thou art still young, and it is in thy power to make up for lost time. Promise me that thou wilt not drink any intoxicating liquor for a year, and I will employ thee to-morrow on good wages. Thy little boy can pick up stones. But eat a bit now, and drink some hot coffee; perhaps it will keep thee from craving anything stronger to night. Doubtless thou wilt find it hard at first; but keep up a brave heart for the sake of thy wife and children, and it will become easy. When thou hast need of coffee, tell Mary, and she will give it thee."

The poor fellow tried to eat and drink, but the food seemed to choke him. After vainly trying to compose his feelings, he bowed his head on the table, and wept like a child. After awhile he ate and drank, and his host parted with him for the night, with the friendly words, "try to do well, John, and thou wilt always find a friend in me." John entered into his employ the next day, and remained with him many years, a sober, honest, and steady man. The secret of the theft was kept between them; but after John's death, William Savery told the story, to prove that evil might be overcome with good.

No. 269. *Puzzle Picture*.—An old-time proverb; we do not endorse it as being altogether true now-a-days.

Iron at \$20,000 per Pound.

A gentleman visiting the American Watch Company's factory at Waltham, Mass., relates that a small vial, such as homoeopathic pills are kept in, was handed to him, which was filled with what seemed to be grains of coarse sand, of the color of blue tempered steel. On examination under a microscope, they proved to be perfect screws, of which it required 300,000 to make a pound. Microscopic bits of steel, with the points exquisitely polished were also shown, so small that fifty weighed only a single grain. These were said to be worth \$20,000 per pound. These, as well as every other of the running parts of the watch, are made entirely by machinery, which turns out each different piece exactly like its fellow.

The following is his description of the method of making the fine screws: What you do see at a first glance is a thin thread of steel, finer than the most delicate of pins, slowly pushing its way through a little hole in a machine, and being grasped by a tiny tool which runs round it, as if embracing it; and then, presto! change! out comes a knife and cuts off its head. All this is done so quickly that you have to wait and watch the operation, after you know what it is all about, before you can see the process I have described. The bits thus beheaded

with a lug, look exactly like little grains of powder. But they are screws. You notice that when you take a microscope and examine them. They are complete—almost. Not quite yet. A girl picks them up, one by one, with a dainty tool, and places them in rows, one in every hole in a flat piece of steel. This little plate, as soon as it is filled, is placed under another machine, and it would do any Irishman's soul good to see it work. It beats Doneybrook Fair "all hollow." I never had a more convincing proof of the superiority of mechanical over manual labor. For while a good hearty man with a stout bit of shillelah may break half a dozen heads of a day—with fair luck—this machine, without so much as saying "By yer lave," comes out of its hole, and runs along each row, quietly splitting the head of each one of them exactly in the center. And now the screw is made.

New Puzzles to be Answered.

No. 270.—*Illustrated Rebus*.—Realized this year.

No. 271. *Arithmetical Problem*.—A and B each sold a hog to one dealer, for which he paid them \$25, remarking that A's hog was worth $\frac{1}{4}$ per cent. per lb. more than B's, but that they might settle that between themselves. A's hog weighed 400 lbs., B's, 300 lbs.; how much money should each receive?

Answers to Problems and Puzzles.

The following are answers to the puzzles, etc., in the June number, page 235. No. 235. *Illustrated Rebus*.—1st Reading, (across the whole of each line). Keep pushing, 'tis wiser to struggle and climb; to keep your eyes open; to conquer all fear; than be watching the seasons of tide and of time; of aid and of fortune; be steadfast to this; in life's earnest battle they only prevail, marching right onward, who will not say fail.—2d Reading, (half way across each line). Keep pushing; 'tis wiser to keep your eyes open, than be watching the seasons of aid and of fortune, in life's earnest battle, marching right onward.—3d Reading, (commencing at the middle of each line and reading to the end). To struggle and climb, to conquer all fear of tide and of time, be steadfast to this, they only prevail, who will not say fail. No. 237. *Word Puzzle*.—*American Agriculturist*. No. 238. *Bible Question*.—Noah and his family. No. 241. *Geographical Enigma*, in May number, page 187.—Moosetocknoquitt Lake, in Maine. The *Spanish Puzzle*.—Place the men as directed on page 236; we will call them A, B, C, D, E, F, the first three representing the black men. Move C towards D, jump D over C; move E towards C, and jump C over E; then jump B over D; move A towards D, and jump D over A; jump E over B, and F over C; move C to the end place; jump B over F, and A over E; move E towards D, and jump F over A; finish by moving A towards B.—The following have sent in correct answers: H. J. Meisel, John Meyers, Jr., Sam'l L. Moore, W. E. Uptegrove, Orlando D. Oathout, "S." M. E. Grigsby, William D. Reese, Mamie and Lenie Close, Thos. D. Smedley, John B. Haviland, Emma Randall and P. E. Randall, Alice McMichael, "Stupid," J. Fred. Scott, J. M. Whitman, Mary Keller, Sam'l Wolf, Jr., J. F. Day, J. Milton Snyder, Wm. Anderson, "James," "S. L. C.," Mickey and Bird, "J. T. H.," Ida and Bertha Challis, Frank H. Marston, "G. H. C." (Thanks for friendly criticism.)

[COPYRIGHT SECURED.]

"MANY A SLIP BETWEEN CUP AND LIP."—*Drawn and Engraved for the American Agriculturist.*

Not quite, Mr. Reynard! You have only a few feathers for dinner, instead of the fine fat duck you were counting on, and now the bird has the use of his wings, he's out of danger from your sharp teeth. The old story of counting chickens before they are hatched is here repeated, with the addition that it's not always safe to count upon them even after they are full feathered. "Many a slip between cup and lip," should also be remembered. We know many men who were as rich over their oil-wells as this fox over his duck—until their visions suddenly flew away, because the oil wouldn't flow, and they have now only a few scraps of paper called "Certificates of Stock," worth about as much as so many ducks' feathers. Not a few of our young, inexperienced friends have other equally valuable documents,—“tickets” for some “Grand Presentation” or “Distribution,” which flew away, or rather the managers did, just *before* the “prizes” were distributed. Perhaps a better way to state it would be, the foxy managers pounced upon these silly ducks, tore out a few greenbacks from their pockets, and then let them go. If they will imitate the duck, and keep out of the ‘cunning sharpers’ way hereafter, it will be well.

Independence Day.

Pop! fizz! snap! bang! hurrah! Hail Columbia!!! That's about the way the boys' thoughts run now, and in a few days they will let them out from fire-crackers, pistols, cannon, and every thing that can make a noise, including their own throats for the shouting chorus. It is well to celebrate the Nation's birthday. People differ as to the best way of doing it. Young folks who don't know what weak nerves are, believe in loud noises; perhaps it is well that they do. Men and women are so full of thoughts about work and business, they might forget

to observe our Great Anniversary, if the children did not disturb their quiet. We believe this jubilee had great effect in keeping patriotism alive during the eighty years of prevailing peace following the Revolution. The Fourth of July orations, the display of the Stars and Stripes, and the general waking up of recollections of the past, and prophecies of the future, aroused the whole people once a year at least. Some day, perhaps five hundred years or more hence, when people have forgotten all about war, there will be less powder burning in celebrating such occasions. That will be when everybody knows how to keep up his own independent right of self-government. The wrongs which nations commit, and which cause wars, are only the great sum of the evil doings of the men and women who make up the nation. One great national sin of the United States is now done away with, and can not again bring on war. Other evils remain, ignorance, too great desire for wealth, love of pleasure, impatience of any restraint—these are dangers that are now to be averted. Laws alone will not prevent their growth and the ruin they may bring. It is necessary for men and women, boys and girls, each to declare their Independence and maintain their Freedom from wrong doing. This will keep the national life pure, and make the country strong enough to stand like the pyramids, or like the living Banyan tree, which no storm can uproot, but whose growth increases century by century.

Educated Senses.

The eye, the ear, the fingers, all the servants of the soul, work more skillfully when properly trained. Perhaps the Indian has the keenest senses, made so by long practice. He must be on the alert, for his life depends on being able to outwit the animals that furnish his table

and his clothing, and also to elude his wary enemies. From infancy his eyes are taught to “look sharp,” and his ears to “keep open,” until not a bent twig or a pressed bunch of moss, or the rustle of a leaf, escapes his notice. But the most wonderful acuteness of the senses, produced by education, is seen where some of them have double duty to perform, as in the case of the blind. Hearing and touch divide between them the work usually done by the eye. A writer says: “To the seeing, touch is an auxiliary; but to the blind boy, it is the primary sense of all. By it he knows his own clothes, and almost all the property that he possesses—his tools, box, bed, hat, fiddle, cupboard, seat in chapel, schoolroom and workshop; by it he reads his chapter in St. John or in Robinson Crusoe; he plays chess or dominoes; works a sum in long division, or writes a letter home to his mother which she can read with her eyes, and he with his fingers. By the help of touch he weaves a rug of colored wools; or fringes with delicate green and red, a door mat for a lady's boudoir; by touch he sees any curiosity, which you describe to him, and which, having once handled, he always speaks of as having seen. He thinks he can read a good deal of your character by touch when you shake hands with him; and when he has heard you talk for a few minutes he will make a good guess as to your age, temper, ability and stature. One blind man at times guessed even more than this. He had been sitting one day and pleasantly chatting with some visitors for an hour, when one of them wished the company good morning, and left the room. ‘What white teeth that lady has!’ said the sarcastic professor. ‘How can you possibly tell that?’ said a friend. ‘Because,’ was the ready answer, ‘for the last half-hour she has done nothing but laugh.’ This was shrewd enough; but specially characteristic of him as a blind man.”

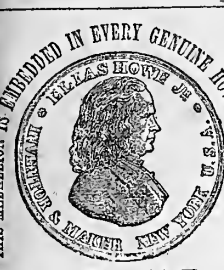

(Business Notices \$2.50 per Agate Line of Space.)

Piano for a Life Time.

Those desiring to find a Piano which will give entire satisfaction in tone, touch and style, and which will REMAIN GOOD FOR A LIFE TIME, will please call and examine, or send to a circular describing the newly invented

NATHUSHEK PIANOS,

constructed on an entirely new plan, the invention of Mr. Frederick Mathushek, who is well known among manufacturers as the "Father" of Improvements in Pianos. By his latest modifications, the power and tone of the instrument are wonderfully increased, so much so, that the smallest size, of "square" form, only four feet nine inches long and two feet eight inches wide, equals the full-sized piano ordinarily made. The peculiar construction INSURES ITS DURABILITY. Address BARLOW, DOEHLER & CO., 691 Broadway, New York.

The Howe Machine Co.'s Sewing Machines,

699 Broadway, Cor. Fourth-st., New York.

For Families and Manufacturers.

These World-Renowned Sewing Machines

Were awarded the highest premium at the World's Fair in London, and six first premiums at the N. Y. State Fair of 1866.

These machines are made under the immediate supervision of the President of the Company, ELIAS HOWE, Jr., the original inventor of the Sewing Machine.

The Stitch invented by MR. HOWE, and made on this Machine, is the most popular and durable, and all Sewing Machines are subject to the principle invented by him.

AMERICAN WATCHES.

The true value of Machinery applied to Watch-making is not that by its use Watches are made rapidly, but that they are made correctly. Very few people know why a Waltham Watch should be superior to any other. In the first place, the Watch is regarded at Waltham as only a machine to be constructed like any other machine on mechanical principles. The Factory is indeed little else but a vast machine shop, the principle work in which is not upon watches, but upon machinery to make them with. If the watches are good, it is because the machinery is good. Of course there must be no fault in the principle or plan of the movement, none in the sizes or shapes of the pieces of which it is composed, nothing wanting in their properties, and no error in their positions. These points once thoroughly settled and fixed in the case of every part of each variety of watch, it rests wholly with the machinery constructed with infinite variety of form and function expressly for the purpose to produce the finished pieces. The method established in every department is in short that of the reduplication of parts by mechanical means, and carried out on the system of the finest sub-division of labor. By means of multiplying gauges and microscopes, tests and inspection for the detection of wear in cutting tools and for faults and flaws in steel or stone, are made to accompany the work in every stage from beginning to end. It follows that the Watch goes together a perfect machine itself. Every part is found to fit properly in its place. Every pin may be pushed till it pinches, and every screw turned home. Instead of a sluggish and feeble action, the balance, even under the pressure of the lightest mainspring, vibrates with a wide and free motion, and the beat has the clear and ringing sound always characteristic of the Waltham Watch. The machine is a timekeeper from the start.

This system is unknown in foreign countries and is entirely original with the Waltham Company. The Company claim that under it they produce watches which cannot be equaled for every quality which makes a watch valuable. Simple in plan and correct in principle, the movement is not only beautifully finished, substantial, accurate and cheap, but is uniform to the smallest details, not easily damaged, easily repaired and always as good as new. There are different grades of finish on the different kinds, as there are different sizes and shapes to suit all tastes and tastes, but every Watch that bears the genuine trade mark of "WALTHAM," is guaranteed to be a good one, and nobody need be afraid to buy it.

From The N. Y. Tribune.

"The American Watch Company, of Waltham, Mass., established in 1850, has grown into proportions which entitle it to a rank among the manufacturing enterprises of America. The quality of these instruments has been thoroughly tested by minute comparisons, and the result is decidedly in favor of the home-made over the imported.

"The first duty of a watch is to keep good time. Its other uses are decorative and subsidiary. The simpler its mechanism the more trustworthily its action, and the system upon which watches are constructed by the American Company is the very perfection of simplicity.

"An important question is that of the relative costliness of European and American Watches. It appears that the advantage of cheapness is also with us. The difference in price is not excessive, but is sufficient to be an object to any purchaser. The virtue of superior durability, however, is one which ought to be well considered in this regard. American instruments will outlast all others. It has been estimated that we pay Europe \$5,000,000 a year for watches, and a like sum for keeping them in order. At our own doors watches are manufactured at a less price, of better quality, less likely to become disordered, and so arranged that in case of injury by violence, the injury may cheaply and expeditiously be repaired."

From The N. Y. Times.

"AMERICAN WALTHAM WATCHES.—This country has reason to be proud of this splendid specimen of American operative genius and enterprise. That it will work a revolution in the watch manufacturing of the world no one can doubt who examines the operations of the Waltham Establishment, for it turns out watch movements at just about one-half the cost of imported movements—beside the uniform reliability of the machine-made watches must give them a great advantage over all others wherever known. A poor time-piece of the machine make will be as rare in the future as a good one of hand-make has been heretofore, for machinery is arbitrary in its performance, and can make a perfect article just as easy as one that is worthless. It will be a cause of congratulation if this highly useful American enterprise shall have the effect of driving out of market the thousands of trashy foreign articles, mislabeled timekeepers, by furnishing so excellent and economical a substitute."

From The N. Y. Herald.

"We notice with regret, (writing of the Paris Exposition), the absence of specimens of American manufacture, which, although only comparatively of recent birth among us, is already producing results of the most satisfactory character. The Watches manufactured by the Waltham Company are certainly, so far as strength, durability, and excellence as time-keepers are concerned, as good as anything produced by the French or Swiss manufactures."

From The N. Y. World.

"We have had one of the works of this Company in a case for some considerable time, and, comparing them with former first-class works of different manufacture possessed by us, they have established, in our opinion, their superiority over any ever introduced for correctness as timepieces."

From The Scientific American.

"It is believed that a Waltham Watch is worth double the price of many of the imported watches made by hand."

From Harper's Weekly.

"The beauty, the precision, the greater cheapness, the uniform excellence of a watch constructed by machinery so exquisite that the mere spectacle of its operation is poetic, gradually give the American Watches a public preference which will not be deceived."

EVERY WATCH FULLY WARRANTED.

J. W. BRADLEY'S

CELEBRATED

DUPLEX ELLIPTIC

(OR DOUBLE SPRING)

SKIRTS.

THEY will not BEND or BREAK like the Single Springs, but WILL PRESERVE their PERFECT and GRACEFUL SHAPE in all CROWDED ASSEMBLAGES, CHURCHES, THEATRES, RAILROAD CARS, and for PROMENADE or HOUSE DRESS, where three or four ordinary skirts are THROWN ASIDE as USELESS.

EACH HOOP is composed of TWO FINELY-TEMPERED Steel Springs, BRAIDED TIGHTLY and FIRMLY together, EDGE to EDGE, forming one hoop, thus making the STRONGEST and MOST FLEXIBLE, as well as the MOST DURABLE and STYLISH, SKIRT EVER MADE. In fact, they are superior to all others, COMBINING COMFORT, ECONOMY, LIGHTNESS, ELEGANCE, and DURABILITY.

THIS POPULAR SKIRT is UNIVERSALLY RECOMMENDED by the FASHION MAGAZINES and OPINIONS of the PRESS GENERALLY.

At WHOLESALE, by the Exclusive Manufacturers and SOLE OWNERS OF PATENT,

WESTS, BRADLEY & CARY,

WAREHOUSES AND OFFICE,

Nos. 97 Chambers, and 79 and 81 Reade-sts., N. Y.

ALSO, at WHOLESALE by the LEADING JOBBERS.

GRAPE VINES.

The Subscriber would call the attention of Dealers and Planters to his extensive stock of Grape vines, and especially to the **Concord** and **Iona** varieties.

Our vines have always been unsurpassed by any in market and our aim is not only to keep up their well known standard of excellence, but to produce, if possible, still better plants than we have had heretofore.

Having a very large number in course of propagation, we are enabled to sell at very low prices where quantities are taken, and all parties intending to purchase will find it greatly to their interest to examine our stock and prices before purchasing elsewhere. Last year the demand for our plants was so large that we were not able to fill one half of our orders. Therefore, send your orders in early to secure the best plants. Address **G. E. MEISSNER,** Richmond P. O., Staten Island, N. Y.

SQUIRE'S PATENT FRUIT JAR.

Fruits Preserved Without Sugar.

The Only Jar for Preserving Vegetables.

The Newest, Most Convenient and Economical Jar extant.

This Jar is constructed so that the contents can be cooked in it, and all handling of Hot Fruit or Hot Jars or Tempering of Jars avoided; the contents retain all their natural flavor, and the labor of preserving is lessened more than one-half. Pamphlets sent on application.

NEW BOOK BY THE AUTHOR OF

"MY FARM OF EDGEWOOD."

Just Published by

C. SCRIBNER & CO.,
654 Broadway, New York.
RURAL STUDIES—WITH PRACTICAL HINTS for Country Places, by D. G. MITCHELL, (the Marvel)—with many Illustrations. One Vol.

(Copies sent by mail post-paid, on receipt of price, \$1.75.)

The author has sought to demonstrate:

1st. Why a man should go, if at all, into the country.
2d. What sort of a homestead he should seek there.
3d. What he should do when in possession of it.

"I have especially sought to excite the ambition of those holders of humble estates who believe that nothing can be done in the way of adornment of country property except under the eye of accomplished gardeners, and to show that the proper appliance of small means will produce effects whose charms must in their way stand unrivaled."

THE GREAT PICTORIAL DOUBLE NUMBER of the PHRENOLOGICAL JOURNAL and LIFE ILLUSTRATED for July, contains portraits with Biographical sketches of CHIEF JUSTICE CHASE, MRS. HARRIET BEECHER STOWE, MRS. LE VERT, EDWARD CARSWELL, and others; articles on Eloquence, QUEEN ELIZABETH, Studies in Physiognomy, MAN-MONKEYS AND GORILLAS, profusely illustrated; and a great variety of matter, agreeable and instructive. A NEW VOLUME—the 46th—ENLARGED, \$3 a year, 30 cts. a number. Address **S. R. WELLS,** 389 Broadway, New York.

THE EUREKA BRICK MACHINE

makes 3,000 splendid Brick per hour, with only nine men and one pair horses, or 4,320 per hour by steam power. Has no complex machinery to be getting out of order or breaking down. Its great simplicity and marvelous power command the approval of every expert at sight.

We challenge the world to produce its equal.
Satisfaction guaranteed to all purchasers.
ABRAM REQUA, General Agent,
No. 141 Broadway, New York.

CELERY PLANTS.

"Incomparable Dwarf."

This variety is so much superior in flavor, ease of culture, and hardness, that for the past six years we have grown it to the exclusion of all other varieties, for the New York market. It is planted one third closer than the tall growing sorts—from 30,000 to 40,000 being grown on an acre.

Dwarf variety, strong plants now ready, price: \$1 per 100; \$1 per 500; \$7.50 per 1,000; \$50 per 10,000; \$300 per 50,000. Large Solid, suitable for light soils, price: 75c. per 100; \$3 per 500; \$5 per 1,000; \$35 per 10,000; \$150 per 50,000.

Safely packed (without extra charge), to any distance not exceeding three days in the transit. Plain printed directions for culture and winter preservation, accompanying each package.

DOUGLASS,** (late of R. H. Allen & Co.), 181 Water-st., N. Y.

5 MORE GOOD AGENTS WANTED TO SELL
"Taylor's Patent Door Bells." See page 263.

SPEAR'S PRESERVING SOLUTION

Will effectually prevent fermentation or decay, and preserve all kinds of fruits, vegetables, cider, milk, &c., &c., in a perfectly fresh and wholesome condition, without sugar—and without airtighting—hence a saving of sugar, and from 50 to 75 per cent. in the cost of jars.

The solution is warranted to contain nothing injurious to health.

Fruits preserved by it are equal to the best "canned" fruits, while its use admits of keeping the fruit, &c., in large vessels, and using them at long intervals when opened.

It will preserve milk sweet from 12 to 36 hours longer than it will naturally keep, causing it to furnish more cream in hot weather.

Give it a trial and be convinced of its merits and great advantages over all other methods.

One bottle will preserve 128 lbs. of fruit, or 43 gallons of cider, or 128 gallons of milk. Full directions for using with each bottle. Price, \$1 per bottle; 6 bottles for \$5; or 12 bottles for \$9. Good discount to dealers, ask your Merchant for it, or form club and send price for 6 or 12 bottles, and receive it by express from the nearest one of the following Wholesale Agents: John M. Maris & Co., and Johnson, Holloway & Cowden, Philadelphia; C. W. Burgess & Son, Baltimore, Md.; Charles H. Atwood, Boston, Mass.; Burnhams & Van Schaack, Chicago; A. B. Eaton & Son, Cincinnati; Valentine Gerber, St. Louis, Mo.; Elliott & Co., Berrien Springs, Mich.; Roe, Whitman & Co., South Bend, Ind.; Johnson & Bro., New Haven, Conn.; Young & Lyons, Providence, R. I.; or to

DRAINING FOR PROFIT AND DRAINING FOR HEALTH.

By GEO. E. WARING, JR.,

ENGINEER OF THE DRAINAGE OF CENTRAL PARK, NEW YORK.

Illustrated.

TABLE OF CONTENTS:

LAND TO BE DRAINED AND THE REASONS WHY.—Indications of the need of draining.—Sources of water.—Objections to too much water.—Wet sub-soil.

HOW DRAINS ACT AND HOW THEY AFFECT THE SOIL.—Characteristics of well laid tile drain.—Surface-water and rain water beneficial, springs and soakage water injurious.—Cracking of stiff clays.—Evaporation and filtration.—Rain fall.—Evaporation.—Temperature.—Drought.—Porosity or mellowness.—Chemical action in the soil.

HOW TO GO TO WORK TO LAY OUT A SYSTEM OF DRAINS.—Amateur draining.—Maps.—Levelling instruments.—Outlets and location of drains.—Main drains.—Spring water.—Fall.—Tiles.—Depth and distance apart.—Direction of laterals.—Collars.—Discharge of water from drains.

HOW TO MAKE THE DRAINS.—Tools.—Marking the lines.—Water courses.—Outlet.—Silt Basins.—Opening the ditches.—Grading.—Tile laying.—Connections.—Covering the tile and filling in.—Collecting the water of springs.—Amending the map.

HOW TO TAKE CARE OF DRAINS AND DRAINED LAND.—Removing obstructions.—Mistake of substituting large tiles for small ones which have become obstructed.—Heavy lands should not be trampled while wet.

WHAT DRAINING COSTS.

Draining, expensive work.—Their permanence and lasting effects.—Cheapness versus economy.—Details of cost.—(1. Engineering and Superintendence.—2. Digging the ditches.—3. Grading the bottoms.—4. Tile and tile laying.—5. Covering and filling.—6. Outlets and Silt Basins.)

WILL IT PAY?

Increased crops required to pay cost of draining.—(Corn, Wheat, Rye, Oats, Potatoes, Barley, Hay, Cotton, Tobacco.)—Instances of profit.—Benefit of draining in facilitating farm work.

HOW TO MAKE DRAINING TILES.

Materials.—Preparation of earthenware.—Moulding tile machines.—Drying and rolling.—Burning.—Kilns.—General arrangement of a tiler.

THE RECLAIMING OF SALT MARSHES.

Extent of marshes on the Atlantic Coast.—The English Fens.—Harlaen Lake.—The exclusion of sea water.—Removal of the causes of inundation from the upland.—Removal of rain fall and water of filtration.—Embankments.—Muskraets.—Rivers and Creeks.—Outlet of drainage.

MALARIAL DISEASES.

Fever and Ague.—Neuralgia.—Vicinity of New York.—Dr. Bartlett on Periodical Fever.—Dr. Metcalf's Report to U. S. Sanitary Commission.—La Roche on the effects of Malarial Fever.—Dr. Salisbury on the "Cause of Malarial Fevers."—English experience.—Reports to the British Parliament.—Cause of Malaria removed by draining.

HOUSE AND TOWN DRAINAGE.

Sewerage.—The use of pipes.—The new outfall sewers in London.—The use of steam pumps to secure outlets.—Utilization of sewage matters in agriculture.—Effects of imperfect house drainage on health.—Typhoid fever.—The Westminster fever in London.—Epidemic at the Mapledown Young Ladies Institute in Pittsfield, Mass.—Lambeth Square, London.—Back drainage.—Water supply.—General Board of Health, (England).

ORANGE JUDD & CO.,

41 Park Row New-York.

A NEW WORK. SMALL FRUIT CULTURIST.

By ANDREW S. FULLER,

PRACTICAL HORTICULTURIST, RIDGEWOOD, BERGEN CO., N. J.

A new work, and the only one devoted to Small Fruits. Special treatises of this kind have the advantage that the author can more thoroughly discuss his subject, and go into greater detail, than in a work embracing both large and small fruits. The work covers the whole ground of Propagation, Culture, Varieties, Packing for Market, etc.

CONTENTS: INTRODUCTION—I. BARBERRY—II. STRAWBERRY—III. RASPBERRY—IV. BLACKBERRY—V. DWARF CHERRY—VI. CURRANT—VII. GOOSEBERRY—VIII. CORNELIAN CHERRY—IX. CRANBERRY—X. HUCKLEBERRY—XI. SHEPHERDIA—XII. PREPARATION FOR GATHERING FRUIT.

We predict that this work will bring Mr. Fuller many enemies, as he has given his opinion about varieties without reserve. On the other hand it will the more strongly endear him to all true lovers of horticulture, as these wish to have the merits of fruit given without reference to the persons who introduce them.

While very full on all the small fruits, the Currants and Raspberries have been more carefully elaborated than ever before, and in this important part of his book, the author has had the invaluable counsel of Charles Downing. The chapter on gathering and packing fruit is a valuable one, and in it are figured all the baskets and boxes now in common use. The book is very finely and thoroughly illustrated, and makes an admirable companion to his Grape Culturist.

SENT POST-PAID.

PRICE, \$1.50

Quinby's Bee Keeping.

By M. QUINBY, Practical Bee-keeper. Fully Illustrated. Entirely new. The result of 35 years' of successful experience—with directions for all contingencies that can ordinarily occur; treating of Breeding, Movable-Comb and other Hives, Pasturage, Robbing, Feeding, Swarming, Queens, Diseases, Anger, Enemies, Wax, Transferring, Sagacity, Wintering, Care of Honey, Italian Bees, Purchasing, etc. Bee-keepers will find this new work of Mr. Quinby's fully up to the times in all practical matter.

Sent Post-paid.

Price \$1.50.

Gratifying Opinions of the Press.

From the Christian Intelligencer.

"Quinby's Work is the very best. It has long been regarded as of the highest authority in the matters concerning which it treats."

From Moore's Rural New Yorker.

"This is a newly written and illustrated edition of Mr. Q.'s former work. That has proved of value to thousands of Bee-keepers, and this, with its riper experience and added knowledge, can not fail of giving better satisfaction. Thirty-five years experience!—What beginner in bee-keeping will not bring this to his aid? We notice the author has no Patent Hive to introduce, and expresses his opinions freely on the merits and demerits of the various hives seeking popular favor."

From the Vermont Farmer.

"The book is written in familiar style, with the endeavor to be practical rather than scientific, thereby making it a guide to the tyro in Apian knowledge, as well as a standard work of reference for the more experienced bee-keepers."

From the N. Y. Christian Advocate.

"All bee-keepers should have this manual, and others may read it as a book of wonders."

SENT POST-PAID.

PRICE \$1.50.

ITS VALUE.

A NEW WORK ON PEAT, THOROUGH AND PRACTICAL;

By PROF. SAMUEL W. JOHNSON, of Yale College.

It gives a full history of PEAT, MUCK, etc., telling what they are, where found, and how to estimate their value.

It describes the various methods of using Peat for manure, as an absorbent, as an ameliorator of the soil, etc. and it is especially explicit in regard to the

USE OF PEAT AS FUEL,

describing minutely the various processes employed in preparing it to burn, from the simplest to the most complicated; such as are in use in this country, and Europe. It is illustrated with many Engravings of machines, etc.

The work is invaluable to those having Peat or Muck swamps, or wishing to invest in Peat Companies.

Either of the Books mentioned in the following list will be sent, post-paid, on receipt of the price.

GRAPE CULTURIST.

By ANDREW S. FULLER.

This is the best Book published on Hardy Grape Culture.

CONTENTS.

INTRODUCTORY.—BOTANICAL CHARACTER OF THE Vine, Propagation by Seed.—4 Illustrations.

GROWING FROM SEED—GATHER WHEN FULLY RIPE.

PROPAGATION BY SINGLE BUDS.—MODE OF OPERATION, Planting in Beds, Single Buds in Open Air, Starting in Hot-Beds, Form of Single Bud Cutting.—5 Illustrations.

CUTTINGS OF UNRIPE WOOD.—THOUSANDS OF VINES are Annually Produced from Green Cuttings.—1 Illustration.

PROPAGATING HOUSE.—PERFECTION SHOULD BE our Aim, Span Roofed Propagating House, Lean-to Propagating House, Single Roofed House, Flues.—2 Illustrations.

CUTTINGS IN OPEN AIR.—TIME TO MAKE CUTTINGS, Selection of Cuttings, Form of Cuttings, Mallet Cuttings.

LAYERING THE VINE.—THIS IS ONE OF THE MOST Certain and Convenient Methods in Use.—1 Illustration.

GRAFTING THE GRAPE.—THIS IS AN OLD BUT VERY Uncertain Mode of Propagating the Grape, but Can be Used Successfully.—4 Illustrations.

HYBRIDIZING AND CROSSING.—THESE ARE OPERATIONS that Should Demand the Attention of Every One Who Undertakes to Produce New Varieties, Mode of Operation.—3 Illustrations.

TRANSPLANTING—VINES WILL OFTEN REQUIRE ONE Season of Nursery Culture before being Planted in the Vineyard, Hedging-in.—3 Illustrations.

SOIL AND SITUATION.—MUCH DEPENDS UPON THEM. Preparing the Soil, Manures and their Operations

STEM APPENDAGES.—SPINES, HAIRS, LATERALS, Forms of Leaves, Tendrils, Buds.—7 Illustrations.

PLANTING THE VINE.—A GREAT DIVERSITY OF Opinion, My Own Rule, Root Pruning, How to Plant.

GRAPE TRELLISES.—2 Illustrations.

TIME TO PRUNE VINES.—PRUNING AND TRAINING, Opposite Arms, Oblique Arms, A Plan for Poor Soils.

GARDEN CULTURE.—POSITION OF BORDER, TRAINING the Vines, Four Tiers of Arms, Double Stem, Trellises in Gardens, Training to Stakes, Girdling the Vine, Removing the Leaves.—9 Illustrations.

GATHERING THE FRUIT.—PRESERVING THE FRUIT, Wine Making, Pruning Shears.—1 Illustration.

INSECTS.—ROSE CHAFER, GRAPE VINE FLEA BEETLE, Spotted Pelidnota, Tree Beetle, Caterpillars, Yellow Bear, Hog Caterpillar, Grape Vine Sphinx, Blue Caterpillar, Proctos Americana, Leaf Rollers, Thrips, Aphids, Red Spider, Vine Scale, Diseases, Mildew, Sun Scald.—18 Illustrations.

DESCRIPTION OF (nearly Seventy) VARIETIES.

REVIEW OF VARIOUS SYSTEMS OF PRUNING AND Training, Reversing the Arms, Single Arm System, Bow System, Long Rod Spur System, Upright Canes, Thorny System.—Index.

(Including the Dahlia.) Being a Practical Treatise on the Propagation, Cultivation, and Management of THE ROSE, to which are added full directions for the treatment of the Dahlia. In neat paper covers. 12mo, 96 pp.

American Weeds, and Useful Plants. \$1.75

An Important Work for every Cultivator—Farmer, Gardener, etc.; being an Enumeration and Description, (with accurate illustrations), of the WEEDS and PLANTS found in American Fields and Gardens, which meet the observation, or require the attention of Cultivators; with practical suggestions for their Eradication when needed. While *practical* in its character, it includes both the common and botanical names and characters of the Weeds and Plants, with a Popular Account of the Structure of Plants. By WM. DARLINGTON, M.D., and PROF. GEO. THURBER. Thoroughly Illustrated with 277 Engravings. 12mo., 460 pp.

Annals.....Paper, 50, Cloth, 75

THE AMERICAN HORTICULTURAL ANNUAL FOR 1867. A YEAR BOOK FOR THE GARDENER, THE FRUIT GROWER, AND THE AMATEUR. It is a beautifully illustrated volume of 168 pages. It contains an Almanac and Calendar for each month, giving hints for work in the various departments, with useful tables, and an article on Growing Grape Vines from cuttings, by William Patrick; How Horseradish is Grown for Market, by P. Henderson; Home Decorations, by A. Bridgeman; The New Apples of 1866, by Dr. J. A. Warder; New or Noteworthy Pears, by P. Barry; Small Fruits in 1866, by A. S. Fuller; Rarer Valuable Evergreens, by T. Meehan, with valuable contributions by other writers.

THE AMERICAN AGRICULTURAL ANNUAL FOR 1867. A companion volume to the Horticultural Annual, and containing, besides an Almanac with hints about work for each month, an Essay on Draining, by Col. Geo. E. Waring, jr.; articles on the Culture of Sorghum, by Wm. Clough; Some of the Newest and Best Potatoes, by Wm. S. Carpenter; How to Train a Horse, by S. F. Headley; Essential Features of a Good Barn, with Plan, by Dr. F. M. Hexamer; Recent Scientific Progress in Agriculture, by Prof. S. W. Johnson, of Yale College; The Culture of Wheat, by Joseph Harris, and other valuable essays upon subjects of interest to agriculturists. Finely Illustrated.

Bement's Rabbit Fancier..... 30

BREEDING, REARING, FEEDING, AND GENERAL MANAGEMENT of Rabbits: their Diseases and Remedies; Full Directions for the Construction of Hutches, Rabbitries, etc.; Recipes for Cooking and Dressing for the Table. Numerous Illustrations. By C. M. BEMENT, author of *Poulterer's Companion*, etc. 12mo, 101 pp., in neat illustrated paper covers.

Boussingault's Rural Economy.... \$1.60

Rural Economy in its relations with Chemistry, Physics, and Meteorology; or CHEMISTRY APPLIED TO AGRICULTURE in the Principles of Farm Management, the Preservation and Use of Manures, the Nutrition and Food of Animals, and the General Economy of Agriculture. By J. B. BOUSSINGAULT, Member of Institute of France, etc. Translated, with Introduction and Notes, by GEORGE LAW, Agriculturist. Cloth, 12mo, 507 pp.

Buist's American Flower Garden Directory.....\$1.50

Containing Practical Directions for the Culture of Plants in the Flower-Garden, Hot-House, Green-House, Rooms for Parlor-Windows, FOR EVERY MONTH IN THE YEAR; with descriptions of most desirable plants, soils, transplanting, erecting a Hot-House, a Green-House, laying out a Flower-Garden, etc., etc. By ROBERT BUIST, a practical Nurseryman and Seed-Grower of Philadelphia. Cloth, 12mo, 342 pp.

Buist's Family Kitchen-Gardener...\$1.00

An excellent Practical work, containing Plain and Accurate Descriptions of all the Different Species and Varieties of Culinary Vegetables, with their Botanical English, French, and German Names, alphabetically arranged; with full Directions for the Best Mode of Cultivating them in the Garden or under Glass. By ROBERT BUIST. Cloth, 12mo., 216 pp.

Chorlton's Grape-Grower's Guide.... 75

INTENDED ESPECIALLY FOR THE AMERICAN CLIMATE; being a practical Treatise, with Engravings, on the Cultivation of the Grape-Vine in each Department of Hot-House, Cold Grapery, etc.; with Plans for the Construction and Heating. By Wm. CHORLTON. Cloth, 12mo, 204 pp.

Cobbett's American Gardener.....75

A Treatise on the Laying Out and Management of Gardens. Though an old work, it is one which will find a place in every considerable library, as the production of a remarkable man. While it is marked by the author's peculiarities, it is so full of plain common-sense, that it is worthy of being kept in print. By WILLIAM COBBETT. Cloth, 12mo., 230 pp.

Cole's American Fruit Book. 75

Containing Directions for Raising, Propagating, and Managing Fruit-Trees, Shrubs, and Plants, with descriptions of the best varieties of fruit, etc. 18mo, 238 pp.

Cole's American Veterinarian.....75

Diseases of Domestic Animals, showing the *Causes, Symptoms, and Remedies*, and rules for *Restoring and Preserving Health* by good management, with directions for *Training and Breeding*. By S. W. COLE. Cloth, 18mo., 288 pp.

Copeland's Country Life.....\$5.00

An elegant Octavo Volume, containing 926 pages, and 250 Engravings. It is a Compendium of Agricultural and Horticultural Practical Knowledge; embracing Descriptions, Hints, Suggestions and Details of great value to every one interested in Fruit, Flowers, Vegetables, or Farm Crops. It describes and illustrates nearly the whole range of topics of interest to the Farmer, the Gardener, the Fruit Culturist, and the Amateur. By ROBERT MORRIS COPELAND. Cloth, beveled boards, 8vo., 926 pp.

Cotton-Planter's Manual. \$1.50

This is the only popular work published on the subject. It is a compilation of facts from the best authorities on the CULTURE OF COTTON, its Natural History, Chemical Analysis, Trade, and Consumption, with a history of Cotton and the Cotton-Gin. Cloth, 12mo, 320 pp.

Dadd's American Cattle-Doctor.. \$1.50.

To Help Every Man to be his own Cattle-Doctor. A work by GEO. H. DADD, M.D., Veterinary Practitioner; giving the necessary information for preserving the Health and Curing the Diseases of OXEN, COWS, SHEEP, and SWINE, with a great variety of original Recipes, and valuable information on Farm and Dairy Management. 12mo, 359 pp.

Dana's Muck Manual.....\$1.25

A Manual for Farmers; treating of Soils, Manures, Composts, etc., and especially of the important subject of using MUCK, the great natural fertilizer of the country. By SAMUEL L. DANA. Cloth, 12mo., 312 pp.

Downing's Landscape Gardening and Rural Architecture.....\$6.50

The most complete and valuable work ever issued on Landscape Gardening in North-America, for the Improvement of Country Residences; containing full Directions for everything connected with the Laying out and adorning the Rural Home, the Grounds, the Gardens, the Buildings, the Trees and Plants, etc., with principles of taste so stated as to adapt the work to all classes. Splendidly Illustrated with many Steel and fine Wood Engravings. By the late A. J. DOWNING. New Edition, Enlarged, Newly Illustrated and Revised, with Supplement, by HENRY WINTEROP SARGENT. Octavo, 534 pp. Extra cloth, gilt, beveled bds.

Dadd's Modern Horse Doctor.....\$1.50

CONTAINING PRACTICAL OBSERVATIONS ON THE CAUSES, NATURE, AND TREATMENT OF Diseases and Lameness of HORSES; embracing the most recent and improved Methods, according to an enlightened system of Veterinary Practice, for Preservation and Restoration of Health. Illustrated. By GEO. H. DADD, M.D., Veterinary Surgeon. Cloth, 12mo., 432 pp.

Eastwood's Complete Cranberry Manual 75

Giving directions for the cultivation in different localities, with illustrations and descriptions of varieties. By BENJ. EASTWOOD. Cloth, 12mo, 120 pp.

Elliott's Western Fruit Grower's Guide.1.50

The previous Edition of this work was Thoroughly Revised; embracing all the new and valuable Fruits, with the latest improvements in their Cultivation; especially adapted to the wants of Western Fruit-Growers; full Illustrations. By F. R. ELLIOTT, of Ohio. Cloth, 12mo, 503 pp.

Field's Pear Culture..... \$1.25

THE PEAR GARDEN; a Treatise on the Propagation and Cultivation of the Pear Tree, with instructions for Management from the Seedling to the Bearing Tree. By THOMAS W. FIELD. Illustrations. Cloth, 12mo, 286 pp.

Flax Culture..... 50

A new and very valuable work, consisting of full directions, from selection of ground and seed to preparation and marketing of crop, as given by a number of experienced growers. 8vo, paper.

French's Farm Drainage..... 1.50

The Principles, Process, and Effects of Draining Land with Stones, Wood, Drain-Plows, Open Ditches, and especially with Tiles; including Tables of Rainfall, Evaporation, Filtration, Excavation, Capacity of Pipes, cost and number to the acre. With over 100 illustrations. The best work on Draining published. By JUDGE FRENCH, of New Hampshire, President of Mass. Agricultural College. Cloth, 12mo, 384 pp.

Fuller's Illustrated Strawberry Culturist.....Paper,.. 20

A new, practical little work, meeting with universal favor. It gives a full list of varieties, down to the latest valuable seedlings. Paper, 12mo, 48 pp.

GARDENING FOR PROFIT;**In the Market and Family Garden.**

By PETER HENDERSON.

A new, finely illustrated work on Market and Family Gardening, and the first ever prepared by a Market Gardener in this country. The author is well known, and he here records his *successful experience* of eighteen years.

The Louisville (Ky.) *Journal* says of this work:

"We know of no manual on any subject that surpasses this. Every part of it displays the hand of a man thoroughly at home with his subject; it is full of sound, excellent sense, expressed in clear and concise language. We say a great deal when we say that Mr. Henderson is as complete as a writer on gardening as he is a practitioner in his gentle but laborious art."

William Saunders, Esq., of the Department of Agriculture, Washington, writes:

"It is the most practically useful work of any on the same subject. In these days of book-writing, it is refreshing to meet a work that has common sense and practical experience for its basis."

Hon. Horace Greeley thus speaks of this book in the *New York Tribune*:

"READING FOR BOYS.—This work would probably not be selected by most boys as the book for their money, wherein they would evince their usual greenness. There are marvels of transformation and rapid production recorded therein, which might well shame the dull fancy of the author of *Aladdin* or of *Kaloolah*. To know that a few rods of good land may well employ and will surely reward the constant labor of a stout man—that there are choice gold-fields all around us for those that *know how to dig*—that \$1,000 may be wisely and profitably expended in draining, subsoiling, fertilizing, and deeply pulverizing a single acre—that he who would get rich by gardening must pile on manures by the hundreds of tons—that great crops always pay; half crops never—such are a few of the important truths succinctly set forth and tersely enforced in Mr. Henderson's little volume. There is no theory about it—one who has made himself rich by market-gardening, plainly tells our young men how they can get rich as easily as he did, and without wandering to California or Montana for it either."

A NEW WORK ON APPLES.

AMERICAN POMOLOGY.

APPLES.

By Doct. JOHN A. WARDER,

PRESIDENT OHIO POMOLOGICAL SOCIETY; VICE-PRESIDENT
AMERICAN POMOLOGICAL SOCIETY, ETC.

293 Illustrations.

To pomologists a work by Dr. Warder will need no commendation. Though a citizen of Ohio, he is so sure to be at any pomological gathering, be it East or West, that the whole country claims him, and if any one has a right to entitle his work *American Pomology* it is certainly Dr. Warder. The present is the first instalment of a work intended to cover the whole ground. In it the author has attempted the difficult task of bringing apples into something like order.

This volume has about 750 pages, the first 375 of which are devoted to the discussion of the general subjects of propagation, nursery culture, selection and planting, cultivation of orchards, care of fruit, insects, and the like; the remainder is occupied with descriptions of apples. With the richness of material at hand, the trouble was to decide what to leave out. It will be found that while the old and standard varieties are not neglected, the new and promising sorts, especially those of the South and West, have prominence. A list of selections for different localities by eminent orchardists is a valuable portion of the volume, while the Analytical Index or *Catalogue Raisonné*, as the French would say, is the most extended American fruit list ever published, and gives evidence of a fearful amount of labor.

This differs from any fruit book heretofore published in this country, in its complete classification of apples. The author gives the principal European systems and modestly puts forth his own to be tested by practice. He divides apples into four classes, according to their forms. Each of these classes is sub-divided by other obvious characters, and it would seem that any apple described in the book might be easily identified. We trust that this will prove a great help to the pomologist.

Fruit-growers will welcome this book as a valuable and long-wished for addition to pomological literature, and it will be found equally useful to the novice and the experienced orchardist. The work has 293 illustrations, is printed on good paper and well bound.

The Miniature Fruit Garden,

OR THE CULTURE OF

Pyramidal and Bush Fruit Trees.

BY THOMAS RIVERS.

Nothing is more gratifying than the cultivation of dwarf fruit trees, and this work tells how to do it successfully.

Dwarf Apples and Pears

are beautiful ornaments, besides being useful in giving abundant crops of fruit; they can be grown in

Small Gardens and City Yards,

and be readily removed. The work also gives the manner of training upon walls and trellises.

Root Pruning

is fully explained, and methods of protection from frosts are given.

Dwarf Cherries and Plums

are treated of as are other dwarf trees. Directions are also given for growing

Figs and Filberts.

This little work is full of suggestions to the cultivator, and like all the writings of its venerable author, bears the marks of long experience in the practice of fruit growing.

SENT POST-PAID. - - - PRICE, \$1.00
ORANGE JUDD & CO., 41 Park Row.My Vineyard at Lakeview;
Or, Successful Grape Culture.

To any one who wishes to grow grapes, whether a single vine or a vineyard, this book is full of valuable teachings. The author gives not only his success, but what is of quite as much importance, his failure. It tells just what the beginner in grape culture wishes to know, with the charm that always attends the relation of personal experience.

It is especially valuable as giving an account of the processes actually followed in

Celebrated Grape Regions

in Western New York and on the shores and islands of Lake Erie.

This book is noticed by a writer in the Horticulturist for August last as follows: "Two works very different in character and value have just been published and seem to demand a passing notice. The better and less pretentious of the two is 'My Vineyard at Lakeview,' a charming little book that professes to give the actual experience of a western grape grower, detailing not only his successes, but his blunders and failures. It is written in a pleasant style, without any attempt at display, and contains much advice that will prove useful to a beginner—the more useful, because derived from the experience of a man who had no leisure for fanciful experiments, but has been obliged to make his vineyard support himself and his family."

ENDLESS AMUSEMENT

FOR

BOYS AND GIRLS.

Crandall's Improved Building Blocks, described in April number of the *American Agriculturist*, page 147, furnish a most attractive amusement for children. They are very simple in construction, will stand years of childrens' handling without breaking, and give renewed pleasure daily.

CHURCHES,

DWELLINGS,

BARNs,

MILLS,

FENCES,

FURNITURE, etc.,

in almost endless variety, can be built with them, and when finished, the structure remains firm so that it can be carried about without falling to pieces.

For developing the ingenuity and taste of children they are unequalled. Having given these blocks a practical trial in their own families, the publishers of the *Agriculturist* were so well pleased with them, that they consented to take the general agency for their sale.

They are retailed at *Two Dollars* per set, of one hundred and thirty pieces, put up in a neat box, and accompanied with a card giving various designs of buildings. A liberal discount will be made to dealers. Address

CONTINUAL LEVER and Screw Press, with Grinder attached, for Pressing Cheese, Wines, Cider, and Lard, &c. Address **WILLIAM C. REA**, Pleasant Run, New Jersey.

Seymour's Grain Drill,

With Fertilizer Attachment and Grass Seeder. Warranted to Sow or Drill all Grains, Seeds, and Fertilizers, in the most perfect manner. Is light of draft, easy to operate, and is very simple and durable. Send for Circular.

Address **P. & C. H. SEYMOUR**, East Bloomfield, N. Y.

PAINTS for FARMERS and others.—The Gratton Mineral Paint Co. are now manufacturing the Best, Cheapest and most Durable Paint in use; two coats well put on, mixed with pure Linseed Oil, will last 10 or 15 years; it is of a light brown or beautiful chocolate color, and can be changed to green, lead, stone, olive, gray or cream, to suit the taste of the consumer. It is valuable for Houses, Barns, Fences, Agricultural Implements, Carriage and Car-makers, Pails and Wooden-ware, Canvas, Metal and Shingle Roofs, (it being Fire and Water proof), Bridges, Burial Cases, Canal Boats, Ships and Ships' Bottoms, Floor Oil Cloths, (one Manut. having used 5000 bbls., the past year), and as a paint for any purpose, is unsurpassed for body, durability, elasticity, and adhesiveness. Price \$5 per bbl. of 300 lbs., which will supply a farmer for years to come. Warranted in all cases as above. Send for a circular, which gives full particulars. None genuine unless branded in a trade mark, Gratton Mineral Paint. Address **DANIEL BIDWELL**, Proprietor, 254 Pearl-st., New York.

WHEELER'S PATENT CHAMPION ROOFING.—The best, cheapest and most durable; it can be manufactured and applied by any one. State, County and Town Rights for sale at reasonable rates. Farm Rights, \$1.00. Address **W. W. GRIFFES**, Schenectady, N. Y. P. O. Box 234.

Elegance, Durability and Cheapness. **LARMORE'S WIRE FENCE WITH CAST IRON POSTS.**

GREEN-HOUSE AND HOT-BED SASH.—The undersigned would respectfully call your attention to their extensive facilities for manufacturing Sashes for Florists and Gardeners, by which means we are enabled to furnish our patrons at a much lower rate of prices than any other establishment in the city. Particular attention paid to all orders, and furnished at the shortest notice. N. B.—Hot-bed Sashes constantly on hand. **W. M. H. COLES & CO.**, Office: 79 Nassau-st., New York.

PERRY'S GRAPE VINES

Are rapidly attaining the merit they justly deserve. Planters and Dealers, and those wishing to form clubs for the sale of the only vines in the country grown by my improvement, and to which none others can compare in health and vigor, either for Garden or Vineyard planting, should send immediately for my Price List or my liberal terms to Clubs. Planters will please state about the number of each variety they wish, and whether for spring or fall planting. My Illustrated and Descriptive Catalogue contains as correct a description of the different varieties of grapes I grow, as ten years' experience in propagating and fruiting vines will admit. Price 10 cents, less than cost. Address **F. L. PERRY**, Canandaigua, N. Y.

Bell's Berry Presses.

We would call the attention of Farmers and Housekeepers to these presses—they are capable of expressing the juice from all kinds of berries, are cheap and durable, and of sizes to suit, and should be in possession of every housekeeper and farmer. Call and see them.

PETER C. BENSEL, Agent, at Lorton's Clock Store, No. 1 Cortlandt-st., New York.

10,000 lbs. of Imported Swede and Ruta-baga Turnip Seed, 10,000 American Purple Top and White Flat Turnip Seed for sale low to the Trade. To Farmers—One pound or more sent by mail on receipt of 75 cents. For sale by **C. B. ROGERS**, No. 133 Market-st., Philadelphia, Pa.

The Best are the Cheapest.

The **MASON & HAMLIN** CABINET ORGANS are acknowledged to be the best instruments of this class in the world. It is the policy of these makers to produce *none but the very best work*. They aim at success, not by using poor material and economizing in workmanship, so that their instruments can be sold at a little less price; but by producing the most durable, reliable, and in all respects the best work possible, and selling it at the very lowest rates at which such work can possibly be afforded, and at the same prices to all.

They now manufacture more than sixty different styles of Organs, varying in price from \$75 to \$1,000 each. These instruments contain all the latest improvements, some of which are not to be found in other instruments, the right to their exclusive use having been purchased by M. & H., in some cases at very large expense.

MASON & HAMLIN have been awarded several times as many highest premiums, at Industrial Fairs, as any other maker, having received fifty-six within a few years.

They present in their Circulars the printed testimony of a large majority of the most eminent Organists, Pianists, Singers and Composers in the country to the superiority of the instruments of their make.

It is certainly economy in purchasing an instrument of this class to *get the best*, although the first cost may be a little more, as a poor instrument will soon get out of order and become comparatively worthless.

It should be remembered that the recommendations of dealers are not always reliable, as there is great temptation for them to recommend those instruments on which they can make the largest profit; and makers of inferior work can afford the largest discounts. **Mason & Hamlin** have fixed their retail prices so low that they can afford only very small discounts, at wholesale, and hence the temptation to dealers to recommend and sell other instruments is great.

Circulars with full descriptions, illustrations, and prices of the different styles, with hints on what constitutes, and how to select a good instrument, sent free to any one desiring them. Address **MASON & HAMLIN**, 596 Broadway, New York, Or, 154 Tremont-st., Boston.

ROPER'S NEW AMERICAN BREECH LOADING REPEATING SHOT GUN, firing four shots in two seconds, using ordinary ammunition. Manufactured by **ROPER REPEATING RIFLE CO.**, Amherst, Mass. Under personal supervision of **C. M. SPENCER**, inventor of the famous **SPENCER RIFLE**. Send for Circular.

ITALIAN BEES—New Importation just received.

Queens, progeny of above, ready for delivery after July 20, 1867. Send for Circular. M. QUINBY, St. Johnsville, N. Y.

\$1. \$1. \$1. \$1. \$1.

You have a Wheeler & Wilson Sewing Machine? Send for a pair of **Patent Sewing Machine Castors**. Ladies can, themselves, immediately attach them to the legs of either end of the machine, and will not then need to call upon husband, father or brother to do the lifting.

The machine stands firmly on the floor, but by slightly tipping it, it will rest upon the castors and move easily about the room. It being desirable to move it every day for the purpose of sweeping where it stands, or for a more convenient position for working than the one it usually occupies, you will find it just the thing wanted. We send them by mail, postage paid, to any part of the U. S. on receipt of \$1. Agents wanted in every Town or County in the U. S.

Most excellent inducements offered.

Address H. B. FANTON, 491 Broadway, New York.

INGERSOLL'S IMPROVED

HORSE AND HAND POWER

HAY AND COTTON PRESSES.

These machines have been tested in the most thorough manner throughout this and foreign countries to the number of over 3000.

THE HORSE POWER is worked by either wheel or capstan, and in many respects possesses unequalled advantages. We invite those wanting such machines to write for a catalogue containing full information with cuts, prices, &c., or call and examine personally.

Orders promptly attended to, by addressing

INGERSOLL & DOUGHERTY, Greenpoint, Kings Co., L. I.

A Clean Sweep Every Day

FOR ALL TIME.

The Silver's Patent Broom.

Enables every farmer to use brush of his own raising, and have a better broom in every respect than can be bought at the store. It is so simple that a child can put it together. The parts (except the brush) will last a life time, and the brush can be renewed in a few minutes.—See editorial description in this number of the *Agriculturist*, also cut of Broom on page 77, February number, and recommendations, etc., on page 277, June number.

Those who do not raise their own brush, will also find it the cheapest as well as the best article in the market, it being adapted to city and country.

AGENTS WANTED throughout the country; exclusive territory given. Sample, and full instructions for putting together, sent prepaid, on receipt of \$1.50.

Address
C. A. CLEGG & CO.,
206 Broadway, New York.

SPECIAL**ADVERTISING AGENCY.**

Advertisements from reliable parties only, inserted in the *Agriculturist*, Religious, and other first-class mediums throughout the country, by the undersigned.

An experience of several years in conducting the advertising department of the *American Agriculturist*, gives superior facilities for satisfactory transaction of such business.

W. A. FITCH, 151 Nassau-st., New York.

(Business Notices \$2.50 per Agate Line of Space.)

THE SHIP GOLDEN STATE

HAS ARRIVED WITH

22,000 HALF CHESTS

OF THE

FINEST**JAPAN TEAS**

TO THE

GREAT AMERICAN**TEA COMPANY,****Nos. 31 and 33 Vesey Street.**

These Teas by the ship Golden State were purchased direct from the Japanese factor, and in consequence of the magnitude of the transaction, were transferred at about half the usual commissions. This is the largest cargo ever imported from Japan by about seven thousand packages. By this operation the GREAT AMERICAN TEA COMPANY put these Teas into the hands of the consumers with but one very small profit—an achievement in commercial enterprise seldom if ever before attained. These Teas are acknowledged, both here and in Japan, as being the finest full cargo ever exported from that country.

ALSO,

THE SHIP GEO. SHOTTON

HAS ARRIVED WITH

12,000 HALF CHESTS

OF THE

FINEST FOOCHOW**OOLONG TEAS.**

The cargo of the ship George Shotton is the second in size that has ever come to this port from Foochow, (which is the finest Black Tea district in China). These are the "finest, first-picking contract Teas"—rich, fresh, and full-flavored.

The receiving of these two large cargoes by the GREAT AMERICAN TEA COMPANY for their own trade is acknowledged by the mercantile community as the largest transactions ever made in this country. They were deemed of so much importance that the fact was telegraphed to all the principal commercial papers in the country by their correspondents here, and thus appeared as an important news item throughout the United States at the same time.

The importance of these transactions in this market is thus noticed by the oldest and most respectable commercial paper in this city—the *N. Y. Shipping and Commercial List*—which says: "The trade have again been startled by the arrival of two large cargoes of Teas to the Great American Tea Company—the ship Golden State from Japan, with 22,000 half chests; and the ship George Shotton from Foochow, with 12,000 packages." And in another place it says: "The recent large operations of the Great American Tea Company have taken the trade by surprise, and are rather a novelty in this market. The taking up of two cargoes within a week, comprising 12,331 packages Black and 23,849 packages Japan, for immediate consumption, at a cost of about a million and a half of dollars, indicates the extensive nature of the Company's business, and deserves a passing notice at our hands."

In addition to these large cargoes of Black and Japan Teas, the Company are constantly receiving large invoices of the finest quality of Green Teas from the Moynne districts of China, which are unrivaled for fineness and delicacy of flavor.

To give our readers an idea of the profits which have been made in the Tea trade, (previous to the establishment of the GREAT AMERICAN TEA COMPANY), we will start with the American houses, leaving out of the account entirely the profits of the Chinese factors.

1st: The American House in China or Japan makes large profits on their sales or shipments—and some of the richest retired merchants in this country have made their immense fortunes through their houses in China.

2d: The Banker makes large profits upon the foreign exchange used in the purchase of Teas.

3d: The Importer makes a profit of 30 to 50 per cent. in many cases.

4th: On its arrival here it is sold by the cargo, and the Purchaser sells it to the Speculator in invoices of 1,000 to 2,000 packages, at an average profit of about 10 per cent.

5th: The Speculator sells it to the Wholesale Tea Dealer in lines, at a profit of 10 to 15 per cent.

6th: The Wholesale Tea Dealer sells it to the Wholesale Grocer in lots to suit his trade, at a profit of about 10 per cent.

7th: The Wholesale Grocer sells it to the Retail Dealer at a profit of 15 to 25 per cent.

8th: The Retailer sells it to the consumer for all the profit he can get.

When you have added to these eight profits as many brokerages, cartages, storages, cooperages, and waste, and add the original cost of the tea, it will be perceived what the consumer has to pay. And now we propose to show why we can sell so very much lower than other dealers.

We propose to do away with all these various profits and brokerages, cartages, storages, cooperages, and waste, with the exception of a small commission paid for purchasing to our correspondents in China and Japan, one cartage, and a small profit to ourselves—which, on our large sales, will amply pay us.

By our system of supplying Clubs throughout the country, consumers in all parts of the United States can receive their Teas at the same price (with the small additional expense of transportation), as though they bought them at our warehouses in this city.

Some parties inquire of us how they shall proceed to get up a club. The answer is simply this: Let each person wishing to join in a club, say how much tea or coffee he wants, and select the kind and price from our Price List, as published in the paper or in our circulars. Write the names, kinds, and amounts plainly on a list, and when the club is complete, send it to us by mail, and we will put each party's goods in separate packages, and mark the name upon them, with the cost, so there need be no confusion in their distribution—each party getting exactly what he orders, and no more. The cost of transportation, the members of the club can divide equitably among themselves.

COUNTRY CLUBS, Hand and Wagon Peddlers, and small stores (of which class we are supplying many thousands, all of which are doing well), can have their orders promptly and faithfully filled, and in case of Clubs can have each party's name marked on their package and directed, by sending their orders to Nos. 31 and 33 Vesey-st.

Parties sending Club or other orders for less than \$30 had better send Post-Office drafts, or money with their orders, to save the expense of collecting by express; but larger orders we will forward by express, to collect on delivery.

Hereafter we will send a complimentary package to the party getting up the Club. Our profits are small, but we will be as liberal as we can afford. We send no complimentary package for a Club less than \$30.

Parties getting their Teas from us may confidently rely upon getting them pure and fresh, as they come direct from the Custom House Stores to our warehouses.

We warrant all the goods we sell to give entire satisfaction. If they are not satisfactory, they can be returned at our expense within 30 days, and have the money refunded.

The Company have selected the following kinds from their stock, which they recommend, to meet the wants of Clubs. They are sold at Cargo Prices, the same as the Company sell them in New York, as the list of prices will show.

PRICE LIST OF TEAS:

OOLONG (Black), 70c., 80c., 90c., best \$1 10¢ lb.
MIXED, (Green and Black), 70c., 80c., 90c., best \$1 10¢ lb.
ENGLISH BREAKFAST (Black), 80c., 90c., \$1, \$1.10, best \$1.20 lb.
IMPERIAL (Green), 80c., 90c., \$1, \$1.10, best \$1.25 lb.
YOUNG HYSON (Green), 80c., 90c., \$1, \$1.10, best \$1.25 lb.
UNCOLORED JAPAN, 90c., \$1.10, best \$1.25 lb.
GUNPOWDER, (Green), \$1.25, best \$1.50 per lb.

Consumers can save from 50c. to \$1 per lb., by purchasing their Teas of the

GREAT AMERICAN TEA COMPANY,**Nos. 31 and 33 VESEY STREET.**

Post Office Box, 5643, New York city.

COFFEES ROASTED AND GROUND DAILY.

GROUND COFFEE, 20c., 25c., 30c., 35c., best 40c. per pound. Hotels, Saloons, Boarding-house keepers, and Families who use large quantities of Coffee can economize in that article by using our FRENCH BREAKFAST AND DINNER COFFEE, which we sell at the low price of 30c. per pound, and warrant to give perfect satisfaction.

THE GREAT AMERICAN TEA COMPANY, (established 1861), is commended by the leading newspapers, religions and secular, in this and other cities, viz.:

SUDBURY, Mass., May 27th, 1867.

ORANGE JUDD & CO.

Seeing by the Commercial and Daily papers that THE GREAT AMERICAN TEA CO., 31 and 33 Vesey-st., have received a new lot of tip top teas, I would like to have this club order filled, and if they are all right, take the liberty to ask you to forward this order to them.

Yours &c., Respectfully,
D. W. PARMENTER.

BELGIAN BULLS. — FROM A PAINTING BY DE HAAS. — Copied for the American Agriculturist.

Flemish, Belgian, and Dutch painters are perhaps tempted to devote themselves to animal painting, more than the artists who live among more diversified natural scenery. De Haas is a universal favorite, and his pictures have great power of showing motion and color, and a reality, which indicates that each one is a genuine experience, or real scene. In the rugged outlines of these bulls there is no taming down of the beef points to suit a "thorough-bred" type—no effort to make an ugly beast less ugly. There is an awkward ponderousness in the saying round of the great carcass of the larger bull, which is very natural, and a soft play of light on the hide of the smaller one, which does not conceal at all the play of the swelling muscles beneath, as the bulls arrange the preliminaries, and take positions for a grand tussle. We lose in the engraving entirely the effects of color, but looking at it

through a roll of paper, these fine effects will come out much plainer than otherwise. The original is owned by Mr. George Jones, one of the proprietors of the *N. Y. Times*, and is valued at \$2,000. Its size is only 20 by 30 inches.

We never witness two steers, or cows even, with locked horns, trying one another's pluck, but we think of the poor adaptation of our best yokes, to secure for us the full power of the willing ox. There is a concentration of force in the forehead of the bull, or of any animal of the ox kind, which we hardly find in any other creature, except, perhaps, the elephant. The horse draws properly by his shoulders, but the ox's shoulders are not adapted to draw by. We make him draw by the top of his neck, where the projecting spines of his backbone are somewhat protected by a tendinous band, and by skin no thicker than any other part of his hide. Of course it hurts him, and under no circum-

stance can he exert his full strength upon the yoke. If yoked by the head, a practice prevalent over most of Europe, and among Spanish Americans, the forehead, pressing against a padded yoke, becomes the point of power. The concentrated energies of every muscle and sinew of the body operate through the forehead upon the load, just as in a fight between bulls, they each concentrate, with the greatest ease, their whole muscular strength in their heads. It is safe to say that in this country we never make use of the whole strength of our oxen. This subject has been repeatedly alluded to in the *American Agriculturist*, in the hope that some one, who uses oxen in farm work, would so break his steers, and report the results. The experiment needs to be made with care, and the animals well broken, before being tried with heavy loads. No one who has watched a fight can doubt the correctness of this principle of yoking.

Back Volumes Supplied.—The back volumes of the *Agriculturist* are very valuable. They contain information upon every topic connected with rural life, out-door and in-door, and the last ten volumes make up a very complete library. Each volume has a full index for ready reference to any desired topic. We have on hand, and print from stereotype plates as wanted, all the numbers and volumes for ten years past, beginning with 1857—that is, Vol. 16 to Vol. 25, inclusive. Any of these volumes sent complete (in numbers) at \$1.75 each, post-paid, (or \$1.50 if taken at the office). The volumes, neatly bound, are supplied for \$2 each, or \$2.50 if to be sent by mail. Any single numbers of the past ten years will be supplied, post-paid, for 15 cents each.

AMERICAN AGRICULTURIST.

NEW-YORK, AUGUST, 1867.

After the rush and weariness of harvest is over, together with the anxieties attendant on the press of summer work, when the crops are growing well, when corn is beyond hoeing, and buckwheat and turnips all sowed, farmers and their families ought to enjoy a few holidays. The Fourth of July finds us in the midst of hoeing, and haying, and cutting grain. We need an August festival, and as there is none in our national or popular calendar, we ought to take each his independent little play spell for a visit to a friend; or in neighborhood parties, to go into the mountains, or to the sea-side, and bake clams, catch fish, and make chowder.

Farmers ought to visit one another, and the agricultural clubs and societies of adjoining towns or counties can do few wiser things than appoint committees to visit and report upon the farming practices of their neighbors in the districts which lie just beyond the circuit of ordinary communication. The relaxation will be conducive to happiness and health, and to the enlargement of ideas. The crop of new thoughts which will be sown or garnered in new fields, will be worth more to any wide awake man, or woman, than months of plodding at home.

The long continuance of rains and prevalingly wet weather has in some measure disturbed the regularity of the harvest. Grain, as usual, has been deemed of more importance than grass, and so the latter has suffered, if either. In many cases, both have been caught; cutting at the proper time has been delayed, and injury has occurred to crops that grew and matured finely. Too ripe grass makes poor hay. The remedy is one which very few farmers will apply. It is to cook or steam the hay. If this is done, the hardest and ripest hay becomes digestible and is readily eaten, and seeds of sorrel, dock, and daisies are killed. Those who steam their fodder express the view that even very poor feed is thus made equal to the best uneoked. Certain it is, that with a slight flavoring of oil-cake or corn meal, all is eaten up, and the stock thrive.

If we have any dry weather this summer, it will probably come in August, and afford opportunity to do the usual drought work. The muck swamps will call for a good deal of labor from all who value swamp muck as they should, in their barn-yards and compost heaps. In draining swamps, the outlet is first determined upon and, if the ditch is to be an open one, as is usually the case, the trench is begun at that place. This is different from the way of laying tile-drains, because, if the tiles were laid first at the outlet, they would be filled up with silt from the muddy water which would flow through them as long as any work was done at the drains above, and longer too. Swamps covered with alders and other shrubs and small trees, are best cut over in winter, and then the next summer, when dry, they may be drained, the stumps and roots pulled out by oxen, and laid in heaps to dry, while the rest of the land is grubbed over or plowed, if dry enough. A man of a little contrivance will devise several ways of using the power of oxen or horses to great advantage in this work. Chains and strong levers, and perhaps a pair of blocks and tackle, singly or in combination, will tear out any of the stumps and roots of common peaty swamps. The peat or muck should be thrown out in heaps to dry, and it is best to top the heaps with that which is most earthy and crumbly, as this prevents the more dense or "fat" portions from baking into hard lumps. Thus treated, after a few weeks it may become dry enough to compost with lime, and be made fit to use in the stables as an absorbent of liquid manure. If, however, it bakes very hard and lumpy, though composted, it will hardly be made fine and dry enough, but will have to be exposed to freezing through the cold season. After that, it will probably need no other treatment to be made fit for use.

In regard to the draining of lands in general, the American farmer can have no safer or better guide than the work of Col. Waring just published, which is especially full in regard to the preliminary ex-

amination and surveys needed. Much land besides the swamps proper, is best drained in August.

The hospitalities of the country are extended to the city in the heat of summer. If bestowed and accepted with that consideration which husbands should exercise for their wives, and friends for friends, these visits of city cousins, of sons with their families, and of old friends with wives and babies, will bring great enjoyment and good to all.

The man or woman who overworks and breaks down in the hot weather, has much less chance to build up again, and become strong and well, than if the prostration occurred in the more bracing weather of other seasons. Farmers, beware of overworking your sons, allow no excuse for laziness, but impose only light work, not straining to back or muscles. The small stature and crooked forms of many once promising and handsome boys tell too plainly against their fathers, who willingly accepted all the hard farm work which the energy and pride of their sons prompted them to perform.

Hints About Work.

Animals at Pasture.—Look to the water supply, and see that no animals suffer for it. Nothing but absolute starvation pulls them down in condition faster than thirst. In the very hottest and driest weather, horses get little good in the field, unless they have thickets and woods to stand in, and get away from flies. It is best to stable horses during the heat of the day, if one has no use for them, and turn them out towards night. Flies are exceedingly annoying on damp days, when storms are approaching, and at such times horses should be taken in. Give salt regularly, or keep it in sheltered troughs, always accessible to cattle and sheep at pasture, away from the sea shore, where, from 10 to 20 miles inland, it is regarded as unnecessary.

Sheep should have their noses tarred; rams should be separated from the ewes, and lambs of suitable age and vigor, weaned. In weaning lambs, put the ewes on the driest pastures, but leave the lambs where they are accustomed to be, with a few large wethers for flock-leaders. They should be out of hearing of one another's calls. The ewes should be driven several evenings into pens and examined, and if their bags are tender, caking, or hot, they should be milked.

Milk Cows need regular feeding with some green fodder as the pastures get dry; yarded, and thus fed in the evening, the gain in manure, to say nothing of the milk, pays well for the trouble.

Swine.—Give plenty of green food. If there are no weeds to pull or mow for them, then cut clover or grass. The trimmings along fences, and sods cut wherever the ordinary field culture cannot extend, are excellent. Some fresh earth, either upon the roots of weeds or in sods is essential to health. Charecoal is very beneficial, and plenty of fresh water desirable. At all events, the hogs should have daily a good drink of pure water, no matter how liquid their usual food, and last, not least, they should have a dry, clean, bed at all seasons.

Wounds upon animals, at this season of flies and quick putrefaction, need the most prompt attention. We know of no better application than hot pine tar, (not hot enough to burn.) It may be put on alone, or as a plaster upon a piece of cotton cloth. Look especially to the heads of rams.

Poultry.—It is desirable to shorten the moulting season as much as possible. To this end feed well and give range, or green food, daily. Make the most liberal provision for their dust-baths; a box with mixture of coal and wood ashes, sifted, and kept where it will never get wet is best. Give them the range of stubble fields, if possible.

Corn.—Little good will be done by plowing or hoeing after the first of August. Weeds should be pulled by hand if they grow large. Let the suckers alone; they are often needed for fertilizing the tips of the ears. If corn is blown down, it is usually best to let it get up as it best can, yet if the field be entered at once, certainly within 12 hours, it may be helped a good deal. Take care not to crack the stalk, bend it, or injure the roots as is often done.

Tobacco needs constant attention, worming, and suckering, to throw the whole growth into the leaves until they are ripe. This may be known by a certain turgid and swollen look which the surface assumes, quite distinct from that of the growing leaf. The plants must then be cut at the ground, in the heat of the forenoon, turned repeatedly and with great care not to break the leaves, and, when wilted enough to handle easily without breaking, hung in airy sheds, or buildings made for the purpose. We believe the best mode of hanging to be that described in the *Agriculturist* for March, 1864, (p. 76), as practiced by Mr. Joseph Reader, of Bordentown, N. J. The plants are hung upon long cords by taking half hitched about the butts. The cords are drawn up as fast as the plants are put on, and fastened at the top of the building, as close as they can hang, and a moderate circulation of air, above, below, and through the plants, given.

Turnips.—Sow early in the month, and up to the 10th or 15th below latitude 40°, putting them in wherever there is ground not otherwise occupied. A sprinkling of bone-dust or superphosphate of lime, with wood-ashes, will tell finely upon the crop.

Buckwheat may be sowed on ground not liable to early frost, as late as the first of the month, perhaps, and make a crop—but sowed any time before the 20th, it will make a fine mass of green manure to be plowed in as soon as it is touched by frosts, or when blossoming freely, if frosts hold off.

Wheat.—Land intended for winter wheat will probably need once or twice plowing and harrowing, and if a good dressing of fine compost can be applied, all the better. Sow at the end of this month or first of next. Use the drill. Put wheat on well drained or naturally dry land. If it does not winter-kill, water in the soil will prevent the crop being profitable. Wheat needs thorough tillage.

Oats.—Harvest before fully ripe, and thus secure better straw for feeding, and equally good grain.

Seed Grain.—The selection should be made at harvest time, when the best grain is allowed to get fully ripe before cutting. If this is not done, select at once the best sheaves, have them threshed, and cull out the best kernels by repeated winnowings.

Stacks.—Examine as soon as they have time to settle, and re-top, thatch or straighten them up, if necessary, using braces set against upright planks.

Grass and Clover.—If the object in bringing any field under the plow is to get it in good grass again, it is often best to sow the seed by itself as soon as the land is in proper condition. Grain detracts from the subsequent grass crops. Timothy, orchard grass, and blue grass may be sown by themselves in August or September. Use an abundance of seed, bush it, and roll it in, with a light dressing of ashes, guano, or fine compost. Clover may also be sown now, but spring sowing is usually preferred. Roll clover seed in gypsum, and sow both together or separately; one ton to ten acres is the common rule.

Water.—Look out for a water supply when springs are low, and tile-drains are generally dry or discharging very little water. Take levels, and see if you may not bring water in pipes to the house or stock-yard, and dig basins in the pastures. If wells are to be dug, or if digging them has been suspended on account of much water, a time of drought is favorable for this work. No farmer should be satisfied until he has good wells or running water close to, or in, his barn or stock-yards.

Implements for which there is no more use this season, should be cleaned, painted, the steel parts covered with linseed oil, and put away.

Brush in Pastures and Fence Rows.—Cut close to the ground, and lay the tops off to give the sun a fair chance at the roots. It will pay to lift a fence after cutting off the brush, and tear up the ground with a heavy plow, and then re-set the fence. Should rains occur, or if the ground be moist, and the brush start again freely, enclose sheep upon the land, stocking so heavily that they eat everything off close, and give the roots no chance to breathe.

Weeds.—Go over grass land, cutting docks, dandelions, burdocks, thistles, nettles, wild teasels, mulleins, with a "spud." Wild carrots and asters

must be mowed off as soon as they throw up their seed stalks, and long before the first blossom.

Bogs.—Cut the heads or tussocks at the surface level, splitting the big ones, and lay them up to dry for burning. Much good bedding stuff may be cut from bog land this month; it should all be secured.

Orchard and Nursery.

The attention of the fruit grower will now be demanded by the early ripening products of his orchard. In the southern fruit regions, the harvest has already begun, and supplies are rapidly coming forward by rail. Peaches, this year, are more abundant than they have been in years past, and only the best prices will be brought by selected fruit. In gathering the larger fruits for marketing, a knowledge of the manner of ripening of the different varieties is important. As a general rule, the fruit should remain upon the tree until it is well formed, but not until it softens or mellow. It should reach the retailer in sound condition.

Assorting.—This is a more profitable operation than is generally supposed, and the larger the fruit, the better does it pay to make at least two qualities by selection. Where careful thinning has been done, there will be less to go with the second quality.

Careful handling, at every step, from gathering the fruit from the branch, to the final delivery of the packages, is essential to its reaching the distant market and the customer in good order.

Pears are, almost without exception, improved by early picking and ripening in-doors.

Ladders of various kinds should be in readiness, and should be self-supporting. We have, during the past year, figured several ladders of this kind.

Insects, especially the moths, may be sensibly diminished if the fallen fruit be gathered up, and fed to the swine. Plant lice are easily killed by strong soap, or tobacco water, and some prefer a mixture of the two. The great trouble is, that these pests come in such numbers, and are usually on the very ends of the twigs, where they seem so inaccessible, that they are generally allowed to have their own way. There are now many efficient and cheap engines for throwing washes into trees.

Budding will continue, and may be done wherever the bark of the stock runs freely, and good buds can be obtained. The maturity of buds may be hastened by pinching off the ends of those shoots from which they are to be taken. The usual order is cherry, plum, pear, apple, cherry on dwarf (Mahaleb) stock, peach, and quince. The stocks budded earlier should be looked to, and the tying not allowed to become too tight.

Layer Shrubs, protect seed beds from scorching, and gather tree seeds as directed last month.

Fruit Garden.

As the fruits ripen in succession, the surplus will need to be preserved in some form. Bottling or canning is of course the best plan, but drying is better than no method of preserving. Some hints on this matter are given in our household pages.

Blackberries are to be kept low and in a compact form, as recommended on page 292.

Dwarf Trees.—Pinch in rampant shoots, especially on young fruit trees, and continue to rub out those that push where they are not wanted. Fruit may still be thinned, especially of those kinds that grow in clusters, and are apt to harbor insects. Pick early varieties of pears for home ripening.

Grapes.—Mildew should not be allowed to get the upper hand. The timely dusting of sulphur will usually arrest it. We last year figured the bellows used for the purpose. Keep growing shoots tied up to stakes and trellises. We know of no better way to deal with caterpillars than hand picking. Where the number of vines is not large, frequent and persistent search will soon free them of these destructive agents.

Raspberries.—The general way is to remove the old canes in spring, but in garden culture it is but

little trouble to cut them away as soon as the fruit is off, and give the new canes full scope.

Strawberries.—In a large way spring planting is preferable, but small beds may with proper care be advantageously made in autumn. Indeed, where the precaution has been taken to start the runners in small pots, they may be set at any time. Where plants are grown in row or hill culture, the runners are to be kept off, and weeds pulled from the rows.

Weeds.—Clean culture is as necessary in the fruit garden, as elsewhere. A mellow soil is secured by frequent working, and there will be much less suffering from drouth if the soil is stirred or mulched.

Water only when absolutely necessary, as it sometimes will be with trees set last spring; remove the surface soil from over the roots, water abundantly; when it has soaked away, replace the earth.

Kitchen Garden.

If weeds have been industriously kept down, this month will be one of comparative leisure to the gardener. Still he must look out for his future interests in the careful saving of seeds, and occupy ground cleared of early crops with such late ones as may be desirable and which have time to grow.

Asparagus.—Old beds will only need to have the coarse weeds pulled out. Seed beds, properly hoed and thinned, will give better plants at a year old than those neglected and over-crowded will furnish at the end of two years.

Beans.—The bush varieties may be planted for late crops, and to give a supply for salting.

Beets.—Give plenty of room in the rows, and thin.

Cabbages and Cauliflowers.—Plants, especially in the warmer States, may be set for a late crop. Lime will destroy slugs, and also prevent club-foot.

Carrots.—Hoe, thin, and weed, and if young roots are desired, seed of the early sorts may be sown.

Celery.—Plants may still be set with the prospect of fair-sized roots by frost. Keep the earlier planted free of weeds, and the soil mellow by frequent use of the cultivator or hoe. At the end of the month commence to earth up the more advanced plantings.

Corn.—Save seed from the finest and earliest ears.

Cucumbers will need picking over every day, or every two days at least, if small pickles are wanted.

Egg Plants.—Caterpillars will often make great havoc with the leaves, and must be picked off. Give liquid manure, and keep the heavy fruits from contact with the ground by the use of mulch.

Endive.—Transplant a foot apart each way, and sow seeds for the latest crops and for winter use.

Herbs.—Cut and dry as they begin to flower.

Lettuce.—Sow small quantities for succession.

Melons.—Increase the size and quality of the fruit by preventing the vines from overbearing. Save seed only from those varieties that have grown at a distance from other plants of the same nature.

Onions.—Harvest as soon as the tops fall over. Those that are to be stored for winter should be thoroughly dried. Take up onion sets, dry them, and spread with their tops on in an airy loft, putting them not over four inches deep.

Radishes.—Sow early sorts, if wanted so late in the season. The best winter radish is the Chinese Rose-colored Winter, which may be sown now or later, and treated in all respects like turnips. If sown too early, it will get overgrown.

Spinach.—Some may be sown for fall cutting, but the crop for next spring's use should not be put in until next month.

Squashes.—Seed of the early kinds should be secured. Let the vines of the running sorts take root at the joints. Crush all the eggs found on the underside of the leaves. Examine often.

Sweet Potatoes.—If the soil be kept mellow and free from weeds, there is no difficulty in getting a satisfactory crop. At the North, it is not advisable to allow the vines to root at the joints, nor is it well to clip them, as it diminishes the crop.

Tomatoes.—The great enemy to the tomato is the

one that causes such annoyance to the tobacco grower. A large and most voracious green "worm," the larva of one of the Sphinges. It spares neither leaves nor green fruit, but eats its way in the most unrelenting manner, until nothing but the firmer stems are left. Fortunately, its copious droppings give unmistakable evidence of its presence, and he must be a careless cultivator who allows the "worm" to get much the better of him. Pick off the fellow and crush him, using gloves if you are squeamish; though repulsive, it is harmless.

Turnips.—Ruta-bagas may be sown early in the month, and the early sorts at the end. As soon as up, dust with lime, or a mixture of equal parts of plaster and ashes, to keep away the "flea," or fly.

Weeds.—We only repeat our frequent caution to always keep a little ahead of these.

Flower Garden and Lawn.

This is the month in which the lover of flowers perhaps gets less return for his labor than in any other. All the early flowering things are gone, and there are not enough of the later ones in bloom to give the garden a very attractive appearance.

Lawns are to be mowed, and if the clip is light, leave it, especially on new lawns, to serve as a mulch to the roots. See that the roots of the grass do not run into beds cut in the lawn, and give

Grass Edgings the same care. Coarse weeds, like plantains, thistles and dandelions in lawns and edgings, must be pulled up by hand.

Chrysanthemums.—These, so appreciated in autumn, their season of bloom, are too often neglected in their early growth. Thin out useless branches, and leave only a few strong ones. We prefer to grow them with three good stems, and then pinch these to make them throw out laterals. The hairy caterpillars seem to be very partial to these plants, and they should not be allowed to suffer from their depredations.

Roses.—The free use of the knife on the constant bloomers will keep up a new growth and a succession of flowers. Of course, the slug and all other enemies, must be kept in check by whale oil soap or tobacco water. Tobacco smoke is the best thing for Aphis. We use a "erinoline," made of stiff paper, which is simply to confine the smoke for a few minutes; as soon as the lice are stupefied, a smart showering will finish them.

Fuchsias, as bedders, are a mere provocation; they do well until hot weather, and then shed leaves and buds, and go into a state of rest. There are a few varieties that will not do this, but of these we unfortunately have lost the names. With those that thus unpleasantly strip themselves, the best way is to prune them rather severely, and when the heat moderates, they will push anew and give late flowers. Start new stock from cuttings.

Dahlias.—These are grand for a few weeks before frost, but, except the dwarfs, or "Bouquet Dahlias," we think that in small grounds they are more trouble than they are satisfaction. It is all sticks and strings, and picking off grasshoppers, and looking after borers. It is best not to allow the tall-growing sorts to bloom in this hot weather.

Gladiolus is a great boon to the gardener, as it is good single, in groups, or in beds. Keep the stems erect by neat stakes, and as fast as the lower flowers are past their prime, pull them off.

"Foliage Plants," a name that we despise, but which we use for want of a better, may be made much more effective by judicious cutting. Coleus—the best of them—is much better when cut back and kept bushy. This remark does not apply to Cannas and things that do not branch freely.

Propagation of bedding stuff for another year should now go on. There are but few things of which the old plants are of much value, and it is much better to lay in a stock of new plants to winter over in the green-house. Those who have no green-house had better buy each year. Those who have, should start a stock of plants.

Seeds.—As a general rule, sow seeds of perennials as soon as ripe. Some of the hardy annuals,

such as Pansies, Larkspurs, etc., are best when fall sown. It is by taking advantage of every accidental perfection that improvement is made. Like does not always produce like, but the seeds of the best flowers are most likely to give good results.

Green and Hot-Houses.

Now that the most of the plants are out, all repairs may be made. Have the heating apparatus in order long before there is any need of it. See that the plants that are left in the house do not get sun-burned, overrun by insects, or suffer for proper watering. Lay in supplies of all needed articles, such as loam, sand, moss, and pots. The plants out-of-doors must not be neglected. Insects will make havoc, sun will scorch the evergreen things, worms will get into the pots, heavy winds will break down tender things, and dogs and cats, and other domestic animals, will do mischief if they have access to the plants. Many good florists are coming to the belief that, take it altogether, the majority of hot-house plants are safer in-doors than out, if properly shaded and well ventilated.

Cold Grapery.

As the fruit is ripening, sudden changes of temperature will be injurious and must be avoided, though free ventilation is to be practised. Stop watering when the fruit begins to ripen, and when it is ripe, keep the upper ventilators open at night. If mildew appears, use sulphur freely, upon the floors, and keep the air of the house very dry.

Apiary in August.—Prepared by M. Quinby.

Look well to the weak colonies now, whether old or new, as all such are liable to injury from the moth worm. Ascertain the cause of weakness; if it is an old stock, and has over-swarmed, or is queenless, or if the queen is barren, supply the deficiency. If it lack bees, give a comb or two, filled with sealed brood; this will hatch without any further attention from the bees. If the stock be a new one which never was strong, it is easily helped in this way. Any colony intended for winter should be made strong this month. If without movable combs to operate with, it is generally best to break up the hive, and secure the contents. This also is the best thing to do with a badly diseased hive. Where there is much buckwheat, it would sometimes pay to drive out the bees to begin again in an empty hive. If they made only a few combs, this would be more valuable for another year than many think. In sections where there is no buckwheat, and the honey sources are clover and basswood, more honey will be obtained by taking up all condemned colonies early in the month. Since the commencement of fruit blossoms, the season here has been propitious. June was a swarming month. Very many stocks will store entirely too much honey in the hive to make it safe for winter. The remedy for those in the old box hive is only partial. Boxes for surplus should at once be added, and room to work inside given to all. The boxes should be furnished with all the clean, nice, white comb you can supply, that they may be tempted to fill them. With movable comb hives, the matter is easily controlled by removing full combs, and replacing them with empty frames or empty combs. Put the empty ones near the centre, alternating with full ones, moving full ones outward. The full combs can be set away, and given to any late swarms that do not obtain sufficient winter stores. When not wanted thus, they may be saved for the table. This honey may not be of the purest quality, yet the quantity obtained in this way, over any method of boxing, ought to compensate considerably. Set shallow dishes with sweetened water among the hives at night to take moths.

Cider.—What is the best steam or horse-power cider-press? Those who have good ones would do well to advertise. We have inquiries for them every year, and would be glad to learn, from those who have good ones in use, how they work, and which is best.

SPECIAL OFFER FOR AUGUST. Will You Take one of These PREMIUMS?

We have referred in a previous number to our valuable ANNUALS, which were prepared for the year 1867, viz.: the **Agricultural Annual, No. 1**, and the **Horticultural Annual, No. 1**. These books each contain 168 pages; they are beautifully illustrated, full of useful information, each of them having an Almanac and Calendar of work for every month, and are neatly done up in enameled paper covers. Price, 50 cents each.

Will You Take These EXTRA PREMIUMS?

We now make the following offer: To every person who shall, during the month of August, send us a subscriber to the *American Agriculturist*, for one year, beginning either with January or July, 1867, at the regular rate, (\$1.50), we will present and send post-paid, either a copy of No. 1 AGRICULTURAL ANNUAL, or No. 1 HORTICULTURAL ANNUAL, whichever is desired, (if applied for at the time of subscribing).

Every one of our present subscribers, or anybody else who is not already supplied, can thus easily secure one or both of these beautiful Annuals. These are each the commencement of a series which will be continued. Each is complete in itself; intrinsically, as useful for one year as another, and the early numbers will grow more valuable as the series increases by regular yearly issues.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the *American Agriculturist*, show at a glance the transactions for the month, ending July 15, 1867, and also for the same month last year:

1. TRANSACTIONS AT THE NEW-YORK MARKETS.

May 15	731,330	261,092	186,804	145,706	608,194	16,461

Business has been influenced very slightly by the rise in gold during the past month. An active demand prevailed for the leading kinds of produce. Breadstuffs have been quite freely purchased for home use, shipment, and on speculation; but prices have been unusually variable. Toward the close, the demand has been good for desirable lots of flour, wheat, and oats, at steady rates. Corn has been in better supply and heavy. A considerable amount of new wheat has been received from the South, chiefly in small quantities. Most of it has been in fine order, and quick of sale, to the local millers. The receipts of California wheat have been less extensive. Provisions have been in fair request. Pork and lard closed in favor of sellers, under a partial revival of the speculative demand. Beef has been very scarce, and wanted. Butter and cheese have been quiet and heavy in price, under liberal offerings. Hay, hops, and cotton have been less active, and are depressed in price. Wool has been unusually dull. Manufacturers have been reluctant to purchase freely, in view of the extreme depression in the market for goods. Holders have been rather eager to realize, and prices have declined, closing irregularly. Stocks are moderate for the season, but are

largely in excess of the current wants of the export.
Tobacco has been in active demand, chiefly for export,
at former rates.

Beef Cattle.—The five weeks which our report covers are remarkable for the fluctuations in prices of beef animals. The decline in prices commenced at the close of our last report. They continued easily dropping a little, until a rush of stock, coming unexpectedly and undesired on a holiday week, caused a collapse in the market, such as has very rarely been observed. This will be fairly shown by the estimated average of prices for each week. June 18th, 17c., June 25th, 16@16 1/2c., July 2d, 15@15 1/2c., July 9th, 15 1/2c., July 16th, 16@16 1/2c. This is accounted for by a reduction of railroad tolls, the hot weather, together with the abundance and excellence of lamb, salmon, and small fruits in market, which lessened the demand for beef for the city trade. We quote at present, extra beef, 17 1/2@17 3/4c. per lb., estimated dressed weight; good average bullocks, 15 1/2@16 1/2c., and poor, 14 1/2@15 1/2c.

Milk Cows.—The supply and demand are both so small that it seems almost a farce to continue the enumeration and estimate of prices. A really good cow will bring—say \$80 to \$120, and this variation depends both on the quality of the cow and the chance of a purchaser, poor cows selling at a little less than they are worth for beef, generally. **Calves.**—The price of veal has been influenced in a measure by that of beef, the closing quotations being the result of a continual though gradual decline. We may state the general range of prices as about 8 to 12 cents per pound, live weight; 11c. being about the average, and very choice calves bringing a little more than 12c., and grass calves, 4 to 7c. **Sheep and Lambs.**—There has been an improvement in the quality of both sheep and lambs since last month, but we are getting too many poor, thin lots of sheep now. Prices about 6 1/2@6 3/4c. for good mutton sheep, live weight, the poorer grades selling at 4@6c. Lambs bring 8@12c., according to size and fatness. The stock of the week was large, but as these figures have been approached gradually, only a very short supply of sheep or falling off in some other department would cause a marked improvement at once. **Swine.**—The market has been subject to a fluctuating supply, and prices have varied accordingly. They now stand at 7 1/2@7 3/4c. for good, fair hogs.

Crop Reports and Prospects.

The high prices which have prevailed thus far during the year for all kinds of provisions, make the crop prospects a theme of unusual interest. Everybody watches the weather, and consults the papers, and dreams at night of the crops. In the main the reports from all parts of the country are favorable, and there is every indication of a bountiful harvest. As we go to press, we are in the midst of the summer fruits, of which there has been an abundance, with the exception of cherries, which have been a failure in the east. Forty cents a pound in the retail market would indicate a general dearth of this fruit throughout the land. Strawberries were never better. They have been so abundant, and the prices ruled so low in the glut of the market, that in some places we have heard of, they were left to rot upon the vines. But these were not the largest and best kinds. Fine berries always sell well in the New York market. Raspberries have been abundant, and sold at good prices. We have never known a glut of this fruit. Currants have been plenty and cheap. The market is improving for this fruit, and we have seen large quantities of the Cherry and other large varieties at 10 to 20 cents per pound at wholesale.

The wheat harvest of the South is gathered, and has been a great relief to the necessities of the famishing districts. The reports made to the Agricultural Department at Washington show an increased acreage of twenty per cent. devoted to this grain, and the yield has been among the best upon record. In the large wheat growing districts of Pennsylvania, and the States lying west, they are gathering the wheat crop, under the most favorable auspices, as we go to press. It is admitted on all hands that the wheat never looked better, and, in recent years, has not been less troubled with insects, rust, or falling down. Reports from the newspapers in Missouri are highly favorable. The weather is fine, and the yield of wheat bountiful. In Central and Southern Illinois the harvest is glorious, and the earth burdened with countless stacks of the golden sheaves. All through Southern Kansas there is an unusually large crop. In Western New York, the appearance of the crop is said to be encouraging. The wheat crop is heavier than it has been for years, and the area of ground sown having been enlarged, there will be a handsome yield. From these and many other reports, we think the yield of this grain cannot be less than two hundred millions of bushels, and from present appearances, it will be gathered in good condition. Rye is much less cultivated, but has a good report from all quarters. Oats and barley are doing well in the sections where they are raised.

It is too early to prophesy concerning Indian corn, which is the king cereal of our country. Its prospects have been somewhat damaged by the cold and rain of May and June, but it is now looking of good color. Reports generally are favorable. July and August make the corn crop.

The season has been very favorable for grass and hay. Butter and cheese have been plenty, and of good quality. The hay crop will be abundant wherever the soil is in good condition. We are now in the midst of the hay harvest, and it is generally admitted to be abundant.

The large promise of apples and pears will not be realized in the East, probably not more than an average crop, which indicates a good market in New York for all the fruit the West can send us. Of grapes it is too early to speak, though the vines are said to be looking well. Peaches in Jersey and Delaware will be plenty.

The great crops of the South, corn, cotton, and tobacco, are doing quite as well as could be expected under the circumstances. In the Mississippi Valley there were extensive breaks in the levees, and wide spread destruction therefrom. In other parts on the sea-board there have been excessive rains and overflows, but the damage is confined to the low lands in the river valleys. In some parts there are complaints from the freedmen, that they are diverted from their labor by political speakers, who are anxious to indoctrinate them in their duties as citizens. But notwithstanding these drawbacks, the reports from the South are in the main of a cheerful character. The freedmen are better paid, and work better than last year. The feeling for the future, growing out of the prospects of the crops, is very hopeful and jubilant. In North Mississippi they have devoted three-fourths of their land to bread-stuffs; the cotton looks healthy, but suffers for lack of the

hoc. About Jackson, they are trying German laborers, and are pleased with the change. In Western Tennessee, two-thirds of the land is said to be in corn and the small grains, which last have been gathered with a fair yield. We have recently conversed with a large planter from Southwestern Georgia, who reports the negroes as working well generally; oats a good crop, and, being fed unthreshed, a great relief to working animals; wheat very good, corn looking well, and fruits abundant. The cotton crop is promising, and planters in his section estimate it at not less than three millions of bales. We have seen this estimate made in other responsible quarters. The apprehension is felt that the crop may be so large as to carry prices down below a remunerative point. In spite of the tax, which we think a great blunder on the part of the Government, cotton is likely to be the main crop in the Gulf States for generations to come. On the whole, the crop prospects are eminently satisfactory, and indicate a profitable trade for the coming fall and winter.

THE CROPS OF EUROPE.—The prices of grain in this country depend very much upon those of Europe. Almost all our surplus crosses the Atlantic, and a heavy European demand, or the prospect of wars, which will interrupt the regular supplies, at once puts our prices up. It is still too early to be able to judge of the wheat crop of Europe. By the last advices the weather was so good, that, though the stock of wheat in first hands was reduced so low that its amount could hardly be estimated, yet markets were dull, and the general expectation of a full harvest caused an unsettled state of prices, which will no doubt continue until the question is settled, and the harvest in good part over. In Great Britain, a large part of the hay had been secured in unusually good order, and though the weather was cold and unfavorable for grains, yet, with an abundance of hay, farmers were feeling very well satisfied.

A New Era in Poultry Breeding in America.

We have expressed ourselves plainly in regard to the sad demoralization of most poultry breeders who raise birds for sale. That the grossest frauds are intentionally and unintentionally practiced, will not be denied. One reason is that poultry fanciers in this country have no sure standard of excellence to guide them. Judges at fairs decide awards upon the same principles that they would judge of hogs or sheep, without knowing the very accurate and uniform points of color, of form and feather, by which the various breeds of poultry are raised and judged of in Europe, and among poultry fanciers of intelligence in this country. Now a society of energetic men has been formed to disseminate knowledge, to correct faulty standards, and establish good ones. We know many of the gentlemen who formed the society, and believe that it was done from the real love of beautiful domestic poultry and their breeding. Some have, and will have, birds for sale, others have not, and never will have, but in the society they meet as lovers of poultry, and breeders, and not as merchants. We hope much from their exhibitions and from their annual reports, but more from the spirit of honorable rivalry, of thoroughly honest dealing, and of fair investigation, which seems to animate all. The members of the society are now located at the North, East, and West, others will join from the South, and by interchange of birds, and opinions, and free discussions at the gatherings of the society, it is not too much to expect a new era in poultry breeding in America. We append a brief report of the meeting for organization.

THE AMERICAN POULTRY SOCIETY.—Pursuant to the call noticed in the July number of the *American Agriculturist*, a meeting was held at the Cooper Institute, in this city, July 10th. Those present represented several States of the Union, and much enthusiasm prevailed, all agreeing in the desirability of establishing a Poultry Society, national in character. A committee, consisting of Messrs. A. M. Halsted, S. M. Saunders, and J. C. Thompson, submitted a draft of a constitution, which, after thorough discussion, was unanimously adopted. The first article indicates the purpose of the society. It is as follows: "This association shall be called 'The American Poultry Society.' Its object shall be to increase interest in, and promote the improvement of poultry breeding and management in this country, by adopting standards of excellence, by public discussions and exhibitions, by collecting and disseminating intelligence, and by such other reasons as may be deemed advisable." The terms of membership fixed upon, are the payment of \$3 a year. The names of thirty-eight gentlemen were enrolled as members, and the following officers were chosen to hold their places until the annual election, to be held the second Wednesday in October. *President*, J. G. Finnie, Esq., 11 Wall-st., New York; *Vice President*, James E. Mallory, Tarrytown, N. Y.; *Recording Secretary*, W. A. Fitch, *American Agriculturist* Office, New York; *Corresponding Secretary*, C. M. Saunders, corner Cedar and Pearl-streets, New York; *Treasurer*, J. C. Thompson, Tompkinsville,

Staten Island, N. Y.; *Auditor*, A. M. Halsted, 63 Pearl-st., New York. These form the Executive Committee.

Editorial Jottings in Europe.

[Mr. JUDD, in making a summer's tour on the other side of the Atlantic, went for the express purpose of securing rest, though expecting to glean much information which will be indirectly useful to our readers hereafter. He expressed the determination to abandon his pen and everything that has the slightest connection with work for the mind. Still, he sends home occasional social letters, and we shall take the liberty to give some brief extracts that will interest others, perhaps, as well as ourselves.—ASSOCIATE EDITORS.]

.... *Mid-Atlantic, June 3d, 1867.*—For five days we have been driven eastward by both steam and wind power, about 300 miles every 24 hours. Our good ship, the "Tripoli," tossed and rolled by the waves, like a floating cork, though built wholly of iron, keeps her straight onward course, regardless of wind or tide. As usual, I refuse any tribute to Old Neptune. Most of our company make at least an hourly contribution. I already begin to feel the exhilaration of absolute freedom from business cares, and every day's journey is adding to the broad sea wall that separates me from routine work. I really feel free for once—the first time in a dozen years, or more. Five years ago to-day I was in precisely the same latitude and longitude, and for the same object, but the depressing anxiety for the fate of the armies and of our country, gave little reason for calm quietude, and the disasters to our soldiers on the Peninsula, magnified by the interested London editors who were holders of Confederate Bonds, so distressed me that I hastened home, worse jaded than when I set out. God grant that no troubles, political or financial, may this year interfere with the quietude and rest I seek.

.... *Cork, Ireland, June 10th.*—All well. Yesterday afternoon we were landed at Queenstown, in less than 11 days' running time from New York, despite several days of severe storm. I could wish every friend crossing the ocean might have as good a ship as the Tripoli, and as good officers as Capt. Martyn and his associates. ... Not a single profane word has been heard from officer, crew, or passengers, and not even a discourteous look. Everything possible to be done, has been done to make every one comfortable, and at a meeting of the passengers on Saturday, a unanimous and hearty vote of thanks was given to Captain and men. To-day we rode out 15 miles through the country, visiting "Blarney Castle," and kissing the "Blarney stone" of course. This is a beautiful region. I am sure that without something wrong in the political, social, and religious condition of the country, no Irishman would ever leave such a fertile and lovely land as this.

.... *Londonderry, Ireland, June 14th.*—During the last four days I have passed through the entire length of the "Emerald Isle"—a distance of full 300 miles as we traveled—and stopped nearly a day each at Dublin and Belfast. I confess, I have fallen in love with the country. You need never think of Ireland as a poor barren country. Nowhere in America can you travel 300 miles and see so beautiful, so fertile, and so well cultivated a region as that I have just traversed. With few exceptions there is a succession of thoroughly tilled fields, clothed with luxuriant crops. I suppose there are barren sections on the island, but I have not seen them. The farther we came north, the more beautiful has the country appeared, and right here, away up to the very shores of the Northern Ocean, and as far north as Hudson Bay in America, the farms fairly rival in beauty and luxuriance, and good culture, the finest regions of South-eastern Pennsylvania, or the Genesee Valley in Western New York. The living hedges, instead of fences, of course increase the attractiveness of the rural scenery. ... Had I not seen scores, if not hundreds, of beggars, everywhere in the streets of the towns I have passed through, I should wonder greatly whence come the millions of poor that have flocked from these shores to our own land. There is another explanation. Every now and then the attentive and polite railway officials have pointed out to me a village and its surrounding country, remarking that "they belonged to such and such" a "lord," or "baron," or "earl," etc. Divide the soil among the people, as in America, and there will be a different state of things.

.... *The "Giant's Causeway."*—The sun rises here now a little after 3 o'clock, A. M., and sets about 9 P. M., and the twilight continues nearly all night. I am writing this by daylight, at 9½ P. M.! Last night I stopped at Portrush, some 40 miles northeast of Londonderry, and taking advantage of the early sunrise, rode 7 miles east to the noted "Giant's Causeway," a mass of regular columns four or five thousand in number, just out from the sea, presenting a most wonderful exhibition. Let no one fail to see this natural phenomenon. It far exceeds my previous conceptions. I will not attempt a description, when so many abler pens have failed.

Containing a great variety of items, including many good hints and suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

How to Remit without danger of loss.—Checks on New-York Banks or Bankers are best for large sums; make them payable in all cases to the order of Orange Judd & Co.

Post Office Money Orders may now be obtained at nearly every county seat, in all the cities, and in many of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, as many hundreds have been sent to us without any loss.

Registered Letters, under the new system, which went into effect June 1st, are a very safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. Observe, the Registry fee, as well as postage, must be paid in stamps at the office where the letter is mailed, or it will be liable to be sent to the Dead Letter Office. Buy and affix the stamps both for postage and registry, put in the money and seal the letter in the presence of the postmaster, and take his receipt for it. Letters sent in this way to us are at our risk.

Fairs.—Who are the Officers?—We desire to have, and to keep regularly, the names of the officers of all the Agricultural Societies in the United States. Will those interested in such institutions, please forward them, and also notify us when changes are made? Also please state time and place for holding next exhibition; we shall publish as complete a list as can be made. Be particular to give in each instance not only the name of town, but that of county, and STATE.

The Death of the Commissioner of Agriculture.—The Hon. Isaac Newton died at Washington, in June last. Though we have at times felt it our duty to be rather severe on his official acts, we believe that he did as well as he knew how, and that he was socially a kind man, but placed in a position for which he was naturally unfitted. Rumor has mentioned the names of some dozen or more, as likely to be nominated as his successor, but at the time of our writing, no nomination for the position has yet been sent to the Senate.

Chemistry of the Farm and the Sea.—This title covers a series of familiar, short, and interesting essays by Dr. Jos. R. Nichols, of Boston, editor of the Boston Journal of Chemistry. The subjects treated, besides those named in the title, are the chemistry of a bowl of milk, of the dwelling, of a kernel of corn, and of the sun, obscure sources of disease, the action of water on lead pipes, and bread and bread-making. Published by A. Williams & Co., Boston, of 123 pages, 8vo.

Sundry Humbugs.—The number of letters received during the last month from parties who have been insulted with piles of circulars from the various swindling shops, is not as large as in some previous months, and they come from fewer sources than is usual; but several of the old offenders are still operating, notwithstanding they have been arrested and held for trial under bonds, and their places cleared of the thousands of circulars, envelopes, etc., which was the bulk and substance of all they contained. The wonder is that people can be so easily taken in and swindled; in fact, it appears as if they were not only willing but desirous of being humbugged, and of paying for the operation. One of our correspondents writes that he sent forty-five dollars to Stoddard, Maguire & Co., Baltimore, whose circular is word for word like C. H. Garland & Co.'s, and received goods which he invoices thus:

2 Brass Watches, worth.....	\$0.00
1 White Watch ".....	0.05
1 Pistol ".....	0.25
12 White Spoons ".....	0.10
1 Brass Chain ".....	0.00
1 Plated Pin ".....	0.10

Grand total.....\$0.50

Such trades are of daily occurrence, and yet the people are infatuated with the idea that somebody is going to give them, as a particular favor, five, ten, or a hundred times the value of their money, for the sake of inducing others to try the same operation, and get gulled. J. E. Brennan & Co. send out their circulars, representing that they are determined to send a good prize to your neighborhood, and have accidentally met with your name, etc., etc., and if you will send them twenty dollars in gold, they

will send a package of tickets, and if these don't draw eleven hundred dollars in gold, clear of all expenses, they will send another certificate in their Brilliant Extra Lottery Scheme.... *Frank Mass & Co.* send a circular precisely similar, only for ten dollars they want you to draw twelve hundred in gold. Of course, whoever "goes in" loses his coin.... A. A. Kelley, who was shown up in the July number, is still selling his lottery tickets, and swindling all those who are foolish enough to buy. May 22d, 1867, Kelley issued a flaming circular, headed "Important Announcement!" To the patrons and agents of Kelley's First Grand North American Gift Concert. Of 500,000 tickets issued, only a few remain unsold. The delay in its completion has been unavoidable, and we have been compelled to extend the time of the first concert to Saturday, July 13, 1867, when it will positively take place at any cost, without further postponement, at Cooper Institute, New York City." Now, TAKE NOTICE. Saturday, July 13th, an advertisement appeared in the New York Herald, headed "Kelley's Grand North American Gift Concert. A card. TO TICKET HOLDERS, ETC. We have found it absolutely necessary, in justice to our patrons, to extend the time of the first concert for a few days, owing to the detention of our mail, containing thousands of letters, by the postmaster of Chicago, etc., etc." Peter Cooper, Esq., informs us that Kelley has never even engaged the hall for his grand enterprise, and furthermore that he cannot have it for any such purpose. Kelley in his last advertisement says, "Our sales have been immense, our success complete." Of course it has; success to him is to fill his pocket with other people's money, but this promise that his "Grand Gift Concert will positively take place without further postponement, July 13, at Cooper Institute," while the hall was not secured, and the concert did not take place, we hold up as a mirror in which our readers may see the man.... Matthew Westbrook sends a great variety of circulars, offering fortunes for very little money. Among the lot thus advertised are the "Continental Tea Company," "The Metropolitan Jewelers' Association," "American Album Watch," "Sporting Greenbacks"—and vile things, too vile for decent people to read. On one of his circulars we find: "Our stock consists in part of 1400 pianos, 600 melodeons, 700 cabinet organs," etc., etc., etc. Matthew was arrested July 3d, in the afternoon, for selling lottery tickets, etc., had an examination, was held for trial, and, for want of ready bail, was sent to the lock-up, protesting most earnestly against this method of celebrating Independence. In clearing out his place, the officers failed to find any of that big stock of musical instruments, etc., the particulars with regard to which are seen in the *small bills*. The stock consisted of a pile of circulars, as usual, worth three cents per pound, electrolyte plates of the Sporting Greenbacks, a few pounds of tea, etc.... Many other smaller concerns of similar character are still sending out their circulars, and gulling the people. Most of them have been already shovled up in our columns, but are still out of the penitentiary, though they ought to be in it, because, as Mr. Beecher said in his sermon, of July 14: "If a man wants to have justice in the courts of New York, it would seem as if he should go there with his purse in his hand. We have heard of corrupt judges. We have heard men speaking of the judiciary of the city of New York, which stinks like Sodom and Gomorrah. They buy and sell justice. They are seeking for pelf, they sell the sanctity of their crimes." We warn all our readers against lotteries of every kind. Anything and everything that has prizes to be drawn for, is a violation of the civil and moral law, and here we mean to include all such drawings at church and charitable festivals, fairs, etc. Those who sell a hundred tickets, more or less, at \$1 each, for a share in a twenty dollar Bible to be drawn or raffled for, are violators of the State laws, and such practices should be discountenanced by all good people. A cause that cannot be sustained by honest and honorable means is not worth sustaining at all. We caution our readers again against quack doctors, (don't write to us about them, we don't know them, and don't want to.) quack medicines, quack traders, and quackery of every kind. Millions of dollars would be saved annually to honest people by heeding this warning.

Manure Frauds—The South Chiefly Victimized.—Our attention is seldom called to fraudulent dealing in pretended fertilizers, when we do not find that the planters and farmers of the Southern States are the great sufferers. A case of most glaring fraud has lately come to our notice in this way. A gentleman having a deposit of excellent shell-marl in Virginia, where it is easy to load vessels with it, was brought in contact with a Baltimore chemist, who proposed to him to manufacture it into a fertilizer fully equal to Peruvian guano, at a very low rate. A sample was furnished of a "manipulated" fertilizer he was then making, and selling for \$40 or \$50 per ton retail, and the manipulator agreed to make an article equally valuable, using the marl as a basis. He took also some of the marl and prepared a

sample of what he would furnish. This was sent by us to Prof. Johnson, of the Sheffield Scientific School, New Haven, for analysis, and we soon learned that it was, as we presumed it would prove, of no value as a high-priced fertilizer. It is probable that the rascally "chemist" had added nothing whatever of manurial value to the marl. The marl itself has value where it can be liberally applied, and the cost of transportation is not much. Our friend was thus saved the loss and shame of being involved, with his friends, in so disgraceful an enterprise, but the fact remains that the chemist continues to make and supply to the southern trade, the worthless article of his own, at a high price. The man actually pretended to court investigation, and to be perfectly willing to have the stuff analysed, thinking in this way to bluff off investigation, by a show of honesty and conscious rectitude. His name is Carey, as we understand, and the "fertilizer" is called "French Manipulated Guano," or some similar name. There are more birds of the same feather.

Drainage—Agricultural and Sanitary.—Among the Book Advertisements of this number will be found a notice of "*Draining for Profit and Draining for Health*," by Col. Geo. E. Waring, Jr., whose Essay on Tile Draining in our Agricultural Annual for 1867, has attracted such favorable attention. After a careful reading of this work, we are impelled to speak more strongly concerning it than is our custom with regard to the publishing firm with which we are associated, for we think that both the importance of the subject and the merits of the work demand that it be commended to the notice of all our readers. The *New York Tribune* says of this volume:—"Every page is lucid and practical; and he who works with this essay in hand can hardly fail to drain thoroughly and permanently. We exhort every one who meditates draining even one acre to obtain Col. Waring's treatise, for it will save him many times the cost." It might have gone still further, and added that every one who owns an acre of land that, at any time during the growing season is too wet for the best cultivation, will find therein arguments to convince him that he cannot afford to have it undrained. The questions of cost and profit are discussed with great fairness, and in a manner to induce even the most "practical" farmer to drain his wet lands. In fact, of all the books and essays on draining that have been published in this country or in England, none is so readable, clear in its directions for practical work, and convincing in its arguments for the necessity and profit of tile drainage and improved sewerage as this. Col. Waring's experience during the four years that he held the position of Agricultural Engineer in the Central Park in New York, and in an extensive private practice, has fitted him particularly well for the preparation of a manual of the art of draining, and he has performed the task with entire fidelity.

Massachusetts Agricultural College.—The Old Bay State, after some preliminary difficulties, is soon to have a college for farmers' boys in complete running order. It is not surprising that there should be differences of opinion among highly intelligent men as to the organization of an Agricultural College. In this country it is an untried experiment mainly, and the few agricultural schools that have been started have not done much to dispel the popular prejudice against agricultural education. The abiding conviction of farmers is, that education, beyond the rudiments, is a dangerous thing for a farmer's son, and if he attempts to master the science of his calling, he is pretty sure to have a call to some other business soon after he opens his books. The great majority do not believe that a young farmer can have any education, to fit him for his business, half so good as that which he can get upon the farm; and if that be the case, agricultural schools and colleges are humbugs. They may make scholars, but they fail to make farmers. The Trustees of the Massachusetts Agricultural College have another idea, and are going to give it a fair trial. It will succeed in Massachusetts if anywhere. Through the efforts of Prof. Clark, of Amherst, they have secured 400 acres of land, admirably adapted to their purposes, about a mile north of the literary institution, and just a convenient distance from the village. Any one who has ever had occasion to buy five contiguous farms for any public enterprise will know how to appreciate the professor's labors in this behalf. The site for the principal buildings has been selected, and a dormitory, built to accommodate 48 students, a dining hall and a laboratory, are now in a state of forwardness, and will be ready for use before the beginning of the college year, which is October 1st. It is expected that a corps of instructors will then be on hand, and, what is rarer in these enterprises, a body of students to meet them. There is to be a regular and a special course of instruction, the first to embrace four years, and to ground the student thoroughly in the science and practice of agriculture. This proposes to take boys of 14 years of age and upward, and to give them a good education cheaper than they can get it elsewhere, and in one of

the most healthful and beautiful regions in the country, distinguished for the high moral and social cultivation of its people. The special course will be arranged for the fall and winter, for the benefit of those who can devote but a few weeks or months to agricultural studies. A spot has been selected for propagating houses and a botanic garden, in which it is designed to have specimens of all the trees, shrubs, and flowers that will flourish in that soil and climate. The Pinetum is to be upon the north and east side of a hill, that overlooks the whole farm—a natural locality for pines and hemlocks. It is proposed to have here all the new varieties of evergreens that promise to be hardy, and to serve for ornamental planting. About twenty thousand dollars have been given for this Botanic garden, but this is not half enough. We hope some gentleman of liberal ideas, who has a spare fifty thousand dollars, will endow this garden, and enable the trustees to give us a good arboretum, and thus do well what has never been done at all in this country. This school of agriculture has no connexion with the literary institution in the same place, known as Amherst College, except the privilege of access to its cabinets and libraries, which are among the best in New England. We are happy to commend this new institution to our readers, and shall be greatly disappointed if it does not meet a want that has long been felt for the sons of farmers, and of men in other pursuits.

Barley—Early Sowed.—"L," of Middlefield, Mass., gives his experience in answer to the objections of J. S. C. to sowing barley early, (p. 244, July No.) as follows: "Seeing a suggestion a few years since about sowing carrots early, to have them get a start of the weeds, I sowed about 90 square rods of very weedy ground with 2½ bushels of barley that had foul seed in it, as early as I could work the ground, and harvested 26 bushels of extra clean barley. I don't think there was half a pint of foul seed in the whole lot. Whether it was the result of sowing early or not, I can't tell, but think it was that and the heavy seeding together, for, after raking off the barley, the stubble was pretty full of weeds."

Should Animals be Shown in their Natural Condition?—Mr. A. C. Clarke, of Henderson, Jefferson Co., N. Y., writes: "I find the following useful and truthful statement in 'Walks and Talks,' of the April No. of the *Agriculturist*, p. 130, 'In the case of animals that have been bred for generations for the sole purpose of producing a large amount of flesh and fat in a short time, a fleshy condition is perfectly natural and will not prove injurious, unless carried to excess.' To what animal can this truth apply so well as to the hog? The same author says, 'I have a thorough-bred Essex sow, that, compared with ordinary sows, was excessively fat, and at ten months old had a fine litter of six pigs.' I ask, is it not better, then, to breed hogs whose natural condition is fat rather than lean? The Agricultural Society of the State of New York offers a premium for hogs 'not too fat to breed.' I have been denied a premium on an 'improved Cheshire sow,' because she was 'too fat to breed,' and yet within two weeks after she had a litter of ten fat pigs that sold, at six weeks of age, at \$20 a piece, and the pigs of the lean sow, that took the premium, were not worth, and would not sell for, more than \$2.50 a piece. Now, the natural condition of the improved Cheshire hog is fat. Though a large breed, I have bred a great many of them that, at one year of age, on coarse food and no extra care, would weigh from 500 to 700 pounds. The pigs are fat, many exceeding 350 pounds, and some 400 pounds, at nine months old. A neighbor fattened one last fall that weighed at nine months and six days 429 pounds. Would not the judges who inspect hogs for a premium at our State Fairs do well to take into consideration the natural condition of the animal?" Certainly, but Mr. C. will admit that an improved Cheshire sow may be too fat to breed, and, if so, ought not to show as a breeding sow.

Pork Raising.—Bidwell Bro's, of Minnesota, suggest that great good might result by calling attention to the unprofitable course pursued by many in pork raising. They say: "In the fall all the largest pigs are fatted and killed, while the smaller ones are left to winter over. These have pigs the next season, and so the evil is continued. From severe cold or want of proper food in winter, or both, they become stunted, and make no heavier pork than spring pigs. The same cause reduces the number of pigs in their farrows. We ought to select the largest and best sows for breeding, and keep them year after year. They should come in early in spring, and be well fed, and the size and number of their progeny will be increased, and early maturity secured."

The Fairs.—The managers of Agricultural Fairs make a great mistake in not putting forth their announcements in time for exhibitors to be able to study their routes over months beforehand. We would

gladly publish in August a full list of fairs, with the names of secretaries, so that the thousands of owners of valuable patented articles, who look to our journal for information, may be able to get it, and form their plans to go, or send their agents, to as many fairs as possible. This is just as important with reference to the county as to State fairs, for the time must all be filled up. The secretary of the State Board of Ohio, has set others an example by publishing early a full list of county and town fairs of his State. If the secretaries of other State Agricultural Societies and Boards of Agriculture would do the same, the cause of agricultural progress would be promoted.

Special to Agricultural Societies.

—Mr. W. A. Fitch, who has charge of the Advertising Department of the *American Agriculturist*, desires to receive proposals from the Executive Committees of Agricultural Societies for the insertion of one or more pages of suitable advertisements in their Annual Circular and Premium Lists. His address is 151 Nassau-st., New York.

Death of Thomas Brown.—An open-handed, free-hearted, big-souled man, fair-minded, just and honorable, a warm, true friend, and genial companion, was Thomas Brown. He was a lawyer of Cleveland, Ohio, established the Ohio Farmer, which is now in its 16th volume, a protectionist and liberal politician, a warm personal friend of Chief Justice Chase, by whom, while Secretary of the Treasury, he was made one of the special agents of the Treasury Department, which office he held at the time of his death, having exercised its functions with great success and credit to himself, both at San Francisco and in New York. His interest in agricultural subjects never abated. All who knew him will mourn his death, which took place in Brooklyn, N. Y., June 13th, cutting short a vigorous manhood in its very prime.

Death of John A. King.—This distinguished citizen, ex-Governor of the State of New York, ex-President of the State Agricultural Society, the recipient from the people of many offices of trust and honor, died on the 8th of July, at his home in Jamaica, L. I. He was born in 1788, has long been prominent as a friend of improved agriculture, and was an active member of the Queens Co. Society, and of the State Agricultural Society, while his health permitted. He was a good farmer and neighbor, a liberal, polished Christian gentleman, bringing down to our, perhaps, too democratic times, the dignity of bearing and grace of manner which characterized the "old regime." Mr. King united with his friends and neighbors in celebrating our National Anniversary just passed, and made a short address, alluding to himself as passing away, and his work as done. A day or two only elapsed before he encountered a paralytic stroke, to which his life soon yielded.

A Portable Pump invented by Mr. N. Page, Jr., was exhibited at this office a few days since. The instrument is very simple, of little weight, requires very little exertion to operate it, and is susceptible of many uses, not only as a convenient pump of small capacity, but also for syringing in Green-houses, watering plants, washing wagons, windrows, etc. It is so constructed as to throw a single stream thirty to forty feet, which, without change of nozzle, may be instantly changed to a coarse spray or fine mist, at the will of the operator. An advertisement of it appears on page 307.

Leached and Unleached Ashes.—E. C. Long, Erie Co., N. Y. At the prices you name (three and twelve cents per bushel) it will probably pay to buy both leached and unleached ashes for manure. Leached ashes usually contain but very little potash, but they are valuable for other ingredients, and on much farm land where the mechanical as well as the chemical effects of ashes are desirable, produce marked good effects.

Subjects on which Subscribers need Information.—"Rheumatism" affecting turkeys, curling up their feet. Their health otherwise being good. Cause and cure wanted.

Cause of the sudden death of calves, taken, some sucking, and others after having been weaned. Symptoms:—They refuse to eat or suck, fall, go into spasms, and soon die, frothing at the mouth.

Reason of ewes eating their lambs, and the cure. In regard to this, C. F. H., of Nebraska, writes:—"I have been troubled for three seasons by ewes eating their lambs. Last year, I found out the guilty one, and knocked her in the head; she was eating the lambs of other ewes. I thought I was rid of the trouble, but this season it appeared to be as bad as ever. I killed the one I caught at it, but that does not seem to prevent the difficulty. They eat off their feet as soon as they are born.

The Double Deutzia.—Two years ago this month, we figured the Double Deutzia, then a recent introduction from Japan. Our figure, which was taken from a green-house specimen, scarcely did justice to the shrub. Now that it is becoming more common, fine specimens may be seen, and certainly nothing can be more beautiful; the flowers are very double, and the outer petals have just a tinge of pink. It is perfectly hardy, a free bloomer, and the flowers are admirable for bouquets.

Fill up the Clubs, and select the premiums. All subscriptions sent in this month, whether commencing with January or July, will count on the premium lists. A few thousand more names may yet be added to this year's list by a little vigorous effort. *Will you have a premium?* See also Special Premiums, p. 276.

Geyelin's Poultry Breeding.—An English book of G. K. Geyelin, C.E., entitled "Poultry Breeding in a Commercial Point of View," etc., has been republished by A. Williams & Co., Boston, Mass., with an introductory preface, by Chas. L. Flint, Secretary of the Massachusetts Board of Agriculture. All contributions of new ideas on the subject of poultry raising, from persons who have given real *thought* to the subject, are of value, and for this reason we place a high estimate upon all that Mr. Geyelin writes. It is not usual for practical men, or those who have put their theories and plans to the test of real use, "in a commercial point of view," to write out their *views*, and say not a single word about their results. There is a real practical and excellent chapter in this book on poultry breeding in France—the report of a visit of Mr. G. K. G., in search of the fabled monster poultry establishments of that country. This chapter was given to the American public, more than a year ago, in an appendix to Saunders' Domestic Poultry. Mr. Geyelin's connection with the establishment of the National Poultry Co., at Bromley, Kent, was not of long continuance, and so, we suppose, his ideas were never thoroughly carried out, still, in many respects, they seem feasible. If any egg-hatching machine will work well, we think the one he describes will be likely to. It displays great ingenuity, as does also his Artificial Hen, and his plan for a large establishment, made up of small independent sections. The book is a neat 12mo. of 127 pages, for sale at our counter, or sent by mail, for \$1.25.

Things by Mail.—Many persons seem to think that they have only to do up a fruit, flower, or insect, in some kind of package, put on the requisite stamps, and place it in the mail to insure its safe delivery. It is the exception that these things reach us in any tolerable condition, and many well-meaning people doubtless wonder why we do not notice their fruit, flowers, etc., while the fact is, their fruit has been converted into "jam" in the mail bags, and their flowers reduced to an unrecognizable pulp. It is quite useless to send fruit, fresh flowers, or insects, by mail, unless they are put in a tin, or other, box so strong that all the pounding the mail bags get, will not crush it. No strawberry has been received this year by mail in good condition. With dried plants we have less trouble, though these are often crushed when put in common envelopes. They should be placed between stiff papers or pasteboards.

The American Naturalist.—We made a brief announcement of the appearance of this journal, and intended before this to call more particular attention to it. The editors have gained by their experience, and each number is better than the preceding one. We have, in the July number now before us, articles on the Sea-Horse and its Young, Recent Bird Tracks, Jelly Fishes, Agency of Insects in Fertilizing Plants, Ice Marks and Ancient Glaciers in the White Mountains, besides a host of smaller items. The whole story is pleasantly told, and those of our readers who have a taste for natural history, cannot do better than send \$3 to the editors of the *American Naturalist*, Salem, Mass., as a year's subscription to this, our best popular scientific journal.

Prong-horn—A Correction.—The spirited drawing of the Prong-horn Antelope, on the first page of the July *Agriculturist*, was erroneously credited. The artist who made the drawing is William J. Hays.

Schrader's Bromus.—In July, 1866, we gave a figure of this grass, and showed what the thing put out under the name of *Bromus Schraderi* really was. We also, upon general principles, expressed our doubts as to its value. In the *Agricultural Gazette*, (English), for June 20, we find an article upon those plants that have been forced upon the community by means of "testimonials," which says: "Schrader's Bromus, then, is another example of a plant unduly urged upon the attention

of cultivators—another example of the way in which advertising seedsmen injure themselves, one another, and those with whom they deal, by those extravagant announcements to which we thus call their attention, as damaging the agency by which alone satisfactory business relations can be established between them."

Additional Strawberry Notes.

We have figured on page 291 most of the novelties of the present season. We intended in those notes to say a word about the unfavorable circumstances under which many of the sorts were exhibited at the American Institute. In many instances the rains had prevented the fruit from ripening properly. This was particularly noticeable with *Durand's Seedling*, a variety of which we gave a figure last year, and expressed a favorable opinion. Though good-sized berries were shown, they were flavorless, the flavor having been washed out.

Abraham Lincoln.—There is some trick about this berry somewhere. If there is a distinct sort with this name, we do not know it. We hear that the *Agriculturist* has been sold under this name, and we know that, at the show of the American Institute, the berry shown, under that name, was not different from the *Jacunda*. There is some trickery in this. If any one has a true and distinct seedling that he has called *Abraham Lincoln*, we shall be glad to get it, and if it is distinct, to make it known.

Doctor Neaise.—We have known of this variety through the French Horticultural Journals, but never had the pleasure of seeing the fruit until Messrs. Frost & Co., the well-known nurserymen of Rochester, sent us specimens. To insure their delivery, Messrs. F. & Co. wrapped each berry in cotton batting. This quite dried out the specimens and took away their flavor.—We can only say that the fruit is very large, has a good flesh, but under the circumstances cannot give an opinion as to its quality.

New Music Store.—We have received a package of music published by C. H. Ditson & Co., 711 Broadway, New York, and O. Ditson & Co., Boston. It gives us pleasure to notice the establishment in this city of a branch of that old and justly distinguished music publishing house, Oliver Ditson & Co., and we heartily wish to the new firm a like honorable and successful career. Purchasers of music, musical instruments, etc., will find these firms worthy of their patronage.

The Results of the Harvest.—In the cities business is very dull, and were it not that men have been cautious in their dealings, and have long looked for a time of financial trouble, there would before this have been serious embarrassment. One hears on every corner reference to the crops; every traveler is inquired of; the newspapers stretch out long columns of dry facts, and estimates of probabilities, and the weather and its influence is discussed on all sides. The farmer has the responsibility of *gathering well* the good crops vouchsafed by a bountiful Providence. With plenty here of all the ordinary crops, prices will range low enough to enable us to ship wheat and flour and corn to Europe, no matter how good the crops are there. With the wheat and corn, our debts to Europe will be paid, gold will even begin to flow this way, perhaps, and business of all kinds will revive. The farmers who can demand and get the money, cash down, for their grain, if they sell at fair prices, will be the first benefited, for they will be able to take advantage of the prevailing low prices of articles of clothing, etc. Very soon, with a buoyant money market, goods now held very low, will be "marked up." The results of the harvest of spring grains, and the prospects of the corn crop, will attract public attention after this, as of great importance. We hope our readers will favor us with brief statements of the weather as affecting these crops, and the results as soon as known.

A Lady's Invention.—The Garment Constructor, advertised in another column, is an ingenious arrangement for fitting dresses, etc. Ladies of our acquaintance who have tried it, say it works admirably, and especially in fitting forms of irregular shape.

Plea and Testimony for the Robins.—"B. Bros.," St. Paul, Minn., writes: "We observe your correspondent's indictment against the robin, and would ourselves feel guilty to have sentence passed upon him without giving our testimony in his favor. They reached here about the middle of April, and busied themselves eating sumach berries until it became warm enough for the appearance of insects. We had two or three acres of borage plowed late in the fall, which, on the first days of warm weather in May, was almost alive with squash bugs. The robins left the sumach, and for several days remained the greater part of the time on the plowed ground, eating millions of the bugs as they appeared on the surface. So well satisfied were we with the destruction of the bugs that we planted an acre of squashes, which are growing finely, unmolested."

Strawberry Show of the American Institute.—The American Institute arranged for an exhibition of Strawberries on June 18th, but the unfavorable weather induced a postponement until the 25th. In consequence of this change, the show was not so large as the very liberal premiums should have brought out. The quality of the fruit more than compensated for the lack in quantity. Several new berries were shown, most of which are noticed on page 291. Though some of the principal prizes were, for reasons satisfactory to the judges, not awarded, we must commend the liberality that proposed them, and we hope that such generous efforts in behalf of horticulture may in the future lead to satisfactory results.

The following are the premiums awarded:

Premium Offered by Dudley S. Gregory, \$50. For the best collection (not less than 25) of named varieties in bearing, to be exhibited in pots not more than 10 inches in diameter—Reisig & Hexamer, New Castle, N. Y.

Premium Offered by Salem H. Wales, Esq., \$25. For the best collection (not less than 20) of named varieties, one pint each—Reisig & Hexamer, New Castle, N. Y.

Premium Offered by Wm. H. Butler, Esq., \$12. For the best collection (not less than 19) of named varieties, one pint each—Frank Brill, Newark, N. J.

Premium Offered by Nathan C. Ely, Esq., \$6. For the best collection (not less than 6) of named varieties, one pint each—E. Williams, Montclair, N. J.

For the best plant (in fruit) of any kind, to be exhibited in a pot not more than 10 inches in diameter, \$5—S. Spingstead, Unionport, N. Y.

For the 3 heaviest berries—S. Spingstead, Unionport, N. Y.

For the best quart of Agriculturist, \$3, James M. Betts, Stamford, Conn.; for the best quart of Austin, \$3, Frank Brill, Newark, N. J.; for the best quart of Durand's Seedlings, \$3, Frank Brill, Newark, N. J.; for the best quart of Green Prolific, \$3, Frank Brill, Newark, N. J.; for the best quart of Ida, \$3, E. Williams, Montclair, N. J.; for the best quart of Jucunda, \$3, Frank Brill, Newark, N. J.; for the best quart of Lennig's White, \$3, Frank Brill, Newark, N. J.; for the best quart of Rippowam, \$3, J. W. Faulkner, Stamford, Conn.; for the best quart of Russell's Prolific, \$3, E. Marshall, Poughkeepsie, N. Y.; for the best quart of Triomphe de Gand, \$3, Mrs. R. A. Kerr, Marlborough, N. Y.; for the best quart of Wilson's Albion, \$3, E. Marshall, Poughkeepsie, N. Y.; La Constante was exhibited by O. Cleveland, Jersey City, but he being a manager, was debarred from receiving a premium.

H. Beecher & Sons, Westville, Conn., for the best fruit basket, \$3.

Twenty-eight varieties of seedlings were exhibited in small quantities; all were presented by T. R. Peck of Waterloo, N. Y., and some of them show good qualities.

THE GREELEY PRIZE.—Regarding the prize of \$50 offered by Mr. Greeley, the Judges, John Ellis, Thomas Mehan, Geo. Thurber, and J. J. Thomas, say that several fruits of great promise were offered for this prize, among which were No. 13, Chas. Downing; a seedling of remarkable size and beauty, No. 30 of Seth Boyden's Seedling; Romeyn's Seedling, a very prolific variety, and Durand's Seedling; but before this premium can be awarded, according to the terms specified, the plants should be examined on the ground to ascertain how they have wintered, and again in fruiting time, by a committee appointed for this purpose.

Notes on Farming in the Grain Districts of Pennsylvania and New Jersey.

—Almost every State has its distinct phases of agriculture, occasioned by its soil and climate, or by its first settlers. Grain growing, which is the leading business in the husbandry of the best portions of these States, is secured by the peculiarities of the soil mainly. The soil which is under the plow is easily tilled, and comparatively free from boulders or large stones. There is nothing to interfere with the plow, the harrow, or the cultivator. For the most part, corn is not touched with the hand-hoe after planting, and even the planting is often done by the drill. Lime is almost everywhere cheap, and with the small quantities of manure made, serves to keep up the fertility of the land with very moderate applications. The farms underlaid with limestone are said to be subject to drought in summer, making them unreliable for pasture. Rye or wheat, oats and corn, are easily raised, and probably pay better than dairy farming. They take less capital, involve less labor, and require less skill. The rotation, corn on a limed sod, oats or a summer fallow, manure and winter grain, either rye or wheat, clover, and timothy are common, making a five or six years' course. There is a uniformity in following this course, without much regard to the nationality of the original settlers.

We come upon the characteristic PENNSYLVANIA BARN, long before we enter the State at Easton, traveling by the Morris and Essex railroad. It is planted, if possible,

upon a side hill, and has one or two stories below the barn floor, where the hay and grain are delivered. The best model has stone gables, and the walls of the lower stories are of stone or brick, laid in mortar, and made rat proof. The entrance to the main floor is directly from the ground on the upper side, or by a broad drive-way of gentle ascent where this is necessary. It is of large capacity, frequently 50 by 100 feet, and will hold several hundred tons of hay and grain. There are deep bays on either side of the floor for hay, and immediately beneath the floor is the granary into which the wheat, oats, and rye are received, when they are threshed. The threshing and cutting of straw, corn fodder, and hay, is all done by horse power. The cut feed is conveyed by a shoot to the stables in the basement, where it is mixed with meal, and fed to the animals. The whole basement is occupied with stalls for cattle and horses. There is a large cistern in the side hill, catching all the water from the barn, and furnishing an abundant supply for the stock. A pipe brings the water from the cistern, immediately in front of the feeding stalls, so that little time is lost in watering. Sometimes a neighboring spring, instead of a cistern, furnishes the water. There is one grand defect in this style of barn—the want of some means near the stalls for the preservation and composting of manures, and with this supplied, we do not know that it could be changed for the better. Manures are not prized so highly as they are further east, and for this perhaps the lime is at fault. It is a great labor to clean out the stables in this kind of barn. The manure is carried out by wheel-barrow or other contrivance, and deposited in the open yard, where, mixed with straw, it lies exposed till the annual clearing out comes in August or September, for the oat stubble or summer fallow. A barn cellar underneath the stables would save largely in labor, and in the value of manure. We think, on many of these farms, from two to five hundred dollars are lost every year for want of a cellar.

PORK RAISING is quite an important item in the business of the grain farm. The pigs are sometimes fed in clover through the summer, but quite as frequently run at large, and the manure is wasted. They are generally fed upon raw corn, and in large inclosures when shut up for fattening. We did not find the small pen well filled with muck or loam, upon which the eastern farmer relies for several cords of his best manure. We believe it pays to have swine sheltered, and to feed with ground and cooked food.

RAISING ROOTS receives very little attention in the grain growing districts. Potatoes are raised for the table, and the yield is quite as generous as in the Eastern States, but we did not see any large fields of carrots, parsnips, beets, mangels, or turnips. Perhaps the climate is not so favorable, but we could not learn that experiments had been tried to test the matter. We think some of the roots would be found to succeed very well, and that they would be found to be a very profitable addition to the stores for the winter feeding of cattle. We suspect room will yet be found in the model barn of this region for a root cellar, and that carrots will become a part of the daily rations of the horse.

THE BREEDING OF HORSES is a common branch of business upon the grain farm, and generally pays well. They are not of any distinct breed, but are larger than those raised at the east. There is a great demand in the seaboard cities for a large horse, weighing from twelve to fifteen hundred pounds, for trucks and heavy wagons, which Pennsylvania, more than any other State, supplies. Almost all the work upon the farm is done by horse-power, and this requires a large force, which, on the eastern farm, is supplied by oxen. The young horses are kept until of snitable age for service, and then sold for from two to five hundred dollars each. Strength and size are qualities sought more than beauty and speed. The horses for exportation are a large item in the wealth of the State.

FARMING BY PROXY is much more common than at the East. The land owner, instead of rearing his farm for a stipulated price, or upon shares, hires a foreman or farmer to oversee and board the laborers. He is not a resident upon the farm, but visits it as often as suits his convenience, and gives such directions as he chooses to the foreman. The compensation of the foreman varies according to circumstances. We found one who received 360 dollars a year, house rent, fuel, and the use of two cows. He agreed to board laborers at three dollars a week, and the laborers worked for 16 dollars a month (wet and dry) and board. Another on a somewhat larger farm received 700 dollars a year with house rent, fuel, and other privileges. He boarded the laborers at a stipulated price, made all the purchases, and sold all the products of the farm, and kept the accounts. Land owners who pursue this course, are generally men of business in the neighboring villages or cities, who see the farm frequently, and keep close watch of the management. They have a farm account, and know the profit or loss of the business. We found one gentleman who farmed in this way, making from 7 to 8 per cent. on his capital, and he could show the figures. He spent money freely, and got it back again.

The Picnic, and How to Go to it.

The picnic is an institution in our cities and villages, and nothing is more common than a general turn out of friends and neighbors for some rural retreat in the dog-days. It is quite as much needed upon the farm, and now that the hay and grain harvests are mainly over, a good time generally should be inaugurated by the young men and maidens of the farm. "All work makes Jack a dull boy." Who should go? Everybody that has done good solid work through the hay harvest and behaved himself; the commodore, who has bossed the work, and done the thinking, and had the tools all ready in season; his wife, who has spread a bountiful table and sent savory luncheon to the field; little Bess, who has mixed the sweetened water, tempered with lemons or with vinegar, and brought it to the field; little Bob, who has rode horse to plow, and raked after the cart all summer; the old folks who have happy memories of harvest days; the good dominie, who has sweat in his pulpit to make your Sabbaths profitable, and you better every day in the week; the doctor, who has taught you to observe the laws of health, and prescribed apples and pears instead of pills—every honest worker, old and young, ought to have a day's release from toil. Where should they go? To any pleasant spot, not too far off to make it a weariness—some river bank, some island, some sea-side resort, some hill or mountain, where there is grateful shade and fine scenery. How should they go? With their own teams, if possible. The railway and steamer will do for poor people who cannot support an establishment of their own. We like independence and a home made picnic. What shall they do? Enjoy nature and society. Do not impose upon anybody the necessity of a lecture, or a speech, or be tied up to any programme. Singing is in order, so is swinging, and silence and quiet, if people like them better. Only get the people together, and let your committee see that each family brings its offering to the festival, and it will take care of itself.

Top Dressing Grass Lands.

A very interesting experiment has been made with various kinds of manures applied to grass, at the State Agricultural College of Michigan. The manures were applied to the plots, from May 5th to 10th, 1864, and the products were carefully cut, dried, and weighed, in July and October of the year 1864 and 1865. The soil was a light sandy loam.

2 bush. of plaster per acre gave an increase of	4,153lb of hay
5 " " wood ashes " " " "	3,942lb "
20 loads of muck " " " "	4,683lb "
20 " " and 3 bushels of salt	5,318lb "
3 bushels of salt " " " "	4,184lb "
20 loads of horse manure " " " "	5,023lb "
20 " " cow " " " "	4,874lb "

This experiment covers two years, and seems to have been carefully made. It gives, without much doubt, the approximate value of these manures as top dressings for light sandy loams. It shows that two bushels of plaster are worth a little more than two tons of hay, and five bushels of ashes produce nearly the same quantity. Estimating hay at 15 dollars a ton, this is a very good price for plaster and ashes. Farmers who want to get ahead should certainly invest.

The experiment also shows the great value of muck in comparison with stable manure, and it is for the sake of the muck argument that we give place to this experiment this month. The muck is shown to be nearly as valuable as the

cow and horse manure, and when composted with salt, is even more so. We wish a compost made of one-third fresh horse dung, and two-thirds muck, had been introduced in the experiment. Something of the value of the horse and cow dung was probably lost by evaporation, which the composting would have saved. We think such a compost would have shown better results than either of the manures specified. Muck must be worth about a dollar and a half a load, delivered upon the field, for top dressing, and if the farmer can furnish it for fifty cents, as many can, he has a strong inducement to enter the muck swamps, which are usually accessible this month and the next. How can farmers be content to do without manure when there is so much profit in applying it with a liberal hand? Muck and its composts can be spread upon grass land with safety at any time after mowing.

Cutting and Curing Grain.

The high price and scarcity of wheat flour of the best qualities, in comparison with the abundance and low price of poor flour, indicate more strongly than any statement we can make, the immense losses our farmers have sustained on account of bad management and unfavorable weather in harvest time. In our opinion, a very serious loss accrues, annually, from the notion, which teachers of agriculture have believed and promulgated for years, that grain

Fig. 1.

ought to be cut before it is ripe, in order to get the most fine flour. The latest thorough experiments seem to disprove this, and so we presume the advocacy of not cutting wheat before it is ripe will be general, and farmers may swing over into the other extreme, and meet with loss from shelling. This is not, however, the great fault of our grain harvesting, especially at the West. Labor is scarce and high; as much as possible is done by horse-power, but the work of binding and shocking is not yet done by machinery, and this is what is slighted. The bundles are poorly made, and they are poorly shocked. The shocks are wet through and through by heavy rains, and more or less by every passing shower. The grain grows, and the shocks mould or become "musty," of course. The market is spoiled, the merchant embarrassed, and the farmer gets poor pay and goes behindhand year after year. Meanwhile he buys a barometer, studies the weather, grumbles, and, perhaps, honestly thinks he does his best, and that the weather must take all the blame. The prosperity, thrift, happiness of any particular agricultural region depends directly upon the good farming, measured by the profits, of its individual farmers. It is therefore for every man's interest to improve his own practice and that of his neighbors as much as possible.

Fig. 2.

In the matter of shocking grain, great improvements are to be made before the country can feel that an abundant crop on the field can be reckoned upon as sure to add materially to the wealth of the nation. We received a communication from John Molony, Jr., of Dubnue

Co., Iowa, a few weeks since, on shocking grain, and since then have taken pains to assure ourselves of the fact, that the common practice in shocking grain over large sections of the Western States is shockingly careless. Mr. Molony writes: "I think there is more grain lost by bad shocking and wet weather following, than

Fig. 3.

in any other way. I generally have a hand to gather the sheaves in piles, twelve in a place, six on the right and six on the left, with a place in the middle for the shock—buts all turned in, and the rows straight through the field. I then commence by taking one sheaf in each hand, by the heads, and set them down firmly on the ground, closing the heads together; then setting two more pairs in the same way, I have six in a double row; I then put two up on each side, making ten in all in the shock, and two left for caps. This makes a round shock, (see fig. 1). I put my arms around the top of the shock and squeeze the heads together—kicking in the butts if they are slanting too much. I then take one of the remaining sheaves, and pull the band back within a few inches of the butt; then put the butt against my chest, the left hand holding up the sheaf, and with the right hand divide the sheaf into three parts, bending the straw first to the right, then to the left, then bend the middle straight down. I put it on the shock and prepare the other cap in the same manner, and place it across the first, and press down firmly, pushing in any heads that may protrude from under the caps, (see fig. 2). We had a fair chance to test my plan last harvest, it being very wet here. The shocks that I put up were perfectly safe, while those that my help put up were nearly all spoiled. The men could not be induced to put the shocks up as I did, but threw from 20 to 25 in a shock—doing pile would be the right name—setting the sheaves down so lightly as hardly to break the stubble, and resting very easily and insecurely against each other. They would break no caps, but only throw five or six on top. With the first wind, down came the shocks; or the weight of so many wet bundles on top spread them and caused them to fall. It is a poor policy to make a shock so large that the cap will not cover it well, and it looks like go-ahead farming to see the shocks of uniform size and in straight rows. My help and others laugh at me, and say that I am too particular, but I find advantage in it, and don't care."

Fig. 4.

The method differs little from the common Eastern practice, in which the number of bundles varies from 10 to 14 in a shock, 12 being usual. When 14 are used, 12 are set as in figure 3. The cap sheaf is made by taking two, having the longest straw, slipping the bands towards the butts a little, then binding them together. It is opened, set over the top of the shock, and well packed down, as shown in fig. 4. This makes, if well done, a very secure thatching, as well as very substantial shock. The use of cotton cloth hay-caps offers an advantage in making shocks stand firmer, but little, if any, better security against rain. These caps which will add

to the firmness of the shocks, should be at least 4 feet square, with loops in the corners, and wooden pins passing through these loops should enter the sheaves near the bands. The time required to put the caps on and off, and to take care of them, is fully equal to that necessarily spent in making good shocks. A good set of caps will often pay for themselves in a single season.

MONEY IN OYSTER SHELLS.—Large quantities of these shells are thrown into the streets in the country villages and market towns. They make a good road bed, but can be more usefully employed in improving the soil. They are easily decomposed by fire and water. Pile any combustible material in a row, about ten feet across and three feet high, as compactly as possible. Brush, turf, peat, or old roots will answer the purpose. Upon these pile your oyster shells, a foot thick or more; then pile on more brush and another layer of the shells. Bank the sides with old turf or sods, and put sods on the top. Fire the heap on the windward side, and with a little attention the whole mass will burn down and make a splendid ruin for the farmer's purposes. Clay burned by the same rude process makes an admirable dressing for the soil.

Southwestern Georgia for Fruit.

We have seen very fine specimens of fall pears from Albany, Georgia, brought north by a resident of that place, in good eating condition July 1st. The early varieties of pears and apples ripen there about the 1st of June, and peaches from the 1st to the 20th of that month. The Catawba grape grows in the greatest perfection, and is ready for market about the 20th of July. This gentleman says there is a large district, embracing several counties, between Albany and Savannah, where these and other northern fruits grow in the greatest perfection. These lands can now be bought from 1 to 10 dollars per acre, without improvements, and from five to thirty with improvements. The wild lands are mainly covered with a heavy growth of yellow pine. The diseases and insects which so greatly annoy the fruit grower at the North, are hardly known in this region. Would not this be a good opening for northern emigration in large colonies? A projected railroad will bring this fine fruit region within 10 hours of Savannah, and 3½ days of New York, and make it another feeder of our city markets. Our fall fruits in midsummer will be worth looking at.

INSECT ENEMIES.—The appearance and disappearance of insects, which destroy our crops, are governed by laws which we understand very imperfectly. Last year over large portions of New England the fruit trees and elms were deprived of their leaves by the Canker-worm, where this year scarcely one is to be found. The good people of the States west of the Missouri were making the plans to do battle with the locusts where they were so abundant last year; yet they have been very generally disappointed. Still, in other localities the locusts (grass-hoppers) have appeared, and eaten almost every green thing. The ten-lined spearman, or striped potato-beetle, is, in spite of every effort to stay its progress, moving steadily eastward—now crossing Northern and Middle Illinois. Each year its ravages become more extensive. The only hope of checking them, seems to be in attacking them in their winter quarters. How little do we know about what so nearly concerns us!

Shrews or Shrew Mice.

Among the shrews we find the most minute of our native quadrupeds. Some, like one shown in the engraving, are not very small. They are remarkable for their great shyness and activity, and, when seen, are usually mistaken for mice, which they somewhat resemble in size and form. They are all insect eaters, hence should never be killed when recognized. Several of the species burrow, forming extensive galleries under ground like the mole. They are found usually in fence rows and old stumps, and about moist, boggy meadows, wherever their food abounds. When wounded, they emit a strong musky odor, which, however, does not deter hawks and owls from swallowing them, and it is from the crops of these birds that naturalists obtain some of their rarest specimens, as we are informed by Mr. John W. Bell, the well known N. Y. taxidermist. The largest of the group in the engraving is the "mole shrew," (*Blarina talpoides*), which is 5 or 6 inches long, including the tail, which is about one inch long. It is found from Nova Scotia to Georgia, and westward, probably, to the Mississippi River. It is shaped a good deal like a mole, having no visible ears, small bright eyes, pointed muzzle, 30 teeth, and large fore-paws. The fur is of a uniform glossy slate color, a little darker above than below. It makes burrows, and in its habits is like the mole. The little one above on the right is the "Broad-Nosed" or "Long-Eared Shrew," (*Sorex platyrhinus*), which often is found in the Eastern States. It is only two inches long to the tail, which is about 1 1/2 inch long; it weighs about 50 grains. The ears are large, the nose flat, but pointed, the body chestnut-gray above, and ashy beneath. The one opposite is "Forster's Shrew," (*Sorex Forsteri*), a species found along the Atlantic coast, and more or less inland. Its tracks are often very noticeable in the winter upon the snow, and these little creatures have been seen

as far north as the 67th degree of latitude, very actively running about when the thermometer indicated 40° to 50° below zero. Full grown individuals are 1 1/2 inches long to the tail, which measures about an inch and one-third. The color is smoky brown, with a pale ash-colored belly. These animals are now classified in

GROUP OF SHREW MICE.

three genera, and although not less than 20 species exist in the United States, yet they are strangers to most people. Most of them belong to the Pacific coast and north-western Territories. They are readily distinguished from mice by the number and closeness of the teeth, and their very sharp pointed noses. We do not know that they do any damage, except by burrowing.

marked with two rows of confluent brown spots from its head to near the tail, where the color becomes nearly black. The scientific name is *Crotalus durissus*. This one is common to a large part of the United States, and there are other species in the Southern States, on the prairies, and on the great plains. The reputed charm-

ing power of this snake, and probably of any snake, is a pure fiction. It takes its food by lying in wait for its victims, and killing them by its bite. It eats squirrels, birds, and such small animals. When alarmed, it at once coils itself up, vibrates the rattle on its tail, and, if menaced, strikes. The mouth is furnished with sharp teeth, and the upper jaw carries two long, curved, grooved fangs, above which are little glands, secreting the poison that is ejected simultaneously with the

bite. The bite so speedily fatal to small animals, is not so dangerous to human life as is generally believed, for comparatively few cases of death to adults or active boys occur, though it is not very uncommon to hear of persons being bitten; still the bite is accompanied by much suffering. When a person is bitten, his own mouth or that of a companion should be

at once applied, and the venom sucked out if possible, (when swallowed, it is harmless). A poultice of wet tobacco should be applied if nothing better is at hand, and the patient kept thoroughly under the influence of alcoholic stimulants, (even drunk). The rattles are formed by a succession of loose, horny shells, of such a shape that, though each is entirely loose from the others, it cannot become detached, unless broken. The number of rattles does not indicate the age, for one to four are added in a year, and often some are lost. The rattlesnake never pursues, and

COPPERHEAD.

RATTLESNAKE.

Rattlesnake and Copperhead.

The common rattlesnake is a sluggish, heavily moving, and, except for its rattle and bite, an uninteresting serpent of 3 to 4 feet long. It is brown above, light colored beneath, and

it is very seldom that men not fool-hardy or utterly careless are bitten by them.

"The Copperhead," (*Ancistrodon contortrix*), is, next to the rattlesnake, the most venomous of our serpents, but more dangerous, as it gives no warning of its presence or alarm, as the other

does. It has a thick, triangular head, and a body continuing quite thick to near the tail. The general color is light brown with transverse bars forked on the sides, which gives an appearance as of crossing diagonal lines; beneath it is flesh-colored, spotted and blotched more or less. The fangs and poison are similar to those of the rattlesnake, and like it also, if a fang is broken off, another will grow to supply its place. "Chunkhead" and "Deaf Adder" are common names. It frequents low and moist places more than the rattlesnake.

The Use of Machinery Upon the Farm.

One of the most cheering indications of the times is the rapid introduction of improved implements in husbandry, especially of those that are moved by horse-power. In this matter the West is far ahead of the East, and the grain growing districts greatly excel the dairy regions. Corn, where it is grown upon a large scale, is now very generally cultivated by horse-power, without the use of the hand hoe. Five times cultivating is much better than three times hoeing, and much cheaper. Some drill in their corn, one kernel in a place and one foot apart, by a horse drill, and claim that they not only do the work at much less expense, but get a much larger crop. There is no hand labor about it until you come to the harvesting, and even this, we anticipate, will soon be done by machinery. Potatoes are cut, dropped, and covered, cultivated and dug by horse-power, and, we think, will soon be bagged and binned in the same way. Wheat is put in by the horse drill, and cut by the horse reaper. The hay harvest is now all secured by horse power. These machines are not indeed universally introduced, but their economy is so apparent, and they put the hay and grain harvests so completely into the power of the farmer, that no man can long afford to do without them. The manufacture of these machines has become a vast business, giving employment to tens of thousands of men, and the demand for them is constantly increasing. They are a powerful argument for the clearing out of stumps and boulders, and for making the rough ways smooth. The man who clings to the time-honored tools, and the good old ways, will be badly beaten in the market.

Ox-Yokes—How to Make Them.

Mr. E. O. Shultz, of Oconto Co., Wis., furnishes some directions about yoke-making, accompanied with a model, which we picture in fig. 1. He writes: "There is no need of having an ox's neck so sore as to require treatment, or to stop his work, if we have a yoke that is fit for a team to work in. There is not one man in ten that can make a yoke. Any one can make a stick with holes bored in it, no matter how, so that a pair of bows can be put in.

Fig. 1.—OX YOKE.

The oxen can suffer the consequences. If there is a law against cruelty to animals, this is one case which should be investigated. I have made a great many yokes, and any one who has used one of them, comes to me if he wants another.

There is no place where oxen are made to draw so hard as they are in the lumber woods, and I

Fig. 2.—YOKE MARKED OUT.

have not seen a single ox laid up, and have heard of but very few that were sore enough to require treatment, where my yoke was used.

Not being able to make a sketch of anything so that it can be understood, I have resorted to cutting a small model which corresponds with a finished ox-yoke, and will show you the principle, the main thing being the shape of the neck. I make them all of the same size and shape, (with the slight variation in breadth and depth noted below), and I have yet to see the pair of oxen that one will not fit. I will give you my plan and I think it will benefit some, at least, of your subscribers to follow it.

Yellow birch is about the best timber you can use. Find a log large enough to split, in order

Fig. 3.—YOKE MARKED OUT.

to work the heart out, as such an one will not be so liable to check in seasoning; square it 8 x 10, then lay your yoke out, (as in figs. 2 and 3). Beginning where the staple is to come, measure 11 inches each way, then 9 inches, and then 8 inches, on each side, making in all 56 inches. Be sure and bore your holes with three-quarters of an inch slant to the foot, to each hole, and you will have no bother in getting a well shouldered bow in. Work the neck out so that the holes will come even on the under side, say like this, (fig. 4), not

Fig. 4.

Fig. 5.

thus, (fig. 5), then shape it both ways alike, so that whichever way the yoke lies on the neck there shall be no lump or ridge. The model will show you how it should be; make yokes just like it, and I warrant there will be no sore necks. For a yoke to draw on a chain, the stick should be 8 1/2 x 11 inches, and the yoke will not roll up on their necks; to use on a tongue, 8 x 10 is the right size; if oxen draw very high, make them 8 1/2 x 12 to draw on a chain, and 8 x 11 on the tongue. The holes should always be made as I have stated above."

Large Fields Wanted.

One of the great nuisances in the New England States and in the dairy regions generally, is the small size of the cultivated fields. One, two, and three acre lots are common, and ten acre lots and upward, are rare. In many cases the cost of fencing has been much greater than the cost of the land, and the keeping up of these fences is a large tax upon the farmer, and the principal labor of repairs comes in the spring, when he is most busy. The fences are always in the way of plowing and cultivation, and of no particular advantage in pasturage, the chief argument for them. We see no reason for any more divisions in the arable part of the farm than there are crops in the rotation. The permanent pasture and woodlands might come under a different rule. In the grain districts recently visited, we were struck with the large size of the fields, even on two and three hundred

acre farms. Fields of twenty, thirty, and even fifty acres, are not uncommon. This feature adds beauty to the landscape, as well as facilitates the cultivation. We are coming more and more into the use of machines and horse-power in the cultivation and harvesting of our crops, and this only makes the fences a more intolerable nuisance. We want a clean sweep for the grain drills, the cultivators, the mowers and reapers, the tedders and rakes that are ready to relieve aching human muscles. The kindest thing that could happen to the average dairy farm would be to have three-fourths of its fences quietly sink out of sight. Fortunately, most of these farms need draining, and the stones are needed to help carry off the superfluous water.

Future Prospects of Cotton in the South.

Those who have held that "Cotton is King," now that the king is dethroned, seem determined that he shall not be even a citizen among us. They prophesy evil of the plant, and advocate the growing of other crops in the Cotton States. "Let us raise the cereals and the meats that we consume at home, and let the world take care of itself. If we grow cotton, let it be only in such quantity as we can manufacture at home." This outcry of disappointed ambition is very natural and very foolish. The vindictive feelings of a people will have very little to do with the crops they raise. These will be governed mainly by commercial considerations. Men will raise that by which they think they can make the most money, whether it accords with their political views or not. We cultivate land to get ahead in the world, and to sustain our families, and not to build up or demolish political theories. It is the best economy for the commonwealth and for the individual that every locality should raise the crops for which it has the best natural or acquired facilities. The new lands in the north-west will grow wheat very largely, because it pays better than any thing else. In the valleys of the Susquehanna and its tributaries, they will follow the rotation, corn, oats, wheat, clover, and timothy, because these crops suit the soil and climate, and pay better than dairy farming. In New York they will raise butter and cheese. About our large cities, they will follow truck farming. In the cotton belt, they will continue to grow cotton for the same reason. The plant flourishes there better than in any other region where it has been tried, and can be raised most economically. When men can make from fifty to a hundred dollars per acre by putting in this crop, they will not plant corn and oats to get half as much. Men will follow dollars rather than dogmas in their industries. We expect to see cotton flourish in the South more extensively than ever. With all the destruction of the war, a very large capital is still invested in lands, gins, gin-houses, presses, and sheds, and the people have the requisite skill to raise and send it to market. The plantations may gradually grow smaller under the new order of things, but the old crops, with some slight variations, will be continued. Last year, with an almost unparalleled drouth and other hindrances in the matter of deficient capital and disorganized labor, nearly two millions of bales were raised. With favorable weather, at least three millions of bales would have been sent to market last year. Within a very short period, we expect to see the old time cotton crops greatly exceeded. Violent partisans may wail because thereof, but they cannot help it.

Liming Land.

This practice, which is so common in British agriculture, is but little known in our country outside of New Jersey and Pennsylvania. In a recent visit to the grain growing districts of these States, we found lime as highly esteemed as manure, and a regular part of their rotation, as we have noticed elsewhere. Where lime can be had at ten cents a bushel and under, as it can in all the limestone regions of Pennsylvania, the practice is almost universal. It is used a good deal on farms, far distant from the lime-kilns, where it costs at the depot or canal twenty cents a bushel and upwards. The conviction of its utility in these States may be said to be universal, and if it is not used, it is either owing to the high price of the article, or to the fact that agriculture receives little attention.

It is applied by some to the sod immediately after mowing, and this sod is turned under either in the fall or in the spring for corn. It is claimed that the lime stimulates the growth of grass, and affects favorably every crop in the rotation. It would be impossible, without liming, to keep up the grain farms to their present degree of productiveness. It is also claimed for the summer application and the spring plowing, that it distributes the lime more equally, and keeps it near the surface. The lime which has been carried down by the fall and winter rains, is brought to the surface again when the sod is inverted. By this method also, the lime has more time to act upon the inert material in the soil, and to prepare plant food for the subsequent crop. Other farmers are quite as certain that the best time to apply lime is upon the inverted sod in the spring, while the ground is preparing for corn. They want to keep the lime as near the surface as possible, and have no fears of its late action upon the crop. The quantity applied to the acre is from thirty to a hundred bushels, depending somewhat upon the character of the soil, the price of the lime, and the theoretical views of the planter. The better the soil, that is, the more clay and vegetable matter it contains, the more lime it will bear. Some think a hundred bushels quite too much, and that so much has a tendency to turn the stalks yellow, and to diminish the yield. Smaller quantities, say from 30 to 50 bushels, are more commonly applied. The lime is usually brought from the lime-kiln or depot in its caustic state, and is dropped upon the land in heaps where it is to be used. It is there slaked by the application of water, and is about doubled in quantity by this process. It is then spread as evenly as possible over the land. This makes a cheap dressing for the land even at twenty cents a bushel. The effect is very clearly marked wherever it is used. It keeps up the fertility of the soil, and makes remunerative crops even without manure. Of course, with manure the crops are larger and pay better. The question very naturally arises, if liming land will pay in other districts where it is not now used? Without answering this question at once in the affirmative, we think the results in these States are such as to encourage every farmer who can get lime at a reasonable price to make the experiment. We have abundance of lime rock in regions where it is not burned at all. The conviction is quite common that it will not pay to use lime upon limestone soils, but in Pennsylvania the effects of the application are quite as marked upon these soils as upon any other. Then it is supposed that it is a difficult and expensive process to burn lime. Very much of this article is

made upon the farms where it is used without even a kiln for burning, as we shall show in an illustrated article next month. The lime can be made by the most unskilled labor, and with the roughest and cheapest kinds of fuel. Wherever there is lime rock and cheap fuel, we have no doubt the lime can be furnished at less than twenty cents a bushel. In the vicinity of cities and large towns, oyster shells accumulate in quantities, and can be put to better use than road making and grading. They are easily reduced with brush or peat, and afford cheap lime and generally of better quality than the rock yields. We desire to have the experiment made in other States on a scale large enough to settle the question. We believe many of our farmers will doubtless find it to their interest to use lime.

When to Turn in Clover.

In the regions where green crops are turned under for manure, there is a diversity of practice. Some plow when the crop is in its most succulent state. The rule for clover is when the heads are about half turned brown. The reason offered for this practice is, that the bulk of the crop is then the greatest, and it undergoes most rapid decomposition in the soil. Others do not plow in clover until late in fall, and after it has been well pastured. The reasons they give for this practice are: 1st, that turning in the clover green, makes the soil sour, and has a tendency to bring in sorrel. 2. It has a bad influence upon subsequent crops. 3. In waiting until fall, you have the advantage of pasturing, and if the cattle are kept upon the pasture, as they should be, everything the field produces is returned to it. 4. More carbonaceous matter is returned to the soil. What you lose in tops, you gain in the roots of the clover, which have four or five months longer to grow. 5. Better crops follow. Some of the best farmers in Pennsylvania follow this method altogether. Others still wait until the following spring, and turn in the clover just as it begins to grow.

Buckwheat as a Green Crop.

Where this grain is sowed the 1st of August, it will be in condition to plow in for a rye crop the last of September. We have seen rye taken from a field four years in succession, with no other manure than buckwheat turned in at the time of sowing the rye. There was a constant increase in the yield of the grain, showing the benefit of the green crop. If the land is not strong enough to give a good growth of buckwheat, some manure will be necessary. A continued succession of grain crops does not show good husbandry, but it may answer for remote fields, where stable manure can not be applied economically. The green crops and the grain should come in a regular rotation, and if the soil is thin, several green crops may be turned in, in succession, with profit.

Plan for a Fixed or Movable Fence.

We need not apologize for again introducing the subject of fences, for it is one which concerns every farmer, and the cost of keeping up good fences is (or would be) a drain upon many farms, which cancels nearly all the profits. Mr. W. T. Millar, of Jefferson Co., Wis., advocates the use of iron posts $2\frac{1}{2}$ feet long, made of inch rod, inserted in large stones. (Fig. 1.) A hole 3 inches

deep is drilled in the stone, the bar inserted, and the remaining space filled up with melted sulphur or lead. The stones

Fig. 1.

used are of such a size that by the aid of the posts, which would afford a powerful leverage, several might be easily loaded upon a stone-boat, and distributed along the line of the fence. Mr. Millar attaches the panels to the posts by putting one on each side, and bolting or pinning them together. (Fig. 2.) The panels of a movable fence might be securely hooked together by a common iron hook and staple, and those of a permanent fence might be fastened best by withes of galvanized iron wire. The posts need not be more than $2\frac{1}{2}$ to 3 feet long to support the panels of a 4 or $4\frac{1}{2}$ -foot fence. The advantages claimed are that the posts will last long, that they will stand on the top of the ground, that they may be easily moved and reset, or straightened up, and that they may be made in winter. Two furrows or more,

Fig. 2.—IRON POST FENCE.

turned together along the line, would be a good substitute for the bottom rail. The strips of which the fence is made should be narrow, to present little surface to the wind.

The plan of using iron posts is not novel, for posts of several forms have long been used, driven into the ground and braced. The ends in the ground rust rapidly; the part above also rusts, unless painted with coal tar. When stones can not be obtained, it is very easy to improvise them with gravel and hydraulic cement. Simply dig a pit, say two feet long, a foot deep, and a foot wide. Fill this with the concrete, and insert the post in the middle, as in fig. 3. This would, we think, be cheaper and better than drilling holes in very hard stones. Wooden posts may be set in the same way—that is, by digging holes, setting in the posts, and filling up with concrete. Use a peck of lime and a quart of cement to $2\frac{1}{2}$ to 3 bushels of gravel, mixed coarse and fine, some of the stones being as large as one's fist. Thus set, gate or fence posts will last a life time.

Fig. 3.

WORK THE MUCK MINES.—The spring has been so wet that it would not be strange if we had a dry summer or autumn, making ponds and swamps accessible. Drawing out muck to some spot easily reached, always pays the farmer well. He should keep on hand a large bank of muck, and the larger and older the better. The sunshine, rains, and frosts, are always improving it, as the rank growth of weeds on such heaps abundantly proves. It is always available then for the yards, stables, or privies, or wherever deodorizers are wanted. Composts can be made on short notice, and top-dressings administered just at the right time for grass field or garden.

Fig. 1.—PERSPECTIVE ELEVATION OF BARN—FROM THE NORTH-WEST.

The Barn of Mr. David Lyman.

With the increase of wealth, and we must add of good sense and enlarged ideas, among the farmers of the country, there is a gradual but very decided improvement in farm architecture. The old system was to build small barns and add others on three sides of a yard, and perhaps of several yards, and to add sheds and pig-pens, and corn-houses, and such minor structures as might seem desirable. Thus, in the course of a few years the group of roofs, big and little, span and lean-to, in the rear of a large farmer's dwelling, would present the appearance of a small crowded village. One of our neighbors has some 25 or 30 roofs pertaining to his barns. Many a farmer is shocked at the idea of investing \$12,000 to \$15,000 in a barn, and to spend \$20,000 to \$25,000 would seem utterly unwarrantable extravagance anywhere. Yet we doubt if the group of buildings referred to could be put up for an average of \$1,000 apiece, while, compared with a well arranged barn, they are inconvenient and extremely expensive to keep in good repair.

Among the many large and expensive barns recently erected, we have seen none which is more thoroughly satisfactory to old school farmers with broad ideas, than one built by Mr. David Lyman, of Middlefield, Connecticut. Mr. Lyman is an active farmer and manufacturer, employing the water power adjacent to the old homestead of his fathers, and tilling the broad acres of the farm on which he was born, a family possession for four generations. He needs a very large barn for his farm purposes simply, and has built one, of which we give a view, and plans. The elevation of the building, (figure 1), shows entrances to its two main stories; there is an other story below.

THE UPPER, OR HAY FLOOR.—This floor is shown in fig. 2; all the hay, grain, and straw is stored upon it, and it maintains the same level throughout. Two threshing floors cross the building, and are entered from the high ground on the west by a very easy ascent. The main entrance crosses over an engine-room, (seen in figs. 1 and 3), which is of stone, arched above, and roomy as well as secure.

By means of Plumb's Hay-Fork and Traveler, of which no less than six railways and travelers are fixtures over the bays, the hay is taken from

the loads and dropped in any part of the immense bays. The forks are worked by one horse, attached to Dedrick's hoisting machine, of which Mr. Lyman has two, placed near the great doors during the haying season, as indicated by the figures marked *H*, *P*, in the plan, fig. 2. A peculiarity of the Plumb-Fork and attachments is, that the traveler on which the fork moves, is brought back over the load, by means of a heavy weight hung, and rising up and down, on the outside of the barn. The timbers containing pulleys over which the ropes pass which suspend these weights, are shown in

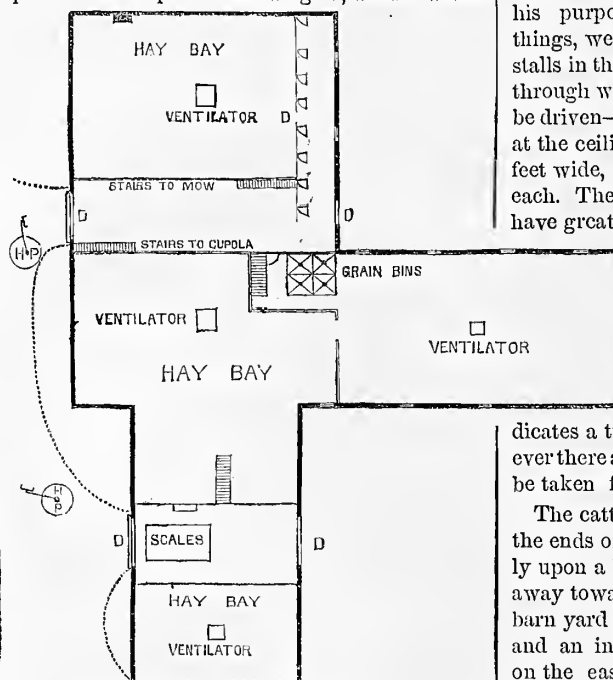

Fig. 2.—PLAN OF HAY FLOOR.

the view, fig. 1, near the high windows in the gable. The hoisting machine consists of a drum, which is turned by a horse driven in a circle; on this the rope is wound. By the movement of a lever, the drum is set loose, and the rope unwinds, thus lowering the fork to the load without backing the horse.

On this floor are the bins for grain and ground feed, provided with shutters connecting them with the feeding floor. There are hay scales, also, a fixture in one of the floors, which afford the means of being very accurate in many

things, in regard to which guess work is ordinarily the rule. Not only are hay, grain, and all products sold by weight, weighed here, but beeves bought to fatten are weighed when brought in, and when turned off fat, and the gain accurately known. The great ventilators, so conspicuous in the view, (fig. 1), pass from the feeding floor through this one to the roof, and being furnished with doors at different elevations, quite to the top of the mow, thus form convenient shutters to throw down hay or straw. A long flight of stairs passes from the principal barn floor to the cupola, from which a magnificent view is had of the whole farm and surrounding country, not the least impressive feature in which is a permanent mowing lot of 100 acres, without a fence, all under-drained, which lies contiguous to the barn, and will do its share towards filling its capacious bays and mows.

THE FEEDING FLOOR is entered by several doors. Those in the main building are seen in the view, and the plan, fig. 3. Two double doors open upon a spacious floor in the rear of the horse stalls and extending through the middle of the main barn. The northwest corner is occupied by a large harness and tool room, in which is a chimney for a stove. On the right of the front entrance is the wagon and carriage room, closed by a sliding door, or partition. There is room on the open part of this floor, (behind the horse stalls, and adjacent), to drive in three wagons at a time, and let the horses stand hitched; and while the stables are being cleaned out, several of the horses may be hitched to pendant chains in different parts of the floor, and so be out of the way, and not interfere with one another. There seems to be a good deal of waste room here. Mr. Lyman assures us that he would not have less on any account; and for his purposes, considering his way of doing things, we agree with him. Between the ox-stalls in the south wing, is a 10-foot passage way through which carts with roots or green feed may be driven—the stairs in the middle, being hinged at the ceiling and fastened up. The stalls are 7 feet wide, and arranged to tie up two cattle in each. The animals are fastened by neck chains, have great freedom of motion, but can not quarrel.

A gutter to conduct off the urine runs along behind each range of stalls, and there are well secured traps, one in about every 15 feet, through which the manure is dropped to the cellar. The letter *C*, wherever it occurs in fig. 3, indicates a trap-door for a manure drop. Wherever there are doors which, in the engraving might be taken for windows, the letter *D* is placed.

The cattle pass to the yards through doors in the ends of the wings. The south yard is nearly upon a level with the floor, sloping gradually away toward the south and east, but the large barn yard is on the level of the manure cellar, and an inclined way gives access to the yard on the east side from the cow stalls. Three roomy, loose boxes are provided, one for horses, and two for lying-in stables for cows; and from the satisfaction which Mr. Lyman takes in these, we think, if he could be brought to admit, that the barn is not perfect, he would arrange to have several more. Near the points marked *W*, and *F*, stand the hydrant for flowing water, and the trough for mixing feed, and here, too, the shutters for grain and cut feed discharge from the floor above.

VENTILATION AND LIGHT.—Four immense ventilating trunks, 4 feet square, rise from the feeding floor straight to the roof. These are

capped by "Emerson's Ventilators," of the largest size, and cause a constant change of air in the stables, the draft being ordinarily sufficient to be felt like a fresh breeze by raising the hand anywhere within a few feet of the open-

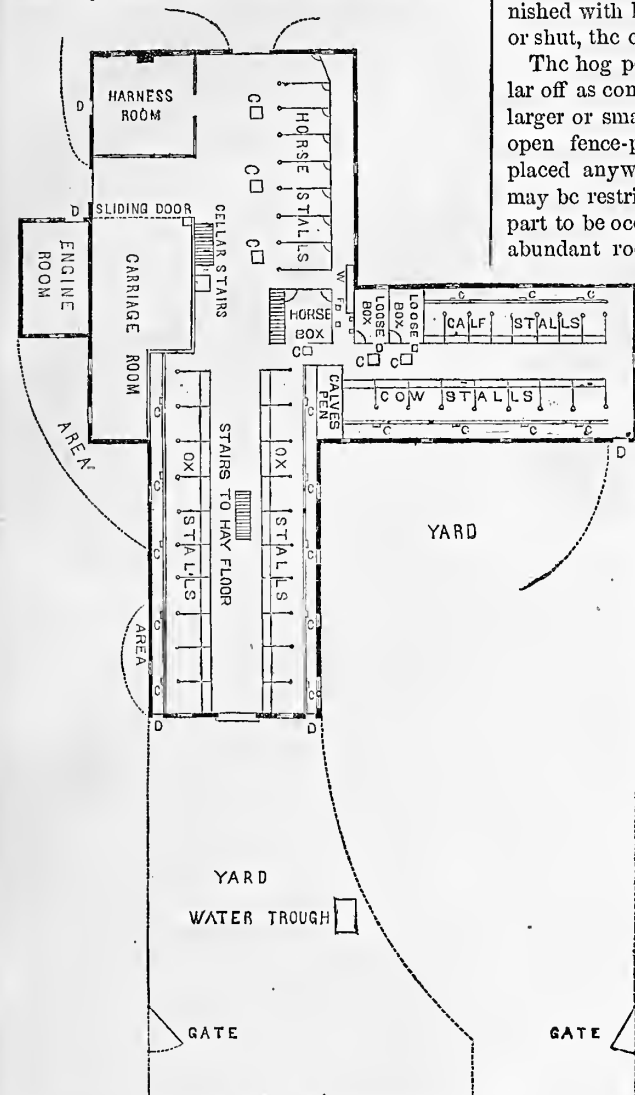

Fig. 3.—PLAN OF FEEDING FLOOR.

ings. This keeps the air in the whole establishment sweeter and purer than in most dwellings. The windows on all sides of this floor are of large size, with double sashes, hung with weights.

Under the main drive-way is a fire-proof room, intended for an engine, but not now in use for that purpose. When this is set and in operation, it will, we presume, do away with horse-power for elevating and carrying hay, cutting hay, stalks, and straw, grinding apples, and grain, and the boiler will furnish steam for cooking hay and cattle fodder.

THE BARN CELLAR.—This is arranged for hogs, roots, and manure. The fixed partitions in it are only two—the one enclosing the root cellar, and the other, outside of that, shutting off a wide, cemented passage way, extending from the door at the northeast corner, around two sides of the root-cellar. (See fig. 4.) The rest of the cellar is occupied by the manure, and hogs are enclosed upon different parts of it, according to convenience. That part of the cellar wall against the side-hill, is very substantial, and laid up of cement concrete. Part of the remaining walls are brick, and in these are ordinary windows; in the remaining portion of the walls wooden partitions are inserted between the posts. These, as a general rule, consist of an upper portion hinged to the sill of the building, which may be raised and hooked

up against the ceiling, and of a lower part, like a solid fence-panel, which two men can take out and set at one side, affording entrance for carts or cattle from the barn yards. The upper parts of these door-like walls are, in most cases, furnished with large sashes, so that, whether open or shut, the cellar is very light.

The hog pens are formed by dividing the cellar off as convenience and necessity dictate, into larger or smaller yards, by means of substantial, open fence-panels. Thus, the hogs may be placed anywhere on the manure, or their range may be restricted, so as to allow a considerable part to be occupied by cattle. The cellar affords abundant room to work over the manure, and make regular compost heaps, if desired. The two large hog-pens are so far fixtures that platforms (2, fig. 4) are set, upon which the hogs are fed, and which prevent a waste of food.

THE YARDS are open to the south and east, and contain large troughs supplied with running water, and racks for fodder. No water flows into them except the direct rain-fall, the entire building being furnished with eave-troughs and conductors; and the wash of the yards being collected is conducted to vats where it can be pumped over the manure heaps. Even this is not sufficient to keep the immense heaps of manure in a suitably moist condition at all times, and so a hose is attached to a hydrant to wet them down occasionally. We append some memoranda received from Mr. Lyman, in response to questions proposed by us, which leave little else for us to say in regard to this most commodious and substantial barn. It is exceedingly roomy and comfortable for men and beasts, at all

seasons. It thoroughly protects animals, and their fodder, with all farm products, implements, and manure, from the weather, effects great saving of labor, is subject to easy and rapid inspection, and not least, it is easier for hired men to keep it clean and in order, than to do otherwise. The barn and surroundings will well repay a visit.

Neither care nor expense has been spared to make the whole structure as substantial and convenient as possible, the material being all of the best quality. The whole subject has been under consideration, and the general plan formed, for several years. Mr. L. did not build until he felt sure he knew exactly what he wanted, and was ready to secure this to himself and his children, at any reasonable cost.

MR. LYMAN'S MEMORANDA.—*Timbers, Flooring, Siding, Roof, etc.*—Lower timbers, white oak, 12 × 14; joists, chestnut; floor, chestnut; rest of the frame, white pine, hemlock, and spruce, mainly hemlock. The long cross-beams, 55 ft. long, squared 12 × 14 inches, are pine. Threshing floors, 2½-inch pine plank, grooved, with a tongue inserted. Bay floors, 1½-inch pine, planed and matched, laid planed side down. Siding is pine, 10 to 12 inches wide, planed and matched, with battening of this form—costs no more than plain.

The Roof is 1¼-inch, planed and matched spruce well slated. Furnished with Spratt's lightning rods. The Architect is R. G. Russell, New-Haven. The Builder, Henry E. Woodward, Thompsonville, Conn.

Size of Barn.—The building covers more than one-fifth of an acre of land, and thus there is over three-fifths of an acre under a roof. The main barn is 55 × 80 feet square; the wings, each 56 feet long, the south one being 35, and the east wing 31½ feet wide. The four points which I sought to obtain were: 1st. Economy of room under a given roof; 2d. Plenty of light; 3d. Plenty of air, and ventilation which would draw off all deleterious gas as fast as generated; 4th. Convenience, to save labor. Saving of manure, and many other things are of course included. No barn should have less thorough ventilation. The windows are all hung with pulleys, and are lowered in warm days in winter, and closed in cold days. This is important.

As to Inspection.—I can in five minutes see whether 75 head of cattle and 8 horses are all right, and the work of attending them well done.

The gables on the sides of the barn and south wing, give great strength to the frame, afford light to the floor, and in summer give a splendid draft of air over the floor, to say nothing of the beauty added to the building.

A cheap barn can be built on this general plan of: 1st. Basement for manure roots and hogs; 2d. Floor for stock, wagons, and tools; 3d. Floor for hay, grain, hay scales, etc. And I believe that a farmer may get for the same money one-third more room than by the old plan. If a man has no side hill, let him make an approach or drive-way, 60 feet long, for his hay story, and

he is just as well off. It is an easy matter. All cement walls should be made early in the season, to have the work get thoroughly dry before frost. The mows are so large that I mow away no hay while carting, but do it the

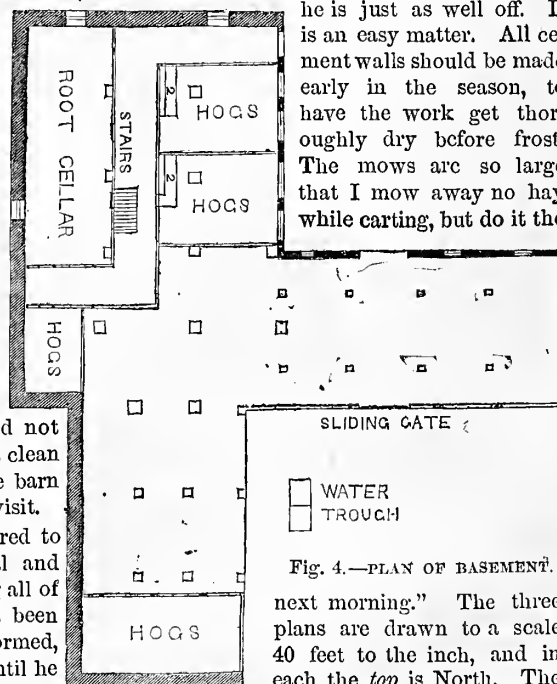

Fig. 4.—PLAN OF BASEMENT.

next morning." The three plans are drawn to a scale 40 feet to the inch, and in each the top is North. The

storing of manure in barn-cellars is objected to by many farmers—but with the free use of dry muck, etc., as absorbents, and such perfect ventilation, we cannot take ground against it.

FEEDING GREEN FODDER.—Cattle and horses will eat an enormous amount of green fodder, if fed fresh to them in the stall. Serious evil sometimes comes from this practice, as the animals eat too much, and bloat, as when turned into rank clover. It saves labor to cut early, and let the corn, oats, clover, sorghum, or whatever else used as green fodder, wilt thoroughly, and thus lose a good part of its water, before feeding it out. Milch cows can hardly

eat too much regularly; and after feeding all day in the pasture, if a cow will eat a good forkfull of green corn fodder, the result will surely be seen in the pail. Green fodder ought to be fed in racks, in the yard, and the cows yarded at night. Two-thirds of all their manure is thus saved, and the dung heaps grow almost as fast in summer as in winter.

Rotation of Crops in Eastern Pennsylvania.

There is much more uniformity in the rotation of crops in Eastern Pennsylvania than we had anticipated. The lower part of the Valley of the Lehigh, and the Valleys of the North and West branches of the Susquehanna, which we recently visited, are mainly grain growing districts, and we suspect all the best farming of the State would come under the head of cereal agriculture. Only about a fourth part of the State was put down as improved land in 1850, and with all the rapid improvement of agriculture, there is probably not more than a third of the State now under cultivation. There are still considerable tracts of unbroken forest, and vast regions of rough, mountainous land, which the lumbermen are rapidly stripping of all large trees, and leaving it to make a second or third growth. The best farming is to be found in the valleys of the rivers and creeks, where the soil is almost uniformly fertile and well adapted to grain and grass.

The rotation is a five or six years' course, beginning with corn upon a clover or timothy sod. The liming of the land, which is almost universal, takes place in connection with this crop. The lime is applied at the rate of from thirty to a hundred bushels to the acre, and is expected to last through the course. There is a difference of practice both in regard to the time of applying the lime and of turning over the sod. Some apply the lime upon the grass immediately after mowing, and turn under the sod the following spring. They say the lime strengthens the growth of the grass, and sinks into the soil, so that the spring plowing brings it to the surface where it ought to be. Others plow in the fall, and lime either in the fall or spring upon the plowed field. We found the best farmers most strongly in favor of the spring plowing, and they would only justify fall plowing where there was danger of not having help enough to finish the needed plowing seasonably in the spring. The lime and the sod are the main reliance for the corn crop, which yields from forty to sixty bushels to the acre.

The second course is either oats or a summer fallow. The best usage is in favor of the oats, for they say that it is in itself a paying crop, and does not very much diminish the subsequent crop of wheat. The third course is winter wheat, for which preparation is made by spreading all the manure of the farm upon the oat stubble or the fallow, and plowing it in. The Mediterranean wheat is the variety most commonly used, and the yield in good years is from twenty to thirty bushels to the acre. The white varieties of wheat formerly used were more productive, but were more delicate, and more liable to be destroyed by insects. At the time of sowing the wheat, timothy is sown, and clover the following spring, about the last of the frosts, when the ground is cracked with settling.

This gives clover as the fourth course, of which there are frequently two crops taken in the same season, one for hay and the second for seed, of which the yield is from one and a half to two and a half bushels. The fifth year the timothy

has the ground, and this crop is continued for one or more years according to circumstances. If the grass is very good, or if manure is plenty for top dressing, it stays in grass until it is wanted to begin another rotation. Much larger areas of land are kept under the plow than is common in the dairy regions. Grain fields of from twenty to fifty acres are of frequent occurrence. Upon one 300-acre farm that we visited in the famous Buffalo Valley, we found 80 acres in wheat, 50 in corn, and 30 in oats; or more than one half the whole area of the farm. We think the farms in these valleys would average one fourth of their whole area in these three crops. Rye, which is so common in the dairy regions, is very little raised in the valley of the Susquehanna. In Eastern Pennsylvania it is much more common. This rotation is very well adapted to the wants of the grain growing districts, and perhaps can not at once be changed for the better. Lime is everywhere abundant, and with the manure made upon the farm, furnishes the ready means of keeping up the fertility of the soil. Potatoes are not much raised, except to supply the wants of the family and the nearest village market. The grain growing farmers of Pennsylvania, and of other districts also in the United States, have no faith in the cultivation of roots. They certainly could be raised profitably for stock feeding in winter, but would require additional laborers. Grain and hay are the principal products sold from these farms. There is some fattening of cattle in the winter, and some raising of pork and making of butter, but they are mainly for the home markets.

Walks and Talks on the Farm.—No. 44.

The editor of the *Agriculturist* wrote me that he had received a number of letters referring to my Walks and Talks, "some praisewise and some otherwise." I asked him to forward them, and he did so. He must have retained the "praisewise," for all of them are "otherwise." Several of them criticize my treatment of the cow we lost by milk fever. I had another cow taken sick in the same way, and gave her the same treatment, except the ergot, and she recovered. This does not prove, however, that the ergot was the cause of the death of the other, as one of my neighbors lost the best cow he had from milk fever that had not had ergot, and the Deacon says a farmer in an adjoining town lost six cows from milk fever this spring. He thinks the disease is unusually prevalent.

One writer advises me to get a breed of hogs that will not kill lambs. I have both the Suffolk and Essex, neither of which have any savage tendencies. The sows that killed the lambs were some coarse, ill-bred creatures that I bought for the purpose of crossing with the thoroughbreds. It is said that such sows are better mothers than finer animals. They certainly breed better, and the little pigs take after the sire in fineness of bone, early maturity, and fattening qualities. But they need high feeding. You can push them forward so as to be ready for the butcher in five or six months, but if half starved, when young, they rarely get over it, even if well fed afterwards. It was very annoying, however, to lose the lambs. I sold the rest of them to the butcher for \$4.00 a head, and the keep of a lamb is never felt.

Another of the letters is very savage. The writer assails me on all sides, but makes no specific charges. I take him to be a city man who knows nothing of agriculture, and is annoyed because I do not represent farming in accord-

ance with his imaginary notions. All I can say is that I tell the truth according to my experience. I do not find farm-life entirely free from care and anxiety. Perhaps I exaggerate the disappointments and annoyances. But if so, it is not a common fault of agricultural editors. We hear more of the successes than of the failures, and yet the latter, properly considered, teach more than the former. A man who really loves farming will not be discouraged by hearing of the mistakes of others. He will try to avoid them. I have had my trials, but think I shall succeed in renovating my farm. Every year affords me more encouragement. If I mistake not, we have five acres that will turn out more, and far better, barley than I got from twenty acres the first year. And I have fourteen acres of clover that will afford more good feed than could have been cut from half the farm. I have a very fair crop of wheat on land where the oats the first year only yielded 8 bushels per acre, and those hardly fit to feed the geese. I have some very promising corn on the "Deacon's duck pond," and fair grass on part of the old stump lot, where nothing ever grew before but rushes and weeds. But if I should talk in this style, it might be thought that I had quit farming, and gone back to the old editorial chair.

The more I use petroleum paint, the better I like it. A few days ago we painted an old wagon that looked as though it would tumble to pieces like the old chaise. The hubs were full of cracks, the bolsters loose, and the box decidedly shaky. We took off the nuts, oiled them, put on wide washers where the wood was rotten, and made all light and snug, then put on all the oil the wood would absorb, going over the hubs and tires several times as fast as the oil soaked in. We got in at least two gallons of oil. The cracks closed up, the tires were tight, the box snug, and the wagon looked almost as strong as a new one. We all know that soaking wheels in water will tighten the tires, but it is merely temporary. As soon as the water dries out, the wheels are as loose as ever. The oil is absorbed more rapidly than water, and will have, I think, the same effect, and be permanent. But if not, go over the wagon again as often as needed. It is little trouble. It seems curious to me that such a use of petroleum could be patented. In Captain Cox's *Asiatic Researches* he says: "The town of Rainanghong is the centre of a district in which there are some hundred petroleum wells in full activity. * * * The annual quantity of petroleum produced by the district exceeds 400,000 hogsheads. It is used by the lower classes in lamps, instead of oil, and when mixed with earth or ashes answers the purpose of fuel. A composition of petroleum and resin is an excellent material for covering wood-work, etc." It was also used for ship bottoms to preserve them from insects, etc.

I planted potatoes this year on clover sod. The clover last year was cut for hay, and afterwards for seed. This is running the land pretty hard, but as nothing is exported from the farm except the seed, and as a bushel of oil-cake meal which costs about \$1.50, contains more fertilizing ingredients than a bushel of clover seed, and as you can get five or six bushels of oil-meal for one bushel of clover seed, the farm is benefited by exchanging the clover seed for oil-cake. But unless some such plan as this is adopted, growing clover seed impoverishes your land. Last fall, in cutting the clover seed, a strip about the width of the machine was skipped, and you can now see the effect on the potatoes. They are

far better than on the rest of the field. I should not be surprised if the yield was one-third or one-half greater, and this will a good deal more than pay for the clover seed. With such effects it is not surprising that so many good farmers object to raising clover seed. But I think it is nevertheless true that if the money obtained for the seed is expended in oil-cake, and the manure returned to the land, there is a decided gain. You do not see the effect, however, quite so soon as if the clover was pastured with sheep, or plowed under.

You may recollect, I asked your opinion as to whether a clover field that was cut for seed would give a good crop of clover the next season. I had such a field, and, not being willing to risk the whole, I plowed up half of it and planted potatoes, and the other half I left for hay. The clover is not quite as good as the first crop was last year, but much better than I expected. I sowed no timothy, but there is quite a sprinkling of it among the clover, and I shall have a fair crop of hay. I presume, nevertheless, that a heavy crop of seed weakens the clover plant very materially, and, as a rule, it should not be allowed to go to seed except in cases where it is to be plowed up the next season.

This morning I was up unusually early, and saw a Dominique rooster in a cherry tree picking off the fruit almost as neatly as a robin. During the day, when we are around, they do not meddle with them. The little chickens eat the strawberries, but the hens seem to know better, although they occasionally take a slice out of a Trollope's Victoria or an Agriculturist. They leave us all the Wilson's. If chickens are well fed, they do comparatively little injury in the garden. The ducks have done us the most damage this year, as they manifest a great partiality for green peas. They gobbled up a whole row of Daniel O'Rourke's, and if we had not shut them up, they would have left us scarcely a pea in the garden. I suppose the only way is to have a large yard and hen-house where you can shut up the poultry when they prove troublesome. The next best thing is to feed them all they will eat, and keep them out of the garden as much as possible. A garden with a high fence round it is not at all ornamental.

A gentleman in Huntington, Conn., writes me that he has sown twelve acres of corn, intending to plow it in for manure, but would like to know my opinion as to "whether it would not be better to cure it and feed it out." I judge from the fact that corn is the crop selected, the land is not a heavy clay, and that the object in plowing it under is simply to furnish manure, and not to loosen the soil. This being the case, the only point to be determined is, whether the feed will not pay for the expense of curing and storing the crop, and drawing back the manure. If the manure does not drain away, but is all saved, it will be worth within five per cent. as much as if the crop was plowed under. This is true, I think, even if the crop is fed out to milch cows. The milk will not carry off more than five per cent. of the nitrogen and phosphates. If fed to dry cows, the loss will be still less. And if, as is too often the case, the cows are no heavier in the spring than in the fall—if, in other words, the animals have neither grown or got fatter, I do not see where there can be any loss except in the carbonaceous matter used to keep up the animal heat. Where can there be any loss of nitrogen or phosphate? or of potash, soda, lime,

magnesia, etc.? There is soda in the blood, but there is no more blood in the animal than there was at the commencement of winter. There are phosphates and lime in the bones, but there has been no increase of bones. There is nitrogen in the flesh, but for each pound of new flesh added, a pound of old flesh has been transformed, and the nitrogen from this is exactly equal to the nitrogen taken from the food. There is, therefore, no loss. The manure will contain as much plant food, except carbonaceous matter, as the food consumed by the animal. The question then is simply, what is the value of an acre of cured corn fodder, say three tons? A good-sized cow would probably eat from 30 to 35 pounds a day, and the three tons would last her about six months. Now what is it worth to winter a cow? A cow weighing from 900 to 1000 pounds will eat about 200 pounds of hay a week. With hay at \$10 per ton, this would make the cost of keeping a cow six months \$26. If we estimate the manure worth half the price of the hay, we have \$13 as the actual value of the food given to a cow during six months. What farmer in the New England or Middle States will winter a cow for less? Now in plowing under clover or corn fodder as a green manure we lose this sum, less the cost of cutting and curing the crop and the expense of drawing back the manure. Many farmers make a great deal more than this from their feed. One would think few could make less. In this section the past spring, hay was sold for a short time at \$30 to \$35 per ton, and it would seem in such circumstances to be worse than folly to plow under good hay or fodder, when, by feeding it to animals, we get the same benefit from the manure, and have the food in addition.

If the present drouth continues, many of us would like these twelve acres of green corn for our milch cows. But if the corn can not be used for this purpose, and if it can not be cut and cured, or used to good advantage when it is cured, why then, plow it under. It is a very low order of farming, but is a good deal better than skinning the land by selling all the hay and straw.

I am not sure that a good summer fallow would not enrich land just as much as plowing under a crop of corn. If not, why not? On very sandy soil, where some of the elements of plant food may be washed out of the soil, a crop that would organize and retain it may be better than a summer fallow. And on a very heavy soil, where you want the mechanical action of the green manure for loosening the soil, plowing under the crop may produce better results. But otherwise I do not exactly see what we gain from plowing under a crop of corn. It must be confessed, however, that we do not know enough to speak very positively on the point. It may be that the large quantity of carbonaceous matter plowed under in the green crop, may, in fermenting, form organic acids that act on the latent plant food in the soil, and render it available. Or, at all events, the carbonic acid ultimately formed, doubtless has such an effect. I have always supposed, however, that we get enough of such matter from the roots and stubble, in proportion to other ingredients, without plowing under a whole crop. So far as wheat is concerned, I have never known an application of carbonaceous matter, directly or indirectly, attended with any increase of the grain. It will give more straw. And those farmers who tell us that the reason they can not grow as good wheat as formerly, is not ow-

ing to the land being poorer, because they get straw enough for forty bushels per acre, while the crop only turns out 20 bushels, should consider whether they are not furnishing too much carbonaceous matter to the soil, and too little nitrogen and phosphates.

"What about the price of wheat?" asks an old friend. It is not safe to predict. I hope we shall have a good crop. The country needs it. Manufacturers need it, the Secretary of the Treasury is looking anxiously at the grain fields of the West, and farmers themselves need it as much as any other class to pay high wages and still higher taxes. I am inclined to think we shall have a fair crop, and I hope for fair prices. The markets of the world are bare of wheat. There is no accumulation any where. High prices have brought it all out. In such circumstances, it would seem that the new crop should command at least as much as the cost of production. Such will be the case if farmers will not sell for less. Manufacturers sometimes sell, they say, for less than cost. But they frequently make large profits. Farmers never do. Then again, a manufacturer fears to hold, because there may be a change of fashion; but the fashion for wheat does not change. It is always wanted. I am aware that consumers have much to say about the extortion of farmers. The charge is unfounded. It is vain to expect that wheat can be grown as cheaply as it was 25 or 30 years ago. In this section, I do not see, with the present cost of implements, wages, and taxes, how wheat can be grown for less than \$1.50 per bushel, even if you get the land for nothing. You may on rich land raise it for less, but you take enough out of the land to make up the difference. Your land will become poorer. If means are taken to keep up the fertility of the soil, we can not grow a bushel of wheat for less than \$1.50 a bushel. And if we expect an interest for the money invested in the farm, we ought to get \$2.00 a bushel. At \$2.50, a good farmer will get ample remuneration. But when the crop does not average over 15 bushels per acre, the profits, even at this figure, are not dazzling. I have made up my mind to sell when I can get \$2.25 for red wheat. If consumers can not pay this, let them curtail their expenses in some other direction. Farmers need the money more than French milliners.

Wheat, in England, is now worth from 60s. to 75s. a quarter of eight bushels. Now, as an English shilling is 24 cents of our money, if we multiply the price per quarter by 3, we get the price in dollars and cents. Sixty shillings a quarter, therefore, is \$1.80 a bushel. Seventy-five shillings a quarter is \$2.25 per bushel. This is in gold. With gold at 140, \$1.80 in gold is worth \$2.52, and \$2.25 in gold is worth \$3.15. Wheat, in England, therefore, is worth in our money, from \$2.52 to \$3.15 per bushel.

The *Agriculturist* should tell us next month, what it costs to send wheat to Liverpool, and London, and we can then form some idea as to what prices we should expect for our wheat. As I understand it, wheat has been for several months higher here than in England, and consequently none was exported. But since the recent decline of \$1.00 a bushel in New York, wheat can be exported with a profit, and as long as this is the case, it will be no lower. If we raise more wheat this year than is wanted by our own rapidly increasing population, the price will depend on the foreign demand. We certainly shall not have enough to spare to glut the markets, and farmers should insist on receiving fair prices—and sell when such are offered.

IMPORTED COTSWOLD RAM, "HIS ROYAL HIGHNESS." — OWNED BY BURDETT LOOMIS, WINDSOR LOCKS, CT.

Cotswold Sheep.—Mutton and Wool.

When the whole community of sheep raisers is running wild, almost, after fine-wool sheep, it may seem strange to some that we should continually advocate mutton breeds. Perhaps it would not be so if these were the favorites of the speculative class of breeders. We can, and do, raise as good mutton in this country as they do in England, but our people are not such mutton eaters, and, though mutton raising pays quite as well, in fact better usually, than beef raising, yet our market is not a discriminating one, and the most profitable sheep to buy and fatten are fine-wools, if bought with judicious care. There is always sale for South-down and Cotswold mutton, and the difference in price is not what it ought to be, though remunerative.

Of late there has been a remarkable change in the value of the combing wools. They have increased in price, while fine wools rule scarcely any higher than in specie times, and, were the quotations reduced to the gold standard, they

would be lower now than for many years. The reasons for the high price of long wools are several. A class of manufactures has come in vogue which requires these combing wools, and the supply from Canada is, in a good measure, cut off by the operation of the new Tariff, while in England, the home demand keeps prices up, and the wool chiefly at home. The small amount of combing wools raised in this country is not, it seems, sufficient for the demand. There seems to be an overstock of goods made from the finest wools, and manufacturers are buying but very limited quantities, hence the general depression of the fine wool market.

A few years ago long wool sold according to quality—length, fineness, strength and gloss—at 25c. to 35c. per pound. Now it sells at 50c. to 75c. The clip of a flock of equal purity and excellence with those shown in our engraving, recently sold, unwashed, at 50c. to 55c., which is equal to 75c. to 82c., according to the usual calculation—deducting one-third as loss in washing. It is not to be expected that these rela-

tive prices will continue, but it is certain that these beautiful combing fleeces have gained, and will hold, a value far above carpet wools.

For the real wool raiser, no doubt the best policy will ever be to raise the finest and best wool, free from excess of grease; but for small farmers who have rich farms on which a few sheep, 50 to 100, will do well, none present so great attractions now as do the Cotswolds. They grow to an immense size, Christmas mutton carcasses weighing over 200 pounds being almost every year brought to New York, and sell at the highest prices. They make large early lambs. The grades, half-bred, are very strongly marked, and the three-quarters pure are often hard to tell from the full-blood Cotswolds, except by the accurate and distinctive marks of purity of blood.

The fine ram in the engraving was drawn by our artist at the New England and Vermont Fair last fall, at which he was a first prize winner, and was imported from one of the best, if not the very best flock in Great Britain—that of Robert Garne, at Aldsworth, near North Leach, Eng.

Notes on Strawberries.

The season has, on the whole, been a successful one for the strawberry grower, though in some places, as in southern New Jersey, the heavy rains, which came just as the fruit was ripe, caused considerable loss. A very fine exhibition was held by the American Institute, in New York, on June 25th and 26th, and another by Mr. Knox, at Pittsburgh, on the 26th and 27th of the same month. We attended both of these exhibitions, and give such notes on varieties as we gleaned from these and other sources.

METCALF'S EARLY.

This variety originated in Michigan. In a basket note last month, we quoted Mr. Williams and Mr. Doty for its earliness. We have since seen Mr. Parry, of Cinnamonson, and others, who do not give a very favorable account of its earliness, productiveness, or good quality. Figure 1 gives the shape of the berry, which is of a light scarlet color.

Fig. 1.

RIPPOWAM.—A variety that has been before the public a few years, but has not been extensively cultivated. It originated with Mr. J. W. Faulkner, Stamford, Conn. The engraving, Fig. 2, gives one of the exhibition berries. We have not seen it in bearing, but at several shows very large fruit has been exhibited. It has a remarkable tendency to assume the flattened, coxcomb shape, which tells strongly against its good qualities, which are a firm flesh and a very

Fig. 2.—RIPPOWAM.

agreeable flavor. Growers of this variety differ in their accounts of its productiveness.

STINGER'S SEEDLING.—This berry originated with Mr. W. H. Stinger, of Gray's Ferry, Pa.

We give a figure of it, (fig. 3,) but from the fact that we have never seen the fruit in good condition, do not care to say much about it. There are very few berries upon which it is fair to pass judgment after they have been picked

Fig. 3.—STINGER'S.

forty-eight hours. We can only say that some of our Philadelphia friends, in whose opinion we place confidence, think well of it.

SETH BOYDEN.—Mr. Seth Boyden, well known as the originator of the *Agriculturist*, exhibited at the late show of the American Institute his seedling No. 30, which, we understand, is to bear his name. Mr. B. stated that the exhibi-

tion was at least ten days too late to allow him to show his berry in perfection. As exhibited, the berry was of great promise, reminding one

Fig. 4.—SETH BOYDEN.

ROMEYN'S SEEDLING.—This is a chance seedling raised from mixed seed of the *Triomphe de Gand*, *Austin*, and *Wilson*, grown together. The plants shown at the late exhibition were apparently very productive, though but a small portion of the fruit was ripe. It has a surface much like that of *Triomphe de Gand*, and its shape is shown in figure 5.

Fig. 5.

CHAS. DOWNING.—Mr. J. S. Downer, of Elkton, Kentucky, with whom originated the well known Downer's Prolific, has sent to the East a berry of remarkable excellence, and which has been named for our distinguished horticulturist, Chas. Downing. Figure 6 gives an average berry, but not one of the largest. Both Mr. Carpenter and Mr. Downing have grown it, and speak in high terms of its productiveness and other good qualities. It is certainly a berry of remarkably high character, as to flavor, and we expect a great deal from its present promise.

Fig. 6.—CHAS. DOWNING.

Fig. 7.—IDA.

JUCUNDA.—Very fine specimens of this variety were shown at the exhibition of the American Institute, and from all that we can learn, it is growing rapidly in favor. Mr. Knox's farm, at Pittsburgh, is the headquarters of this variety, where it is also known as "700." The show of this fruit upon his grounds was this year something wonderful to see. To say that the crop was large, would not express it—it was immense. We never before saw berries run so uniformly

large. The fruit is of fine color, and that it car-

Fig. 8.—JUCUNDA.

ries well is shown by the fact that it is sold in the New York markets, after a long journey from Pittsburgh. The day we were at Mr. Knox's farm, he shipped a hundred bushels of this variety to New York, a similar quantity to Philadelphia, besides supplying the home market. We figure a good sized berry of regular shape, (fig. 8,) but it would have been easy to select a larger, if no regard were had to form.

ABRAHAM LINCOLN.—A variety with this name was shown at the Exhibition of the American Institute. As far as the fruit is concerned, it is not easy to see how it differs from Jucunda.

LUCIDA PERFECTA.—This is a foreign sort that is attracting some attention. The fruit is medium size, (fig. 9), round, of a bright salmon color. For sweetness and richness of flavor it is scarcely surpassed by any variety. The foliage has a very robust appearance, and is of a deep green. From what we have seen of it, it does not appear to bear well enough for a market berry, but it is certainly a sort worthy the attention of amateur cultivators.

Fig. 9.

FILLMORE.—This is a variety about which there is much difference of opinion. On the strong soil of Mr. Knox it proves itself a valuable sort, being there a good bearer, early, and of excellent quality. The fruit is of good size, and its firmness allows it to carry well to market. It has the disadvantage of being pistillate.

GOLIATH, (Kittley's).—An old variety which the American Pomological Society placed upon

Fig. 10.—GOLIATH.

their "Rejected List" some ten years ago, and the cultivation of which is generally abandoned. Yet Mr. Knox finds it to his account to grow it, and thinks more highly of it than of many newer sorts. Size and shape shown in fig. 10.

AGRICULTURIST.—This has assumed a place among the standard varieties, and though like other sorts it is unsatisfactory in some places, there are but few first class berries of recent introduction, so really valuable. It holds its character and size in a remarkable degree. To show how difficult it is to get satisfactory information about varieties, we have before us two letters, dated only one day apart, from Washington, D. C., one of which says: "I find it, on sandy soil, large, ragged, flat, and of poor flavor," while the other writes: "For size and quantity to the stool, the Great Agriculturist stands far ahead."

Upon Mr. Knox's grounds, where it has not heretofore done itself justice, it this year gives a most abundant crop of great excellence.

Pruning the Blackberry.

We know of no plantation that, if left to itself, will become a greater nuisance than one of blackberries. We often see the bushes having their own way, with the fruit up out of reach, or the unsupported, long canes bent over and entangled in an almost impenetrable mass. By proper pruning, the plants may be kept under control, and rendered more productive.

As soon as the new canes get to the height of four or five feet, their upward growth should be stopped by pinching off the tops. They will then throw off lateral branches freely, which, in turn, are to have their growth checked by pinching, when they reach the length of 18 inches. Bushes thus treated will have their wood better ripened, and will be much more likely to pass the winter in safety than will those that are allowed to continue their growth until it is checked by the approach of frost.

Propagation of Black Cap Raspberries.

The Black Cap Raspberry, (*Rubus occidentalis*), so common in its wild state, has sported into a number of varieties, which are quite popular with growers on account of their productiveness and the absence of suckers. Most other kinds of raspberry sucker to a degree that is annoying, and in the abundance of young plants thus formed, propagate themselves; but the Black Caps multiply by quite a different method. At the end of summer, or early in autumn, when the growth is nearly completed, the long branches bend over until their ends touch the ground, and the plant has the general form of figure 1. From the tips of the branches thus brought in contact with the ground, roots are thrown out, and finally a strong bud appears. We have only to sever the stem just above the surface, and we have a new plant. Often, after the point of the stem has taken root, the buds just above (or

Fig. 1.—MANNER OF GROWTH OF THE BLACK CAP.

rather below,) it will throw out shoots, which will in turn take root, and thus form a cluster

of plants, as in figure 2, which, of course, are to be separated when taken up the following spring. Though more or less young plants will be formed without any care on the part of the cultivator, yet as the motion caused by the winds will prevent many of the pendant branches from taking root, it is best, where plants are wanted, to slightly cover the tips with sufficient earth to hold them in place. This operation should not be performed until the wood acquires sufficient firmness, otherwise it will decay.

There are several red raspberries, of which

Fig. 2.—TIP OF A BRANCH ROOTED.

the species is doubtful, such as the Purple Cane, that are propagated in the same way. The two engravings given here are taken from Fuller's Small Fruit Culturist, a work recently published and indispensable to the grower of small fruits.

Where is the Mixing of Varieties Shown?

The question of the crossing of varieties has been considerably discussed of late, and it does not seem to be satisfactorily settled as to whether the influence of a mixture, caused by the ferti-

zation of one variety by the pollen of another, is manifest in the fruit resulting from this operation, or if the crossing is only manifest in the progeny of the seeds of such fruit. There is some evidence that indicates that a cross is shown in the fruit, but Mr. Gregory, who has carefully observed squashes, plants that "mix" very readily, is quite positive on the other side of the question. In his recent excellent little treatise on squashes he says:

"All of the crossing or mixing of squashes is caused by the pollen from the male flowers of

one variety being carried by the bees to the female flowers of another variety. Squashes are crossed or mixed in their seed, and not in the fruit. Many cultivators are in error on this point; they have the very common illustration of the crossing of different varieties of corn in their mind, where the mixture of the varieties is at once apparent to the eye, and infer from this, that the mixture between different varieties of squashes should make itself visible to the eye the same season it occurs. A moment's reflection will correct this; the crossing of the first season is always

in the seed, and for this reason we see it in the corn the first season, as the seed is immediately visible to the eye, while the various colors of the different varieties also aid us in the matter. With squashes the crossing is likewise in the seed, and hence cannot be seen in them, until the seeds are planted, when the yield will show the impurity of their blood. But, though the crossing cannot be seen in the squashes themselves the first season, yet if one of the varieties planted near each other, has seed having the peculiar, thick, salmon-colored coating, so characteristic of some of the South American varieties, this indication of admixture may be detected by the eye the first season. The parallelism between the crossing of squashes and corn may be carried further, for it is oftentimes true with corn as with squashes, that there is a mixing of varieties, of which no indication can be detected in the seed by the eye the first season, which a second season will develop—what was before an eight-rowed variety, into a ten or twelve-rowed sort, or dark kernels may be replaced with white ones, and by numerous similar freaks, bring to light an admixture of varieties.

"It is of considerable practical importance, that the law of admixture should be clearly understood, that the risk, incidental to planting seed from squashes that look pure, should be generally known; for it will be seen from what I have written, that seed taken from squashes that externally are perfect types of their kinds, may yield a patch, where every one may show marks of impurity. Again, no matter how many varieties are planted together, no crossing from the result of that planting will be seen in the external shape, color, or appearance of the crop the same season.

To have squash seed pure, the squashes from which they are taken, must have grown isolated, and this not only for one season, but for a succession of seasons. Should several varieties of squashes be grown together, and it be desirable to keep one kind pure, it can be done by preventing any male flowers of the other varieties from maturing—no easy job, as those who have tried it know. The product of any particular blossom may be kept pure under such circumstances by covering with fine muslin, removing it only to fertilize with pollen from a male flower of its own vine."

This subject is not only one of scientific interest, but has an important practical bearing, and we shall be glad to receive carefully collected evidence on either side of the question.

The Care of Seeds.

Those who would propagate shrubs or trees, either for the interest that attends the production of new varieties, or as a matter of profit, a raising of stocks, often fail from lack of proper care with their seeds. The seeds, or pits, of peaches, plums, and cherries, we all know, are enclosed in a very hard and bony envelope, and these, though they have a large and vigorous embryo, often fail for want of proper care. The seeds of the strawberry, raspberry, blackberry, and of many of our ornamental shrubs, are enclosed in a case, which, in proportion to the size of the embryo, is scarcely less formidable than that of the peach. Most seeds with these very hard envelopes, if once thoroughly dried, are very difficult to germinate. Nature sows them at the time of ripening, but this is often very inconvenient, and the best way is, to imitate nature and not allow the seeds to dry. With all hard-shelled seeds, whether as large as that of the peach or as small as that of the raspberry, the best way is to clean the seeds from the pulp, and then put them with sand or sandy loam, in sufficient quantity to preclude all danger of heating by fermentation, and keep the mixture of sand and seeds in a place so cool that there will be no danger of the seeds starting too early in the season. This process is known in the books as "stratification," and is often performed by making a mound of alternate layers of seeds and sand, and covering the whole with earth, sloped to keep off the rain. In a small way, a flower-pot answers every purpose, or, if a larger quantity of seeds are at hand, a rough box, in which the seeds and sand are to be placed and kept in a cool cellar, or buried at the north side of a fence or building. Many failures result from the seeds being kept too warm; they start with the first warm day of spring, and having no opportunity to grow, the germ withers, and the seeds of course fail.

These remarks apply to the seeds of all of our small fruits, and to all of our hardy shrubs, the seeds of which have a bony shell. Indeed the seeds of many of our trees and shrubs, such as the thorns, need to be stratified in this way through one year. Keeping them in a mass, and exposed to the changes of temperature through one whole year, is much better than to sow them, and be at the trouble of keeping the grounds clear of weeds. Freezing and thawing does not, as a general thing, hurt the seeds of our hardy trees and shrubs, but helps them.

About Weeds.

We have—we know not how many letters asking how to kill this or that weed. If those who write us these queries would only think on the subject, they would see that there can be no specific that will kill an undesirable plant—or weed—and not injure the desirable plants of the crop. Therefore, all applications, be they salt, plaster, ashes, or what not, merely to kill weeds, are simply absurd. Cultivation consists solely in giving the plant that we wish to grow an advantage over other plants. In an uncultivated field, where everything is left to itself, it becomes a "struggle for existence," and the strongest—which is usually the most worthless—gets the best of it. In all our cultivation, the aim is to give the crop we wish to grow sole possession of the soil, and all our cultivators, horse-hoes, hand-hoes of all kinds, etc., are used to destroy every plant except a particular one that we wish should have full possession of the soil.

Now we know of no help for weeds, whether in garden or in field, except a mechanical one. If one finds a few Canada Thistles in his lawn, cuts the stems and puts some salt on each, and thus destroys them, it is no exception to the general rule. Had he put an equal amount of salt all over his lawn, he would have killed everything upon it. We have but little sympathy with a gardener who lets the weeds get the better of him. His soil should have been kept so constantly stirred that weeds could have no chance. Whoever is not able to keep down the weeds by the use of the rake, or the many weeding hoes, has more garden than he can properly care for. If weeds have got the mastery, use some of the various weeding hoes, rake them at once from the ground, and if there is a sign of a flower or a seed upon them, do not let them go the manure heap—it is all nonsense to talk of destroying their vitality by fermentation—but just spread them where they will dry, and then, with the accumulated brush and other combustible garden rubbish, burn them. With a little care, ashes, so valuable as a fertilizer, may be made in considerable quantity from properly dried refuse of the garden.

Neglected Squares in Cities and Towns.

A "Subscriber" in New York sends us the following communication upon the smaller parks and squares. We give his article place, as the fault to which he refers is found in most public grounds in large and small towns all over the country. It is very rarely that these places fall under the management of persons of either knowledge or taste. Those having them in charge order trees for them, and the nurseryman, naturally enough, sends those that he can propagate most readily. The consequence is, our public squares are planted with but a few kinds of trees, and these are almost without exception rapidly growing foreigners.

"Why should they not, the numerous parks and squares of New York, be improved and made worthy of the commercial metropolis? The Central Park is a well managed institution, and an honor to our city. Why should not a little of the wisdom which has produced so satisfactory results in that locality, be brought to bear upon Union, Madison, Tompkins, and Washington squares, which are in the heart of the city, and are within easy approach of multitudes who rarely find time to visit Central Park? We do not hesitate to say that the management of these Squares is a disgrace to the city. Tens of thousands of dollars are lavished upon granite and iron fences, as if the inclosure was of any value when there was nothing to inclose. Trees have been planted there that are a nuisance upon any soil devoted to human use. They are unsightly to the eye, and their roots are continually sending up suckers that mar the beauty of the lawn, when it is established. We would have these coarse, ugly trees, like the Abele and the Poplar, removed at once, and the others judiciously thinned, so that every tree left may have ample room to develop its natural beauty. As a rule, they are now interfering with each other, and quarreling for a share of the air and sunlight, as well as for the soil.

We would have well kept lawns mowed every two weeks. A clean, smooth sod is refreshing to the eye. At the date of this writing, June 7th, much of the grass in these squares is still untouched. There ought to have been, at least, two cuttings. Should a city square, kept ostensibly for the esthetic culture of a million of peo-

ple, be conducted upon the same principle that a stingy merchant manages the lawn of his country residence—with an eye to hay rather than beauty? It would probably cost no more to have these parks kept as they should be. Men enough are employed, and if their labor was wisely directed, it would give us what we pay for—clean, attractive squares. But whatever the cost, give us clean, smooth lawns. Instead of cheap and easily raised foreign trees, we would have specimens of the beautiful natives of our own forest, and all properly labelled, so that children might learn to know the difference between an oak and a butternut. Then, we would have these places planted with more evergreens and flowering shrubs. We want something to refresh the eye in the winter as well as in summer. Our suburban nurseries are able to turn out over a hundred varieties of pines, spruces, piceas, arbor vitas, cedars, yews and cypresses, perfectly hardy, and many of them beautiful. Why should not our citizens be permitted to make the acquaintance of the finest of them in the squares that they are obliged to frequent every day? Why should we not have rhododendrons and laurels in masses, and other beautiful flowers in their season, where we can see them with our families, without paying five dollars for a carriage, and spending two or three hours to accomplish it? Those who live in the city are heavily taxed, let them have something refreshing and beautiful for their money."

The Achilles.

Every one knows the common Yarrow, *Achillea Millefolium*. Yet this vulgar plant—rated as a pest by cultivators, when it shows its white flowers, is, when its flowers assume a rose color, prized as a border plant, and sold at a good price by the florists. Even the common weed has a delicacy of foliage and flower that would make it prized did it not make itself too abundant, but the rose-colored one is really beautiful. We have, in years past, got much satisfaction out of the double variety of *Achillea Ptarmica*, even though it does bear the common name of "Sneeze-wort." It is perfectly hardy, and gives a long succession of pure white flowers. It is so valued among the French that they give it the name of "Silver-bud," (*bouton d'argent*). Nothing is more valuable for summer bouquets than the double *Achillea Ptarmica*. Those who like yellow flowers will be pleased with *Achillea tomentosa*, another hardy species, with foliage and flowers much like those of the common Yarrow, except that the leaves are downy, and the flowers are of a bright yellow. We wish that hardy, herbaceous plants were more generally cultivated than they now are.

Among the Wild Flowers.

It is a good thing to leave the garden occasionally with its Verbenas, Heliotropes, and all the like, and go out and see a bit of nature's gardening. In this month of July there are many fine things in bloom in the meadows and woodsides, and a ramble among them is refreshing to one who has to weed and train the exotics. If there is any thing in our gardens handsomer than our low meadows can show now, we would like to see it. The beautiful *Calopogon* now spreads its numerous pinkish, purple and fragrant flowers in all the low places, while its near relative, *Arethusa bulbosa*, too delicate to be very common, is more chary of its bloom, and gives us only a single beautifully

DEER-GRASS—(*Rhexia Virginica*.)DWARF IRIS—(*Iris pumila*.)

fringed flower to the stalk. We have been much pleased with the abundance of these that have fallen under our observation this season, and hope in due time to give engravings of them.

Among the plants of our low lands, none makes more show than the "Deer-grass"—which, by the way, is no grass at all, but we have to accept common names as we find them. This plant is so striking in its appearance, and has been sent us so often for a name, that we have figured it. Its botanical name is *Rhexia Virginica*. The derivation of the generic name, *Rhexia*, is not well made out; the specific name *Virginica*, was applied to it before the geography of this country was well understood. The plant is not peculiar to Virginia, but is found from Massachusetts far southward. The plant belongs to the family Melastomaceae, one which gives us many valued green-house plants from the tropics; but is only represented with us by the genus *Rhexia*. The leaves of the plants in this family are all opposite, very strongly ribbed, and the anthers burst in an unusual manner—by openings or pores at the apex, instead of by the ordinary way of a longitudinal slit. We have three species of *Rhexia* in the Northern States, but the one we have figured is the showiest. This plant was long ago cultivated in England, and we see no reason why it should not be introduced into our own gardens. The peculiar form of the four petaled, bright purple flower, with the conspicuous yellow anthers, gives it so peculiar an appearance, that if the plant were potted, no one except a practical botanist would recognize it as an inhabitant of our Eastern swamps.

Later will come the most gorgeous of all our wild flowers, *Lobelia cardinalis*, the Cardinal Flower, before the intense brilliancy of whose color the exotics pale. But we can not notice now all that one will meet with in a ramble. We would merely give the advice to those who would transfer these wild beauties to their grounds, to mark the plants while in flower, and if there are many ramblers in the neighborhood, to follow the practice of one of our friends, and render the plants less conspicuous, by removing the flowers. Mark with good stakes, that can be readily recognized—a common stick with a bit of white rag tied to the top, so as to flutter in the wind, we have found to be as good as anything—and after the foliage is dead, transfer the plants to a situation in the garden as near like their natural one as may be.

The Flower de Luce.

The name Flower de Luce has been applied to some species of *Iris*, because it was assumed by Louis VII., of France, as his badge or device. It was in old French *fleur de Louis*, and the recent *fleur de lys* is a change from the original. So much for the derivation of a common name about which people who try to be correct differ. Flower de Luce is as much English, among flowers, as *avoiirdupois* is in respect to weights. Every one knows our common wild Blue Flag; that is a Flower de Luce, or, botanically speaking, *Iris versicolor*. The genus *Iris* is a large one, and comprises both tender and hardy species. Our present object is to call attention to the

hardy ones, as there are few hardy herbaceous perennials that will give more satisfaction than a collection of the best sorts of *Iris*; they present a great variety of color, from white, through blue and deep purple to yellows and browns.

One of the very earliest is the European Dwarf Iris, *Iris pumila*. Its leaves grow but a few inches high, and its very early flowers are borne on very short stems. We have figured this species of its natural size. Ordinarily its flowers are of a violet color, but it varies from white to pure blue. On account of the low growth of the plant and its hardiness, it is very useful for edgings. It is not at all particular as to soils, and does very well in a dry situation. We have three native species of Dwarf Iris, which, if brought into cultivation, would doubtless be as valuable as the old *Iris pumila*. These are the *Iris verna*, found on the hill-sides of Virginia and Kentucky; *Iris cristata*, which grows in similar localities, and *Iris lacustris*, another dwarf species, found along the shores of the great lakes of the West. These native species bloom in April and May, and are well worthy the attention of cultivators. Among the taller growing kinds are: *Iris Germanica*, the common Flower de Luce of the old gardens, and *Iris sambucina*, the elder-scented kind. *I. variegata* and *I. Belgica*, (of the books,) give no end of pleasing varieties, and some of them give a quite late bloom. All that we have mentioned have large and fleshy root-stocks, which are readily divided, and give an abundance of plants. The "orris root" of the drug stores, much valued for its violet perfume, is the dried root of *Iris Florentina*, a species often found in our collections.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

Dashes at House-Keeping with a Free Pencil.

PRIZE ESSAY BY MISS EVA M. COLLINS, ROCHESTER.

We have been canning fruit all day—plums, peaches, and pineapples. The latter were not set down in the programme for to-day. Aunt Mary brought us a half bushel after we had got well started with the peaches and plums. She said they were very ripe, and besides she wanted to attend to their canning herself, so if Ralph could be detailed for her special service in the back kitchen, she should be exactly suited. They require so much cooking to make them tender, he would be able not only to keep enough pared and sliced ahead, but assist her in putting them into the bottles. Aunt Mary has been telling us about a "Fruit Drying House," which she says we ought to have, as it would not be a quarter the trouble to prepare fruit in that, that it is to can enough to last the year around. There are a number of sizes in operation, from one intended for use in a small family, to one of sufficient size where fruit drying is made a special business for market. Father says, "just as mother says," so probably we shall have one. Most of the berries, cherries, plums and pears, are as good for common use when dried, as canned, and green corn and many other vegetables are better so prepared. Father thinks the expense of a Drying House would soon be met by the saving of cans.

Paring fuzzy peaches all day is nervous work, so I begged an exchange with Mary for an hour or two, and scalded the milk-room shelves.

Aunt Mary came into the milk-room while I was scalding the shelves, and described a milk-rack which Uncle Charles recently brought home for her to use as a provision stand, which would be very useful for us, when, as on this occasion, we set the milk. It is a circular wire work of shelves, 6 in number. Aunt Mary says her rack stands in the center of her store-room, between the windows. She has it covered with a musquito net, which readily admits the air, while doing its duty in keeping out insects. I can readily understand that the cream would rise much better in the rack than on shelves, as Aunt Mary describes, because we always find that, however thick, and firm, and golden the cream may be in the front of the pan, which has access to the air, that on the opposite side of the pan is thin, soft, and white, in comparison. The action of the atmosphere would effect as great a miracle over the entire pan, when in the rack, as at present it does in the fore part of our milk pans, as they stand upon their shelves.

To-day, mother remarked that she learned something of value from every one she knew; so we set our wits to work, conjuring up some most incorrigible specimens of humanity; but, to our surprise, we found mother was right even in this, which we all thought a wonderfully wild remark for her. Old blind Pierre taught us years ago to leave out a portion of the coffee, until just as the coffee pot was removed from the stove, in order to secure the fragrance as well as strength of the beverage. Even the old woman whom we took into the house and employed during the great snow storm, and then sent on her way rejoicing in a comfortable wardrobe, besides her wages, because she was so very destitute, and who the next day sold our tea through the village, mother says, taught us two valuable lessons. One lesson was to let the tea toast in a warm place for fifteen minutes before steeping, and the other, to be more watchful of stragglers, and the tea chest.

We thought this case the climax, until Jennie suggested, "Ike, mother, what did Ike do?" As mother hesitated a moment, and the case seemed rather dubious, I asked Jennie "Who made her first wish-bone doll?" Ralph said this was not admissible, for mother said "lessons of value;" but he might better have let the wish-bone doll pass unchallenged, for mother turned to him immedi-

ately and said, "Ike hung the south woodshed door, which you know was impossible to be done with those heavy hinges, and we have no more substantially hung door, or gate, on the premises than that." Ralph gathered up the peach skins, and replenished the dishes all around, and before we had got ready to work again, Aunt Mary came with the pipeapples, so no more cases were brought forward. After we were all at work again, grandmother told me "it was only those persons who had their eyes and ears open, who picked up valuable lessons from every one about them. Many persons go through the whole course of their existence without learning much, except what is forced upon them through their own experience, and those persons rarely profit even by such lessons."

Leaves from My Journal.—No. VI.

PRIZE ESSAY BY MRS. B. MCLELLAN, OF OHIO.

August.—How much watching and care everything about house requires these sultry days! Mould gathers here and there, for there is moisture notwithstanding the heat. Mildew and blight take one by surprise. These are gala days for insects, spiders and flies. Brooms, brushes, and suds, are in good demand. Where does all the dust come from in the darkened and closed rooms? A house with good elevation, not too closely surrounded with trees and shrubbery, is far healthier now. I wonder if we don't greatly mistake here, filling our yards too full of trees, and covering houses and porches with too many vines. They are beautiful, and the shade grateful, but would not more of the free sunlight and air of heaven make all purer within? The flowers are in their glory. Dahlias threaten to outvie the roses. I have great respect for dahlias! They so faithfully fulfill their mission. Till the heavy frosts come, they will never weary mounting one tier of blossoms above another, perfect in form, and varied with every color. I made a great mistake with verbenas; I tried to grow them in the same bed with dahlias, and thought they would look finely together. But the poor things, like the frog in the fable, tried so hard to be like their aspiring neighbors, climbing hither and yon, that though they could not after all become dahlias, they certainly were not verbenas in any way flattering to their kind—putting out only a profusion of large, coarse leaves, and here and there a straggling, puny blossom. They want a bed to themselves, with the sun shining full in their faces, where, in every variety of color, they lovingly intertwine, serving only by contrast to show the rare beauty of each,—like two lovely sisters, the blonde and brunette, on the same parent stem.

Is it, indeed, true! that, with the country filled with sewing machines, and so many other labor-saving implements, we housekeepers are no nearer the "leisure time" we covet, than ever before? Our garments are so highly embroidered, so continuously tucked and plaited with innumerable rows of stitching, that, though quickly done, there seems no end to the doing. Are we not misusing the price put into our hands to get wisdom? Few housekeepers allow themselves time even to read the papers on their tables. There is ever another piece of work to be done, calls to be made or received, unexpected company to be entertained, or invited friends to prepare for. There are demands outside of home, upon the time as well as charity of all. But after making full allowance for all these, can not an hour or half hour be secured for self-improvement and culture, on subjects of more consequence than dress or the pleasures of the table? How often have I resolved that to-morrow shall not be like to-day in this matter, only to see to-morrow's sun set upon broken promises of amendment. We are too much the slaves of fashion. Like the centurion to his servants, she says to one, come, and she cometh; to another, go, and she goeth; and still to another, do this, and she doeth it. But where shall the line be drawn, beyond which it is not safe to venture? Where is the blessed mean beyond the ever widening extremes? Who shall point out the path in which our wayward,

wandering feet may walk without stumbling? A friend said to me once, "I should think I had lived long enough to find out that I never shall see the time that I have not plenty of work to do, and indeed to feel hurried about." Must we not then take time as it passes, for reading and correspondence with friends or absent members of the family? "As cold waters to a thirsty soul, so is good news from a far country." We can not afford to lose such delightful refreshment.

I made some pumpkin pies to-day. They are nice and fresh as those of last thanksgiving, and a real treat. The pumpkin was stewed and dried upon plates. If these are well greased it comes off without trouble. It must be kept in a tight bag in a dry place. Soak over night in milk before using, and prepare the same as when fresh. Hubbard squash prepared in this way, is excellent also.

I make a variety of jellies. They are always acceptable, and a great ornament to the table. Quinces, crab apples, and fall pippins, make the very best. Currant jelly should be made when the fruit first ripens. After straining the juice, boil gently half an hour before adding the sugar, after which it needs little more. Cool a small quantity in a dish before taking up, to see if it thickens.

Leaves from the Diary of a Young Housekeeper.—No. VIII.

PRIZE ESSAY BY MRS. LAURA E. LYMAN, STAMFORD, CT.

August 3d.—For a week now, I have been pretty busy. The blackberries are ripe, and Sue and I have picked a good many, some of which I have dried, made several pounds into blackberry jam for winter use, and to-day, I made two to three bottles of cordial. For light cases of summer complaint, I know of nothing more agreeable or effectual. If I do not need it myself, some of my friends may, and there is nothing more pleasant than to have it in one's power to relieve the sufferings of friends, and add to their happiness. How grateful, in that long spell of fever I had two years ago, were the kind attentions of our neighbors! How I relished the various delicacies they sent in to tempt my appetite after I began to convalesce!

August 7th.—To-day I commenced drying corn for next winter. We have had it on the table several days, but it is just coming in abundantly. I boil it about ten minutes, then cut it off the cob and spread it on a board to dry, covering it with a piece of fly-netting. Edward relished that mother sent me last winter so much, that I mean to have a plenty laid by in store.

August 15th.—The weather for a month past has been very sultry and oppressive, and some of the time very hot, so that my enterprise of converting the milk, of which we have a great deal, into cheese instead of butter, proves to have been very timely. I have now twelve cheeses which I keep on a new, clean shelf in the milk-room. The little milk and cream that I appropriate for butter, I keep on the swinging shelf at the north end of the cellar. I have a great curiosity to know how my cheeses are going to taste. They look to my eyes very tempting, and I count them over every day, when I turn them and rub them, much as a miser would twenty dollar gold pieces, and they are almost of the color.

August 17th.—I have been putting up peaches. Edward has been helping me, for the stress of farm work that has been on him ever since the middle of April, has relaxed a little at last, as haying and harvesting are over. In the preparation of my canned peaches, I followed a recipe that I found in a bound volume of the *Agriculturist* for 1860. I think it is the same one mother went by last year, and her peaches were splendid. She brought me a couple of cans when she came to visit me in June. As I have plenty of other preserves, I canned all my peaches, for I think, generally speaking, peach preserves are too rich to be wholesome.

Edward says I must go visiting a few days, that I am quite too enthusiastic a farmer's wife. But how can I be otherwise, when he is so industrious and laborious, and makes every edge cut on the

place? He says now that all the workmen are gone but our soldier, who is entirely recovered, and that the weather is cool, I can be spared a few days as well as not. Sue can take care of the milk, and the cream will keep till I come back. I agree with him that it will be very pleasant to recreate awhile, but I can not go without him. Our soldier is so grateful for the attentions we paid him when he was sick, and so reliable a man, that I think Edward may feel safe in leaving everything in his care.

August 23d.—Home again! Found everything in a satisfactory condition. The weather was cool, the cream rose well, and Sue ventured to try her hand at making butter in my absence, and really succeeded very well. I told her she should have it to take down to the store and sell on her own account, but advised her to work it over once more.

We went to see an old friend of Edward's, about fifteen miles distant, and our visit was delightful. The ride through the country, now rich with all the pomps of midsummer, was truly exhilarating to the spirits of us both. It is the first journey that we have taken since our marriage. How busy, how crowded, and how happy have these eight months of our married life been! We have both been blessed with perfect health, our table has been, with the exception of tea, coffee, and salt, supplied by the labor of our own hands, and as I reflected on the past, that beautiful sentence of "the pious Hooker" was recalled to my mind, where he describes the farmer as "living nearer to God, and seeing more of His works than any of the less favored children of men, for he beholds the blessings of God blossoming out of the earth around him!"

We started just after dinner and reached the farmhouse about sunset, where we received a most hearty welcome. Edward had told me, during our ride, that most of the valuable ideas which he had about farming and housekeeping, he had acquired during his residence with this family. The first year after he was of age, he worked for Mr. George during the summer and fall, and in the winter taught the adjoining district school, boarded with Mr. George, and paid his board by working before and after school. The family have always thought very highly of him ever since his residence with them, and when I made their acquaintance I could see why the respect and admiration was mutual. Their's is the best farmer housekeeping I ever saw anywhere. It is Mr. George's ambition to have the best cows and the largest milkers of any dairyman in the county, and it is his wife's to send to market the largest firkins of the most perfect, golden and fragrant butter. She took three successive prizes for butter at the October fair, and if the three handsome little silver cups and butter knives which she drew were out of solid amethyst, she would not think more of them. But I can see that her success is produced by the almost perfect arrangements and appliances for butter-making, as much as by the care that she herself bestows. The house is one which was planned throughout by Mr. George, who has the great advantage of knowing precisely what he wants, and possessing the ability to suit himself in everything he does.

The architecture of the farm-house is very much in the usual style, having in the main part, four rooms below and four above. It is situated on a gentle slope which looks eastward, and the house fronts westward, being on the lower side of the road. At the rear of the house and attached to the main building is a lean-to, which is also of two stories, the first being a basement, of which the walls are heavy masonry. Here in the upper part, and on a level with the first story of the main building are the kitchen, store-room and tool-house. Underneath is an ice-room, a small wash-room, back of which is the cellar door, and on the north-side is the milk-room or dairy. I was so much pleased with the arrangement that I made a plan of it, and Edward says that when he builds a new house it shall have all these conveniences.

A, is the ice-house, entered by a large trap door from the tool-room floor above; on one side of it, I, is a small ice-chamber, six feet by six, entered by a double door from B, the wash-room, and so sur-

rounded by ice as to be a perfect refrigerator. C D is a door, also double, that opens into the cellar in the rear, which is not shown in the plan. The outer door of the wash-room has a low threshold, so that a large wheel-barrow can be trundled directly into the cellar from without, thus obviating the necessity

PLAN OF BASEMENT OF LEAN-TO.

of laying planks or props for it to run upon. K is a large kettle or caldron, set in masonry, and very near the outer door, so as to be convenient at hog-killing time, for soap-making, washing, cooking food for animals, and furnishing hot water for dairy purposes. L is a small lead pipe leading from a tank in the kitchen above, so that by turning a faucet, the caldron may be filled with water in two or three minutes. E is the milk-room, twenty feet square, with a shelf of masonry, S, on the top of which is a shallow trough, thoroughly lined on the inside with cement, so as to be water-tight. P is a pipe, also leading from the tank above, and throwing a small stream of water into the trough, which, after making the circuit of the shelf, and cooling all the pans alike, runs out at p, whence it passes to the barn yard. There is a fall from P to p, of a fraction of an inch, so as to give a gentle and uniform current. The room is lighted by double windows on hinges, so the amount of external air to be admitted can be easily and perfectly regulated. There is a flue in the corner, and in winter an air-tight stove is used, by which the temperature of this apartment can be so perfectly adjusted that the thermometer which hangs there does not vary ten degrees the year round. Fly screens are fitted into the windows in midsummer. The washing of milk vessels, and the churning, are all done in the adjoining room, the butter, when packed, is set into the ice chamber, and thus, whether in January or July, nothing affects the flavor, the quality, or the hardness of the butter, except changes in the food of the cows.

The water, which is so admirably economized and skillfully applied, comes from a never-failing spring on the side of the hill above the house, and is conducted in pump logs. The tank in the kitchen into which it discharges, is divided into two compartments, one of which is always full, and supplies a uniform stream to the milk-room below. The other compartment supplies the kitchen, the caldron below, and its waste passes to the barn-yard. All the labor of the house is strictly confined to these six apartments, the rooms of the main building being kept in perfect order, and pleasantly furnished with carpets, sofas, agricultural and other books, so that a visitor would never know whether Mr. George was a farmer or a gentleman retired on his fortune, unless he visited the working rooms in the rear.

I noticed that Mr. George himself, his sons, and the laborers that are hired by the year, upon coming in from their work, left their heavy farm boots in the tool-room, where were also conveniences for washing, and wore light and clean slippers when they came into the nicely carpeted rooms.

Like a model mother, Mrs. George is training her three daughters to understand every department of domestic industry. One week Mary, the elder, directs the dairy girl, and is held responsible for the quality of the butter, while Jane attends to the washing, ironing, and mending, and the clothing department generally, and Ellen presides over the management of the kitchen and pantry.

From my observations of Mrs. George's methods of conducting the housework on a large farm, I have obtained some valuable hints for my own benefit, when by our thrift and economy our stock has become much larger than it is at the present time.

A noticeable feature which I have seen also in other well kept houses is, that everything at Mrs. George's moves in an unchanging routine, which is probably the secret of her accomplishing so much, and doing everything so well.

I observe that although the labors of the farm are confined to a set of apartments, the entire house is open to her guests and the various members of the family, and their amusements, the conversation at table, the books they read, and their modes of entertaining their friends, are as high toned as in any family I have ever visited.

His sons are taught to aspire to the ownership of a well kept farm, and a thorough understanding of all departments of agriculture as their most legitimate and praiseworthy ambition; and the daughters all expect to become the wives of farmers.

I cannot but think that if all were to look upon agriculture as this admirable family does, the young men of our country would not have such a proclivity to the cities, nor girls show a preference for white handed dandies and professional men.

Reading for Boys and Girls.

A father asks our advice as to suitable reading for boys from the age of 12 to 17. He has five sons, whose education occasions him a good deal of solicitude, and wants a library of choice books for them in the departments of history, biography, travels, and natural science. This request opens a subject of great importance, and we have a few old fashioned ideas upon the subject, which are at the service of our readers. The books we had access to, at the age of twelve to fourteen, were Plutarch's Lives, Hume's History of England, Rollin's Ancient History, and works of that stamp. It was the best thing perhaps that could have happened, that we saw little of fiction until maturer years. We think many of our Sabbath School books, and works especially written for the young, run too much to fiction and small talk. There is no occasion to resort to novels for interesting reading. Historical writers have as much grace of style as the masters of fiction. Any boy or girl, of average intelligence, would be charmed with Macaulay's History of England, Bancroft's History of the United States, Prescott's and Motley's historical works, Irving's Life of Washington, Irving's Columbus, Life and Letters of W. Irving, Sparks' American Biography, and the travels of Stephens, and of Bayard Taylor. These alone would make a respectable library, and would be as much as any child ought to read between 12 and 17 years of age, in addition to the drill of the school room and the reading of the papers. One of the pleasantest winters we remember was that in which Irving's Life of Washington was read aloud in the family, for three evenings in the week, the children taking turns in the readings. All of Irving's most genial works may be read with profit, at a later age.

There is much less need of private libraries now than thirty years ago; for public libraries are greatly multiplied in our cities, and villages, and the best thoughts of the best minds of the country are given to the public through our periodical literature. These papers and magazines are virtually circulating libraries, and a good selection of them should be found upon the centre table of every intelligent family. Farmers of course will see that the agricultural papers are well represented at their fire-sides, if they wish to cultivate rural tastes in their children.

Pickling Beans.—Robert Black, New Bedford. We know no better way than to pick them before they have any strings, soak in weak salt water for 24 hours; prepare vinegar with spices as for other pickles, pour it hot on the beans, and then after 3 or 4 days pour it off and re-seal it. A little alum hardens them, but is not desirable, nor is the poisonous verdigris from the brass kettle that gives such a beautiful green to the pickles cooked in that metal. It is much better to have pickles of any kind wholesome, rather than make them attractive to the eye by injurious additions.

An Eventful Life.

A Small Piece of Work.—A most curious and interesting model at the French exhibition is that of the rock and fortress of Gibraltar, with a fleet of ships lying in the harbor. This fleet consists of a ship of the line, a frigate and a steam corvette, a brig and a schooner, every spar and rope being faithfully represented; and yet the hulls of these little vessels were constructed out of less than the tenth part of a cherry stone. The rock and fortress of Gibraltar are in the same proportions, and the whole structure can be covered over with a florin.

Our Artist's Game.

A Valuable Nest.

A Sincere Mourner.

large dog that had been the companion of the horse for several years. They succeeded, however, in partially quieting him, and raised the carcass upon a cart to take it away, the dog meanwhile holding on to it with his teeth, and trying to pull it back. At last, when the cart was started, the faithful friend mounted beside the body of his dead companion, and was carried away with it, a sincere mourner. After about three hours absence, he returned, and entered the stable, showing plainly by his downcast look and whining, how much he missed his former companion. Such attachments are not rare.

A Troublesome Sliver.

Charley came to his father one day with a pitiful face, and, holding up his finger, said: "It hurts so, I wish you would see what is the matter." His father examined it carefully, noticed a small red and swollen place, and when he touched it, Charley flinched, saying, "Oh! it's sore there." "I think there must be a silver in there," said his father, and, taking out his penknife, he carefully picked away the skin, and soon brought out a small, sharp bit of wood, which had caused the trouble. "Now, it will soon be well." "Thank you, sir, it feels better already: I must have got it in yesterday, when I was piling up boards." "Don't get a silver in your *conscience*, my boy," said his father, and Charley started off for his play, thinking of his father's curious remark. Soon he was enjoying a lively game of base ball. Quarter to nine came, and he knew it was time to start for school, but his side had the "innings," and it would soon be his turn

To strike, and he waited. Somehow, every boy before him took a long time, and after he had sent the ball flying across the field and made a good run, he waited to have another turn at it, for the game was a close one, and a few more runs would decide it in favor of his party. Boom! boom! sounded out the village clock, just as the innings were finished, and then Charley knew he must be late to school; the door would be locked, and he must wait until half past nine before he could be admitted. He gathered up his books, and slowly santered off, thinking what excuse he could give for tardiness. It seemed to him that half past nine would never come, as he waited before the door, and heard his companions inside singing their morning song, and he could not make up his mind what to say to his teacher. At last he entered. The teacher looked at him pleasantly, saying: "An unusual run for *you* to be late. Charley, you were

husy, no doubt." "Yes, sir," replied the boy promptly. "I was busy," thought he, pleased that his teacher had shown him how to evade the truth. "I knew it must be so, for you are a pattern for punctuality," said his teacher and sent him to join his class in the recitation room. "I got off nicely, and I didn't tell a lie, either," was Charley's first thought; but somehow it didn't satisfy him, and he couldn't get it out of his mind, that he had done wrong. Things did not go pleasantly all day; his mind wandered from his books, he was reprimanded for want of attention, and altogether had a hard time of it. Just before school was out, while sharpening his pencil, he slightly hurt his finger, which was yet tender, and like a flash it came to his mind, "there's a sliver in your conscience." Now he knew what his father meant. "I'll have it out," bravely said he to himself. He waited until the other boys had gone, and then told his teacher the whole story about the real cause of his lateness in the morning. Then his peace returned—the "sliver" was out, and you may be sure he remembered it many times afterward, and when he had done wrong, made haste to confess it, and in this way to get rid of his trouble.

A Fair Division.

It is related that when one of our largest war vessels lay at anchor in the harbor, a man who wanted to see all the sights endeavored to go on board. The Commander warned him off, saying they were not then receiving visitors. The man called out, "That ship belongs to the people of these United States, and I am one of the people, and being an owner, I have a *right* to go on board." The Commander, who loved a joke, took out his pen-

A similar anecdote is told of one of the house of Rothschild, the great Bankers of Europe. During revolutionary times an excited workman called at the banking house, and demanded that a division of riches be made, saying that no one had a right to be richer than another. The banker handed him a *son* for his portion of what was in their hands, and the man at once felt the absurdity of his demand, and left the banker undisturbed.

Counting all who *read* the *Agriculturist*, month by month, the number must be nearly a million. Once in a while a reader seems to forget that he is but a very small fraction of this number, and claims that *his* letter shall be printed, or *his* views set forth, or some thing else be done for his special gratification, as though in 1,000,000 he were the 1 and the remainder were the 000,000's. When we publish 36 pages, as in this number, a paper will contain somewhere about 500,000 letters, that is about *half a letter* to a reader, if each could claim his special share. How will you have your half-letter fixed, Mr. One-eye-dear man?

New Puzzles to be Answered.

No. 272. *Illustrated Rebus*.—For obstinate individuals.

No. 273. *Mathematical Problem*, by J. D. McGiffert.—Three neighbors, A, B, and C, whose dwellings are situated in the form of a triangle, and distant from each other 60, 75, and 90 yards, respectively, desire to dig a well, to be used in common by them, at a point, within the triangle, equally distant from the abode of each. How far from each neighbor's dwelling must the well be dug?

No. 274. *Illustrated Rebus*.—A truth worth studying.

Answers to Problems and Puzzles.

The following are answers to the puzzles, etc., in the July number, page 261. No. 269. *Puzzle Picture*.—"Nine tailors make a man."....No. 270. *Illustrated Rebus*.—"One swallow does not make a summer."....No. 271. *Arithmetical Problem*.—A should receive \$20.42 $\frac{1}{2}$; B, \$14.57 $\frac{1}{2}$. *Solution*.—A's hog weighed 400 lbs., which at $\frac{1}{4}$ cent per lb. more than the price of B's, would bring him \$1 extra. This \$1 subtracted from \$35, the money for both hogs, leaves \$34 to be divided according to the weight of the hogs; $\frac{4}{5}$ for A, and $\frac{3}{5}$ for B.

More About Breath—Experiments.

The experiments described last month on page 261, proved that breath coming from the lungs is a very different thing from the air which enters them. They showed that air supports a flame, but breath will extinguish it; and that breath is heavier than air. Very many experiments have proved that whatever will not support a flame, is not fit to be breathed, but is destructive to life. A mouse dropped into a jar filled with your breath, would die if kept there a short time. Or if it or any other animal were simply placed in an air-tight box, it would soon spoil the air by breathing it, and die unless fresh air were admitted. A close room, where the air can not enter freely, is unfit for human beings. The first symptoms of being poisoned by breathing again what has passed from the lungs, is a dull, heavy feeling, accompanied by headache; this is followed by sickness at the stomach, fainting, and by death unless relief be given. Thousands of persons are partially *poisoned* every day by the want of ventilation in rooms. Some thoughtful boy or girl may ask, "If this is true, why has not all the air in the world been spoiled long since, by the millions of human beings and animals that have breathed it?" Because the Creator has arranged a wonderful process by which the poisoned air is purified. To give a clear idea of this we must first know something of what breath is. Two experiments will help us somewhat. Take a small handful of quicklime, pour water enough upon it to slake it, and also to have a quart or two remain in the vessel after the lime is slaked; it will settle, leaving the water looking nearly as clear as before, but still containing a little of the lime dissolved. Pour this clear fluid into a wide-mouthed jar. Next put some *air-slaked* lime into a bottle. Have a cork for the bottle fitted with a tube passing through it, conveniently bent, and long enough for one end to pass to the bottom of the jar containing the "lime-water," while the other end with the cork is in the bottle. Pour some vinegar into the bottle, and immediately stop it with the cork and tube, and place the other end of the tube at the bottom of the jar of lime water. Bubbles will soon begin to pass up from the tube, the lime water will lose its transparency, and become of a milky color.

Second Experiment.—Blow through a tube into the bottom of another jar of clear lime water for a minute or so, and that will also turn milky in appearance. Then it seems that what passed from the bottle through the bent tube into one jar of lime water, and what was sent through the other tube from the lungs, must be somewhat alike, for they produce similar effects upon the lime water. Find out something more about this by reading or asking questions, before we have room to tell you more about it, and you will become more interested.

The Home Guards.

Oh, such fun! Mr. Editor. You see cousin George, from the City, is spending the summer at our house, and his father, who used to be one of the Zouaves, sent him ever so many fireworks, and a whole suit of soldier clothes to keep up Fourth of July with. Then George must have a "training" he said, and we, that is, his five

consins, must be his soldiers. "I can make a soldier cap," said Edward, and he soon folded one up from a newspaper, and stuck some lily leaves into it for a feather. Then he took the poker for a gun, Nate seized the shovel, Susie the tongs, Fanny the toasting fork, and I took father's cane, and at it we went *pell mell*. But Captain George soon brought us into line, and we had *regular* fun, with "shoulder arms," "order arms," "present

Our News-boy Correspondent.

For some year or two past there have appeared from time to time articles in the *Agriculturist* from a correspondent then personally unknown to the editors. We had a pleasant call from him a few weeks ago, and as he was leaving he said: "This ground was very familiar to me some 20 years ago." Knowing that our office stands on the ground which the "Old Brick Church" occupied, we said: "You used to attend Dr. Spring's church, perhaps?" — "No," said he, "not much—in those days—I used to sleep in the grass inside the railing."—He went on to tell how he used to sell papers and black boots all day—spend his few pennies, some for food and the rest to get admission to some place of amusement or show in the evening, and sleep in the street at night. The narrow grass plot around the church made a very soft bed for tired boys, if the police did not notice them and drive them out. He told us, too, how he had, by avoiding bad companions and by diligence in business, acquired a competence and good education. The little boot-black he employed looked up to him with mingled reverence and wonder, when he told him that at his age he used to brush boots for one to three cents, and never thought of getting five or ten cents as boys do now-a-days. So he called to a mate, saying: "Look-er here, Big Billy, aint this a fine gent'man to ha' used to shine boots in the streets, same as us?"

The Great Family Meeting.

The newspapers for some months past have been filled with accounts of the great "Exposition," at Paris. How many of our young friends have taken pains to look out the exact meaning of that word "Exposition"? If you examine it properly you will find it has a root and branch—(prefix, the grammarians call it,)—which together signify *placing out*. When Mary invites her young friends to tea, and brings out her new doll, her china dishes, and other treasures to show them, she has an "Exposition." The Emperor Napoleon invited all the world to come and see the fine things made in

France, and to bring with them what their countries could furnish to add to the show. People from every part of the globe accepted the invitation, and a very grand time they are having. Americans are proud to find that they have taken so many prizes, some of them for things which Europeans thought could be made nowhere as well as by workmen on their side of the Atlantic.

But we think the best part of the whole performance is the *family* meeting. Brothers and sisters come together there, from almost every nation and race under the sun. The brown Japanese shakes hands with the sooty African and the white Englishman; Egypt embraces Australia; the Islanders of the Pacific exchange greetings with the Tartars of Asia, and men of different manners, customs, and religions, are learning that all belong to one great family. Kings and Emperors come together and talk over national affairs, and a kindly feeling is awakened which will do much to prevent wars in the future. All are learning that the skill, the wisdom and the excellence of the world is not confined to their own country, but that each nation has its share, more or less, and so they come to respect and sympathize with each other, and acknowledge their brotherhood.

THE HOME GUARDS.—Drawn and Engraved for the American Agriculturist.

arms," etc. Here's a picture to show how we looked "at rest." But we did not stay at rest, for soon a pig came into the garden, through the gate which we had left open, and our Commander gave the order "charge," in a hurry. Away went piggy, over flower beds, among cabbages, and through the currant bushes, retreating in great disorder, and he was soon routed out of the garden. Nobody was wounded on our side, except Fanny, who fell into a rose bush and scratched her arm. After repairing the damage done by the enemy upon our earthworks, we marched in good order into the house, where we were reviewed by father and mother, and treated to a grand complimentary dinner, which was properly disposed of. — MARY.

[We print the above lively account of the exploits of a section of Home-guards, that their comrades throughout the country, who are fond of military exercise, may enjoy their share of the sport and the glory. — Ed.]

A Freedman from down South was lately inspecting a horse-power in operation, driving a thrashing machine, when he broke out thus: "Mister, I have seen heaps of things in my life, but I never saw anything whar a horse could do his own work and ride hisself too."

(Business Notices \$2.50 per Agate Line of Space.)

Piano for a Life Time.

Those desiring to find a Piano which will give entire satisfaction in tone, touch, and style, and which WILL REMAIN GOOD FOR A LIFETIME, will please call and examine, or send for a circular describing the newly invented

MATHUSHEK PIANOS,

constructed on an entirely new plan, the invention of Mr. Frederiek Mathushek, who is well known among manufacturers as the "Father" of improvements in Pianos. By his latest modifications, the power and tone of the instrument are wonderfully increased, so much so, that the smallest size, of "square" form, only *four feet nine inches long and two feet eight inches wide*, equals the full-sized piano as ordinarily made. Our full ordinary size equals the **CONCERT GRAND** of any other maker. The peculiar construction INSURES ITS DURABILITY. Address
BARLOW, DOEHLER & CO., 691 Broadway, New York.

The
**Howe Machine
Co.'s Sewing
Machines,**
699 Broadway,
Cor. Fourth-st.,
New York.
For Families and
Manufacturers.

These World-Renowned Sewing Machines

Were awarded the highest premium at the World's Fair in London, and six first premiums at the N. Y. State Fair of 1866.

These machines are made under the immediate supervision of the President of the Company, ELIAS HOWE, Jr., the original inventor of the Sewing Machine.

The *Stitch* invented by MR. HOWE, and made on this Machine, is the most popular and durable, and all Sewing Machines are subject to the principle invented by him.

SEND FOR CIRCULAR.

THE LATEST AND INCOMPARABLY THE BEST FAMILY SEWING MACHINE EVER INVENTED.

Combining the Greatest Simplicity with the Highest Section of Mechanism and Greatest Range of Work.

All the Highest Premiums of 1866.

Send for Circular and Samples of Work.
ELLIPTIC S. M. CO., 543 Broadway, N. Y.

SPECIAL NOTICE.

Whereas the Howe Company advertise six First Premiums at the New York State Fair of 1866, we deem it justice to ourselves to publish the following certificate:

We, the Committee on Sewing Machines of the New York State Fair of 1866, hereby certify that ALL the Highest Premiums on Sewing Machines were (except one for heavy leather work) awarded to the Elliptic Sewing Machine, to wit:—For "Best Family Sewing Machine; Best Double-Thread Machine; and Best Samples of Sewing-Machine Work."

C. E. PETERS,
HECTOR MOFFAT, } Committee.

**WHEELER & WILSON
ROTARY HOOK****SEWING MACHINES.
625 BROADWAY.**

"WOMAN'S GREATEST BOON.—We would advise a man to forego a Thresher and thresh wheat with a flail, rather than to see the wife wear her health, vigor and life away in the everlasting 'stitch, stitch, stitch,' when a Sewing Machine can be obtained. The WHEELER & WILSON is an invaluable aid in every household. We have had several different kinds on trial, and after a six years' service, the WHEELER & WILSON has taken the precedence as the best, where all kinds of sewing are to be done in a family."
[*American Agriculturist*, Jan. 1863.]

THE MAP

IS DONE.

THE

New Double Map

which has

A TOWNSHIP AND RAILROAD MAP
of the**GREAT WEST**

on one side, and

ALL THE WORLD

on the other.

On the same side with the World Map is a New Pacific R. R. Map, 10x40 inches, and a minute map of the Mississippi River, 5x60 inches.

The best work ever made for canvassers. Size of each map, 40x72 inches. Price of the whole, \$3.50. Sold only by subscription by experienced canvassers, to whom Town and County Rights will be given.

H. H. LLOYD & CO.,
Publishers, 21 John-st., New York.

STRAWBERRIES.

Our Strawberry Circular for fall of 1897, is now issued, and will be sent to all applicants enclosing five cents.

It gives complete lists of the best varieties for home use and market purposes, and contains much valuable information in reference to the Strawberry.

J. KNOX,
Box 155, Pittsburgh, Pa.

Would call the attention of Dealers and Planters to his extensive stock of Grape vines, and especially to the **Concord** and **Iona** varieties.

Our vines have always been unsurpassed by any in market, and our aim is not only to keep up their well known standard of excellence, but to produce, if possible, still better plants than we have had heretofore.

Having a very large number in course of propagation, we are enabled to sell at very low prices where quantities are taken, and all parties intending to purchase will find it greatly to their interest to examine our stock and prices before purchasing elsewhere. Last year the demand for our plants was so large that we were not able to fill one half of our orders. Therefore, send your orders in early to secure the best plants. Address

Red Bank, Monmouth Co., N. J.

IMPORTANT TO ALL.

Another Great American Invention.

It is recommended by Surgeon Backe, of U. S. Navy, Surgeon Woodward, U. S. Army, by J. R. Chilton, the celebrated Chemist, New York, by Drs. Hayes and Jackson, State As-sayers of Mass., by J. M. Maris & Co., Chemists, Philadelphia, and other Chemists, and by N. Y. Tribune, American Agriculturist, N. Y. Independent, Southern Cultivator, and other leading journals, and by thousands of families of the highest respectability who have used it.

A cheap and healthful antiseptic—the only method in the world for preserving Fruits, Juices of Fruits, Vegetables, Milk, &c., &c., without sugar, and without making air-tight.

It does away entirely with the need and use of all expensive Patent Air-tight Jars, and admits of keeping the fruits, &c., in vessels of any size and kind, by simply corking them or tying paper or cloth saturated with *Paraffin*, or with *Losin* and *Wax* over them. When opened the fruit will keep for 1 to 2 months during winter, or 2 to 4 weeks during summer—fully exposed to the air—giving ample time to use them from large vessels as wanted.

It will preserve with or without sugar. It is the only reliable method for preserving cider. Every dairyman wants it during summer to preserve milk sweet. It will preserve milk 24 to 36 hours longer than it will naturally keep—causing it to furnish more cream.

It is warranted healthful and effectual. No family should be without it. It is sold by all Druggists in every wholesale market in the U. S. Retail price, \$1 per bottle. Each bottle will preserve 128 pounds of fruit, &c., and is accompanied with full directions for using.

Ask for **Spear's Fruit Preserving Solution**, and don't fail to try it—get it from your Merchant.

L. P. WORRALL, Gen'l. Agent,
91 Hudson-st., New York.

AGENTS WANTED!—Male or Female, in all parts of the United States, to sell **"Abbott's Lives of the Presidents,"** one of the best books for Agents ever published in this country. The work is finely illustrated, complete in one volume, ready for subscribers, and sells splendidly. Address **B. B. RUSSELL & CO., Boston, Mass.**

SPECIAL

ADVERTISING AGENCY.

Stocks, scarlet and white intermediate London, extra, each, (ready in August),..... 25
Stock, French Coarctate, scarlet, purple and white, mixed, fine for winter flowering,..... 25
Stock, new white wallflower leaved, a superb variety for pot culture,..... 25
Sweet Williams, Hunt's extra select, far surpassing anything hitherto offered,..... 25
Wallflower, extra fine double German,..... 25
Collections of twenty varieties of **HARDY ANNUALS**, **BIENNIALS** and **PERENNIALS**, for Autumn sowing, for \$1.00. Address
B. K. BLISS, Springfield, Mass.

GRAPE VINES

BY THE

1,000 or 10,000.

Iona, Israella and Delaware,

[the three best grapes]

A SPECIALTY.

Superior vines of all other varieties. Our vines, already well known as of first quality in every respect, this year surpass all we have heretofore grown.

The Trade are particularly invited to examine the stock. A visit to our grounds and examination of our well trained vineyard of bearing vines, will well repay those about planting for fruit or wine, as they may here see how to **save time and money**.

Address
HOLTON & ZUNDELL,
Haverstraw, N. Y.

The New Strawberry.

CHARLES DOWNING.

This new Seedling was raised by **J. S. Downer**, of Kentucky, and is justly entitled to bear the name of this first Pomologist of America. It is a Seedling of Downer's Prolific. The plant is more vigorous and productive than its parent; fruit enormous in size, solid, firm enough for market, scarlet, and of the finest flavor. The great vigor of this plant enables it to mature all its fruit to a large size. The leaves are very large, and stand a foot high; flowers perfect. A bed of this variety set out the first of Oct. last, in my garden, was picked over on the 18th of June, by John C. Thompson, of Staten Island, N. Y.; of a fair average of the berries selected, 28 weighed one pound. Mr. Downer informs me that several of his neighbors have grown them on plants one year old, weighing over one ounce each. Mr. Greeley having offered a prize of \$50.00 for a better berry in every respect than the Wilson, this berry has been entered for the prize, and submitted to the Committee. Mr. Greeley requires it to be tested by two years trial, consequently the award cannot be made this season. We understand, however, that the Committee consider it far in advance of any other seedling. Charles Downing, one of the Committee, says:

Newburgh, July 5th, 1897.
"Downer's new Seedling is certainly a very promising sort, and from what I have seen this season, think it will prove an acquisition, and for *vigor, productiveness, size and quality*, combined, think it *superior to any new sort*. The name I think Charles Downing prevents me from saying much about it."—**CHAS. DOWNING.** We propose sending out plants after the 15th Sept., in rotation, as ordered, at the following rates: 3 plants, \$2.00; 6 plants, \$3; 12 plants, \$5; 100, \$25; 500, \$85; 1,000 plants, \$150. Twenty per cent. deducted for cash orders, received this fall, plants deliverable next spring. Address **WM. S. CARPENTER, 156 Reade-st., New York.**

NEW STRAWBERRIES.

PRESIDENT—A new Seedling of very large size, productive and firm.

HARRISON—A chance Seedling, raised in Westchester Co., fruit very large, quite equal to the Hovey in size and quality, and more productive and firm.

MARKET—A Seedling from Illinois, of large size, wonderfully productive, and very early. Several days before the New Jersey Scarlet.

ABRAHAM LINCOLN—A Seedling raised by Mr. Plattmen, of Erie, Pa., monstrous in size, productive, and of extra quality. These 4 splendid varieties, \$2 dozen, each, or the collection of 4 dozen for \$1.00 each.

PERPETUAL FINE—I have imported this remarkable berry, at a large expense. It is described by Mr. Gloede, the originator, as follows: "The kind I have the good luck to offer is a real, perpetual, large-fruited strawberry, of the pine class, which, during three years culture, not only bore an abundant crop in spring, but continued flowering and fruiting till late in the Autumn."
Plants \$1.00 each, 6 for \$5.00, 12 for \$5.00.

The following new Seedlings have been well tested in different parts of the country, and strongly recommended.
PHILADELPHIA, very early, *Starr, Stinger, Great Eastern, Hubbard Seedling*, very fine, *Fennier Seedling, Durand Seedling*, and *Ellis*, one of earliest to ripen, and very fine. Plants \$1.00 per dozen for each variety, or for \$5.00.
ROYAL FINE—A new Seedling is better than the Wilson, quite as firm and productive, and continues fruiting until August. 5 for \$1; 20 for \$3; 50 for \$5; 100 for \$10; 1,000 for \$75.

RIPPOWAM, has proved this season to be the king of strawberries, monstrous in size, firm, exquisite flavor, and very productive. 12 plants \$1.00; 100, \$3.00. Address **WM. S. CARPENTER, 156 Reade-st., New York.**

DRAINING FOR PROFIT

AND

DRAINING FOR HEALTH.

By GEO. E. WARING, JR.,

ENGINEER OF THE DRAINAGE OF CENTRAL PARK, NEW YORK.

Illustrated.

TABLE OF CONTENTS:

LAND TO BE DRAINED AND THE

REASONS WHY.—Indications of the need of draining.—Sources of water.—Objections to too much water.—Wet sub-soil.

HOW DRAINS ACT AND HOW

THEY AFFECT THE SOIL.—Characteristics of well laid tile drain.—Surface-water and rain water beneficial, springs and soakage water injurious.—Cracking of stiff clays.—Evaporation and filtration.—Rain fall.—Evaporation.—Temperature.—Drought.—Porosity or mellowness.—Chemical action in the soil.

HOW TO GO TO WORK TO LAY

OUT A SYSTEM OF DRAINS.—Amateur draining.—Maps.—Levelling instruments.—Outlets and location of drains.—Main drains.—Spring water.—Fall.—Tiles.—Depth and distance apart.—Direction of laterals.—Collars.—Discharge of water from drains.

HOW TO MAKE THE DRAINS.—

Tools.—Marking the lines.—Water courses.—Outlet.—Silt Basins.—Opening the ditches.—Grading.—Tile laying.—Connections.—Covering the tile and filling in.—Collecting the water of springs.—Amending the map.

HOW TO TAKE CARE OF DRAINS

AND DRAINED LAND.—Removing obstructions.—Mistake of substituting large tiles for small ones which have become obstructed.—Heavy lands should not be trampled while wet.

WHAT DRAINING COSTS.

Draining, expensive work.—Their permanence and lasting effects.—Cheapness versus economy.—Details of cost.—(1. Engineering and Superintendence.—2. Digging the ditches.—3. Grading the bottoms.—4. Tile and tile laying.—5. Covering and filling.—6. Outlets and Silt Basins.)

WILL IT PAY?

Increased crops required to pay cost of draining.—(Corn, Wheat, Rye, Oats, Potatoes, Barley, Hay, Cotton, Tobacco.)—Instances of profit.—Benefit of draining in facilitating farm work.

HOW TO MAKE DRAINING TILES.

Materials.—Preparation of earthen.—Moulding tile machines.—Drying and rolling.—Burning.—Kilns.—General arrangement of a tiler.

THE RECLAIMING OF SALT

MARSHES.—Extent of marshes on the Atlantic Coast.—The English Fens.—Harrow Lake.—The exclusion of sea water.—Removal of the causes of inundation from the upland.—Removal of rain fall and water of filtration.—Embankments.—Muskrats.—Rivers and Creeks.—Outlet of drainage.

MALARIAL DISEASES.

Fever and Ague.—Neuralgia.—Vicinity of New York.—Dr. Bartlett on Periodical Fever.—Dr. Metcalf's Report to U. S. Sanitary Commission.—La Roche on the effects of Malarial Fever.—Dr. Sallisbury on the "Cause of Malarial Fevers."—English experience.—Reports to the British Parliament.—Cause of Malaria removed by draining.

HOUSE AND TOWN DRAINAGE.

Sewerage.—The use of pipes.—The new outfall sewers in London.—The use of steam pumps to secure outlets.—Utilization of sewage matters in agriculture.—Effects of imperfect house drainage on health.—Typhoid fever.—The Westminster fever in London.—Epidemic at the Mapewood Young Ladies Institute in Pittsfield, Mass.—Lambeth Square, London.—Back drainage.—Water supply.—General Board of Health, (England).

A History and Description of the HORSE, MULE, CATTLE, SHEEP, SWINE, POULTRY, and FARM DOGS, with directions for Breeding, Crossing, Rearing, Feeding, and Preparation for Market, with their DISEASES and REMEDIES. By R. L. ALLEN. Cloth 12mo, 227 pp.

Allen's Rural Architecture.....\$1.50

Practical Directions and Suggestions for Construction of convenient FARM-HOUSES, COTTAGES, and OUT-BUILDINGS, including Barns, Stables, Sheds, Carriage and Wagon-Houses, Work-Shops, Wood-Houses, Ash and Smoke-Houses, Ice-Houses, Poultry and Bee-Houses, Dove-Cotes, etc., together with directions for the gardens and grounds; useful and ornamental Domestic Animals, etc. By Hon. LEWIS F. ALLEN, Editor "American Herd-Book," etc. Cloth, 12mo, 378 pp.

American Bird-Fancier.....Paper, .. 30.

Field, Cage, and House-Birds, breeding, rearing, etc. Paper, 12mo, 107 pp.

American Farm-Book.(R. L. ALLEN).\$1.50

OR A COMPEND OF AMERICAN AGRICULTURE; Being a Practical Treatise on Soils, Manures, Draining, Irrigation, Grasses, Grain, Roots, Fruits, Cotton, Tobacco, Sugar-Cane, Rice, and every Staple Product of the United States; with the best methods of Planting, Cultivating, and Preparation for Market. Over one hundred engravings. By R. L. ALLEN. Cloth, 12mo, 325 pp.

American Rose Culturist..... 30

(Including the Dahlia.) Being a Practical Treatise on the Propagation, Cultivation, and Management of THE ROSE, to which are added full directions for the treatment of the Dahlia. In neat paper covers. 12mo, 96 pp.

American Weeds, and Useful Plants.\$1.75

An Important Work for every Cultivator—Farmer, Gardener, etc.; being an Enumeration and Description, (with accurate illustrations), of the WEEDS and PLANTS found in American Fields and Gardens, which meet the observation, or require the attention of Cultivators; with practical suggestions for their Eradication when needed. While practical in its character, it includes both the common and botanical names and characters of the Weeds and Plants, with a Popular Account of the Structure of Plants. By WM. DARLINGTON, M.D., and PROF. GEO. THURBER. Thoroughly Illustrated with 277 Engravings. 12mo., 400 pp.

Annuals... Paper, 50, Cloth, 75

THE AMERICAN HORTICULTURAL ANNUAL FOR 1887. A YEAR BOOK FOR THE GARDENER, THE FRUIT GROWER, AND THE AMATEUR. It is a beautifully illustrated volume of 163 pages. It contains an Almanac and Calendar for each month, giving hints for work in the various departments, with useful tables, and an article on Growing Grape Vines from cuttings, by William Patrick; How Horseradish is Grown for Market, by P. Henderson; Home Decorations, by A. Bridgeman; The New Apples of 1886, by Dr. J. A. Warder; New or Noteworthy Pears, by P. Barry; Small Fruits in 1886, by A. S. Fuller; Rarer Valuable Evergreens, by T. Meehan, with valuable contributions by other writers.

THE AMERICAN AGRICULTURAL ANNUAL FOR 1887. A companion volume to the Horticultural Annual, and containing, besides an Almanac with hints about work for each month, an Essay on Draining, by Col. Geo. E. Waring, jr.; articles on the Culture of Sorghum, by Wm. Clough; Some of the Newest and Best Potatoes, by Wm. S. Carpenter; How to Train a Horse, by S. F. Headley; Essential Features of a Good Barn, with Plan, by Dr. F. M. Hexamer; Recent Scientific Progress in Agriculture, by Prof. S. W. Johnson, of Yale College; The Culture of Wheat, by Joseph Harris, and other valuable essays upon subjects of interest to agriculturists. Finely illustrated.

Bement's Rabbit Fancier..... 30

BREEDING, REARING, FEEDING, AND GENERAL MANAGEMENT of Rabbits; their Diseases and Remedies; Full Directions for the Construction of Hutches, Rabbitries, etc.; Recipes for Cooking and Dressing for the Table. Numerous Illustrations. By C. M. BEMENT, author of *Poulterer's Companion*, etc. 12mo, 101 pp., in neat illustrated paper covers.

Boussingault's Rural Economy.... \$1.60

Rural Economy in its relations with Chemistry, Physics, and Meteorology; or CHEMISTRY APPLIED TO AGRICULTURE in the Principles of Farm Management, the Preservation and Use of Manures, the Nutrition and Food of Animals, and the General Economy of Agriculture. By J. B. BOUSSINGAULT, Member of Institute of France, etc. Translated, with Introduction and Notes, by GEORGE LAW, Agriculturist. Cloth, 12mo, 507 pp.

Breck's New Book of Flowers, or Flower Garden..... \$1.75

In which are described the various Hardy Herbaceous Flowers, Annuals, Shrubby Plants, and Evergreen Trees, with Directions for their Cultivation. New edition, revised and corrected. By JOSEPH BRECK, Seedsman and Florist, former editor of *New England Farmer*, and *Horticultural Register*. Cloth, 12mo, 395 pp.

Buist's American Flower Garden Directory..... \$1.50

Containing Practical Directions for the Culture of Plants in the Flower-Garden, Hot-House, Green-House, Rooms for Parlor-Windows, FOR EVERY MONTH IN THE YEAR; with descriptions of most desirable plants, soils, transplanting, erecting a Hot-House, a Green-House, laying out a Flower-Garden, etc., etc. By ROBERT BUIST, a practical Nurseryman and Seed-Grower of Philadelphia. Cloth, 12mo, 342 pp.

Buist's Family Kitchen-Gardener.... \$1.00

An excellent Practical work, containing Plain and Accurate Descriptions of all the Different Species and Varieties of Culinary Vegetables, with their Botanical English, French, and German Names, alphabetically arranged; with full Directions for the Best Mode of Cultivating them in the Garden or under Glass. By ROBERT BUIST. Cloth, 12mo., 216 pp.

Cobbett's American Gardener..... 75

A Treatise on the Laying Out and Management of Gardens. Though an old work, it is one which will find a place in every considerable library, as the production of a remarkable man. While it is marked by the author's peculiarities, it is so full of plain common-sense, that it is worthy of being kept in print. By WILLIAM COBBETT. Cloth, 12mo., 230 pp.

Cole's American Fruit Book. 75

Containing Directions for Raising, Propagating, and Managing Fruit-Trees, Shrubs, and Plants, with descriptions of the best varieties of fruit, etc. 18mo, 283 pp.

Chorlton's Grape-Grower's Guide.... 75

INTENDED ESPECIALLY FOR THE AMERICAN CLIMATE; being a practical Treatise, with Engravings, on the Cultivation of the Grape-Vine in each Department of Hot-House, Cold Grapery, etc.; with Plans for the Construction and Heating. By WM. CHORLTON. Cloth, 12mo, 204 pp.

Cole's American Veterinarian..... 75

Diseases of Domestic Animals, showing the Causes, Symptoms, and Remedies, and rules for Restoring and Preserving Health by good management, with directions for Training and Breeding. By S. W. COLE. Cloth, 18mo., 288 pp.

Copeland's Country Life..... \$5.00

An elegant Octavo Volume, containing 926 pages, and 250 Engravings. It is a Compendium of Agricultural and Horticultural Practical Knowledge; embracing Descriptions, Hints, Suggestions and Details of great value to every one interested in Fruit, Flowers, Vegetables, or Farm Crops. It describes and illustrates nearly the whole range of topics of interest to the Farmer, the Gardener, the Fruit Cultivist, and the Amateur. By ROBERT MORRIS COPELAND. Cloth, beveled boards, 8vo., 926 pp.

Cotton-Planter's Manual..... \$1.50

This is the only popular work published on the subject. It is a compilation of facts from the best authorities on the CULTURE OF COTTON, its Natural History, Chemical Analysis, Trade, and Consumption, with a history of Cotton and the Cotton-Gin. Cloth, 12mo, 320 pp.

Dadd's American Cattle-Doctor.. \$1.50.

To Help Every Man to be his own Cattle-Doctor. A work by GEO. H. DADD, M. D., Veterinary Practitioner; giving the necessary information for preserving the Health and Curing the Diseases of OXEN, COWS, SHEEP, and SWINE, with a great variety of original Recipes, and valuable information on Farm and Dairy Management. 12mo, 359 pp.

Dadd's Modern Horse Doctor..... \$1.50

CONTAINING PRACTICAL OBSERVATIONS ON THE CAUSES, NATURE, AND TREATMENT of Diseases and Lameness of Horses; embracing the most recent and improved Methods, according to an enlightened system of Veterinary Practice, for Preservation and Restoration of Health. Illustrated. By GEO. H. DADD, M.D., Veterinary Surgeon. Cloth, 12mo., 432 pp.

Dana's Muck Manual..... \$1.25

A Manual for Farmers; treating of Soils, Manures, Composts, etc., and especially of the important subject of using MUCK, the great natural fertilizer of the country. By SAMUEL L. DANA. Cloth, 12mo., 312 pp.

Downing's Landscape Gardening and Rural Architecture..... \$6.50

The most complete and valuable work ever issued on Landscape Gardening in North-America, for the Improvement of Country Residences; containing full Directions for everything connected with the Laying out and adorning the Rural Home, the Grounds, the Gardens, the Buildings, the Trees and Plants, etc., with principles of taste so stated as to adapt the work to all classes. Splendidly Illustrated with many Steel and fine Wood Engravings. By the late A. J. DOWNING. New Edition, Enlarged, Newly Illustrated and Revised, with Supplement, by HENRY WINTHROP SARGENT. Octavo, 534 pp. Extra cloth, gilt, beveled bds.

Eastwood's Complete Cranberry Manual 75

Giving directions for the cultivation in different localities, with illustrations and descriptions of varieties. By BENJ. EASTWOOD. Cloth, 12mo, 120 pp.

Elliott's Western Fruit Grower's Guide 50

The previous Edition of this work was Thoroughly Revised; embracing all the new and valuable Fruits, with the latest improvements in their Cultivation; especially adapted to the wants of Western Fruit-Growers; full Illustrations. By F. R. ELLIOTT, of Ohio. Cloth, 12mo, 503 pp.

Fuller's Illustrated Strawberry Cultivist..... Paper, .. 20

A new, practical little work, meeting with universal favor. It gives a full list of varieties, down to the latest valuable seedlings. Paper, 12mo, 48 pp.

Field's Pear Culture..... \$1.25

THE PEAR GARDEN; a Treatise on the Propagation and Cultivation of the Pear Tree, with instructions for Management from the Seedling to the Bearing Tree. By THOMAS W. FIELD. Illustrations. Cloth, 12mo, 286 pp.

Flax Culture..... 50

A new and very valuable work, consisting of full directions, from selection of ground and seed to preparation and marketing of crop, as given by a number of experienced growers. 8vo, paper.

French's Farm Drainage..... 1.50

The Principles, Process, and Effects of Draining Land with Stones, Wood, Drain-Plows, Open Ditches, and especially with Tiles; including Tables of Rainfall, Evaporation, Filtration, Excavation, Capacity of Pipes, cost and number to the acre. With over 100 illustrations. The best work on Draining published. By Judge FRENCH, of New Hampshire, President of Mass. Agricultural College. Cloth, 12mo, 384 pp.

Guenon's Treatise on Milch Cows.... 75

An interesting work, giving new and peculiar directions, and many illustrative engravings, for determining by natural marks or external signs, the quality and quantity of milk a cow will give, length of time she will continue in milk, etc., with introductory remarks of forty pages on the Cow and Dairy. Sixty-third thousand. 8vo, 88 pp.

Herbert's Hints to Horse-Keeper.. \$1.75

This is the best practical work on the Horse, prepared in this country. A COMPLETE MANUAL for HORSEMEN, embracing: How to Breed a Horse; How to Buy a Horse; How to Break a Horse; How to Use a Horse; How to Feed a Horse; How to Physic a Horse (Allopathy or Homeopathy); How to Groom a Horse; How to Drive a Horse; How to Ride a Horse, etc., and Chapters on MULES and PONIES, etc. By the late HENRY WILLIAM HERBERT, (Frank Forester.) Beautifully illustrated throughout. Cloth, 12mo., 425 pp.

Hooper's Dog and Gun..... 30

"A Few Loose Chapters on Shooting," with some Anecdotes and Incidents, Notes on Guns, Choosing and Training Dogs; about Game, etc. By J. J. HOOPER, Montgomery, Ala. Neat paper covers; 12mo, 105 pp.

Hop Culture..... 40

PRACTICAL DETAILS fully given, from the Selection and Preparation of the SOIL, SETTING and CULTIVATION of the Plants, to PICKING, DRYING, PRESSING and MARKETING the Crop. Plain Directions by Ten Experienced Cultivators. Illustrated with over forty engravings. Edited by PROF. GEORGE THURBER, Editor of the *American Agriculturist*. 8vo., paper.

Johnston's Agricultural Chemistry.. 1.75

LECTURES ON THE APPLICATION OF CHEMISTRY AND GEOLOGY TO AGRICULTURE. New edition, with an Appendix, containing the Author's Experiments in Practical Agriculture. By the late JAS. F. W. JOHNSTON, M.A., F.R.S.S. L. and E., etc., etc. This is an American edition of the large and extensive English work. Cloth, large 12mo, 709 pp.

Leuchars' How to Build Hot-Houses. \$1.50

GREEN-HOUSES, GRAPERIES, etc. etc., and how to Ventilate them. Illustrated with numerous Engravings. This is the only work published in this country, specially devoted to this subject. By ROBERT B. LEUCHARS, Garden Architect. Cloth, 12mo., 366 pp.

My Vineyard at Lakeview..... \$1.25

This book is especially valuable as giving an account of the processes actually followed in celebrated Grape Regions in Western New York, and on the shores and islands of Lake Erie. To any one who wishes to grow grapes, whether a single vine or a vineyard, it is full of valuable teachings. It tells just what the beginner in grape culture wishes to know, with the charm that always attends the relation of personal experience. Cloth, 12mo., 143 pp.

Orions: How to Raise them Profitably, Paper..... 20

Being the Practical Details, from Selection of Seed and Preparation of Ground to Harvesting and Marketing the Crop, given very plainly by *Seventeen Practical Onion Growers* of long experience, residing in different parts of the country. No more valuable work of its size was ever issued. Octavo, 32 pp. Neat paper covers.

HAVE YOU A GARDEN?

A NEW WORK.

GARDENING FOR PROFIT,

IN THE MARKET AND FAMILY GARDEN.

BY PETER HENDERSON.

Illustrated.

This is the first work on Market Gardening ever published in this country. Its author is well known as a market gardener of eighteen years' successful experience. In this work he has recorded this experience, and given without reservation the methods necessary to the profitable culture of the commercial or

MARKET GARDEN.

It is a work for which there has long been a demand, and one which will commend itself, not only to those who grow vegetables for sale, but to the cultivator of the

FAMILY GARDEN

To whom it presents methods quite different from the old ones generally practiced. It is an

ORIGINAL AND PURELY AMERICAN

work, and not made up, as books on gardening too often are, by quotations from foreign authors.

Everything is made perfectly plain, and the subject treated in all its details, from the selection of the soil to preparing the products for market. Frames, Hot-beds, and Forcing Houses, the management of which is usually so troublesome to the novice, are fully described, and the conditions of success and causes of failure clearly stated.

The success of the market gardeners near New York City is proverbial, and this is the only work that sets forth the means by which this success has been attained. Valuable hints are given to those who would raise Vegetables at the South for northern markets.

The following synopsis of its contents will show the scope of the work:

Men Fitted for the Business of Gardening.
The Amount of Capital Required and Working Force per Acre.
Profits of Market Gardening.
Location, Situation, and Laying Out.
Soils, Drainage, and Preparation.
Manures. Implements.
Uses and Management of Cold Frames.
Formation and Management of Hot-beds.
Forcing Pits or Green-houses.
Seeds and Seed Raising.
How, When, and Where to Sow Seeds.
Transplanting. Insects.
Packing of Vegetables for Shipping.
Preservation of Vegetables in Winter.
Vegetables, their Varieties and Cultivation.

HINTS TO HORSEKEEPERS,

A COMPLETE

MANUAL FOR HORSEMEN.

BY THE LATE HENRY WILLIAM HERBERT.

(FRANK FORESTER.)

Beautifully Illustrated.

HOW TO BREED A HORSE.—

CHOICE OF STALLION.—National Value of the Horse—The best class of Horses the cheapest for all purposes—What constitutes excellence—Blood: what it gives, should be on the side of the Sire—Breed up, not down—Diseases and Defects Hereditary—General Rules.

CHOICE OF THE MARE.—Size, Symmetry and Soundness more important than Blood—Points of the Brood Mare—Diseases Hereditary—Condition of the Mare should have moderate work when with Foal—Food and care during gestation—Health and temper.

MUTUAL ADAPTATION OF SIRE AND DAM.—First consideration in Improvement of "cold" Blood—Relative size of Sire and Dam—Defects in either Parent—How Remedied in Progeny—Bloods which "hit."

CANADIAN BLOOD.—The Canadian originally the French Norman—Characteristics—Hardhood—Speed—Mode of Improvement—Crossing with Thorough-breds.

NORMAN BLOOD.—Origin and History of the Percheron Norman—A pure race—Characteristics and Points.

MODERN ARAB BLOOD.—English and American Thorough-breds derived from Oriental Blood—are now superior to the Modern Arabs—Nolan Arab.

PONIES — DIFFERENT BREEDS.

CHARACTERISTICS AND UTILITY.—Origin—Different Breeds—Shetlands and Scots—Galloways and Narragansetts—Mustangs and Indians—Profit of raising Ponies.

HOW TO BREED MULES.

Value of Mules—Their History and Natural History—The Mule and Hinney—Thorough-blood wasted in the Dam for Mules—The Male in the United States—Large size not desirable—Varieties of the Ass—The kind of Mares to be selected.

HOW TO BUY A HORSE.

Of whom to Buy it—Extraordinary Cheapness and Extraordinary Excellence not consistent with each other—Points to be regarded—How to Examine the Eye—Broken Wind—Roaring—Whistling—Broken Knees—To examine the Legs—Splints—Damaged Back—Sinews—Spavins—Kingbones—Curbs—How to tell the Age of a Horse.

HOW TO FEED A HORSE.

Consequences of Improper Feeding—Different Food for different conditions—Food for the Brood Mare—for the Foal—For Working Horses—Green Food—Carrots—Corn—Feeding Horses in Training—While Travelling—Summering Horses—The Best Method—Management of Omnibus Horses in New York.

HOW TO STABLE AND GROOM A HORSE.

Requisites for a good Stable—The economy of Proper Arrangements—Ventilation—Grooming; its necessity for all descriptions of Horses—How Performed—Clothing—Treatment when brought in from Work.

HOW TO BREAK, AND USE A HORSE.

What is required in a well-broken Horse—His education should commence when a Colt—Biting—Putting in Harness—How to Use a Horse—Travelling—Working—Pleasure Horses—Punishment.

HOW TO PHYSIC A HORSE —

SIMPLE REMEDIES FOR SIMPLE AILMENTS.—Causes of Ailments—Medicines to be given only by the order of the Master—Depletion and Purging—Spasmodic Colic—Inflammation of the Bowels—Inflammation of the Lungs—How to Bleed—Balls and Purgatives—Costiveness—Cough—Bronchitis—Disemper—Worms—Diseases of the Feet—Scratches—Thrush—Broken Knees.

FARRIER, ETC.

Castration—Docking and Neking—Blood-letting—Treatment of Strains and Wounds—Galls of the Skin—Cracked Heels—Clipping and Singeing—Administering Medicines—Diseases of the Feet.

HOW TO SHOE A HORSE.

Unskilful Shoers—Anatomy of the Foot Illustrated—The Foot of a Colt—Preparation of the Foot—Removing the Old Shoe—Paring the Foot—The Shoe—Fitting the Shoe—Nailing—Number of Nails—Diseases of the Foot.

BAUCHER'S METHOD OF TRAINING HORSES.

What Constitutes a Well-trained Horse—To make him come at your call—The Philosophy of Training—Flexions of the Jaw—Flexions of the Neck—Flexions of the Croup—Backing—The Pace—Leaping.

HOW TO RIDE A HORSE.

The Saddle—The Girths—The Stirrups—Saddle-Clothes—The Crupper—The Martingale—The Bridle—Spurs—Mounting and Dismounting—The Seat—The Hands—The Legs—The Paces—Hints for Special Cases—The Art of Falling—Riding with Ladies.

LADIES' RIDING—WRITTEN BY

A LADY—Learning to Ride—The Side-saddle—The Girths—The Stirrup—The Bridle—The Martingale—The Bit—The Dress—Mounting and Dismounting—The Position—The Hands—The Leg and Whip—Accidents.

HOW TO DRIVE A HORSE.

The Art of Driving—Pleasure Driving—How to Hold the Reins—Driving a Pair—Four-in-hand Driving—Driving Working Horses—Plowing—Three-a-breast.

RAREY'S SYSTEM OF HORSE-

TAMING.—Rarey's System a New Discovery—Previous System—Principles of this System—Instructions for practicing Rarey's Method—To Stable the Horse—To Approach the Horse—Tying up the Leg—Laying the Horse Down—Finale—Vices and Bad Habits—Rearing—Kicking—Baulking—Pulling on the Halter—Shying.

VETERINARY HOMOEOPATHY.

Principles of the System—Table of Remedies—General Directions—Treatment of Sick Animals—Diet—Remedies for Specific Cases—Glossary of Diseases.

12mo. 425 p.—Sent by mail post-paid. \$1.75.

NEW BOOKS.**Saunders' Domestic Poultry.**

By S. M. SAUNDERS.

New Edition Revised and Enlarged.

This Book contains Articles on the Preferable Breeds of Farm-Yard Poultry, Their History and Leading Characteristics, with Complete Instructions for Breeding and Fattening, and Preparing for Exhibition at Poultry Shows, etc., etc., derived from the Author's Experience and Observation.

The work is compact, full of valuable hints and information, and beautifully illustrated.

An appendix contains an account of *Poultry breeding on a large scale*, as practiced in the neighborhood of Paris, and is a very important addition to the work.

Price, paper 40 cts., cloth 75 cts.

ORANGE JUDD & CO., Publishers.

Money in the Swamps.**PEAT! PEAT! PEAT!****FUEL — MANURE.****WHERE TO FIND IT.****HOW TO MAKE AND USE IT.****ITS VALUE.****A NEW WORK ON PEAT,**

THOROUGH AND PRACTICAL;

By PROF. SAMUEL W. JOHNSON, of Yale College.

It gives a full history of **PEAT, MUCK**, etc., telling what they are, where found, and how to estimate their value.

It describes the various methods of using Peat for manure, as an absorbent, as an ameliorator of the soil, etc. and it is especially explicit in regard to the

USE OF PEAT AS FUEL,

describing minutely the various processes employed in preparing it to burn, from the simplest to the most complicated; such as are in use in this country, and Europe. It is illustrated with many Engravings of machines, etc.

The work is invaluable to those having Peat or Muck swamps, or wishing to invest in Peat Companies.

ORANGE JUDD & Co., 41 Park Row.

A NEW WORK. SMALL FRUIT CULTURIST.

By ANDREW S. FULLER,

PRACTICAL HORTICULTURIST, RIDGEWOOD, BERGEN CO., N. J.

A new work, and the only one devoted to Small Fruits. Special treatises of this kind have the advantage that the author can more thoroughly discuss his subject, and go into greater detail, than in a work embracing both large and small fruits. The work covers the whole ground of Propagation, Culture, Varieties, Packing for Market, etc.

CONTENTS: INTRODUCTION—I. BARBERRY—II. STRAWBERRY—III. RASPBERRY—IV. BLACKBERRY—V. DWARF CHERRY—VI. CURRANT—VII. GOOSEBERRY—VIII. CORNELIAN CHERRY—IX. CRANBERRY—X. HUCKLEBERRY—XI. SHEPHERDIA—XII. PREPARATION FOR GATHERING FRUIT.

We predict that this work will bring Mr. Fuller many enemies, as he has given his opinion about varieties without reserve. On the other hand it will the more strongly endear him to all true lovers of horticulture, as these wish to have the merits of fruit given without reference to the persons who introduce them.

While very full on all the small fruits, the Currants and Raspberries have been more carefully elaborated than ever before, and in this important part of his book, the author has had the invaluable counsel of Charles Downing. The chapter on gathering and packing fruit is a valuable one, and in it are figured all the baskets and boxes now in common use. The book is very finely and thoroughly illustrated, and makes an admirable companion to his Grape Culturist.

Just Published. A NEW WORK ON APPLES.

AMERICAN POMOLOGY.

APPLES.

By DOCT. JOHN A. WARDER,

PRESIDENT OHIO POMOLOGICAL SOCIETY; VICE-PRESIDENT
AMERICAN POMOLOGICAL SOCIETY, ETC.

293 Illustrations.

To pomologists a work by Dr. Warder will need no commendation. Though a citizen of Ohio, he is so sure to be at any pomological gathering, be it East or West, that the whole country claims him, and if any one has a right to entitle his work *American Pomology* it is certainly Dr. Warder. The present is the first instalment of a work intended to cover the whole ground. In it the author has attempted the difficult task of bringing apples into something like order.

This volume has about 750 pages, the first 375 of which are devoted to the discussion of the general subjects of propagation, nursery culture, selection and planting, cultivation of orchards, care of fruit, insects, and the like; the remainder is occupied with descriptions of apples. With the richness of material at hand, the trouble was to decide what to leave out. It will be found that while the old and standard varieties are not neglected, the new and promising sorts, especially those of the South and West, have prominence. A list of selections for different localities by eminent orchardists is a valuable portion of the volume, while the Analytical Index or *Catalogue Raisonné*, as the French would say, is the most extended American fruit list ever published, and gives evidence of a fearful amount of labor.

This differs from any fruit book heretofore published in this country, in its complete classification of apples. The author gives the principal European systems and modestly puts forth his own to be tested by practice. He divides apples into four classes, according to their forms. Each of these classes is sub-divided by other obvious characters, and it would seem that any apple described in the book might be easily identified. We trust that this will prove a great help to the pomologist.

Fruit-growers will welcome this book as a valuable and long-wished for addition to pomological literature, and it will be found equally useful to the novice and the experienced orchardist. The work has 293 illustrations, is printed on good paper and well bound.

SENT POST-PAID,

ENDLESS AMUSEMENT

FOR

BOYS AND GIRLS.

Crandall's Improved Building Blocks, described in April number of the *American Agriculturist* page 147, furnish a most attractive amusement for children. They are very simple in construction, will stand years of children's handling without breaking, and give renewed pleasure daily.

**CHURCHES,
DWELLINGS,
BARNs,
MILLS,
FENCES,
FURNITURE, etc.**

In almost endless variety, can be built with them, and when finished, the structure remains firm so that it can be carried about without falling to pieces.

For developing the ingenuity and taste of children they are unequalled. Having given these blocks a practical trial in their own families, the publishers of the *Agriculturist* were so well pleased with them, that they consented to take the general agency for their sale.

The Blocks are put up in neat boxes, each box containing a set, and a card giving various designs of buildings. Price per Set: Plain, \$2.00; Painted, red, white, and blue No. 1, \$3.00; No. 2, \$2.00; No. 3, \$1.50. A liberal discount will be made to dealers. Address

THE STAR DRILL. Ewell & Co., Proprietors, Baltimore, Md.

half the yield, having been affected by the hard winter, and was but eight to ten inches high, which was the average of all sown in any other manner than by this Machine." Very recent certificates have been received from some of the same Farmers, stating that they saw the wheat threshed and measured in June, and that that seeded by the "Star Drill," yielded an average of twenty-nine and a half bushels per acre, which was more than double the yield seeded in the ordinary way, in adjoining fields. These are facts. This Machine seeds all kinds of small grain, and the different grass seeds, with perfect regularity. As a Corn Planter or Drill, for Sorghum, Peas, Beans, &c., it can not be surpassed. Its construction is very simple, and the material of which it is made, the very best, in every particular. Any laborer who can plow or drive a wagon can work it with ease. The saving of labor and economy in the various uses for which it is adapted, must make it invaluable to the Farmer. All that is asked is a fair trial. Send for Circulars. Price for each Machine complete, \$175. All orders promptly attended to by EWELL & CO., (Patentees, Proprietors and Manufacturers), Baltimore, Md.; Also, R. H. Eureka Cider Mill and Press.

THE BEST PORTABLE MILL AND PRESS ever built, and greatly improved for 1867. It has repeatedly taken the First Premium at State Fairs over all others, and is warranted in every respect. It does not simply crush or cut the apple, but crushes and pumps, so that at trials the pomace from this mill has yielded one quart more cider from a bushel of apples than other mills. It is a superior

TO FARMERS.

THE LODI MANUFACTURING CO. offer for sale by far the *finest and purest Bone-Dust* in the Market, at the same rate as a coarser article. Also a (*warranted pure, or no sale*) Flour of bone. Samples of each sent on receipt of 3-cent postage stamp, with address.

DOUBLE REFINED POUDRETTE.

This is one of the most forcing as well as quick acting manures in market; it is composed of the night-soil of New-York City, from which all the impurities have been extracted. It is then deodorized, dried, and pulverized to flour. From 400 to 600 lbs. per acre on wheat will bring a *good crop* on poor soil. Price only \$25 per ton.

Apply to THE LODI MANUFACTURING CO.,
66 Cortlandt-st., New-York.

PAINTS for FARMERS and others.—The Grafton Mineral Paint Co. are now manufacturing the Best, Cheapest and most Durable Paint in use; two coats well put on, mixed with pure Linseed Oil, will last 10 or 15 years; it is of a light brown or beautiful chocolate color, and can be changed to green, lead, stone, olive, drab or cream, to suit the taste of the consumer. It is valuable for Houses, Barns, Fences, Agricultural Implements, Carriage and Car-makers, Pails and Wooden-ware, Canvas, Metal and Shingle Roofs, (it being Fire and Water proof), Bridges, Burial Cases, Canal Boats, Ships and Ships' Bottoms, Floor Oil Cloths, (one Manul. having used 5000 bbls., the past year), and as a paint for any purpose, is unsurpassed for body, durability, elasticity, and adhesiveness. Price \$5 per bbl. of 300 lbs., which will supply a farmer for years to come. Warranted in all cases as above. Send for a circular, which gives full particulars. None genuine unless branded in a trade mark, Grafton Mineral Paint. Address DANIEL RIDWELL, Proprietor, 254 Pearl-st., New York.

FAY'S PATENT WATER-PROOF ROOFING PAPER, etc. For Circular and Price List, and terms of State-Rights, address C. J. FAY,

NAPOLEON, III.**The Highest Flavored, Most Productive, and Best Berry for Amateur Culture.**

Combining large size, handsome appearance, and very high flavor, with great vigor, and productiveness almost equalling "Wilson's Albany."

"One of the most distinct fruits we know, and one of the best in many respects."—THOS. MEEHAN, Editor of "Gardeners' Monthly."

"Promises to be an acquisition."—A. S. FULLER, Author of "Small Fruit Cultivator."

Price, (by mail, postage free), \$3 per doz.; \$20 per 100.

ALSO

The New Perpetual Strawberry.

"Perpetual Pine."

recently raised and introduced by Mr. F. Gloede, Les Sablons, France, and now first offered in the United States. Mr. Gloede describes it as a "real, perpetual, large-fruited strawberry," and adds, that "during 3 years culture, it not only bore an abundant crop in the spring, but continued flowering and fruiting until late in the Autumn." The plant is very hardy, and the fruit bright vermilion, solid, juicy, sweet, and high-flavored.

We offer a very limited supply of plants of this novel and valuable variety.

Price, (by mail, postage free), 50 cents per plant; \$5 per dozen. Descriptive Circulars mailed to any address.

EDWARD J. EVANS & CO.,
Central Nurseries, York, Pa.

Romeyn's Strawberry Seedling.**A DESIDERATUM SUPPLIED.**

The attention of Strawberry producers is called to **ROMEYN'S NEW SEEDLING**—the best plant extant, for general cultivation.

This Seedling is a most prolific, as well as a late bearer—COMING INTO FRUITAGE A FORTNIGHT AFTER THE WILSON—thus giving the producer control of the market after the glut of the Wilson is past.

The flavor is equal to any grown—THE BERRY IS A FINE COLOR, AND VERY SOLID, and the size is large and uniform. The plant is unequalled for vigor and hardiness.

It received a SPECIAL PREMIUM for flavor, at the New York Institute, in 1865. The plant in fruit was exhibited at the late Queen's County Horticultural Fair, and at the Newburgh Day Exhibition, receiving SPECIAL PREMIUMS at both places.

A limited number of plants, (deliverable on and after August 20th), are offered for sale, at the following rates:

1000.....	\$75.00
100.....	10.00
50.....	6.00
20.....	3.00
5.....	1.00

Orders addressed to either of the subscribers will receive prompt attention:

STRAWBERRY PLANTS

Sent out in August and September, at prices annexed, and lower, if so offered in this paper, *charges prepaid by me*.

Jenny Lind, Downer, French, Wilson, Early Washington, and Russell, 20 cts. per doz.; 15 cts. per 100; Fillmore, Shaker, Buffalo, Green, Prolific, and Agriculturist, 20 cts. per doz.; \$1.00 per 100; Metcalf, Juconda, Golden Queen, and Ida, 30 cts. per doz.; \$3 per 100. Enormous quantities of all kinds of Small Fruits at extremely low rates. Those wanting largely to plant or sell, address

A. M. PURDY, South Bend, Indiana.

METCALF'S EARLY. 200,000 plants, of this valuable early strawberry. A large stock of grape vines, leading varieties, Blackberries, old and new. Also, Peach trees, including Van Buren's Golden Dwarf. Plants packed and delivered in Chicago, free. THOS. ARCHER, Lake Shore Nursery, St. Joseph, Michigan.

The Great European Strawberry.**"DR. NICAISE."**

Said to be the largest berry known. From plants set in September last, fruit was picked and exhibited at the *Fruit Growers' Society*, held in Rochester, on the 27th of last June, which weighed 1½ ozs., and measured 6½ inches around.

Plants very hardy, vigorous grower, and productive. From five plants imported in the Spring of 1866, we produced 500 very strong plants. This variety we have imported at a great expense, and will have a fine stock to offer our customers in August and September.

The following are extracts from European Catalogues:

"It is of enormous size, the berries weighing over 1½ ozs., (9 to the pound), and early, of a bright red color, very glossy, the flesh white, and of fine quality."

This sort is one of the finest cultivated in Europe, and has the best characteristics of any we have ever introduced. Orders must be sent in early, as they will only be filled in rotation.

We will furnish plants, postage paid, at the following rates: \$1 per plant; \$10 per doz.; \$15 per 100. A liberal discount to the trade. Address

FROST & CO.,
Genesee Valley Nurseries,
Rochester, N. Y.

J. KEECH'S

New Seedling Strawberries, Genl's. Grant, Sherman, Meade, and Sheridan. The people's choice of all berries. Plants ready by August 20th. \$1 per doz. \$3 for 50; \$5 per 100; \$25 per 1000, cash. J. KEECH, Waterloo, N. Y.

SMALL FRUITS.—40 varieties of Strawberries, and 3 varieties of Raspberries in fruit this year—description and comparative merits in my new Price List now ready. Strawberry plants also ready and warranted to arrive in good condition or the order duplicated. Address with three cent stamp for Price List.

JOHNSON'S NURSERY, South Bend, Indiana.

**PERRY'S GRAPE VINES**

Are rapidly attaining the merit they justly deserve. Planters and Dealers, and those wishing to form clubs for the sale of the only vines in the country grown by my improvement, and to which none others can compare in health and vigor, either for Garden or Vineyard planting, should send immediately for my Price List or my liberal terms to Clubs. Planters will please state about the number of each variety they wish, and whether for spring or fall planting. My illustrated and Descriptive Catalogue contains as correct a description of the different varieties of grapes I grow, as ten years' experience in propagating and fruiting vines will admit. Price 10 cents, less than cost. Address

THE GREAT AMERICAN TEA COMPANY

HAVE JUST RECEIVED
TWO FULL CARCOES
OF THE
FINEST CROP OF TEAS.

22,000 HALF CHESTS by ship *Golden State*.
12,000 HALF CHESTS by ship *George Shotton*.

In addition to these large cargoes of Black and Japan Teas, the Company are constantly receiving large invoices of the finest quality of Green Teas from the Moyune districts of China, which are unrivaled for fineness and delicacy of flavor, which they are selling at the following prices:

OOLONG (Black), 50c., 60c., 70c., 80c., 90c., best \$1 per pound.
MIXED, (Green and Black), 50c., 60c., 70c., 80c., 90c., best \$1 per pound.
ENGLISH BREAKFAST (Black), 50c., 60c., 70c., 80c., 90c., \$1, \$1.10, best \$1.20 per pound.
IMPERIAL (Green), 50c., 60c., 70c., 80c., 90c., \$1, \$1.10, best \$1.25 per pound.
YOUNG HYSON (Green), 50c., 60c., 70c., 80c., 90c., \$1, \$1.10, best \$1.35 per pound.
UNCOLORED JAPAN, 90c., \$1, \$1.10, best \$1.25 per pound.
GUNPOWDER, (Green), \$1.25, best \$1.50 per pound.

COFFEES ROASTED AND GROUND DAILY.

GROUND COFFEE, 20c., 25c., 30c., 35c., best 40c. per pound.
Hotels, Saloons, Boarding-house keepers, and Families, who use large quantities of Coffee, can economize in that article by using our **FRENCH BREAKFAST AND DINNER COFFEE**, which we sell at the low price of 30c. per pound, and warrant to give perfect satisfaction.

Consumers can save from 50 cents to \$1 per pound (beside the Express charges,) by purchasing their Teas of the

GREAT AMERICAN TEA COMPANY,

Nos. 31 and 33 VESEY STREET.
Post Office Box, 5643, New York City.

We warrant all the goods we sell to give entire satisfaction. If they are not satisfactory, they can be returned at our expense within 30 days, and have the money refunded.

By our system of supplying Clubs throughout the country, consumers in all parts of the United States can receive their Teas at the same price (with the small additional expense of transportation), as though they bought them at our warehouses in this city.

Some parties inquire of us how they shall proceed to get up a club. The answer is simply this: Let each person wishing to join in a club, say how much tea or coffee he wants, and select the kind and price from our Price List, as published in the paper or in our circulars. Write the names, kinds, and amounts plainly on a list, and when the club is complete, send it to us by mail, and we will put each party's goods in separate packages, and mark the name upon them, with the cost, so there need be no confusion in their distribution—each party getting exactly what he orders, and no more. The cost of transportation, the members of the club can divide equitably among themselves.

The funds to pay for the goods ordered can be sent by drafts on New York, by Post-Office money orders, or by Express, as may suit the convenience of the club. Or, if the amount ordered exceeds \$30, we will, if desired, send the goods by Express, to "collect on delivery."

Hereafter we will send a complimentary package to the party getting up the Club. Our profits are small, but we will be as liberal as we can afford. We send no complimentary package for a Club less than \$30.

N. B.—All villages and towns where a large number reside, by Clubbing together, can reduce the cost of their Teas and Coffees about one-third (beside the Express charges,) by sending directly to "The Great American Tea Company."

BEWARE of all concerns that advertise themselves as branches of our Establishment, or copy our name either wholly or in part, as they are *bogus* or *imitations*. We have no branches, and do not, in any case, authorize the use of our name.

Post-Office orders and Drafts, make payable to the order of "Great American Tea Company." Direct letters and orders to the

GREAT AMERICAN TEA COMPY,

Nos. 31 and 33 VESEY-ST.,
Post-Office Box, 5,643, New York City.

SCALES.

THE ACKNOWLEDGED STANDARD.

Take the FIRST PREMIUMS

at the great PARIS EXPOSITION, and are mentioned in the award as

THE STANDARD SCALES.

FAIRBANKS & CO.,

No. 252 Broadway, New York.

MAGNIFICENT TRIUMPH!

MASON & HAMLIN

Have the honor to announce that they have been awarded a

FIRST PRIZE MEDAL!

AT THE

GREAT PARIS EXPOSITION, 1867,

FOR THE SUPERIORITY OF THEIR

CABINET ORGANS.

It is not easy to over-estimate the importance of this recognition of superiority, because this is the greatest Industrial Fair the world has witnessed, at which the best makers of all countries have competed for the honors, and because Mason & Hamlin were

Represented only by their ordinary Styles

of instruments, such as are currently sold from their warehouses. The superiority of the M. & H. Organs in substantial excellence, was universally recognized by the eminent jury, and by the musical profession of the world, as represented at Paris.

THIS IS THE FIFTY-SEVENTH MEDAL,

or other highest premium, awarded M. & H. within twelve years, completing the most emphatic and universal official record of demonstrated superiority ever realized by any maker of musical instruments in the world.

M. & H. now manufacture about twenty-five styles of Organs, differing in musical capacity, from an instrument having one set of reeds of four octaves' compass, to one of twenty-two stops and nine octaves of tone. Most of these are furnished in cases of different degrees of excellence, from those which are quite plain, though neat and substantial, to others of most elaborate design and finish, comparing favorably with any furniture manufactured. They are thus adapted to a very wide range of uses, public and private, and are sold at prices from \$75 to upwards of \$1,000, each. They are adapted to secular as well as sacred music, occupy little space, can be easily transported all ready for use, are not liable to get out of order, and are most fully warranted in every respect.

The most important improvements used by M. & H. are patented, and cannot be employed by other makers. Circulars, with full particulars, free to any address.

MASON & HAMLIN.

GRAPE VINES AT IONA.

My stock of plants the present season is large, and promises to be of surpassing quality.

All persons interested in the purchase of vines, are invited to call and inspect during the season of growth.

A Descriptive List, stating quality and price of plants will be published in August.

ALSO,

Plows for Deep Working and Thorough Trenching.

I have a set of plows designed for performing every grade of deep working, from a few inches deeper than that generally attainable by ordinary tillage plows to thorough trenching with reversal of the soil to the depth of two feet or more.

The complete set will consist of six or more, four of which are now ready for inspection or trial. For information concerning vines or plows referred to, address

C. W. GRANT,

IONA, near Peekskill,
Westchester Co., N. Y.

A NEW GRAPE. SALEM.

The subscriber now offers for sale for the first time the above grape, No. 53 of his hybrids, named SALEM, from the place of its origin.

This grape has been withheld from sale or exhibition for various reasons, until a stock of plants could be obtained. It is a variety considered not only superior to any of the former well known numbers, but also to any hardy grape at present before the public, combining, as nearly as possible, every quality desired in an out-door grape; being one of the hardiest, healthiest and most vigorous of vines, and producing enormous crops of beautiful and high-flavored fruit.

This grape is a hybrid between the native and Black Hamburg; bunch large and compact, berry large as Hamburg, of a light chestnut or Catawba color, thin-skinned, perfectly free from hard pulp, very sweet and sprightly, with a most exquisite aromatic flavor, not equaled by any other out-door grape for wine or table; as early as Delaware or Hartford, having never failed to ripen in the most unfavorable season for the past six years.

Taking all its qualities into consideration, earliness, hardiness, and great vigor of vine, size and quality of fruit, it is pronounced by a few of the best judges who have tried it, to have no equal among all the numerous varieties now before the public; and I can, with confidence, recommend it as the best of all my collection, and now offer it for sale.

E. S. ROGERS, Salem, Mass.

NOTICE.—The subscriber would here state that he has disposed of his entire stock of vines and wood of the Salem Grape to J. L. WAIRING, of "Amenia Vineyard," Amenia, Dutchess Co., N. Y., to whom all orders for the same must hereafter be addressed.

E. S. ROGERS.

Salem, Mass., March 24, 1867.

The undersigned now offers for sale, this Autumn, the above valuable Vine, in quantity, one and two year old plants, suitable for vineyard purposes. The demand for it will be large, and those wishing to secure them would do well to send in their orders early. Price List and engraving will be sent in August, on application to

J. L. WAIRING, Sole Proprietor "SALEM" Vine,
Amenia, Dutchess Co., N. Y.

PERRY'S GRAPE VINES

are grown on high, dry ground, where mildew is unknown, hence the perfectly ripened berries and roots which they possess, that gave so much satisfaction to those who patronized me last season. They promise this year to be much larger than last, and worthy of particular attention. My extra selection of two year-old Vines for the Garden is very desirable. My Vines for Dealers and Vineyard planting, are in quality, all that one can wish for. PRICES NOT ADVERTISED, but sent upon application, and found to be as low as the lowest. Address

F. L. PERRY, Canandaigua, N. Y.

NEW WATER PIPE.

WHY RUN ANY RISK?

That leaden pipes contaminate spring water, and injure the health, is beyond question. A certain protection is the recently invented ENCASED BLOCK TIN PIPE. Water flowing through this pipe cannot be impregnated with poisonous solutions of lead, as it comes in contact with pure block tin only. The Tin-lined Pipe will bear nearly double the pressure of Lead Pipe, and is sold at the same price. Pamphlets of reports, and opinions, sent free on application. THE COLWELLS, SHAW & WILLARD MFG. CO., Foot of West 27th-st., New York.

Great Economy in Painting.

DOTY'S PATENT COMPOUND PAINT OIL, four years tested. Fully as durable, covers as well, easier to spread, quicker to dry, and in no respect inferior to pure Linseed Oil, yet much cheaper! Warranted to render White Lead whiter, either inside or outside, and FULLY AS DURABLE as Linseed Oil, and as good for all colored paints. Four years' use has fully established this.

PRICE, by the Barrel (40 gallons).....\$33 00
5 Gallons for trial, put up in good oak keg..... 6 00
10 11 00

Shipped as common Railroad Freight, or by Express. Testimonials as to Durability, in Circulars. Agents wanted everywhere. Exclusive sale given.

[COPYRIGHT SECURED.]

THE AMERICAN BUFFALO.—DRAWN BY W. J. HAYES, N. A., FROM LIFE STUDIES, FOR THE AMERICAN AGRICULTURIST.

The Buffalo is the largest of American quadrupeds, and one of the most interesting of the bovine family. When this country was first inhabited by the Europeans, this animal undoubtedly ranged freely over the whole of what is now the United States, except, perhaps, those mountainous, swampy, or densely wooded regions of which the Elk and Moose are the natural lords. The Buffalo is adapted to the open prairies, regions sparsely wooded and more or less dry, and to river bottoms, where he can obtain grass, his natural food. Our ancestors, recognizing the close relation which the animal bears to their domestic cattle, and having heard

about the Buffaloes of the East, which they knew to be ox-like, but had never seen, gave him the name Buffalo, though in reality he bears even less resemblance to the Asiatic Buffalo than he does to the ox. The name thus given has been popularly retained; and we might as well try to change the name of the Indians, (who are, indeed, quite as little related to the Indians of India, after whom they were named), as to call the Buffalo, "Bison." The Bison, once of Europe, now nearly extinct, very closely resembles the American Buffalo, and if our magnificent ruminant should, of necessity, bear a borrowed name, that he should have been called *Bison* is

indisputably true. But he was not, and we do not use "Bison robes" in our sleighs, nor "Bison horn" knife-handles, and we never will. It is *our* Buffalo, though the *pedants'* Bison.

The studies from which the above striking picture was drawn, were taken by the artist upon the Plains. It strikes one as exaggerated, for the simple reason that few of the drawings of the Buffalo which we see, are made by artists who know them on their grazing grounds; they do not dare give that fullness and length to the shaggy hair of the head and jaw, nor the towering flatness to the hump. On page 255, will be found other facts concerning the Buffalo.

Back Volumes Supplied.—The back volumes of the *Agriculturist* are very valuable. They contain information upon every topic connected with rural life, out-door and in-door, and the last ten volumes make up a very complete library. Each volume has a full index for ready reference to any desired topic. We have on hand, and print from electrotype plates as wanted, all the numbers and volumes for ten years past, beginning with 1857—that is, Vol. 16 to Vol. 25, inclusive. Any of these volumes sent complete (in numbers) at \$1.75 each, post-paid, (or \$1.50 if taken at the office). The volumes, neatly bound, are supplied for \$2 each, or \$2.50 if to be sent by mail. Any single numbers of the past ten years will be supplied, post-paid, for 15 cents each.

AMERICAN AGRICULTURIST.

NEW-YORK, SEPTEMBER, 1867.

Every year we are led to regard with thankfulness the beneficent provision which ordered the territory now occupied by this great nation, to be subject to so varied climatic and meteorological influences, yet so closely connected, and the intercommunication between its parts so intimate. This year the seaboard has been wet, and the inland States have been rather dry. If grain has been damaged for flour in one State, the well secured harvests of others easily supply the need. If we, of the East, lose our potato crop, as it seems probable that we shall, we can look to the West for a supply, and to the South for a substitute. The hay of New England may have been gathered in too poor a condition for market, and so while her farmers will lose their wonted profits, the railroads may now, thanks to improvements in hay-presses, bring the hay a thousand miles, and not make the price too high for our city markets. Eastern farmers who have been in the habit of selling hay may now learn an important lesson if they will, namely: that hay kept on the farm and fed out or made manure of, is worth a good deal more to them than if sold at any ordinary prices. The hay being unfit for sale must be used; part of it will be fed, the rest made into manure. Another lesson:—the poor hay, either that which has been wetted in curing, or that which has stood until it is hard, grown too tough, and wiry to be profitably used, must be either chaffed short and steamed, or wet down with a little meal or oil-cake, bran or other similar feed, and left to stand until incipient fermentation commences. The value of the grain thus used need not be much—the labor will not be grudged when the results are seen.

September is a happy month; it brings the golden fruits of the orchard, and the golden corn ripens under the Autumnal suns. There is, too, a harvest of greenbacks—no gold now-a-days—which September usually yields to those who have early crops to sell. During this month the prices of grain in Europe become settled, ordinarily. They may be such as to excite speculation, or the prices here may quietly settle down to what we may consider about remunerative values.

Save time to attend the Fairs; and be sure to take or send something to help the show. Have it in the best possible order, and don't expect so confidently to get the prize as to be made uncomfortable if you lose it. It is no shame to be beaten, but it would be shameful for a poor article to take a prize over a better one. Therefore rejoice that something more excellent than your's could be raised and that the raiser brought it. A good part of your reward should be in having contributed to make a fine show. A man seldom gains credit to himself by declaring openly that things he has, at home, are much better than those exhibited. Such statements, if made, should be said privately and generally in self condemnation for not having brought the articles. The unsuccessful competitor seldom gains more than an unenviable notoriety by openly impugning the motives of judges.

Every one is happy to receive prizes, and the hope that he may, is a great inducement to present articles in competition. The honor and credit should count for much, the money for very little, and really the unselfish motive of contributing to make a fine show, should be the chief inducement to exert ones-self for the fair. An exhibitor going to the fair with these feelings will not leave his wagon loads of fruit, vegetables, and dairy products outside, while he searches through the exhibition tables to find out if he will be morally certain of the prizes, before he decides to exhibit. There is nothing criminal in this, but it is certainly not honorable and commendable.

Hints About Work.

There is a greater variety of labors to employ farmers in September than perhaps in any other month. We have manuring, plowing, sowing and

harvesting, thrashing, feeding, marketing, all upon us at once, yet the labors are seldom pressing and of an anxious kind, except perhaps a little anxiety in regard to early frosts.

Animals, in general, need little care, except good pasture or feeding. *Fattening bullocks* that are to be finished off for the autumn trade need a gradual increase of meal as the weather grows cooler. *Sheep*, also, that are to be sold, should be separated from others and fed a little grain. Examine any that it may be necessary to have in moist pastures to check the very first appearance of foot rot. Shelter all during storms, and give access to water and salt. *Swine*, to be fattened this fall, will do much better if fed a little ground old corn now while at grass, or being kept on thin swill, as is usual.

Orchard fruit collect frequently, not only for feeding swine and cows, but in order to destroy the insects which sting the fruit at the time of laying their eggs, and to prevent the development of the larvae which causes it to become gnarly and to drop, prematurely ripe, or even green. Much good cider for vinegar may be made from windfalls.

Root crops.—All kinds of root crops having become well established and full of leaf, keep on growing until freezing weather, and often swell with prodigious rapidity, as the season becomes moister and cooler. Keep the weeds down and the ground open and loose, and pull for cow feed wherever they stand too thick.

Beans.—Pull before the ripened pods dry, and lay them up to ripen in small heaps, or, better, between two stakes driven perpendicularly about 5 or 6 inches apart. The plants being laid alternately heads and roots, and at the same time crosswise.

Grass and Clover Seeding may be done now upon land which is in order to be laid down, to very good advantage, provided we have rains. If the grass and clover can get a start this fall, so as to make an approximation to a sward, they will stand the winter well, and if the land is rich, be fit to mow next year. If not rich, the clover may be fed off in June, but not close, and cut for seed in the fall. Timothy sowed now and getting a good start of all other accidental grass on a good land, often yields a fine crop for seed two years in succession. If you need the grain or straw, sow it, but if you want grass, sow that.

Wheat.—Too much stress can not be given to having wheat land well prepared—drained rich, and mellow, also free from weeds, if possible. Sow during this month; the earlier the better. Drill rather than sow broadcast, and put the seed deep rather than shallow on all light soils.

Rye.—It is generally best to sow rye in the early part of October, as it often gets too much growth before the ground freezes if sown earlier.

Vermis in Granaries.—See article on corn-houses p. 323. Arrange to have security from mice and rats. Rats will generally clear out mice and may themselves be gotten rid of by the phosphorous paste which is a safe poison if the poultry are shut up and kept so for several weeks. The rats vomit up the poison, and the chickens eat it and die. The poison kills a few, but stampedes the vermin. Mice are not so affected; a few die, the rest remain. Use traps and cats; give the cat a sand box and punish her severely if she does not use it. A good mouser, and well trained, is almost invaluable.

Potatoes.—At the East the season has been such as to rot potatoes in some places very much. After the vines die or are thoroughly blighted, the tubers will make but little growth. They are fit for swine, but not for market. Yet many are perfectly good. It is sometimes best to dig and feed to pigs or cattle before they rot. If left in the ground the sound ones will remain good, while most of the diseased ones will become so bad that they may be detected at a glance. This, it is claimed, is a great saving of labor in picking over potatoes that rot in the bin; besides, the sound ones are not contaminated, and so more sound ones will finally be saved.

Draining and Irrigation.—These subjects are hinted at every month; their importance demands it. See what has been said in previous numbers and act upon the hints.

Manure.—Dig muck and peat, cut swamp grass, collect all weeds not in seed, and through the agency of swine, of the liquid manure of the barn-yard and the stables, of ashes and lime, and of every method of composting, start an active fermentation in the largest possible quantity of vegetable matter.

Ashes.—Send a team through the neighboring villages and wherever wood is burned, and engage the winter's ashes, agreeing to pay in soap, tin ware, wooden ware, money, or in any other way.

Bones.—Collect by paying children to gather them at the rate of 50 cents a barrel—you can afford to pay \$1.00 if you use the bones in gardening or in the fruit orchard, or if the land needs phosphates.

Straw.—September is a good month to buy straw; taken direct from the thrashing machine, it often sells cheap. In most wheat regions it is worth the price of three bushels of wheat per ton for manure, and should not be sold for that of four.

Linsed Cake.—Lay in a stock in advance. It is worth all it costs simply as manure, (taking the price of Peruvian guano as a criterion of value,) and if fed, you either gain in some other way, as in milk, or get nearly the full value in the manure, with the flesh and fat of the animals, as clear profit.

Weeds.—Mow or pull while in bloom or before; if possible, use as an ingredient of compost heaps or in the pig pen. If seeds have formed, dry the weeds, burn them, and use the ashes.

Orchard and Nursery.

The question of autumn planting should be decided by the locality. In those places where winter sets in early, spring planting is preferable; but where a long, mild autumn succeeds the planting, the trees become well established, and setting them at this season is advantageous. The ground for the orchard should be prepared as early as may be, by deep plowing and subsoiling. In most cases draining also is advisable. Order trees from the nurseries before the season of taking up begins, so as to obtain them as soon as they are fit for removal.

Autumn Fruit is to be picked as it matures. This and all other fruit should be left upon the tree until it attains its full development. Peaches must be picked before they soften. Pears should be kept in a cool, dry cellar, until they show signs of ripening. Bartlett pears, kept in a cool place until the supply is nearly exhausted, bring very high prices.

Packages should be at hand in sufficient abundance to allow for the uncertainty of returns from market. For peaches, pears, and even the choicer early apples, the basket is fast giving way to a wooden crate, with two compartments that hold a half bushel each. The sides of these are made with slats which allow of ventilation, while the compact form of the package allows it to be packed to better advantage than the baskets.

Budding will continue with the peach, and pear upon quince stocks. Remove or loosen the ties as soon as the buds have formed a union with the stock, which is usually in about two weeks. In cases of failure, re-bud if the bark will lift.

Preserving fruit, either by drying or canning, is to be attended to as the different sorts ripen. A drying house of some kind is useful where the quantity is large. Fruit dried out-of-doors should be covered by some open fabric to keep off flies and other insects.

Pomological Exhibitions, either those held by themselves, or in connection with State and County fairs, do much to impart a knowledge of fruits. Visit these; and if you have any fruit, go not only as a spectator, but as an exhibitor. If there are any varieties of which the name is lost, or any of doubtful identity, take specimens for comparison, and for submitting to other fruit growers.

Insects.—Much may be done to diminish the number of these by picking up all fallen fruit and feeding it to swine.

Seeds.—Secure these as the fruits ripen. Those of stone fruits must not be allowed to get too dry. See hints on page 293—last month.

Weeds must be kept down in the nursery if good

plants are expected. The plow, cultivator, and pronged hoe, are the principal implements used for this purpose, and they should not be idle.

Fruit Garden.

Autumn planting is in many cases desirable, but the practice in this respect must be governed by the considerations given under "Orchard and Nursery." The secret of success in small fruit growing is in well preparing the soil, selecting good varieties, and in giving thorough cultivation. Those who think that they have done their whole duty in merely setting out the plants, will find their mistake when they come to harvest the crop.

Blackberries, if properly shortened, will have thrown out side shoots, which, when they attain the length of 18 inches, should be pinched early this month. This will cause the wood to ripen and withstand the winter better than when they are allowed to grow on until checked by frost.

Black-caps and others, that only propagate from the tips of the branches, will need to be layered. See illustrated article on page 292, last month.

Raspberries.—Keep the young canes tied up to wires and stakes, and the soil clear of weeds.

Grapes.—Market the early ripening varieties, handling carefully so as not to injure the bloom. Use scissors in gathering, and leave long stems to the bunches.

Pears are to be gathered as soon as mature, and ripened in the house. If picked too early, they will shrivel instead of ripening.

Strawberries.—If fall planting is practised this is the month in which to do it. Plants that were struck in pots are removed with little risk. With others, unless the roots are taken up with a ball of earth, it will be better to remove all the large leaves, as this diminishes the evaporating surface and increases the chances of success.

Kitchen Garden.

The gardener is now occupied with the care of his late crops, which, under good culture, should be growing rapidly.

Asparagus.—It is recommended by some to plant in the fall. We have never tried it, but Meehan, of the Gardener's Monthly, says it is advisable. One year old plants have their tops cut off and are planted in a well manured bed in the usual way.

Beans.—Shell or dry all the Limas that will not be used before frost comes. They are excellent in winter. Salt string beans.

Cabbages and Cauliflowers.—Promote their growth by frequent stirring of the soil. Use lime if slugs are troublesome, or trap them by means of cabbage leaves laid on the ground. From the 10th to the 20th sow seeds of early sorts in the open ground to get plants for wintering in cold frames.

Borecole, or German greens, sow for "sprouts."

Corn.—Save seed from the best, and dry an abundance for winter use.

Cucumbers.—Gather, if large enough for pickles.

Celery.—Keep the plants cultivated and earth them up in flat culture about ten days before wanted for use. That for winter is left until later.

Endive.—Blanch as wanted for use either by tying the leaves together, or laying a piece of board or slate over the plant.

Manure.—This is the key to successful gardening, and the heaps should be increased from every available source.

Melons ripen better if a board or wisp of straw be placed between them and the earth.

Onions.—Harvest, if not already done, and cure and store as directed last month.

Radish.—The Chinese Rose-colored Winter may be sown. When not overgrown, it is tender and will keep good all winter.

Shallots.—A species of onion, and much used in the green state as a substitute for it. Divisions of the bulb are set 6 inches apart, in rows one foot distant. It is hardy and comes early in spring.

Spinach, for early spring, may now be sown, in drills 12 to 15 inches apart. It meets with a ready sale in the spring, and is a profitable crop.

Sweet Potatoes.—Carefully remove the earth and take out the largest roots for use. The smaller ones will grow until frost comes.

Squashes.—Allow the vines to root at the joints, and look out for late broods of insects.

Tomatoes.—Preserve a good supply and make cat-sup while the fruit is abundant. Select only the best formed and earliest for seed. The "worm," before mentioned, will still continue its depredations.

Turnips.—Sow the round sorts and give Swedes good culture.

Winter Cherry.—Gather as the fruit ripens, and use for sweetmeats, or spread in a dry room.

Flower Garden and Lawn.

A number of things may be done in preparing for next year's enjoyment. Among these one of the most important is the planting of

Bulbs.—These should be purchased as soon as the florists receive their stocks, as the best bulbs are soon bought up. All the spring-flowering ones should go in the ground the last of this month, or early in October.

Chrysanthemums.—Pot those intended for house blooming, and shade them for a few days. See that those left in the grounds are properly staked.

Dahlias should now be in their prime. Remove faded flowers and keep the stems well tied up.

Bedding Plants must have cuttings made for a new stock. Those that it is worth while to keep over, should be potted before cool weather. Seeds of

Perennials, if sown at once, will make plants strong enough to winter safely, at least if a slight protection be given them. Make preparation for

Wintering Plants.—A well drained and vermin proof pit, covered with sash, will answer for storing tender roses, carnations, and other half hardy things. A light, dry, and not too warm, cellar, will also serve for the same use.

Violets for winter blooming are to be set in a cold frame this month. The soil should be fine and rich. The frame should not be covered until frost.

Green and Hot-Houses.

Repairs and alterations of the house and heating apparatus ought to be finished, and everything ready for immediate use.

Sow Seeds of such annuals as are desirable for house blooming as well as those of cinerarias, calceolarias, Primulas, and other florists' flowers.

Cuttings, to give a stock of young plants, are to be made.

Cape Bulbs must be potted for winter blooming.

Plants out-of-doors must not be neglected. They often receive much injury in the heavy gales of autumn.

Hanging Baskets and Vases should be stocked with plants. Use plenty of Ivy for this purpose.

Cold Grapery.

When the fruit is ripe, keep the atmosphere of the house dry, but give ventilation on fine days. If rats trouble the fruit, set traps or poison for them, and look out for two-legged marauders.

Apiary for September.—As Mr. Quiuby's notes have failed to reach us this month, we simply call the attention of the bee-keepers among our readers to the necessity of shielding their weak colonies from the tendency of bees to rob, which increases as the season advances and pasturage yields a less abundant supply of honey. When buckwheat is in full flower, bees will busy themselves in storing honey, but when this supply fails, they will rob other hives, or take honey out of the surplus boxes. These should be watched and removed before they are attacked. The fly-holes of weak colonies should be contracted very much, and these

stocks should be strengthened or broken up altogether. Look out also for queenless stocks or barren queens, and either give other queens, if the drones are not killed, eggs or young brood, or combine hives in such a way as to keep only populous ones with good queens.

A QUARTER OF

A MILLION

WANTED FOR 1868;

OR,

ALL OUR OLD SUBSCRIBERS,

AND NEARLY

100,000 MORE.

LOOK AT WHAT WE OFFER.

**A Most Beautiful Paper,
The Most Liberal Terms,
Most Valuable Premiums,**

And Three Months Free.

The subscription list of the *American Agriculturist* for the year 1867, is far in advance of that of any previous year. The Publishers take this opportunity to thank the hosts of friends who have not only expressed in the most emphatic terms their satisfaction with our paper, as it has made its monthly visits, but who have also swelled our subscription list by calling the attention of neighbors and others to the paper. We hope to retain all our old subscribers, and to add 100,000 to the list. And we want as many names as possible **this month**.

LOOK AT WHAT WE OFFER.

Interesting to all Readers.

1st. What you will receive for a very little money. For \$1.50, or less, every one of our subscribers receives an entire volume, 12 numbers, of this paper, any one number of which contains articles, hints, suggestions, etc., worth more than the cost of a year's subscription. The engravings are of the first order, drawn and engraved by the best artists, and illustrating subjects so various that they cannot fail to interest every member of a family. Many a father has written to us that he must continue to take the *American Agriculturist*, not only for himself, but because his children think so much of it. Our determination is to make each year's issue better than that of the preceding year. Whether or not we have done this thus far, our friends who have subscribed for some years, can tell by comparing back volumes with the later ones.

LOOK AT WHAT WE OFFER.

2d. Every worker for us may secure a

Premium. All of our premiums are good, and many of them very valuable. No paper can be found for which it is easier to secure subscribers than the *American Agriculturist*. This is the testimony of many who have sent us club lists. In order to give to all an equal chance, the Publishers will offer a General Premium List, in which a description of premiums is given, and also all needed information relative to getting up clubs. Among the premiums will be found Seeds, Vines, Plants, Trees, Implements, Machines, Books, Gold Pens, beautiful extra-plated Tea-sets, Pitchers, Guns, Rifles, Melodeons, Pianos, etc.

(The Premium List will soon be ready, and will be sent free to every one desiring it.) Begin **now** to make up your clubs. Every new subscriber received after September 1st, may count in the New Premium List. Extra inducements are offered to those who subscribe in September, as will be seen below.

LOOK AT WHAT WE OFFER.

3d. Look at our special offer for September. To any new subscriber sending in the regular subscription price **this month**, and the name marked **new**, we will send the *Agriculturist* for all of 1868, (volume 27,) and the last three months of this year **FREE**.

Notice:—This offer applies to **all** new subscribers received in September, whether single names, or members of clubs. Thus, \$5 will pay for **four** subscribers for 15 months, (October 1867 to December 1868 inclusive,) and so of all other club rates. **All new subscriptions received this month, will be entered on our mail books for 15 months from October 1st.**

The Publishers will allow sufficient time after September 30th for responses to this offer to come from the Pacific States and Territories, and other distant points.

Try the American Agriculturist for a year—or 15 months, now,—three months free.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the *American Agriculturist*, show at a glance the transactions for the month, ending Aug. 15, 1867, and also for the same month last year:

TRANSACTIONS AT THE NEW-YORK MARKETS.

5. Receipts of Breadstuffs at tide water at Albany, May 1st to August 7th:

	Flour, bbls.	Wheat, bush.	Corn, bush.	Rye, bush.	Barley, bush.	Oats, bush.
1867	64,700	316,400	5,682,700	126,200	35,100	1,616,200
1866	114,400	1,499,500	11,435,000	473,000	105,300	4,194,000

Gold has advanced one or two points since our last, closing quite firmly.... Receipts of produce have been increasing, especially in the breadstuff line. New wheat has come in quite freely, chiefly by coastwise vessels, and by railway. New wheat from the South has been abundant, but not of the best average quality.... The demand for breadstuffs has been good, but holders have been eager sellers, as a rule, and prices have been generally lower, and quite irregular. Old wheat and old wheat flour have been quite scarce, and have been quoted firmer than almost any other kind of produce. They have been given decided preference over new, which has been much depressed. Quite a brisk speculative business has been transacted in corn within the past two weeks, leading to a rapid rise in prices. The export trade is kept in check by the advance. Weather and crop reports from Europe have been more favorable, and have tended to lessen the export call. Oats have been scarce and held very stiffly. Various speculative operations have been in progress in them.... Provisions have been quite active, but irregular in price, closing, as a rule, rather firmly.... Cotton has been in better demand, at higher quotations, closing buoyant.... Wool has been sparingly dealt in at declining prices. Holders have been rather eager to sell, in view of the accumulating supplies.... Tobacco has been freely purchased, especially for export, at uniform prices, quality considered.... Hay has been plenty, particularly new, which has declined materially. The demand has been moderate.... Hops have been salable and firm.... Seeds have been nominal and dull.

Beef Cattle.—Our report covers four weeks of exceedingly variable weather, part of the time very hot and moist—bad weather both for animals and for butchers. Irregularity of supply, at this season, influences the prices promptly, and consequently there has been rather more than the ordinary fluctuations in the ruling prices.

At the last two markets, the average price was determined more perhaps by the quality than by the supply, for most of the stock was very poor and badly treated. We quote extra beef 16½c., and from that to 15c. for good fair steers. The general average of the market was not more than 14½c., and the lowest grade of cattle sold for about 10 to 12c. Those prices are per pound for the estimated weight of the dressed meat in the quarters....

Milch Cows.—Little demand and small supply; prices \$60 to \$90 with calves.... **Calves.**—Fat calves sold at about 11c. @ 12c. per lb live weight. Common ones at 8 to 9c.; poor, 4½ to 6c. A good many grass calves are reported as sold to neighboring farmers, at an average price of \$12.40 per head.... **Sheep.**—The last market leaves prices about as follows: Prime sheep, 66½c. per lb live weight; medium, 5½c.; poor, 4½c. Lambs, 7½c. @ 9½c., according to quality. Really extra mutton sheep will bring better prices than quoted, say 70 to 7½c. per lb; but it takes remarkably fine lambs to sell for over 9 or 9½c....

Swine.—As we close our report, the prices have been unusually uniform for some time. The supply is abundant and steady, though less than for two weeks past; prices 7½ and 7¾c. per lb live weight, a few extra lots going a little above the highest figures.

Containing a great variety of items, including many good hints and suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

WHY FOR NOTHING? "Why Do You Give Three Months' Papers for Nothing?" some of our readers may ask.

1st. Because we feel sure that thousands of families who may be induced by our offer to take the *American Agriculturist*, will give their testimony to the benefit received from reading it; and thus, through them, we shall gain many other friends and new subscribers.

2nd. Because there is a very large amount of labor to be done near the close of a year, and at the beginning of a new year, in entering on our books, and properly arranging, the great number of names of subscribers whose subscriptions are renewed at that time; and we are willing to offer these extra inducements for the sake of getting some of this large amount of work done earlier in the season. *Help us swell the list.*

How to Remit:—Checks on New-York Banks or Bankers are best for large sums; make them payable in all cases to the order of Orange Judd & Co.

Post Office Money Orders may now be obtained at nearly every county seat, in all the cities, and in many of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, as many hundreds have been sent to us without any loss.

Registered Letters, under the new system, which went into effect June 1st, are a very safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. *Observe, the Registry fee, as well as postage, must be paid in stamps at the office where the letter is mailed, or it will be liable to be sent to the Dead Letter Office. Buy and affix the stamps both for postage and registry, put in the money and seal the letter in the presence of the postmaster, and take his receipt for it.* Letters sent in this way to us are at our risk.

Three New Grape Books.—If our people fail in grape culture, it will not be for lack of a sufficient number of teachers. The literature of the subject is becoming voluminous, and one who would have all that is written upon grape culture must invest in a moderate sized library. The books on grape culture since Fuller, are so much alike, that, as a general thing, one is about as good as another, and we find a dreary sameness about them. The fact is, if one only comprehends the structure and mode of growth of the vine, he can easily follow any of the many systems of training. We have now before us three books, which we mention in the order of their publication:

AMERICAN GRAPE CULTURE AND WINE MAKING, by Peter B. Mead, N. Y. Harper & Brothers. pp. 483. 8vo. Price, \$3.00. This is by far the most sumptuous grape book that has yet appeared, good paper and type, a most liberal margin, and illustrated by engravings that are, for the most part, of great excellence. In all the practical part we find scarcely anything that has not been told before. In this case the story is clearly and well told, and the book will doubtless be a safe guide. The chapter on

varieties will attract attention. As there are few grapes commended save the Iona, Israella, and Eumelan, the book is open to the criticism of having been written in the interest of the originator and owner of those varieties. We are not aware that this makes it any better or any worse; books and grapes must stand on their own merits. In one point we must dissent from the author. He introduces a new word for lateral—*thallon*, and from this derives *athallize*, *dethallize*, etc. This appears learned, but is useless, for the reason that the word lateral has become well understood as applied to the grape vine, and people will not unlearn it to substitute so uncouth a word as *thallon*. There is just as much need of a new word for stake or post as for lateral. Despite a rather extravagant use of adjectives, the work is generally well written, and will be acceptable not only to the many personal friends of the author, but to those grape growers who wish to read all sides of the subject.

VINEYARD CULTURE, by A. Du Breuil, with notes by John A. Warder. Cincinnati, Robert Clarke & Co. pp. 337. 12mo. Price, \$2.00. This is a translation of a work by one of the highest European authorities, and is brought out in a remarkably neat and beautiful style. The original was written for a different climate, and other vines than ours, but the very copious notes of Doctor Warder have quite naturalized it. We should have preferred that Dr. W. had given us a work entirely his own; as it is, he has embodied a great deal in his notes, and the work cannot fail to have a large sale.

THE GRAPE VINE, by FREDERICK MOHR. Translated by Horticola. New York, Orange Judd & Company. pp. 132. 12mo. Price, \$1.00. This work takes up its subject quite differently from any other, and devotes more attention to the structure of the vine and its manner of growth than it does to particular methods of training, though it is not by any means deficient in practical instructions. One who fully masters the teachings of Doctor Mohr will be able to work among his vines understandingly. The translator, (Dr. Chas. Seidhof,) has added a chapter on the propagation of American varieties, as the practice with these is different from that followed in Europe with their vines. We think that this will prove a most useful little book, and it will, doubtless, in its English dress, take the same high stand here that the original holds in Germany.

"An Opinion as is an Opinion."

Some horticultural Jack Bunsby, in the American Journal of Horticulture, answers a "subscriber," who asks, "Can good wine be made from grapes grown at the North?" as follows: "We very much doubt it; what are or have been called native wines, are fixed-up stuff—grape juice and water sweetened, not wine." What did its "Western Editor" think when he read this? What do the Hammondport people think? What do the members of the Lake Shore Wine Growers' Association say to this? Can Mottier and the Longworth Wine House subscribe to the statement that native wines are fixed-up stuff?—Oh, we forgot—"the North" means the country within sight of Boston State House.

The Strawberry Chas. Downing.

—In describing this berry in our August No., we omitted to say that the engraving was from fruit borne upon young plants, set out in October last. The illustration, therefore, fails to do justice to the fruit, which on old plants attains a much larger size than is there represented.

Exhibition of the American Institute.

—The American Institute will hold its thirty-seventh Annual Exhibition in New York at the armory on 14th st., near 6th avenue, beginning on September 12th, and closing on October 26th. The programme, which is well arranged, and a marked improvement on those of former years, as well as all necessary information, may be had by addressing Prof. S. D. Tillman, Corresponding Secretary. The Department of Agriculture and Horticulture includes all products of the farm and garden, as well as all the tools and implements used in cultivating them. Liberal premiums will be offered, and we hope to see this department better filled than it has been of late years. The Institute seems to have taken a turn in the right direction, and as we see a disposition to shed its shell of old fogysm, we shall try to second its efforts.

Gardening for Profit.

—The sale of this book has been something unprecedented, and shows that it was just the work that was needed. It gives the experience of a practical market gardener, who, cultivating valuable land, was obliged to make it pay. While it is written by a market gardener, its teachings are none the less applicable to the family garden, as the best mode of culture in one place is the best in another, and if it will pay a market gardener to get two or three crops a year from the same soil, it will be profitable for the farmer or owner of a town or village lot to do the same. If the doctrine of this book, high manuring and thorough

cultivation, should find an application outside of the garden, we do not think that the farmer would suffer. No one who raises vegetables of any kind for sale, can afford to do without this book, and indeed the same remark will apply to those who have only private gardens. Those who intend to try market gardening, should begin this autumn. The work covers the whole ground, from selecting and preparing the soil to marketing or storing the crops. It has a particularly valuable chapter on the construction of houses for forcing vegetables and propagating plants. The demand has been such that our stock has several times been exhausted. We have made arrangements for a constant supply. Price, \$1.50 by mail.

What will Secure the Agriculturist?

—\$1.50 pays for a copy of the *American Agriculturist* for the whole of 1868, and a new subscriber sent us this month, (September,) will receive the paper free the last three months of this year.

\$5.00 pays for four copies for 1868, and each new subscriber will receive the paper for the rest of this year free. The same rates for five, six, seven, eight, or nine copies.

\$12.00 pays for ten copies for 1868, and each new subscriber will receive the paper for the rest of this year free. The same rates for any number of subscribers up to nineteen. A free copy to the sender of the club.

\$20.00 pays for twenty copies for 1868, and each new subscriber will receive the paper for the rest of this year free. The same rates for all copies over twenty. A free copy to the sender of the club.

The American Pomological Society.

—The President of the Society, Col. Marshall P. Wilder, writes us from Paris that he shall sail from Europe in company with Mr. Barry, in time to be present at the meeting at St. Louis, on the 11th of this month. This promises to be a largely attended and important meeting. All interested in pomology should join the society, attend its meetings, and get its Transactions.

The Practical Entomologist.

—We regret to learn that this most excellent monthly is about to cease, unless adequate support be immediately tendered. The journal is devoted entirely to the interests of cultivators, and we should hope that there might be enough of these, sufficiently awake to the importance of the subject, to sustain it. The price is only 50 cents a year. E. T. Cresson, Philadelphia, receives subscriptions.

Sundry Humbugs.

—Letters received during the last month, with reference to various swindling operations, though numerous, indicate a decided falling off in this line of business. We have reason to believe that our blasts are telling upon them, and the sums of money which we are assured by correspondents, have been saved to their owners by our timely warnings, would be sufficient to set up several respectable establishments in Wall-street, and leave enough to buy out the whole stock in trade of a hundred or two of these villainous sneaks, who flech money from the unwary by means of confidential circulars, nice little tickets put up in nice little envelopes, as if they were worth something, offering valuable articles for one tenth, or less, of what they are reported to be worth. Respectable dealers don't do business in this way, and those parties who have written us in the last month for special aid in their particular cases, because they have sent money, and got no returns, are advised to take the *Agriculturist*, heed our general warnings, and in future save their money.... Clark, Webster & Co. come out as follows: "A CARD to the Ticket Holders and Agents of the Bankers' and Merchants' Grand Presentation Enterprise. We are sorry to say that we have been obliged to extend the time of drawing to August 24, 1867, on account of the city authorities claiming that the enterprise was a violation of the law, so we have at a great deal of trouble and expense secured a United States License to carry the enterprise through, and we have obligated ourselves to make the Grand Distribution of Prizes on the evening of the 24th of August, 1867. As we have the United States License in our possession, we will guarantee that there will be no further delay in bringing this stupendous scheme to a close." The claim of the city authorities is just, and, we think, will be sustained. The *United States license* is no protection, and gives them no authority to carry on their illegitimate business. A decision from Chief Justice Chase, published in the city papers July 21st ult., settles this question. We cannot quote the whole of this lengthy document; a few lines are sufficient. Speaking of the U. S. License Law, as to giving authority to carry on business against State laws, he says: "But it is not necessary to regard these laws as giving such authority. So far as they relate to trade within State limits, they give none, and can give none." Clark, Webster & Co. are still under bonds for trial, and, we hope, they will get their deserts. Their new obligations and guarantees, we suppose, are as

good now as they were before; that is, good for nothing. . . . A. A. Kelley & Co. are still operating, and assure the public that the Gift Concert will positively *come off*. Please keep in mind that this concert was to have been given July 5th, 1866, then September, 1866, then November 17th, 1866, then January 27th, 1867, then July 4th, 1867, and now at some *indefinite* time. Let fools send in their money for tickets. . . . Matthew Westbrook & Co. would like to send more of their cheap Greenbacks, Watches, Jewelry, several hundred Pianos, Organs, Sewing Machines, etc., etc.; that is, they would like to get your money on their promises to do such things. Matthew says he runs one end of this town—give him a wide berth. He is under bonds for trial. . . . H. Ballou Carter, Hampstead, N. H., pretends to want to furnish counterfeit greenbacks done in the best style, \$2 for \$1, \$12 for \$5, and 4 Vs for \$10. If you want to *throw away* your money, it can easily be done nearer home. . . . R. H. Foster & Co., Chas. Elmer & Co., S. Curtis, and others, offer to send Watches, Chains, Jewelry, etc., etc., \$50 to \$100 worth, for from \$2.50 to \$10. Curtis don't want money orders or registered letters sent to him. What is the matter? It will not injure an honest man to sign his name at the post office for such documents. . . . We are glad to announce that an Association for the Suppression of Gamblers has been formed in this city, and we understand that their attention has already been turned to these Gift Enterprises and other swindles. We wish them God speed in their truly Herculean task.

The Death of Wm. N. White.—Mr. Wm. N. White, editor of the Southern Cultivator, died at Athens, Ga., on July 14th. The Southern Cultivator was the only agricultural paper that sustained itself during the rebellion, and it was maintained mainly by the great energy of Mr. White. While we had occasion to differ with Mr. W. on many points, we never lost our admiration for his agricultural and horticultural knowledge, nor for his personal character. The cause of agriculture in the South has, in Mr. White, lost a zealous and intelligent advocate, and the horticultural community, one of its most devoted members.

Bread Kneading is well done by a machine advertised on another page. This, in large families, especially, will be appreciated. The machine is simple, works on the right principle, and is very durable.

Cottswold Sales in England.—Cottswold sheep breeders in this country look with interest for the reports of the annual ram sales. Private letters state that fifty rams of the flock of Wm. Lane, of Broadfield Farm, sold, July 25th, for an average of £31 17s. 11d., and fifty of Robert Game's flock, of Aldsworth, brought an average of £24 14s. 8d., on the following day.

Begin on your Clubs this Month.—The Premium List for 1868 is not quite ready, but the Publishers will complete it this month, and send to all who may desire it. Do not wait for this, but **start your clubs at once**. You can choose the premium after the new list comes out. Both old and new names will be counted in the premium clubs. The special offer to new subscribers will aid you greatly in securing names, as the extra numbers will be sent to all new subscribers on your list, **provided they are thus marked when received by us**. N.B.—Mark every list of names designed for a premium club, **when you send it in**. This insures its entry to the credit of the sender, in our Premium Book.

State Bank Bills.—There are still in circulation some of the old State bank bills. The charters of some of these banks have already expired, and their bills are sold at a discount, or are entirely worthless. Many others will soon follow. Some bank notes that were good yesterday, last week, or last month, are worthless to-day. We advise the sending in for redemption at once the notes of ALL STATE BANKS. Take the greenbacks—as many as you can get honestly.

Fuller's Small Fruit Culturist.—Now that the small fruits are receiving deserved attention, the work of Mr. Fuller comes most opportunely. Those who wish to embark in this most profitable culture, can have no safer guide. Much preparatory work has to be done in autumn, and in many places, planting at this season is advisable. Nowhere else can such complete directions be found as in the work under notice. It has been very favorably noticed by the press. The Gardener's Monthly, a periodical that is always very discriminating in its book notices, and never given to undue praise, says in its August number: "A well-printed and illustrated octavo of 275 pages, giving the results of Mr. Fuller's experience and observations on the culture of small fruits. It is a common proverb that 'Doctors

disagree,' and especially is this true of fruit Doctors, no two of whom agree as to the best way of treating anything, if we are to judge by reports of discussions at fruit meetings. But after a careful perusal of Mr. Fuller's book, we can say we think he has been fortunate in hitting on the true medium or common ground wherein most of the best practical men will agree with him; and thus has been fortunate enough to produce a work which will prove generally acceptable alike to those who believe they know, and to those who want to know the best general way to grow small fruits."

Report of Central Park.—The Tenth Annual Report of the Commissioners of the Central Park has been received from A. H. Green, Esq., Controller. We are always glad to get these reports, as they not only advise us of the progress of this great work, but they give many useful details concerning road making and similar matters. A set of them will be invaluable to a person undertaking any work of this kind. The present volume is illustrated by several maps, and plans, and photographs of scenes in the park. Among the latter is a representation of some noticeably fine designs for stone carving, by J. Wrey Mould, the well known Architect.

Fruit Notes from Ohio.—Mr. G. W. Campbell, Delaware, Ohio, sends us the following notes on fruits in his locality: "Most kinds of grapes are doing well this season. The Iona is doing better than ever before. Fruiting vines perfectly free from rot and mildew. Concord, near by, rotting slightly; the first time I have had any rot upon this variety. Catawbas, I am told, are rotting pretty badly about Sandusky, and upon the Islands—to the extent of one-fourth to one-half of the crop. Delawares are doing better than last season, wherever I have heard from or seen them, and seem to be increasing in favor among the vineyardists of the Lake Shore region. The Agriculturist and Juncunda have proved the finest of all strawberries on my grounds this season, the former much the stronger and more vigorous plant. The Clarke Raspberry promises well here. Stood 25° below zero perfectly uninjured, in several localities, all fully exposed, and without protection.

The Horticultural Indelible Pencil.—The Indelible Pencil Co., Northampton, Mass., make a pencil for the use of gardeners, nurserymen, etc., with which we are much pleased. Ordinary wooden labels are moistened with a solution of soda or saleratus, and the pencil is used like an ordinary lead pencil. We have had labels out during three months of the rainiest of seasons, and cannot see any change in the writing.

Pickled Grapes.—Drop grapes into hot spiced vinegar. The better the grapes, the better the pickles. Put up a jar of these, and you will be sorry you had not put up more.

Catalogue of Agricultural Implements, etc.—We have received from R. H. Allen & Co., 189 Water St., New-York, one of the largest, and best illustrated catalogues we have ever seen, we presume the most complete ever published in this country.

The Size of a Peach Crate.—The crate used for sending peaches and some other fruits to the New York market is 24 inches long, 8 inches high, and 14 inches wide. The end pieces and central partition are of half-inch stuff. The sides are of quarter-inch boards. The top and bottom are covered by five slats, 24 inches long, 2½ inches wide, and ¼ inch thick.

Sending by Express.—Good natured Mr. A., living in Illinois or Wisconsin, has some apples of which he would like to know the name, and he puts up a few dozen in a box, and sends them by express, at the same time writing us a polite letter, informing us that he has sent the apples, and asks the name. We have been too good-natured to inform Mr. A. that we had to pay from \$2 to \$3 express charges, and that the apples were of a common sort that would have been readily recognized by the nearest nurseryman or orchardist. This thing has become a little extravagant, and an item of expense which we wish to stop. Most of the things sent for our inspection are for the purpose of eliciting information for the benefit of the sender. We submit that it is not fair that we should pay the charges.

Rye for Early Feeding.—"Young Farmer," Cumberland Co., Ill. Rye makes excellent and the earliest spring feed, but if pastured it is very rapidly fed off and destroyed. The best plan is to mow it, and feed to cattle or swine in the stall or pen. Though, if fed off first by cattle, and then by swine, it might be economically consumed. How early it will do to feed it off, we

cannot say, but it is making its most rapid growth just about the time that grass begins to be fit for grazing. The period for the most economical cutting and feeding is between the first appearance of the heads and their full growth before blossoming. Rather, perhaps, after the heads begin to show, and before wheat arrives at the same stage. Wheat comes later, but makes better feed, because so much more leafy. Sow the wheat earlier than the rye in autumn.

LOOK AT THIS.—Fifteen Months for One Year's Subscription.—The attention of all our readers is called to the very liberal offer made on a preceding page. It will be seen that the *American Agriculturist*, for the last three months of 1867, will be given to all new subscribers for 1868, whose subscriptions are received in September. Will all our friends make this offer known to all their friends? This offer is only for September.

Salt and Plaster Mixed, for Grass Land.—"B. Z." The theorizers are, and have been, at loggerheads about these two articles, in trying to settle how they act as manure, and in endeavoring to give us rules for the application of each by itself. As yet, no one has troubled himself much about the mixture. Practically they may be applied separately or mixed, and in such proportions as one's judgment shall dictate. Experiments are always instructive, and, in the absence of sound bases to found opinions on, always try different quantities in making the mixture, or the application of any fertilizer; also use each ingredient alone, and keep a record of everything in black and white.

The Crops and the Weather.—The solicitude of the public, and especially of the mercantile community, in regard to the crops has been in a great measure relieved, and though business is still dull, the hopes of people seem to presage prosperous times in the near future. The Monthly Report of the Department of Agriculture opens with the statement that never before has the Department been able to report so favorable a prospect for uniformly good crops. There are, indeed, localities in which some crops are a comparative failure, or much damaged by the insects or the weather, but, on the whole, our information up to the middle of August, gathered from correspondents, exchanges, and personal observation, (which has been quite extensive, covering a good portion of New York, Pennsylvania, New Jersey, Ohio, Indiana, and New England,) confirms the view taken by the Department of Agriculture.

The great *Wheat* crop of the country has been secured in unusually good condition, and if well thrashed and marketed, will meet high expectations as regards quality; and in respect to the amount of wheat raised this year, though early for accurate estimates, the opinion is general that the crop will prove very heavy. The rains which have affected the seaboard, caused some injury to grain, but this will not influence the general result.

Rye, where much raised, has turned out well on the whole, the lightness of the grain being, in general, compensated by the excellence of the straw.

The *Corn* crop of the West is looking finely; localities which feared drought have generally been relieved, and the reports are numerous that not a curled leaf has been seen this season in many localities. At the East, the crop is still backward. At the South, the abundant crops both of small grain and corn have relieved the pressure of hunger on the part of many of the poor and improvident, so that now, if we may credit newspaper reports, in Texas, corn, which was worth \$3.00 per bushel, is selling as low as 25 cents.

Oats.—The crop will probably be an average one. It is as yet too early to learn accurately, as the crop is not cut throughout the most extensive oat producing regions.

Grass.—The product has been very large, the late and continuous rains having thickened it up by a short undergrowth, which has added largely to the bulk and quality of the hay. A large part of that of New England and the seaboard was harvested well, but much in bad condition.

Potatoes.—The promise of a very fine crop is still held out throughout the West, Central New York, and Pennsylvania; but the rot has affected many localities quite seriously, and fears are entertained that the malady will affect the general crop of the country.

Sorghum.—*Tobacco*.—The product of syrup will be less than that of last year, and the tobacco crop will be less than the average.

Cotton.—The reports are generally very favorable. Central Louisiana seems to be the most marked exception, though in many sections a deficiency of labor allowed the grass to get such a start during the wet weather, that the crop is not nearly so good as it should have been.

Fruit.—Apples are a failure in the Middle States, east of the Alleghanies, but good in parts of New England and the West. Peaches are most abundant.

Brinckle's Orange Raspberry Blighted.—A. S. Jack, Province of Quebec, Canada. You do not say whether your vines were protected in winter or not. From your description of the blight we should infer that it was caused by a cold and wet spell, just at blossoming time. This is a most critical period with all fruits, and unfortunately we cannot control the weather. A cold rain, just when bushes or trees are in flower, prevents fertilization, and as a consequence we get very little, or no fruit. English gardeners often cover their dwarf pear trees with a screen or tent while in bloom.

Mosquito Nets or Bars for Windows.—These can easily be manufactured at home, and the pest of autumn be effectually barred out. First make a frame for the netting, that will just fit into the lower part of the window. If you have a pine board, a saw, and a jack plane, make them yourself; if not, you can buy mouldings about 1½ inches wide, by ¾ thick, for one to two cents a foot. With a knife, a fine saw and a few tacks or wooden pegs, the frame can be joined together at the corners. Now stretch over it the mosquito netting, and fasten with tape and tacks, and your work is done. It is light and handy, and a great comfort in all regions where these insects flourish. We have just completed four, and are ready for dog days. The netting cost sixteen cents each, and the material for the frames about twenty cents each. A boy or girl can readily make the frames, and sleep all the better for it.

Sheep Raising at the West.—A gentleman in Illinois, after four years' experience in this business has discovered that his practice does not correspond with the theory of the papers. He says in the *Prairie Farmer*: "My losses have been greater; my percentage of lambs less; my weight of clip less; the price obtained for my wool less, and I have been generally and particularly disappointed. Sheep hite so close than when a drouth comes it uses up a pasture much worse than when stocked with cattle. I have about come to the conclusion that one sheep will eat, of grass, as much as two steers." If his former conclusions are as reliable as this last, they will not be likely to damage sheep raising on the prairies very much.

Wiegela Nivea.—Under this name, Mr. Geo. Such, South Amboy, N. J., sends us a *Wiegela* with pure white flowers.—Very beautiful.

Making Vinegar.—P. T. S. Hard cider will turn to vinegar very soon, by exposing it to the atmosphere in a warm place. Allowing it to run slowly from one vessel into another, over a platform covered with oak shavings, will hasten the process. A few drops of red cabbage water will make the color a deeper red, if people desire it.

Massachusetts Agricultural College.—Prof. Chadborne has resigned the Presidency. Prof. Wm. S. Clark, of Amherst College, has been elected President by the Trustees. Prof. E. S. Snell, also of Amherst College, has been offered the Chair of Mathematics and Engineering, and Prof. H. H. Goodell, of Williston Seminary, East Hampton, Mass., has been appointed instructor in French, Gymnastics, and Military Science.

A Tree Swindle.—L. Newton, Washington, Iowa, sends a leaf of a tree which some nurserymen are selling for "Silver Maple." The leaf is that of the Silver Poplar, or *Abele*—one of the worst nuisances among trees. It suckers so badly that it is unfit for any place except a paved street. The Silver-leaved Maple is *Acer dasycarpum*, also called White Maple, and in some places at the West, Soft Maple. The Soft Maple of the East is *Acer rubrum*, also called Red and Swamp Maple.

Nutritive Value of Corn of Different Colors.—Wm. Bremner, of Iowa, asks, "What is the nutritive value of our white western corn compared with the yellow or mixed?" Color is no indication of nutritive value, except as it is a feature of a particular variety. The only reliable guide is *weight*, when the varieties compared are of about the same degree of dryness, or have been exposed to the same conditions of temperature, circulation of air, etc., for several weeks. The heaviest corn will be found to be the most nutritive, provided both can be equally well digested.

Much Land to be Possessed.—New York, the great dairy State of the Union, is said to produce less than a ton of hay to the acre on an average. The pastures are still less productive, for it is the best land that is kept in meadow. The Eastern States aver-

age still less. There are large tracts that do not yield a dollar's worth of grass to the acre. We know of a twelve hundred acre farm that rents for a thousand dollars, and we suppose the rent is some criterion of its value. It is a sad sight to travel through such farms—often situated within a half hour's ride of good markets, and behold the neglect and slovenly farming. What a good time there will be when these farms are redeemed, and made to yield their increase! He who has skill and capital, need not go West to find a profitable field for his investment. New England and New York can be more cheaply fed from their own soil, than from the prairies of the West and from the shores of the Pacific. California wheat for sale in Rochester! Ohio hutter and cheese in New England! What a comment upon our husbandry!

English Market Reports.—£. s. d. "E. E." of Philo, Ill., reads the reports of foreign markets, and asks the value of Pounds, Saillings, and Pence, Sterling. *Sterling* is the name applied to the currency of Great Britain, and means hard money. A *pound Sterling* (£) is worth, at par, \$4.84; a *shilling* (s) is one-twentieth of a pound, hence worth 24 cents 2 mills; a *penny* (d) is one-twelfth of a shilling, hence is worth a little more than 2 cents. All these values are in gold, with exchange at par. Now our gold values are very different from paper or currency values, and this difference must be included in the calculation of values of grain, etc. Besides, the state of trade varies—at one time making the merchants of this country in debt to England, at which time the pound sterling is worth here more than \$4.84; at another time the merchants of England are in debt to us, and then exchange is said to be in our favor, and the pound is worth less than its par value. A "quarter" is 8 bushels, and wheat is calculated at 60 pounds to the bushel; hence the quarter of wheat is 480 pounds.

Holcus Tartaricum.—This year, a new cereal has been advertised in England, under the name of *Holcus Tartaricum* and *Sorghum Tartaricum*. The London Field has tried seed from three sources, and thus records its opinion: "Here then we have one of the gigantic humbreds of modern times; but we ought to be thankful that the puffs were so high, and the seed so dear that little soil was wasted in the trials; at the same time it is most devoutly to be wished, for the good of all, that matters of this kind should not be so lavishly extolled without due trial, or very good evidence on the part of those by whom they are so authoritatively recommended." We quite agree with the Field, and give its caution for the benefit of our readers, as this "new cereal" will probably make its way here. From all we can learn, it deserves a place along side of *Bromus Schraderi*.

Value of Farms in Indiana.—In Marion County, in which the capital of the State is situated, farms will average \$75 to the acre. This county is about twenty miles square, and contains some of the best land in the world. Nothing can exceed the fertility of the White River bottoms. The clay lands are not so valuable for some purposes, and much better for others. Excellent farms, with comfortable buildings, can be bought in this State for \$50 an acre, which would be worth \$200 an acre in any part of Connecticut or Rhode Island. In Benton County, 24,000 acres of land were bought for about \$6 an acre, and in this and the adjacent counties, wild lands are still to be had for about that price. In Allen County, within a few miles of Fort Wayne, improved lands can be bought from \$15 to \$30 an acre. We were informed that farms with improvements upon them could be bought cheaper in this county than in any other part of the State. There are plenty of cheap farming lands in Indiana, and it is unquestionably one of the best States for thriving Eastern people to go to. The land is superb, and only needs skill and capital to make its owners independently rich.

Price of Land in Pennsylvania.—A subscriber inquires for the price of land in the Valley of the Susquehanna, Pa. In Buffalo Valley, which comes down upon the Susquehanna, at Louisburg and Milton, a district about ten miles broad by twenty long, the value of farms will average \$150 per acre. In the Paradise Valley, on the opposite side of the river, the price of land is about the same. These lands are probably as productive as any in the State. In the immediate vicinity of the large towns and villages, where there is a prospect of selling building lots, land is worth from \$500 to \$3000 an acre. Good land in all the Valley of the Susquehanna is worth from \$75 an acre upwards. The farms run large, and would probably average 150 to 200 acres to the farm. Back on the bills, remote from railroads and other privileges, land can be had much cheaper, say from \$15 to \$30 per acre, and is dearer than land that costs ten times more.

Salmon Culture in Australia is entirely successful. The eggs were carried 16,000 miles,

packed in ice, and successfully hatched three years ago. This year they have a fine run of salmon up the Derwent river, and a promise of abundance for home use and export. These eggs were a magnificent present to that island continent. Let us profit by this example.

Chess—the Crucial Test.—On page 244, (July No.) we say: "When we can be shown a plant that is part wheat and part chess, we shall be willing to discuss the subject." Mr. P. P. Severance, of Greenfield, Mass., sends us two specimens of plants of wheat and chess, growing with their roots so intertwined as to appear to be but one plant. On putting them under a stream of water, and washing all the dirt off, the roots slipped apart, and showed no sign of connection. If this is the best the transmutationists can do, we must still decline to "discuss the subject,"—of wheat turned to chess.

Barn Cellars.—In a recent trip through Connecticut and Massachusetts, we were struck with this almost universal appendage of new barns. They are generally built in the most substantial manner, and well supplied with muck. Farmers who economize as closely as New Englanders generally do, would hardly make this investment unless it paid. We noticed also, that the best farms invariably were those that had the barn cellars. These are the stomachs of the farms, indispensable in the North, and soon to be so on the new farms of the West.

Willow Trees About Wells.—A subscriber wishes to know if those will injure the water. The popular belief that they will is well founded. The roots will go very far and deep to find the water, and will impart vegetable matter to it which affects the taste. The leaves also will be likely to fall into the well and defile it. All trees should be kept away from it, and the mouth of the well should have ventilation. The old sweep with an oaken bucket was useful in keeping away trees.

Insects' Eggs.—Geo. Surface, Upshur, Ohio. The eggs are those of the tent caterpillar. We have more than once figured them. Remove all you can find. They do not hatch until spring, and are readily seen in winter.

The State Alms-house at Palmer, Mass., is a model institution of a model State, and well worth visiting for its lessons of economy in farming. A poor worn-out farm has gradually been brought up to a high state of productiveness, by utilizing every thing that too often runs to waste in public institutions. The privies, the styes, the barn-yard, the waste water from the house, are all made to pay tribute to the soil. It stands on a beautiful eminence overlooking the village, and the meadows and gardens looked greener than ever, as we recently passed them. The inmates are not exactly self-supporting, but the cost of their maintenance is very much diminished by their location upon this farm.

Salmon in the Connecticut.—Satisfactory laws, we are informed, have been passed by the Connecticut Legislature, just adjourned, for the protection of this fish, according to the programme laid down by the New England Fish Commissioners. The eggs placed in the upper waters of the stream were hatched, and the young fry are said to be now making their first visit to the sea, in large numbers. In three years more we hope to be eating this fish, from the Connecticut, whence it disappeared more than fifty years ago. Cheap salmon is a great desideratum in our markets, and with suitable legislation it can once more be realized.

A Cheese Factory in England.—A meeting was held in Cheshire, June 22d, to discuss a cheese factory, at which American example was quoted with favor. A committee was appointed to investigate the factory system and report. We are astonished at this. John is so confident that he can do everything better than his neighbors, that he seldom looks abroad for a new idea. He has been over thirty years trying to get so simple a thing as the connecting of a train of steam cars by a bell rope, through his head, and does not see it yet. If he sees a cheese factory before the millenium, we shall be bapily disappointed.

Elms and Evergreens.—G. W. W., Green Castle, Ind. There is no elm equal to the American, or White Elm. It bears removal better than any other tree, and we have seen trees twenty to thirty feet high successfully transplanted. Of course, the tops must be cut back, in proportion to the shortening of the roots. They grow with great rapidity, and we should prefer trees of smaller size, say ten to fifteen feet high. As to the best evergreen for a door yard, our taste inclines to Hemlock, though the Norway Spruce is more generally planted. Whatever one is chosen, always keep the upper branches from overhanging, and stifling the lower ones.

Notes on Farming in Indiana.—

We have heard much of the dairies of the Western Reserve of Ohio, of the blue grass pastures of Kentucky, of the boundless prairies of Illinois, and its seas of Indian corn, but whoever heard of anything remarkable in the agricultural line in the State of Indiana? That there were farms there, tilled by thinking people, our large list of subscribers testified; but beyond this we looked upon the State as a sort of *terra incognita*, that needed exploring. Approaching Indianapolis, the capital of the State, by rail, from Columbus, Ohio, our first impressions were of a new level country, half subdued and imperfectly tilled, yet everywhere giving evidence of the overflowing riches of its soil. Along the line of the road, one is rarely out of sight of broken forests, dead trees and stumps, luxuriant meadows burdened with grass, oats, and corn. The breadth of wheat sown is less than in former years, but is everywhere good, and the yield is considered satisfactory, though but about one half what better husbandry would give. The weather has been everything that the farmers could desire during the wheat harvest, clear and sunny, and there will probably be very little sprouted or unsound wheat in the market this year.

INDIANAPOLIS.—We rubbed our eyes as we stepped out of the depot amid a bustling population of 40,000, into wide streets, with great warehouses and imposing public buildings. This is the railroad center of the State, and here seven lines daily discharge their passengers and freight. The city has grown quite rapidly in population and wealth during the war, and the thousands that the necessities of the war brought hither seem still to linger. It is a large market town for agricultural produce, and grain is shipped in large quantities, in favorable seasons, to various points East and South. A railway connects it with Michigan City, upon the lake, and with Jeffersonville, upon the Ohio river, nearly opposite Louisville. We found old corn selling at 63 cents a bushel upon the cob, reckoning 68 pounds to the bushel; and new wheat at \$2 a bushel. A farmer's wagon, loaded with wheat, is said to be quite a novel sight in the streets, the last two years having given very poor crops of this grain. The farmers are thrashing the wheat as fast as possible, eager to realize good prices while they can. The expectation is general that wheat will be lower as soon as the harvest is gathered.

THE STATE AGRICULTURAL SOCIETY has its headquarters here in the State House, and is much ahead of the State authorities in its enterprise. It issued several interesting volumes of transactions previous to the war, receiving appropriations from the State to foot the bills. These were widely distributed through the State, and did much to quicken the zeal of the people in agricultural improvement. When the war broke out, this appropriation was withheld in a spasm of very short-sighted economy, and no volume has been published since that of 1859 and 1860. One has been authorized for the present year. The State Society owns thirty-six acres of land in the suburbs of the city, which has been fitted up as a fair ground. Buildings were put up, and about \$3000 were expended upon them last year. They have a like sum on hand, and are making preparations for a State Fair at Terre Haute, in September. There are ninety-two counties in the State, of which fifty-three have organized societies. Twenty-two were discontinued during the war.

FARM OF F. M. CHURCHMAN.—This gentleman is a banker in the city, and resorts to farming in the suburbs, for recreation and health. He has about 200 acres, threaded by a brook, which is a pleasant feature in any farm, and much more so here, where clear streams are not abundant. The home is a neat white cottage, about twenty feet above the water. The bank furnishes a living spring, which has been utilized for a milk-house, and to supply in part a fish pond in the valley below. This valley is shaded with magnificent trees, which have been left from the primitive forest. We found here under the Sugar Maples and Burr Oaks, well bred Devons from the herd of E. Faile, of Westchester Co., N. Y. Cotswold sheep from the flock of Mr. Loomis, of Hartford, Conn. Chester White pigs and Brahma fowls.

THIS IMPROVED STOCK flourishes at the West, and is not likely to lose any of its good points under the supervision of the present owner. The only danger is that the Devons may become too fat for breeding in the very abundant food which the Indiana lands furnish. The Shorthorns usually attain their best development in the adjoining State of Kentucky, and the beef families of this breed are probably the most profitable for Indiana farmers. The Cotswold and Chester Whites are at home here, and the soil and climate, with good breeding, will unquestionably perpetuate their best points. Improved stock of all kinds is very much needed in the State. The want is generally felt among intelligent farmers, and there is a disposition to invest in this line of improvement. Mr. Churchman has made a good beginning. We noticed with great interest the commencement of *tile draining* upon this farm—an improvement more needed in this State than almost

anything else. The drains were put down about three feet, and were working well. Though there is very little swamp land in this State, there are millions of acres of heavy clay loams, that can never be made to yield more than half a crop until they are drained. They have a compact soil, and cannot be worked in the spring on account of water. Fortunately the material for making tile is very widely distributed, and the coal and wood for burning them is abundant. One of the best enterprises that could be started in the suburbs of this city would be a manufactory of tile. The transforming power of good drainage is so wonderful, and the remuneration is so large, that a few examples would set the whole region in a blaze of excitement upon this subject. We expect to hear of forty bushels of winter wheat to the acre, and one hundred bushels of corn upon clay loams, when this improvement is generally introduced.

STEAM THRASHERS are a prominent feature in Western husbandry. The horse thrashers are still in use, but are as certainly doomed as the scythe or the hand rake. They are altogether too slow for this age. The steam thrasher is mounted upon wheels, and is drawn by horses from place to place, as it is wanted. It costs about \$1700, with all the apparatus necessary for running. The power may also be used for chaffing straw, hay, and corn stalks, for sawing wood, and other purposes. It takes fourteen hands to work it, where the wheat is brought in from the shocks, and it will clean, ready for market, 500 bushels of wheat in a day. The price of thrashing is eight cents a bushel. Wheat straw is sold in town for \$10 a ton for paper making and for bedding, and forms an important item in the farmer's profits. The great advantage of the steam thrasher is that it puts the wheat harvest so much into the power of the farmer. As a rule, wheat stands in the shock until it is thrashed, and the first good weather is availed of to clean the crop, and send it to market. As yet, there is no adequate provision made for storing wheat in first hands, and this is one great disadvantage that the producer must labor under until he secures better barns. He cannot hold on to his wheat for a rise, unless he keeps it in stack, and there it is exposed somewhat to the weather, and still more to the depredations of rats and mice. Tens of thousands of bushels of this precious grain are lost almost every year by sprouting and moulding.

THE WHITE RIVER BOTTOMS are a splendid corn region, and the sun shines upon no richer land. We saw a single field of three hundred acres, where we were informed corn had been planted from the first settlement of the country, and the yield was still from sixty to one hundred bushels per acre, in good years. The land is annually overflowed, and needs no other fertilizer than the deposit of the river. This is the general experience upon all the bottom lands of the White and Wabash rivers and their tributaries that are subject to overflow. When the great length of these rivers and the breadth of their bottoms is recalled, we have some conception of the vast extent of the corn lands of the State, which must be inexhaustible while water runs.

Notes on Farming in the Grain Districts of Pennsylvania and New Jersey.

—Traveling toward Easton, through Morris and Warren Counties, New Jersey, one of the first things that strikes the eastern farmer, is the greatly increased size of the fields. The one and two acre lots so common in his observation, have expanded to ten and twenty acres, and thirty and forty acres are not uncommon. Farming is manifestly pursued upon a much larger scale. There is a clean sweep for the sulky cultivators and harrows among the corn, and for the reapers and mowers among the grain and grass. In some cases the fields have always been upon this generous scale, in others, the stone walls and hedges have been removed, in order to enlarge them. We found one farmer who had just cleaned out the old fences, and made several smaller fields into one of 60 acres. Very little time will be lost in turning round at the ends of the rows, and little corn trampled in cultivation. Another noticeable feature of the farming here is the much larger proportion of plowed land. From a fourth to one-half of the land is kept in grain. On one farm we saw 80 acres in corn, 25 in wheat, and as much more in oats. On another 300-acre farm, we found 80 in wheat, 50 in corn, and 30 in oats. Grain fields of from 20 to 50 acres are common. Probably not less than a fourth part of all the cleared lands in the valley of the Susquehanna is in these three grains, the present season.

THE VALLEY OF THE LEHIGH, which we enter at Easton, is one of the richest in the State. The soil is fertile, and is well cultivated at the lower part, with the usual grain crop. Rye stands side by side with the winter wheat, and is nearly as extensively cultivated. The soil is full of limestone and iron ore, and the coal is near at hand. The leading business in the villages below Maunch Chunk is the smelting of iron ore, and the manufacturing of the metal. The foundries and rolling mills support a large population, and one is hardly ever out of sight of the smoke stacks of

these institutions. We were surprised to see the extent and thrift of these iron cities and villages. By giving variety to the industry of the region, they are a great advantage to its agriculture. Almost everything that can be raised upon the adjacent farms finds a ready market at good prices in these villages. At Maunch Chunk, the coal mines first begin to disgorge their contents, and a new industry absorbs the whole attention. The mines are several miles back from the river, and the coal is brought by rail to the top of the bluff at a very moderate grade, whence it is either discharged into a shoot that conducts it into canal boats, or sent down in cars by a wire rope attached to a windlass, the loaded cars drawing up the empty ones. All the Lehigh coal mines in this basin send their freights to market down this valley, either by rail or by canal. Above the coal district there is an extensive lumber region, and vast quantities of peeled hemlock logs are seen in the ponds, made by damming the river. There are vast tracts of forest above White Haven, with very few clearings, poor, rough land, that will probably pay better to grow timber for generations to come than for any other purpose. Two rival railroads have found their way through this wild region to the

WYOMING VALLEY, for the traffic of which both are struggling. Much has been said and sung of this charming valley, but, with all this in mind, we were not prepared for the vision of beauty that burst upon us as we emerged from the wilderness on the crest of the mountain, some twelve hundred feet above. One gets glimpses of it through the rifts in the forest all the way down until the depot at Wilkesbarre, on the banks of the Susquehanna, is reached. Coal of an excellent quality underlies the whole region for a distance of forty-four miles long, by about three in width, and by its superior value has spoiled one of the finest farming districts in the State. Unimproved coal lands are worth from \$300 to \$500 an acre for mining purposes, and have been bought up extensively by companies, who care very little for the surface of the soil. It is estimated that not one-fourth of the land is tilled by people who own it. It is very generally leased, and the tenant looks for present profit without much regard to the future of the soil. In some parts of the valley, where the land has been bought up on speculation, the farmhouses are abandoned and the fences are broken down. Mining also works to the disadvantage of the farmer in enhancing the price of labor. During the war, skillful miners were making from \$8 to \$10 a day, and even now they make \$3, working about nine hours. Those who work with them to break up the coal, and load it into the cars, make about \$1.75 per day, which is too high for farming. Of course, it is somewhat difficult to get labor, and agriculture has to give place to mining. But notwithstanding these drawbacks, there is some good husbandry in the valley. The bottom lands of the river are very productive, and though overflowed in the freshets almost every year, are frequently sown with winter grain. There is a County Agricultural Society organized in the valley, which has its exhibition grounds, and holds an annual fair at Wyoming.

Our Exhibitions of Poultry.

The only poultry shows that we have, so far as we are aware, in this country, are held in connection with, and as part of our State and County Agricultural Fairs, with the single exception of those of the Worcester Co. (Mass.) Poultry Club. At these fairs, fowls, geese, turkeys, ducks, and fancy poultry, pigeons, etc., are arranged in the utmost disregard of order, except so far as to group the coops and cages of each exhibitor by themselves. One would suppose that for his own convenience, and to show off his birds to the best advantage, an exhibitor would have his coops made nearly alike, and of one or two definite sizes, but we often find every imaginable form of box, coop, and cage, some neat and convenient, others dirty and inconvenient; though some exhibitors do better.

The judges are, no doubt, selected conscientiously by the managing officers, but as they frequently know little or nothing of the points of excellence in fancy poultry, they err in judgment, make poor awards, and help to establish false notions about the different breeds, to poor specimens of which they give value by awarding high and entirely unmerited premiums.

The American Poultry Society begins its career by announcing its intention to do what it

can to correct these things. It has decided that each entry shall consist of one pair only, and that each pair, except of turkeys and pea-fowls, shall be exhibited in coops 2 feet in width, 2 feet in depth, and 2½ feet in height, perpendicularly slatted on the front, and provided with boxes and cups for food and water. We presume that these coops might be divided so as to accommodate two pairs of bantams, or small ducks, but they are none too large to show off a fine cock and hen of any of the larger breeds, and barely large enough for geese.

The most tasteful and convenient exhibition cages we have ever seen, were of wickerwork, and the space allowed by the Society, viz.: 2 x 2 feet on the shelf, and 2½ feet high, would be abundant for such a basket-work coop. Any basket weaver could make one in a short time, and with little explanation. A good size and shape would be 18 inches in diameter at the base, the sides 20 inches high, flaring to exactly 2 feet in diameter, outside measure, the top coming to a point with a handle upon it, so that the whole height should be not more than 2½ feet. The willow rods forming the sides should stand up and down, 2 inches apart, and the top should

BASKET-WORK COOP.

be formed of the same rods bent and drawn together. Unless the rods are very stiff, they will need a narrow band woven around the middle to prevent their being spread apart. The bottom is movable, and may be made of a round piece of board, or of basket-work, which is much lighter, covered with a piece of floor oil-cloth, or canvas, for cleanliness. There need be no door, the birds and their food being put in from beneath. The bottom is pinned in securely when the coop is moved.

Would it not be well for Agricultural Societies to take some uniform stand in regard to the manner in which birds should be exhibited? If the size of coops adopted by the American Poultry Society is right, then let it be generally adopted and the rule strictly adhered to.

Thorough Draining—The Secret of Success in a Nutshell.

The present practice in regard to thorough draining has not been arrived at simply by the reasoning of engineers and physicists, but by a long course of practical experiments, guided by sound philosophy. If any man says that open drains are good enough, we can now show him in thousands of cases that covered ones are vastly better; if one claims that 2-foot drains are deep enough, we can refer him to farms where 2-foot drains gave place to 3-foot ones, with a great increase of good results, and where, keeping pace with the march of ideas, the use of 3-foot has given place to that of 4-foot

drains. Stones, wherever used, and no matter what the necessity for getting rid of them, give way to tiles—for the whole cost of digging, laying and filling 4-foot tile-drains on any ordinary land is not so great as the handling of the stone alone, as stone drains are usually made; besides this, their shallowness, liability to fill up, and the fine harbor they present for vermin, ensure their condemnation. Nevertheless, a badly laid tile drain is worse than a stone one. So true is this, that we can name an excellent Connecticut farmer of large means who had tiles replaced by stone drains, at a heavy expense, and who rejoices now in much better drained land than before, with fewer stoppages and trouble from imperfect drainage. The reason was that the tiles were poorly laid and much too near the surface, so becoming filled with roots at some places, and deranged by receiving surface water at others, they failed adequately to drain the land.

There are places where drains must be laid shallow, not more than 20 or 30 inches deep. For such spots, wherever the roots of grass might cause obstruction, we prefer to use *brush drains*, for they last a long time, are no more likely to fill up than stone ones, are cheap, and easily dug out and mended, if repairs are needed.

No one should undertake the drainage of farm lands without thoroughly understanding the principles on which good drains act, and are made. We have prepared a diagram to illustrate these principles. It is a section of the ground, crossing a drain, showing the drain tile (C) laid in collars at a depth of 4 feet, with a packing of clay (E) well rammed down above it, to prevent surface water finding its way downwards to the tile, and any water entering from above. It shows the level at which water (W) stands in the ground, and the drops of water (D) trickling down through the soil and blending with the water of the soil at the level of the drain. Were there no drain there, the water level would rapidly rise until it reached the surface, but as fast or almost as fast as it rises the drain carries it off. The upper part of the filling of the drain trench (B) is porous and permits the rain to enter, but it is stopped and the water turned off to either side by the clay-filling, or hard-rammed soil below. Water which rises into the tile can bring with it but little silt, but that which flows downward into it brings, of necessity almost, sand and much fine silt. How absurdly wrong, then, is the practice of filling-in the lower part of the trench

DRAINING DIAGRAM.

directly above the tiles or stones with loose materials such as swamp grass, sods, shavings, etc.

If the drain be properly constructed, it is almost an impossibility for the occurrence to take place which we have figured at *H*, namely, for a passage to be formed for surface water down to the tile. To obviate all chance for anything of this kind, before the loose filling of the upper

part of the trench becomes compacted and like the rest of the soil, no surface water should be allowed to stand or flow over the newly laid drains for a year at least, if it is possible to prevent it, but if impossible, then the trench for its entire depth should be filled with well rammed earth, and the filling raised some inches above the surface. Surface furrows on each side of the drain are effective, if they carry off the water.

We should really wrong our readers did we close an article on draining without alluding to that most excellent book by Col. G. E. Waring, Jr., which was issued the past summer from the press of Orange Judd & Co. We regard the fact that water should always enter the drain from below, and that it does so in all good drains, as the very foundation of successful drainage. In this nutshell is the secret of success. Col. Waring's book is full of just such "nuts."

Hexamer's Wide-Pronged Hoe.

Dr. Hexamer, (Reisig & Hexamer, Ivy Hill Nurseries, New Castle, N. Y.) has such a sure way of making his investigations and coming at his facts, that we accept his results with almost the same confidence we would have in our own. He makes use of expensive labor, and the month-

WIDE-PRONGED HOE.

ly pay-roll is so large as to lead him to employ his men to the very best advantage. The problem was, what tool to place in the hands of his laborers for hoeing out between rows of strawberries, or other small fruits, root crops, nursery stock, etc. The common hoe is a slow, hard, old-fogy tool, and, of course, its use out of the question. The potato hook, or pronged hoe, with round prongs, good, but not sufficiently rapid for the outlay of strength, yet vastly superior to the hoe for the same purposes, except after weeds have grown large, which ought rarely or never to occur. After having made numerous experiments with tools made expressly for him, he decided upon the implement of which we present an engraving. The six teeth or prongs are eight inches in length, the outer ones being ten inches apart, which is the width of the actual cut. The prongs are square, of the best steel, and inserted in pairs into a malleable iron head, in which they are firmly wedged. They are delicate, but very strong and elastic.

The tool is used by a man walking backwards. It stirs the soil thoroughly more than a foot wide, and from two to four inches deep, killing all small weeds, lifting out stones of small size, removing weeds, and all obstructions as effectually as a rake. On light soil, it is as easily worked as a hoe, and on heavy soils, if dry enough to work at all, very much easier. It is safe to say, that a man with one of these can do several times as much work as with a hoe. We think it will prove more useful as a potato digger, in light soils, on account of its breadth, than the implement made for the purpose.

The American Gray Wolf

This is the wolf of the exciting tales of our childhood, the destroyer of sheep and calves of the frontier settler; the wolf which followed benighted or snow-bewildered travelers in the old colony times. Moreover, it is the White Wolf of the north-western border, the Black Wolf and the Red Wolf of the South, the Dusky Wolf of the West, etc. The tendency of the species to vary is remarkable, and the common European and Asiatic wolves are by some naturalists considered, we believe, as belonging to the same species. The Dog closely resembles the Wolf in some of its varieties, and these species have been very closely studied by naturalists, with the result that they are undecided as to whether the dog is a tamed wolf or not. Some claim that the dog is a distinct species; others, that certain varieties of the dog are descended from wolves, while other varieties sprung from the jackals of Asia. Certain it is that wolves and dogs, and jackals and dogs, will breed together, and their progeny will be fertile with either of the parent species; and, we believe, after the first generation, among themselves. It is said that the northern Indians are in the habit of crossing their sledge dogs with wolves, to gain strength and fleetness.—The picture which accompanies this article is the portrait of a fine animal in the possession of a gentleman of Manchester, N. H., drawn upon the wood by Herrick. We know of no other engraving of the Gray Wolf equal to it. It exhibits all the prominent peculiarities of the animal so accurately, that a further description on our part seems unnecessary. Still we must call attention to the general gauntness so characteristic of wolves, the sharp, snappish muzzle, the convexity of the forehead, the wicked, oblique-set eye, the erect, pointed ears, the powerful muscular development of the forequarters, the protection furnished to the throat and neck, (perhaps the wolf's and dog's most vulnerable part,) by the length and abundance of the hair, and,

lastly, to the drooping of the tail, which character is the only one which will enable an unscientific observer to decide at sight between wolves and dogs; for the tails of all dogs have a greater or less tendency to curl up.

The Latin name of the European Wolf is *Canis lupus*, that of the American Wolf *Canis occidentalis*; the Dog is *Canis familiaris*, and the best

in packs, seldom attacking man or animals that will resist them when single; but when pressed by hunger, they are rendered savage and fearless, and at those times devour any animal they can master, singly, or by overpowering numbers. The weaker ones of their own pack are often victims of the ravenous appetite of the rest. Their traits of character are maliciousness,

cowardice, treacherousness. They are often so overcome by abject fear, that, when taken in situations which they consider hopeless, they will allow themselves to be handled freely, and killed like sheep. Hunters have been known to jump without harm into pits containing several wolves, seize them by the hind legs, and throw them out to have their throats cut by their companions,

Meadow Mice,

These little animals, of which we give an engraving, are familiar to most of our readers, and universally regarded as enemies of the farmer. We know of no plea to set up for their defense; they destroy very considerable quantities of grain and grass seed, frequently penetrating the granary, and taking up their abode in barns. They are often pressed for food in winter, and gnaw the bark of young trees, especially if they gain easy access to them beneath the snow. When numerous during the winter, they often cause a very serious damage to the grass crop by eating the roots. We believe they eat grubs and insects when pressed by hunger, but not from choice. The largest of the group represents a very beautiful and long haired variety of the meadow mouse, two-thirds the natural length. The fur is dark-brown above and ashy beneath, very long and soft—whence it is called the Beaver mouse—and the ears, which are very delicate

THE AMERICAN GRAY WOLF.—(*Canis occidentalis*.)

known of the oriental Jackals, is *Canis aureus*.

Wolves are no longer the terror of farmers over a large part of the older States. They still exist in the densely wooded mountain ranges, and in general wherever deer are found, as these form their principal food. They were formerly so numerous as to warrant the high bounties, amounting often to \$15 or \$20 each,

are familiar to most of our readers, and universally regarded as enemies of the farmer. We know of no plea to set up for their defense; they destroy very considerable quantities of grain and grass seed, frequently penetrating the granary, and taking up their abode in barns. They are often pressed for food in winter, and gnaw the bark of young trees, especially if they

GROUP OF MEADOW MICE.

offered by States, counties, and towns, for their heads. The usual size of the wolf is 3 $\frac{1}{4}$ to 4 $\frac{1}{2}$ feet from nose to tail, which is 17 to 20 inches long. The female has 4 to 9 whelps at a birth in the spring, and conceals them so thoroughly in holes and burrows that it is very difficult to get at them. Where wolves are abundant, they hunt

and membraneous, but not very small, are almost entirely concealed. These mice are 5 to 5 $\frac{1}{2}$ inches long, and the tail less than half that length. The one on the left, the common meadow mouse, (*Arvicola riparia*), is usually found in moist meadows throughout the northern States. It is tawny and very glossy above, and

of a light lead color below, 4 to 4½ inches long, the tail being about ⅓ the length of the body. The engraving also shows the light colored meadow mouse, described in the New York State Natural History, which is probably only another variety of the same species.

Walks and Talks on the Farm.—No. 45.

We finished thrashing wheat yesterday. There were 316 bushels from 17 acres of Amber Michigan, and 264 bushels from 12 acres of White Whittaker. The latter yielded the better, but the Amber was the larger and plumper berry, and I think it will make the whiter flour. The White Whittaker wheat, if mine is the genuine article, is not white at all. It is no whiter than good Amber. The chaff is white, and it has large heads, and looks very handsome when it is growing, but the berry is rather small, and the miller would pay no more for it than for the Amber. In fact, two or three of our best millers pronounced the latter the better wheat. I sold the whole crop for \$2.50 per bushel. Some of my neighbors who thrashed early got \$2.75 for Soule's wheat.

One reason why the white wheat yielded the better, is owing to the fact that three years ago the land received a dressing of five or six hundred pounds of bone-dust per acre, applied to corn. It did comparatively little good on the corn the first year. But the land was full of thistles, and we planted it to corn another year, followed by barley, and then with wheat seeded down. I think the bone-dust helped the corn the second year, and also the barley, and now the wheat has yielded about 4 bushels per acre more than that on land, in the same field, not dressed with bone-dust. And I expect the clover will show a still greater difference. Phosphatic manures, as a general rule, have a better effect on clover than on the cereals. Last year my wheat that was dressed with an ammoniated superphosphate gave a fair crop, due entirely, I think, to the manure. Still the effect was by no means as decided as it is this year on the following crop of clover. A heavier crop of clover is seldom grown, and the second growth is now very fine, promising a good yield of clover seed. The increase of the wheat may hardly pay for the manure, but taking clover and all, the application will be quite profitable.

Mr. Wade, of Port Hope, C. W., was here a few days since, and he thought my clover very fine, but says we do not cut the first crop early enough. One of his neighbors last year raised 70 bushels of clover seed from ten acres, and sold it for \$7.00 a bushel in gold. Five bushels per acre is the largest crop I ever heard of before.

"Will not these ammoniacal manures run out your land?" asked a gentleman from Virginia, who was here last week. Such, he said, was found to be the case in his section before the war. Farmers in Virginia who used Peruvian guano, got excellent crops for a few years, but it left the land poorer than it was before. On the other hand, a mixture of Peruvian guano and a phosphatic guano like Swan Island, gave equally good results, and kept up the fertility of the land. Peruvian guano, he thought, contains too much ammonia in proportion to the phosphates, and it was better to add more phosphates in the form of bone-dust or Swan Island guano. It is not improbable that such is the case, and if so, use the mixture. It is cheaper than Peruvian guano. But buy the guanos or bone-dust separately, and *do your own mixing*.

In manipulated guanos you are not always sure of getting just what you bargain for.

But in regard to guano impoverishing the land, there is a good deal of misconception, and more or less prejudice. You *can*, of course, impoverish your land by the use of guano. Take the field where I sowed 300 lbs. per acre of the ammoniated superphosphate on wheat, two years ago this fall. It gave probably an extra yield of eight or ten bushels of wheat per acre. Two crops of clover would probably give two tons of hay extra. Then plow it up and plant corn, and there would be still some increase from the extra amount of clover roots in the soil. After the corn, sow barley, followed by wheat in the fall. Now, then, suppose I sell all the wheat and the straw, and also all the clover hay from the two crops, together with the seed. Suppose, too, I sell the next crop of corn and the stalks, and serve the barley and straw in the same way, and also the next crop of wheat and straw, would it be surprising if the next crop of clover is hardly worth cutting? Would not such a course impoverish the land? And the larger the crops at first obtained from the 300 lbs. of ammoniated phosphates, the more plant food I should export from the farm, and the more rapidly would the land be impoverished. But, on the other hand, if I sell only the wheat and make the straw into manure; if I plow under the clover, or feed it out and return the manure; or if the corn and stalks are all consumed on the farm, and the barley straw is also fed out and made into manure, and this carefully preserved and returned to the land, will not the extra amount of wheat straw, and the extra crops of clover, and the extra crop of corn make an extra amount of manure, and will not the land, after the manure is returned, give me an extra crop of clover, and this in turn supply a large quantity of plant-food for the following crop of wheat, and if the system of growing clover is continued,—of making it and the straw, and corn, and stalks, with an occasional crop of peas, into manure,—will it not greatly increase the fertility of the soil? The guano will give me more clover, and this will make more manure, and when the yards are filled with rich manure in the spring, it will not be long before larger barns will be required to hold the crops in the fall. So that while an injudicious use of artificial manures may impoverish your land, their proper application, coupled with a judicious rotation of crops, and a right system of feeding animals, and saving and applying manures, will prove permanently advantageous. The principle is equally true in regard to the use of plaster. Whenever plaster increases the growth of clover, it affords the opportunity of making more manure, and of enriching the land. But sell the clover and all the grain and straw, and the use of plaster will tend to impoverish the farm.

John Johnston's remarkable success as a farmer might be attributed to his underdraining, and to the large quantity of plaster he used for many years on clover. But this would only be a partial statement of the truth. His success is owing, first, to the man himself—to his rare good judgment, combined with indomitable energy, persevering industry, close observation, and prompt, intelligent action. Second, to underdraining. Third, to the free use of plaster on clover. Fourth, to consuming all the clover, straw, and corn, on the farm. He has raised 3,000 bushels of corn in a year, but none has ever been exported from the farm except some which he gave to be sent to Ireland at the time

of the famine. *He never sold a bushel.* It has all been fed out with the clover, straw, stalks, etc., raised on the farm. In addition to this, he has bought large quantities of oil-cake to feed to sheep and cattle, and this has added greatly to the quality of the manure heap. Fifth. He bestowed great care on his summer-fallows. They were not allowed to grow up to weeds, but were repeatedly plowed and harrowed, and rolled and cultivated, until the stiffest clay was reduced almost to as fine a tilth as an English turnip field. Such thorough tillage is itself more than equivalent to a heavy dressing of our common strawy manure.

Underdraining enabled him to work his land thoroughly and in good season. This thorough tillage set free the latent plant-food in the soil. The clover took it up and organized it into good food for sheep. The sheep extracted the fat from the clover hay, and left the nitrogen and mineral matter in the manure heap. So of the corn, straw, and stalks. They all found their way back to the land, with oil-cake in addition. It is easy to understand why his land is vastly more productive than when it first came into his possession. Underdraining, good culture and good manure will make any land rich.

A few days since I received a letter from a subscriber of the *Agriculturist* in Kentucky, who wished to get for himself and half a dozen of his neighbors, some of our leading varieties of wheat. Their plan was for each to sow one variety, and if it proved good, to distribute the product among the others. The idea is a capital one. He says they have been raising the "New York Premium" wheat. When they first got the seed from this State, the crops were excellent, sometimes 40 bushels per acre, but they have grown it so long on the same land that it has degenerated, and the yield is now very light and the quality poor.

A miller and farmer in Maryland writes to the same effect. He has introduced a great many varieties of wheat, and for a few years they do well, and then run out. Is such really the case? Do not farmers, when they get a new kind of wheat from a distance, select their best land, give it extra care and culture, and consequently get good crops; while after a few years, when the seed is common, they bestow only ordinary culture, and get only ordinary crops?

John Johnston writes me, July 23d: "My Deihl wheat is pretty good. One field may yield about as well as last years; the other, not. Cause: *Not manured for many years.*" The variety has degenerated on the one field, but not on the other! Mr. J. adds: "If plenty of manure were applied, there would be less loss from midge. All that is needed to insure good crops is more and better manure. Deihl wheat is excellent for rich land, but not good for poor." This is not a popular doctrine, but it is true. Breeders of improved stock tell us that it costs no more to raise a good animal than a poor one. The nurserymen assert that it is as easy to raise a choice variety of fruit as a common, inferior kind; and some farmers appear to think if they send to a distance for a celebrated kind of grain, they are sure of good crops. Now, the truth is, if we want any thing that is really good, we must work for it. But when we get it, it will be so *very good* that we shall esteem the extra care and labor nothing. We ought not to expect to raise a barrel of large, well grown, highly colored Northern Spy apples as easily as we can a barrel of common seedlings, or even Baldwins. We can not raise a Sheldon as easily as a Choke pear. I question if the

Agriculturist strawberry will stand neglect as well as Wilson's Albany; certainly Triomphe de Gand will not. We have a tree that bears every year bushels of small insipid peaches. If we should wake up some morning and find them all turned into Royal Kensington's, I should conclude the millennium had come, and send word to the good people in the Dutch Settlement, who have had a sharp fight with the weeds, that they might bring their baskets to gather the fruit, but leave their hoes at home.

As things now are, it is easier to raise a crop of thistles than a crop of wheat, and we can raise poor wheat more easily than good. But what of it? It is far better to raise wheat than thistles, and better to raise good wheat than poor. It is a mistake to suppose that any real farmer or intelligent horticulturist will be discouraged by a knowledge of the fact that if he wants well bred animals, or the best grains, or the choicest fruits, he must bestow the requisite care and attention. For 25 years, Thomas Bates did not show an animal at any of the fairs. He was quietly at work. But when he did exhibit, at the Royal Agricultural Fair, at Oxford, in 1839, he swept all before him. One thousand guineas were offered for one of his bulls—and he was worth it. And to-day, all our high-priced short-horns can be traced back to this twenty-five years of care and labor of the Yorkshire farmer. It is always so. Bakewell, Ellman, Webb, other agricultural worthies, paid an honest price for their success. It was no lucky hit, but the result of persevering and intelligent effort.

The *Agriculturist* for July calls attention to the value of corn husks for making paper. If there is a demand for them at good prices, it will be an additional reason why we must have a machine for husking. I have great hopes of "French's American Corn-Picker and Husker." From what I saw of its operation, at the New York State Fair, last year, I shall be disappointed if it does not husk corn to perfection. All that is now needed is some method of operating it by horse-power in the field. This machine separates the husks from the stalk as well as from the corn, and they could easily be gathered up, pressed, and sent to market. Out West, I was once offered shelled corn for "ten cents a bushel in trade, or nine cents cash." I do not know how they husk it. Here it costs me at least twelve cents a bushel to husk and shell corn. I pay five cents for husking a bushel of ears, and by the time we get it to the barn and shelled, it will cost at least a cent more, and it takes nearly two bushels of good corn to make a bushel of shelled corn. We need a good machine for husking, and I hope this fall will not pass by without giving us one. If French's will do it, let it be introduced. The person who exhibited it at the fair seemed more anxious to sell "rights" than machines, which is not a hopeful sign; if it worked well, it would be for sale.

We may as well make up our minds, first as last, that we must fight insects and fungi. It will not do to fold our hands, and wait till they pass over. Study their habits, find out their weak spots, foster their natural enemies, and we shall soon conquer.

One reason why we have so much fungus is owing to the slovenly practice of throwing the branches of trees, etc., into fence corners, and allowing them to decay, instead of burning them. No wonder that so many varieties of pears and apples are specked and cracked by fungus growth. I have an orchard of Virgalieu pears, and I do not think there is a single specimen free from specks. And even the Louise Bonne

de Jersey begins to show symptoms of the disease. Flemish Beauty and Seekel have been liable to it for two or three years. Several varieties of apples crack as badly as the Virgalieu pears. We ought to be careful to remove all the fallen fruit, and to keep our gardens neat and clean, and especially should all the affected fruit be removed from the trees before winter. Because it is worthless, it is not unfrequently allowed to stay on the trees as long as it will hang. We could not devise a better plan for propagating the disease.

We do not use lime as freely as we should in our gardens and fruit orchards, or, for that matter, on our fields either. It would not only enrich the land, and give us larger crops, but they would be of better quality, and not so affected by disease. This is the experience of all who have used it. If we could burn our own lime, so that it would not cost more than ten cents a bushel, we could well afford to use it freely, at the rate of 150 to 200 bushels per acre. Large dressings at once, are better, I think, than small quantities more frequently applied. We want enough to change the character of the soil, liberate its potash, decompose the organic matter, and destroy fungus. We have plenty of limestone in this section, and there is more or less rough wood that could be used to burn it. What we want is a method of building a cheap kiln, or some plan of burning without kilns. As the lime is to be used for manure, it is not at all important that it should be free from charred sods or burnt clay. In fact, both these substances make excellent manure.

The probabilities are that we shall have a great deal of immature corn this fall. Where the corn and stalks are both fed out to cattle, sheep, and horses on the farm, why is it not just as well to cut the crop while rather green, cure it, and feed the stalks and corn together? We do not let our timothy get ripe, and then thrash out the seed, giving the horses the timothy straw in the rack, and the seed in the manger. Why should we do so in the case of oats or corn? If my corn matures, I shall husk it, and feed it out separately, because this is the orthodox way. But if it does not mature, I shall cut up the crop, and make it into fodder, and shall try and persuade myself that the method is in strict accordance with the teachings of science.

The Deacon says, in old times, when they sowed wheat after corn, and it was desirable to get the crop off as early as possible, he frequently put the stalks, while quite green, into the barn, and by putting a layer of six inches of dry straw between every two or three layers of corn stalks, they never mildewed, and the whole made excellent fodder.

The Use of Steam for Farm Work.

In this country we concede great advantage in the use of steam on large farms where stationary engines, or those used as such, may be placed and do a variety of work, such as cut wood, hay, and stalks, thrash, and grind, pump water, etc., and where the steam may also be used to cook feed for swine and other stock, but so far we have not used this power much in plowing and otherwise cultivating the land. In Great Britain, where steam tillage is more in vogue, it is, except on a few very large estates, accomplished by joint-stock companies, the shareholders consisting chiefly of farmers. The directors employ competent engineers and

hands who go about with their different machines to do the work required, thrashing or plowing as the case may be. Some of these steam cultivating companies are quite successful, and declare handsome annual dividends; others are less prosperous. Much is found to depend upon the character of the country, much upon the hands employed, and also upon the superintending engineers. First class hands are needed, but they can not be employed at all seasons, as there are many days when they can not work on account of the condition of the soil, and the men must have some other employment.

Where the engines are well managed, and the fields are of a character to allow of their being profitably employed, the companies find no lack of custom, for the work is done more thoroughly and better than it could be by horse-power, and it costs less. The company usually furnishes every thing except coal and water for the engine. This requires a boy with a horse and cart, furnished by the farmer.

Ordinary surface plowing and tillage even upon farms where steam is regularly employed, are done by horse-power, but the steam plows are used for subsoiling and deep working, and for accomplishing deep tillage by powerful cultivators adapted to the purpose, which, by once or twice working a field over, will accomplish more towards the reduction of a stiff fallow than four or five times plowing and harrowing. Some of the managers have employed their engines at mole-draining with marked good results, the drainage being at the depth of two feet, and the drains four feet apart. The opinion of the Secretary of one of the most successful companies is that before declaring any dividends, 10 per cent. of the whole capital should be reserved as a sinking fund, besides 10 per cent. of all earnings thereafter, and 5 per cent. for interest on the investment. The engines used are Howard's, and Fowler's, and between these public opinion seems divided.

We have no doubt that there are many districts in this country where a similar system would prove most advantageous, and are waiting to learn particularly in regard to some experiments now being conducted on the prairies, before giving our readers pointed advice in regard to either English or American steam plows.

Drilling Wheat.

We found the practice of drilling wheat almost universal in the grain districts of Pennsylvania and New Jersey, and the only exceptions are among the small farmers who do not feel that they can afford a drill. At the West, the practice of drilling is coming rapidly into favor. Those who have their farms sufficiently cleared of stumps, and can own a drill, generally use the instrument. There are many patented drills, which cost from \$90 upwards. Some, drawn by two horses, sow eight inches apart, and make eight drills at a time. We found at Terre Haute, Ind., a sulky cultivator and drill combined, costing \$55. In that neighborhood the sale of drills is increasing very fast. The advantages of the drill are that it saves seed, which in the case of wheat is a very important item; that it gives the growing grain more air and sunlight, and guards against winter killing. It plants the seed at a very uniform depth in the bottom of a narrow trench, the sides of which crumble under the action of the frost, and cover the roots of the plant, if they are thrown out. The conviction is universally in favor of the practice, and a good drill will prove a good investment.

How Lime Is Burned.

The simplest method of preparing lime for agricultural uses is by burning it in stacks, very much in the same way as charcoal is prepared. (Fig. 1.) The spot selected for the burning is the quarry, which should be a soft variety of stone cleaving naturally into small fragments or being easily broken. The heap is usually in the form of a parallelogram, about a rod wide,

Fig. 1.—STACK OF LIME BURNING.

and of any desirable length. The first thing is a ground-work of wood about eighteen inches in thickness, of the size of the proposed stack. The wood may be old stumps or any coarse material, and the dryer it is the better. The wood is surrounded with a layer of earth and sods, leaving holes about fifteen inches square, at intervals of five or six feet, for firing the wood, and for regulating the combustion. These ventilators should run back into the mass of wood several feet, and be filled with dry kindling wood at the time of firing the heap. Upon this foundation of wood, a layer of the broken stone is placed, about six inches thick, then a layer, two inches thick, of fine anthracite coal, called culm in the coal districts. This is what is screened out in preparing the merchantable coal for market. It can generally be had for the cost of earthing or freight at the shafts, where it often accumulates in large quantities. It adds very much to the heat of the fires, and reduces the expense of burning. The heap is then carried up six or eight feet high with alternate layers of culm and limestone, the stone layers increasing a little in thickness toward the top. The whole mass is covered with a layer of dirt at the sides, and at the top as soon as the heap is well ignited. A heap containing several thousand bushels will burn down in about six days. It is calculated that one ton of the coal will burn about 150 bushels of lime. Any one who has skill enough to burn a coal pit, can prepare lime by this method. It is principally of use where the limestone is in small fragments or easily broken. Of course, good coal and wood can be substituted for the refuse anthracite, if that is not to be had. Under favorable circumstances for obtaining fuel, lime is burnt in this way for one or two cents a bushel.

The harder varieties of limestone require a kiln for burning them. This is usually placed

Fig. 2.—LIME-KILN.

upon a side hill for convenience in delivering the stone and fuel for charging. (Fig. 2.) A convenient size for a farmer's use would be about

twelve feet across at the top, sixteen at the bottom, and eighteen feet high. The outer walls should be laid in masonry, and the walls of the inner chamber that holds the charge, (Fig. 3.) should be lined with fire brick, or with some refractory or infusible stone. The chamber is nearly in the shape of an egg, the small end downward, about three feet across at the bottom, seven at the top, and sixteen feet deep. There is a flue at the bottom,

two feet or more square, and extending completely under the chamber, for the purpose of giving draft for the fire, and it also serves for discharging the lime when it is sufficiently burned. The small holes above the flue, in figures 2 and 3, are for the purpose of thrusting in an iron rod, when needed to hold up the mass of stone and fuel within. In charging such a kiln as this, about a cord of dry wood would be placed upon the bottom, and on top of this three or four bushels of refuse anthracite, then a layer of the broken stone about one foot in thickness. Three inches of coal would be placed upon this, and so on until the chamber was filled, the layers of stone increasing in thickness toward the top. The burnt lime would be drawn

Fig. 4.—KILN FOR OYSTER SHELLS.

out at the bottom twice a day, about thirty-five bushels at each drawing, and fresh layers of coal and lime added on top. Such a kiln can be kept going for months until any desired quantity of lime is burned. It is calculated that by this method a ton of coal will burn a hundred bushels of lime. The culm is carried on the railroads considerable distances, and delivered at the depot for just the cost of freight. At two dollars a ton at the kiln, it is probably cheaper than wood cut upon the premises. The cost of the lime to the producer would not be, under favorable circumstances, more than four or five cents a bushel. This very cheap lime is one of the secrets of its almost universal use in Pennsylvania and western New Jersey. Of course, where fuel costs more, lime will be dearer; but we think wherever lime rock and wood are plenty, lime can be economically made and applied to the soil. The experiment certainly ought to be tried over a much wider region. Figure 4 shows the process of preparing oyster shell lime in our cities and villages. The refuse of coal yards, now so often used for road

making or grading, might be applied to burning oyster shells with great economy. This lime is usually considered better for agricultural purposes than that prepared from stone.

Willow Stakes for Fences on Bottom Land.

BY HOOSIER.

Spring freshets and floods prove very destructive to farmers living along water courses, by washing away fences. Stakes without roots will decay, and wash out, letting the rails take a free ride on the swift and turbid waters. Almost every farmer knows what a disagreeable task it is to reset fences, and it is particularly so after freshets, when the rails are all coated over with mud and slime. To make rail fences compar-

Fig. 1.—WILLOW FENCE POSTS.

atively permanent, you must have self-supporting stakes, that is, stakes that will firmly support themselves, and also the weight of the fence and waters. To make a stake self-supporting, it must have roots to enable it to retain a firm hold of the earth. The willow, white, or yellow, is for this purpose about as near being "the right thing in the right place," as any tree we can find. It grows without trouble, and is a natural denizen of wet, marshy grounds; therefore it is well adapted for stakes through bottom lands. The stakes may be cut from three to ten feet in length, and from three inches to a foot in diameter. They may be set in holes made with a post auger, about two feet deep, firmly ramming the earth around them; or they may be pointed, and driven into the ground. In one season they will be well rooted, thrifty trees, well able to resist, and hold the fence against, the impetuosity of the rushing water.

The willow grows easily from cuttings, and when properly pruned, makes a beautiful tree. From its rapid growth it is rendered valuable as a shade tree for pasture lands. It grows almost as well on the hill top as in the valley, unless the former be very dry or rocky.

Perhaps a willow hedge through bottom lands would be better than staking rail fences. The only trouble would be the closeness of the hedge, making too much "back-water," but that might be obviated. As to the size of the cuttings it may be said that they will grow from a small twig to a limo as large as a man's body. Keep stock from browsing them for the first year or two, and after that there will be no trouble.

[The cuts represent two light fences made altogether of willow. In fig. 1, the posts are two

Fig. 2.—WILLOW FENCE WITH RIDGE.

stakes driven perpendicularly, and bound with withes which form the support of the rails. It is best to nail besides. Fig. 2 shows a fence made by turning four furrows together on the

line of the fence, then driving stakes crossing so as to support rails over these furrows, the lower rails "breaking joints," as the carpenters say, with the upper ones. Such a fence is strong, and one not likely to be broken through by common cattle, if the rails are stout.—Eds.]

Cost of Raising Corn by the Old and New Methods.

The sight of a man on a Sulky Cultivator, sweeping through a cornfield astride the rows, and leaving scarcely a live weed behind him, has led us to speculate a little upon the cost of raising corn by the old and new methods. We will take a piece of 80 acres, 160 rods long and 80 rods wide, and calculate four rows to the rod running one way. If the breaking up and harrowing cost two dollars per acre, we have \$160, as the cost of preparing the ground for the crop. There will be 320 rows in the plot, and with a drill drawn by one horse, the corn may be dropped 1 foot apart, and covered in four days, the horse walking 20 miles a day. At \$2.50 a day, this would be \$10. It will take a man and pair of horses four days to cultivate once, which at \$3.50 per day, will cost \$14, and for cultivating five times, \$70, making the whole cost \$240. The 80 acres with this attention, on good land, would produce 40 bushels to the acre or more, say 3,200 bushels. The corn fodder, we think, would be a fair offset against the expense of harvesting and storing, as it is now generally admitted that, well cured and eared for, it is worth two-thirds as much as the best hay. This would make the cost of the corn a trifle less than eight cents a bushel.

Cultivating the same piece by the old method, the cost of preparing the ground would be the same, \$160; marking out the ground both ways, with plow, \$20; planting at \$1 an acre, \$80; cultivating or plowing between rows, both ways, six times, \$34; hand-hoeing three times, at \$1.50 an acre each time hoeing, \$364; making the expense about \$703, or 22 cents—nearly three times as much as by the new method—the proportions, if not the figures, being nearly accurate.

There are variations of these methods, increasing or diminishing the cost. Some do not use any drill or planter, but make rows both ways and plant by hand, covering with the hoe, and do all the cultivation by horse-power. The hand planting increases the cost. The use of fertilizers increases the expense, but adds to the yield enough to make up the difference. If the land is poor and the yield is less, of course the corn costs more. On some farms the cost of raising corn is probably a dollar a bushel. On the prairies, under favorable conditions, it does not probably exceed ten cents per bushel. There is, on an average, we think, a difference of two hundred per cent. in favor of the new methods. Farmers at the east, with their eyes open, should invest early in roek and stump pullers, and beat their hoes into sulky cultivators.

How the Paper Pays.

A good many farmers are still shy of agricultural papers. They say it don't pay to take them. They never made an experiment but they lost money by it. The same men will talk about crops by the hour with their neighbors, comparing their own practice with what they see and hear of in others. The agricultural paper does for its readers, on a much larger scale, simply what these men do for themselves, at much greater expense. It gathers up from a

thousand sources the details of farm experience all over the country, and gives them in a condensed form. These results, surely, are no worse for being printed. They are generally stated with as much accuracy as the farmer would give them in his own language. To most cultivators these details of experience are instructive, and are most prized by those who know the most. They furnish important hints to all. They serve to quicken thought, and to make the practice of farmers more profitable. A single suggestion acted upon often makes a difference of dollars in the productiveness of every acre under the plow. Here it guards against loss, there it makes large gains. It leads the farmer to study his business, and puts him in the way of learning much more from his own observation and experience. He gets out of the ruts, and thinks as he works. He uses his brains and grows as a man, and as a consequence, therefore, makes everything else grow that he touches.

Corn Crib.

Whatever temporary expedients the grower of Indian corn may resort to for storing his crop, he at last comes to a crib as a prime necessity. The rail pen is a very insecure inclosure, much exposed to damage from the storms, and an invitation for any thief to plunder. Storing in the garret is a very laborious business, and unless spread very thin, it is exceedingly liable to

Fig. 1.—CONNECTICUT CORN CRIB.

injure by mould. Spread upon the barn floor, it is always in the way, and free plunder to all the rats and mice upon the premises. This grain is more liable to injury from imperfect curing than any other that we raise. Wheat, oats, rye, barley, and buckwheat are easily cured in the field, so that a few days or weeks after cutting they can be thrashed there, and immediately stored in bins or sent to market. But Indian corn has a much larger kernel, and grows upon a thick stout cob from which it takes months to expel the moisture after it is fully ripe. Each section has its peculiar contrivances for storing this grain on the cob. In the South it is quite common to store husks and all in the barn or some other outbuilding. In the North they have buildings put up especially for storing the husked ears.

The Connecticut corn crib, (Fig. 1.) is the common type at the East, and has many good qualities. It sets upon posts covered with inverted tin pans, (Fig. 2,) to make it inaccessible to rats and mice. These posts are a foot or more in diameter, and two or three feet from the surface of the ground to the bottom of the building. Sometimes flat stones, two or three

Fig. 2.

Fig. 3.

Fig. 4.

feet broad, are substituted for the tin pans, but the latter are preferred. The sides of the build-

Fig. 5.—TWO CRIBS ROOFED OVER.

ing are made of slats nailed to sills and plates at bottom and top, and to one or more girders between. The bin upon the inside is made by a board partition, three or four feet from the siding. The boards are movable, and are put up as the crib is filled. The remaining space between the bins is used for shelling corn or as a receptacle for bags and barrels, and the back part is sometimes used for a tool-house, or fitted with bins for storing shelled corn or other grain.

Fig. 3 represents the end view of the model Pennsylvania corn crib, and Fig. 6 the side view showing the mode of construction. Fig. 4 shows the same thing with a more economical roof. Fig. 5 shows two of these cribs with a roof thrown over them to form a convenient shed or shelter for carts, wagons, and farming tools. Sometimes the passage is boarded up at one end, and furnished with doors at the other. These cribs are entered

Fig. 6.—SIDE OF CRIB.

at one end by a narrow door, and the whole space is occupied by the corn. They are from three to five feet in width, and give very perfect ventilation to the ears. They have usually a stone foundation with a sill and board floor above. They are not usually rat proof. They are made of any desirable size, and cribs holding from five hundred to a thousand bushels are common. In case the farm enlarges, and more room is wanted, the roof of Fig. 3 is extended downward on one or both sides; or other cribs are added, and more room is made for carts.

The American Buffalo.

The fine picture on our first page introduces this magnificent and valuable animal to the notice of the reader, but the arrangement of our pages forbid our writing but very briefly in connection. No one can look into the history of the Buffalo on this Continent, its rapid extirpation east of the Mississippi, and wherever civilization really sets her foot, without a feeling of pain. With the Indians, these splendid herds are rapidly approaching extinction. The present range of the Buffalo is the Great Plains between the northern part of Texas and the Red River of the North, and between the Missouri River and the Rocky Mountains. Here they exist in immense numbers, so great that parties crossing the plains have sometimes been a week and more in passing through a herd. Mr. Hayes, the artist, writes: "The Buffalo is a timid animal, and generally will run from a man; but when parties are in the neighborhood of one of these herds, the great danger is from a stampede, in

which case it requires the utmost care and watchfulness to prevent the mass of frightened animals from running over the camp, or making the cattle break from the corral, and join the terror stricken herd, leaving the traveler to pursue the remainder of his journey on foot.

The cows bring forth in the spring, producing one and sometimes two calves, at which time the herds break into small bands, of from half a dozen to fifty; and remain so until the autumn, when they come together again.

Many attempts have been made to cross the Buffalo with the domestic cattle. The Buffalo bull has been crossed with the domestic cow, and the heifer calf from this union has bred with both the Buffalo and domestic bull; no attempt has succeeded in crossing the domestic bull with the Buffalo cow. The Buffalo has been broken to the yoke, but is said to be unreliable and dangerous.

The hump is caused by the prolongation of the processes of the spine, commencing at the first dorsal vertebra. The second, which is longest, sometimes measures twenty-two inches in length. Across the top of these processes runs the strong ligament which serves to raise the enormous head. This hump gives a formidable appearance to the animal, and when coming directly towards you, with the head down, presents a similar outline to the freshwater sunfish. The flesh of the Buffalo bears about the same relation to beef that venison does to mutton.

The Buffalo is the main dependence of the Indians, and it is a low estimate that half a million are destroyed yearly. About fifty-five thousand robes are annually brought to market, the skin of the cow only being saved for that purpose, that of the bull being too thick to dress. This operation is performed by the squaws."

The destruction of the Buffalo, as now carried on, is sheer wantonness in the exercise of the ability to kill. Often only the tongues are taken; often not even these, but the animals counted as they roll in mortal agony, that their destruction may be boasted of by the hunters. This certainly calls for action on the part of the Government to prevent it, and preserve some representatives of these great herds for future generations to make use of, if we cannot.

The Crops—Editorial Correspondence.

One of our editorial corps is up in one of the New England States—we won't say which one—fishing for his health. He sends us the following: "When I went off, it was with the injunction not to put pen to paper while I was gone, so I will write in pencil. While I have caught fish, the weight of which "averaged well," (i. e. the boy with me caught a 6 $\frac{1}{4}$ pound pickerel, while mine was only $\frac{3}{4}$ of a pound, making the average 3 $\frac{1}{2}$ pounds,) I could not help between spells having an eye to the crops, and I give the result of my observation.

"MULLEN promises fair, and though rather late, there is a good stand, and no fear of scarcity of seed for next year.

"WILD PARSNIPS.—I am surprised at the abundance of this crop. In some fields it grows with such luxuriance that the fence cannot restrain it, and it has run over and fills the roadside. There will be no lack of Wild Parsnips at this point, and I probably the breadth of land devoted to it will increase each year.

"VIPER'S BUGLOSS.—Some fine patches of this are to be seen. It is a rather local crop, but I do not see why it should be. A small patch of it in a meadow or pasture will soon run every-

thing else out, and in a few years the field will be covered with its beautiful blue flowers, and the plant will become so well established that there need not be the least fear of losing the stock. Botanists call it *Echium vulgare*.

"CANADA THISTLE.—This seems to be the staple crop of the farms hereabouts, and, on the whole, promises well. In some fields I noticed that the crop is interfered with by a few oats, but notwithstanding this, I think there will be an average yield. The farmers in these parts economize every available foot of land, and devote the roadsides to the Canada Thistle. This, I believe, is from purely benevolent motives, for while their fields supply seed for home use, the plants by the roadside are sure to give the neighbors all the seed they want.

"These seem to be the principal growths of this neighborhood, though some of minor importance are to be found. Elecampane is grown to some extent, as are Ox-eye or White Daisy, Tansy, etc., but they are fast being superseded by the Canada Thistle. Wild Carrot, so abundant in York State, seems to receive but little attention here, but it will doubtless come in. Corn, oats, and the like are grown to some extent, but the land is mainly devoted to the crops I have mentioned above, of which I see not the least reason to fear a reduced yield."

A Western Grazing Farm.

The immense consumption of beef cattle in the great seaboard cities, has built up a great business extending clear across the Mississippi Valley into Texas. There are at least four distinct branches of this business: the raising of the cattle in districts where there are no inclosures, and where ear-marks are the only badge of ownership; the purchase and removal of these cattle to the more thickly-settled regions where there are inclosed pastures, and beef is higher; the fattening of these animals; and their forwarding to the eastern markets.

There are many farms in the West, some of them of vast extent, whose chief product is fat beeves. The whole farm is managed with reference to this result. If grain and grass are raised it is to feed to cattle. If hogs are kept it is to consume what the cattle do not perfectly digest, and to gather up the waste. If wheat is raised, it is for the purpose of subduing the soil, and getting it into better condition to produce grass. Messrs. Fowler and Earl, of Lafayette, Ind., have a farm of 24,000 acres in Benton Co., of that State, which is worked exclusively to prepare cattle for market. The enterprise was begun some three years ago, and, as will be seen, has involved a large expenditure of capital. The land alone, at six dollars an acre, must have cost nearly \$150,000. The tract lies upon Mud and Sugar creeks, and is about eight miles long, by five broad, and is well watered by these streams. The first step toward improvement was the inclosure and subdivision of 13,000 acres of the prairie with a board fence. This was made with cedar posts, seven and a half feet long, three feet in the ground, and placed at a distance of six feet apart. Upon these boards were nailed, making a fence four and a half feet high. The 13,000 acres were divided into eleven fields, making in all about forty-three miles of board fence, at a cost of \$850 a mile, or \$36,550. The remaining 11,000 acres have just been furnished with seventy-seven miles of Osage Orange hedge, which will be in condition to turn cattle, in three years from planting. The farm and the improvements are under the effi-

cient management of A. D. Raub, Esq., who resides upon the place.

It is found that the cultivated grasses are more nutritious than the wild, and the aim is to bring about a thousand acres a year into meadow. This requires at least two years of cropping. The prairie is broken in May and June with five yoke of cattle and a plow which turns a furrow from eighteen to twenty-two inches wide, and about three inches deep. This is planted with corn, which receives no cultivation, and yields about forty bushels to the acre. The corn is followed by wheat, either of the fall or spring variety, and with the wheat is sown a mixture of four parts of herds-grass and one of red clover, at the rate of one bushel to five acres. This is mowed the first season after it takes possession, and after that it is turned into pasture. The tendency of the pasturing, it is thought is to run out the herdsgrass and red clover, and to bring in the blue grass and white clover, which need no seeding. It is expected that these pastures once established will be permanent, and fully equal in value to the celebrated blue grass pastures of Kentucky. It seems to flourish quite as well here as in Kentucky, and it only needs good husbandry to make their pastures quite as famous.

It is expected, when the whole tract is brought into grass, that it will carry 8000 cattle a year, and its present productiveness justifies this estimate. The cattle of three or four years of age are bought of drovers and small farmers, from January to April, wherever they can be bought to the best advantage. The corn is drawn from the field where it was raised, and where it has stood in shocks through the winter, and is fed out to the cattle upon the open prairie. They eat the corn quite clean, and the leaves from the stalks. They are also fed with hay of which about nine hundred tons were cured last year. The cattle come to grass in high condition, and by June or July the best of them are ripe for the butcher, and they are sold off in lots to suit purchasers, as they fatten through the summer and fall. A lot of 176 bullocks, averaging a little over 1400 pounds each, was sold the last of July at seven and a half cents a pound. The custom is to sell by live weight, twelve hours after the cattle have been last fed and watered. This sale amounted to over \$18,000. There were 1250 acres in corn last year, and the yield was about forty bushels to the acre; 500 acres were sown in winter wheat, much of which was winter killed; 550 acres were sown with spring wheat of the Italian and Tea varieties which were a decided success. Thus far much more money has been expended than received in this enterprise, but there can be no doubt that it will prove a good investment. Other items of interest upon this farm are noticed elsewhere.

Forwarding Beeves to the Eastern Markets.

The great demand for beef in our seaboard cities is felt in the Mississippi Valley and beyond, and millions of capital are invested in supplying it. Chicago alone has about two millions invested in fixtures for carrying on this business, and sends east about a thousand cattle a day. But these are not all fat cattle, nor do they immediately reach their destination. Many tarry for a year or more, and change hands several times before they reach the consumer. The large towns farther east become centers of a cattle trade, where they are collected from the pas-

tures in which they have been fattened, and from whence they are forwarded to market. We came upon traces of this trade at Lafayette, Indiana, and made some inquiries of Col. W. J. Templeton, who is engaged in it, as to the mode of sending fat cattle to market. On an average he forwards about three hundred head every week during the year. The cattle are bought, generally of the large farmers, or at large markets, and are forwarded in open flat cars by rail. They are well fed and watered before starting, and the first stop on the journey is at Toledo, where they are taken out of the cars for feeding, and rest for twenty-four hours. They have a similar stop at Buffalo, and another at Albany, whence they come through to New York, and are discharged from the cars into the cattle pens to be sold to the butchers. It takes about six days to transport a lot of cattle from Lafayette to New York, with the necessary rest. This is very important, as it brings the cattle to the butcher without much loss of weight and in good condition. The cost of transportation, by special contract with the railroad companies, is about eleven dollars a head. Without this arrangement, the cost would be sixteen dollars or more. If the bullocks averaged eleven hundred pounds each of beef, it would cost only a cent a pound to get them to market. This is about the real difference between beef in Indiana and in this city, and all that is paid over that goes to the shipper, the butcher, and the retailer, each of whom makes a respectable profit. Is it necessary for the consumer to pay from twenty to thirty-five cents a pound for beef, to keep these gentlemen thriving and good-natured?

Raising Corn on the Prairie Sod.

Corn is usually the first crop put into the virgin soil, whether upon the prairie or in the fresh clearings of the forest at the West and South. It prepares the way for cotton, and for wheat and grass as well. There is some variety in the methods of handling the crop, but in most cases it is a very simple process. The practice of breaking the sod in May and June, and turning it over in a very thin, broad slice, about three inches thick, is almost universal. The ranker the grass at the time of breaking, the better for the rotting process. Very strong plows are used to break this sod, and it requires about five yoke of oxen, or their equivalent in horses or mules, to do it well. The shallow plowing is found in experience to do better than the deeper upon the virgin sod. The sod rots better, and the corn grows with luxuriance. The planting immediately follows the breaking. This is done with a variety of appliances, but upon the large farms always with machinery. At the farm of Messrs. Fowler and Earl, in Benton Co., Ind., it is done with a large, heavy drill, something like Brown's Corn Planter. It plants two rows at a time, three feet eight inches apart, and eighteen inches apart in the row, three kernels of corn in the hill. The drill is made about six inches deep, with sharp steel cutters, which sever the sod and drop the corn, which is covered by a roller. It takes four horses abreast to draw the machine and two men to manage it, and it will plant about twenty acres a day. This machine works very well, and is considered an improvement upon anything yet tried. It cuts the sod so clean that it is not much disturbed. The deep planting of the corn is considered a safeguard against drought. The vegetable mold is so loose above it that it is not smothered as it would be in older and more compact loams.

After the planting, the ground is gone over with cutter harrows, and rolled with a heavy roller. There are no weeds upon the sod, and there is no cultivation. The yield is about forty bushels to the acre. We think if the rows were four feet apart, and the stalks two in a hill, there would be more corn. Cultivation with a light harrow or cultivator, just to disturb the surface of the inverted sod, would also probably increase the yield. There are machines that plant two rows at a time, and with such regularity in the hills as to make rows running both ways. This is a great advantage in older soils, where there are weeds to be subdued by cultivation. Cultivation on old ground is performed with a great variety of implements, but almost always with horse-power. There are shovel-plows and double shovel-plows and bar-plows, cultivators, and harrows, and last, but not least, the sulky cultivator, which goes astride the row with two horses, and finishes the cultivation at once. With this implement cultivation becomes a genteel business, and a lady, handy with the reins, might clean out her dozen acres in a day, with no more fatigue than in riding to market. Some M. D., who is not a quack, we suspect will soon be recommending this as a substitute for the water-cure in nervous diseases. We know it would be good for the corn, and it might help a certain class of invalids just as much.

When the corn is well glazed, it is cut near the roots, and shocked in bunches made up of sixteen hills each. Here it remains until it is wanted for fodder, when it is drawn out upon the sod, and fed to cattle, if grazing is the style of the farm. If pork is the chief product, the swine are often turned into a field of standing corn, and left to do their own harvesting. Of course, there is some waste in this process, but where corn costs less than 20 cents a bushel, the waste does not keep people awake at nights.

Specialties in Farming—Hops.

The age of Homespun is past, and the tendency of society is now very strongly in the direction of the division of labor. Men confine themselves more and more to the doing of one thing as a means of livelihood. This is more manifest in other callings than in that of husbandry, but it is beginning to be felt even in this. Fifty years ago, the farmer mainly clothed as well as fed his family, furnished lights and fuel, and did the most of his own tinkering and cobbling. One by one mechanics and manufacturers have come to his aid, until he has little else to do but till the soil. Long ago, the spinning wheel, cards and loom disappeared from the kitchen, and are now only looked for in the lumber of the garret. Tin candle moulds drove out candle rods and dips, and whale oil and petroleum banished tallow candles. Anthracite has taken the place of wood at many a farmer's fireside, and the forest is only valued for timber. He no more sleds wood in winter, and his wife goes wool gathering among magazines and quarterlies rather than among Saxony and South Down fleeces. Instead of the general farming which was once almost universal in the North and East, we have now many specialties in husbandry, which are becoming more clearly defined. This, no doubt, has its advantage in pecuniary results, but we are not so clear about its influence upon manhood. The old style farming gave a wonderfully varied discipline to all the powers of body and mind. The modern gymnasium could hardly put the body into more postures, and better discipline every mus-

cle. It sharpened the wits, and developed the inventive faculties, so that the graduate of the farm was prepared for every emergency in life. He was not likely to find any new obstacles or difficulties that had not been met and overcome in his early discipline. Possibly some substitute may be found for this training, but we are a little skeptical. However that may be, there is no mistaking the tendency of farm life in our country to a division of labor. In the vicinity of all our large towns and villages, there has sprung up, within a few years, a distinct business, known as truck farming. A man buys a few acres, often less than ten, raises vegetables for the city markets, educates his family, gets a competence, and if the city grows fast enough, leaves a fortune to his heirs by the rise of his real estate. Nearly allied to this, and sometimes united with it, is fruit farming. Then there are whole farms devoted mainly to the production of some one article, as hay, onions, hops, tobacco, etc. Then there is the production of milk for the supply of the city; cheese farming and butter farming, and both combined; sheep farming, and grazing to make beef. In the grain districts, the chief business is the production of wheat, oats, and corn for sale. This style of farming, no doubt, simplifies the business, and generally pays better. There will come, however, bad years, and defective crops, and if the farmer stakes everything upon one product, he is liable to lose a year's labor. This is a thing which never happens in a varied husbandry.

Sometimes these specialties are enormously profitable. We recently visited the hop farm of M. C. Wetmore, near Rochester, who makes hops his main product. There are thirty acres in the farm, and he has this year fifteen acres in hops—four on poles by the old method, and eleven on strings, about seven feet from the ground. He sold last year, from fourteen acres, \$10,000 worth of hops, and this year, judging from the look of the vines, the product will be still larger. Hops sold last year for sixty-five cents a pound. This article can be raised at a profit for ten cents a pound. He gets about 1100 pounds to the acre in good years. He finds the strings very much better than the poles; they cost about one-eighth as much, and make a yield of 200 pounds more to the acre, and save a good deal of labor in the picking. These are facts worth knowing among our hop growing friends. A small farm, well tilled, with a single crop, will keep a man out of the almshouse.

Agricultural Improvement.

It has always been our custom to accept from every source suggestions bearing in however slight a degree upon improvement in agriculture, and using them as best we can for the good of the public. We get a great variety of letters, but rarely have we had a communication so sensible and suggestive as the following, from so humble a source. We commend it to certain of our readers who will no doubt sympathize with our correspondent in his sentiments.

Editors of the American Agriculturist:—That you may understand me the better, and be less surprised at my suggestions, I must tell you at the outset that I am one of a troupe of performers who have been for some years traversing this broad and beautiful land, seeing and being seen. It is our highest ambition to imitate as well as we can the actions of mankind, and the kind gentlemen who conduct us over the country exact no other reward. They furnish us, as you know, both ponies and dogs for horses; they

RACE FOR THE ALL-WIN PURSE OF THE JOCKO CLUB.

INTENSELY EXCITING AND GREAT MORAL ATTRACTION OF THE MUTUAL BENEFIT AGRICULTURAL UNION.

clothe us like human beings, and we do the best we can to *act* like men in all the different circumstances in life in which we see them. We find it a very great aid to us in successful imitation, to study the motives of men, and by these we judge of their actions.

This is what leads me to write to you,—and now to come directly to the point. It appears to us that to make people take an interest in the things which are of most value to them, is a great art. Thus subjects of no use interest everybody, but only the wise among men are interested in matters which promise lasting benefit to mankind, or even to themselves.

We have been repeatedly engaged to perform at some of the minor Agricultural Fairs and Cattle Shows, and the general features of those exhibitions have impressed us most favorably, but it seems to us passing strange, while a town is full of strangers attracted by the fair, and the grounds surrounding are quite crowded, that so few people enter the enclosure until the time for the horse-race, the balloon ascension, or our monkey-show. Once in, these people see and learn a great deal of use to them. In our innocence, we supposed that the horse-races were really trials of speed, and tended to improve the breeds of that fine animal, but from what we learn from the horses, this is not so, for they seldom are allowed to exhibit their good qualities, being held back or urged forward, accord-

ing to their jockey's whims, and these jockeys or drivers are influenced by pay received from various parties, and so make the honest horses lose or win the race, not on their merits, but according as they are paid by their employer or by those inimical to him; or, as it often happens, the owners arrange the race between themselves, and, winning or losing, divide the purse.

Now monkeys are good riders, and so far as they know, they are honest, and money is of no value to them; and, besides, being morally irresponsible, the employment of Jocko for a jockey would prevent the distressing moral corruption to which these drivers and riders are subjected. Why not then, I ask, employ monkeys and apes at these "agricultural fairs" more extensively?

Moreover, as this racing, instead of being beneficial, is injurious to horses, we would suggest the employment of dogs, as less liable to injury, and answering well, with monkey-riders, the sole purpose of horse-races, as conducted by agricultural societies,—that of drawing a crowd.

One point more:—In many parts of this country it is very discreditable to have anything to do with the running or trotting of horses, so by all artfully selected names the Fair managers cover up the real character of the horse-races which they superintend. They are, they say, "tests of speed," "trials of wind, bottom, and endurance," and simply, the best means for the judges to decide upon the relative merits of dif-

ferent horses. This, we see, is all a pretence. The truth is, they want an exciting scene, and though they regret the betting and gambling which always attends horse-races, (at any rate after the first year or two,) yet they know of no other way to draw a crowd, to fill up their treasury, pay their premiums, and so do all the good they can with their Agricultural Society. The employment of us and our dogs will give all the excitement, draw the same crowd, and interest more people, while it will neither foster gambling, betting, calling things by false names, nor immorality of any sort. Moral or immoral, it is all one to us, yet even we dislike to have the good people wound their consciences, and play the hypocrite to no good purpose. Please observe that we require no race-course, but only a smooth bit of turf or tan-bark. Where race-courses, (called "tracks,") cannot be afforded, "female equestrianism" has, I believe, been tried with entire success, so far as gathering the crowd, (to do them good,) is concerned, but the effects upon the females are said to be anything but good, from the moral and modest standpoint from which we poor monkeys are forced to view these things for the reasons stated.

I enclose a picture of what might, I think, take the place of horse-racing and of all immoral and indelicate shows at fairs. Let your readers see it, and then judge for themselves.

Yours, jocularly, JOCKO THE JOCKEY.

Petunias Then and Now.

Do any of our old horticultural friends recollect their first Petunia? Over thirty years ago, we cherished our first one as a prized house plant. It was the old *Petunia nyctagyniflora*, the first one introduced into cultivation. It had coarse white flowers, but then it produced them abundantly, and it was altogether a pleasing plant. Great was our surprise when we found that the plant could be grown as a garden annual, and greater still when we discovered that it would grow from self-sown seeds, and in fact become, in some places, a weed. After the common white species, came the purple one, greatly superior to the other. Then began a course of improvement by the crossing of these two and with other species, and now we have the Petunia ranking as a florist's flower, presenting a great number of named varieties, both single and double. Some of the single ones are beautifully veined or blotched, and the habit of the plant is greatly improved as well as the texture and fineness of the flowers. For bedding purposes we much prefer the finer single varieties to the double ones. The choice kinds are propagated from cuttings, which strike root with the greatest ease, but seeds of good sorts will produce nice plants, and there is a chance of getting fine varieties in this way.

The double varieties are now becoming numerous. Some of the flowers are enormous in size, beautiful in color, and very fragrant. The variety, Abraham Lincoln, is one of the most generally distributed and best known. Something after the same style is a new variety sent out this year by Mr. J. Kadletz, Staten Island, and named by him Mrs. Peter Henderson. The flower is large, of good shape, and very brilliant, the ground white, with a purple blotch on the tip of each petal. Mr. K. considers this the best of his numerous seedlings. Messrs. Frost & Co., of the Genesee Valley Nurseries, Rochester, N. Y., have also sent us specimens of a fine new seedling, called Edward Beach, from the gentleman with whom it originated. The flowers were full, rich in color, and quite equal to any that we have seen. Messrs. F. & Co. state that they have had blooms measuring over six inches in diameter.

Tree Planting by the Road-Side.

What traveler in the summer has not blessed the thoughtful man who planted, or spared from the original forest, the road-side tree, where he found rest and shelter for himself and his jaded beast? Why should we not have continuous rows of such trees planted through every farm? Why should not every village center in a town form its tree planting association, and line its streets with the beautiful indigenous trees that are to be had for the cost of digging in the

neighboring forests? Why should not these rows of trees extend every year, along every thoroughfare, until the villagers meet in the honorable rivalry of mending their ways, and beautifying the country? We have a good many

the work of planting the road-side is yet to be done. One or two generations have gone by without developing public spirit enough to attend to this enterprise. The church, the academy, the school-house, the inn, and the dwell-

ings that cluster around them, stand through all the scorching heats of summer unblest with shade. And this is the case too, where there is no want of refinement among the people. The desirableness of the improvement is admitted, but there is great lack of public spirit, and no one provokes his neighbor to this kind of good works. It is time something was done, and we propose a familiar talk with the reader upon his personal responsibilities in the matter. If you live in one of these neglected districts, you have missionary work before you, and it will require a good degree of faith to undertake this ministry of the beautiful. You may not meet with violent opposition and personal abuse, but the big pagan, Indifference, will resist you at every step. The place has stood for fifty years, they will tell you, without any shade trees, and they have got along pretty well. They would give money or volunteer their men and teams if they could see any use in it. But they don't see the need of it. This, and much more like it, will be your first salutation. Never mind. "There is no impossibility to him who wills." Get one man enlisted on your side, and if possible let that man be a woman. Take the matter up and make a business of it. If you have a sewing society in the parish, get the ladies interested. While they are laboring for the heathen, and for the starving South, and trying to make the wilderness bud and blossom, let them have an eye to the wilderness along their own street. Buds and blossoms are wanting there, and the desolate wayside can be made "a thing of beauty and a joy forever." This is a home enterprise that has been neglected quite too long. Talk with the minister about it, and if he be a man

of taste, as he is apt to be, get him to preach a sermon on the moral uses of beautiful things, text, St. Paul, "Whatsoever things are lovely," or, better yet, the Great Preacher, "Consider the lilies." There is a great deal of unapplied truth in the Bible that touches upon this matter of tree planting. Stir up the Farmers' Club if you have one, and if not, form one. Get the Horticultural Society or County Agricultural Society to offer premiums for planting wayside trees. One resolute man in a place can carry this much needed reform, and make his name immortal. Hillhouse Avenue, in New Haven, with its lordly elms, will preserve the name of the planter long after his monument has crumbled and his career as a Senator is forgotten.

EDGINGS AND EDGING PLANTS.—Recently we saw some cast iron edgings in use around beds cut in a lawn; they were of a rustic pat-

DOUBLE PETUNIA—MRS. PETER HENDERSON.

model avenues in New England and in the older parts of the country, where the present generation is enjoying the results of the good taste and toils of their forefathers. Trees were planted when the village streets were first laid out, and their branches are now a crown of glory, affording shelter from the summer heats.

We admire the arrangement of those early settled towns in the Connecticut River Valley, and elsewhere, where they had a common a mile long, and twelve rods wide or more, the houses arranged upon the sides, and looking out upon the village green beneath the shadows of noble elms. These trees are now the glory of the village, fondly cherished by the residents, and forming beautiful pictures never to be effaced from the mind of the stranger who visits them.

We find hundreds of villages and towns in our occasional visits, and they are by no means confined to the more recent settlements, where

tern, but being painted of a bright red, the effect was anything but pleasing. Had they been of a subdued or neutral tint, it would have been much better, as a scarlet edging detracts from whatever may be in the bed. To the list of plants already suggested for edging purposes, we have to add *Sedum spurium*, a dwarf growing and hardy species. It spreads rapidly, and will need to be kept within bounds. A variegated Thyme has been introduced that makes a very neat edging. It is like the common Thyme except that each leaf has a delicate white line upon the margin. Its general effect is subdued and quiet. We have not yet tested its hardness.

Seedling Strawberries.

BY B. HATHAWAY, LITTLE PRAIRIE ROND, MICH.

The remarks of Mr. Boyden, in the July *Agriculturist*, although correct in the main, contain some erroneous statements.

He says, "The strawberry seed, like several other seeds, remains until the following spring before it germinates." How he could adopt such an hypothesis, that analogy and observation must alike refute, seems unaccountable. It is well known that the strawberry is almost cosmopolitan in its character and habits. Its geographical range covers three zones, and it is alike at home in Lapland, Mexico, South America, and the islands of the Pacific.

For some years I have given attention to the improvement of this fruit, and I have never failed to get the seed to grow by putting it in the ground at once, without previous preparation, giving plenty of water, with shade. I have at this date—July 14th—hundreds of plants up, many of them showing the third leaf, from seed sown since the 1st inst.

For ten years, or more, I have been experimenting with seedling strawberries—have had a thousand or more new sorts fruiting in a season.

Several years were spent in random experiments, before developing anything like improvement. I sowed seed from the largest and best berries, without regard to class or the sexual character of the plant. It was only after discovering that seedlings from hermaphrodites, or from foreign sorts, or from hybrids in which the foreign element predominated, whatever might be their sexual character, were of little or no value, that I conceived of the true theory of progress.

It is this: our native scarlet strawberry must be the basis of any improvement that will be permanent and valuable. While we may get size and, possibly, flavor from foreign sorts, in our native kinds alone lies the germ of productiveness.

Only from the time when I first grew seedlings from the old Virginia scarlet, that were purely pistillates, do I date any real progress.

These were fertilized by the old sorts—Wilson, Triomphe de Gand, Boston Pine, etc., and the best of the pistillates grown were used as the maternal parents of the next generation.

Last year I set a small plot of ground—about thirty square rods—to several of my new kinds, and the leading older sorts, for the purpose of testing their relative value and productiveness, and the result was as surprising to myself and friends as it was gratifying, in disclosing the fact that I had several new seedlings that proved more productive than the world-renowned Wilson even, besides being possessed of other qualities that make them of greater value.

In order to give a more definite idea of the test, I will give my plan more in detail.

The plants were propagated by rooting them into thumb-pots, and were put out as they were

grown, a row or two at a time, in July, August, and some as late as September, and consisted of the following sorts:

2 rows of No. 1 Seedling, 5 of No. 9, 2 of No. 5, 1 of No. 8, 1 of No. 10, 1 of No. 3, 1 of No. 2, 2 of Wilson, 1 of Agriculturist, 1 of Brooklyn Scarlet, 1 of Monitor, 1 of Russell's Prolific.

The plants were set two feet by four, two plants to the hill, and had good culture.

My most valuable seedlings are identified by numbers, and are known as No. 1, 6, 9, and, possibly, 3. It was no unusual thing to gather a heaping quart of ripe berries from a hill at one picking of either of these numbers, except 6, which is not quite so prolific.

No. 1, for field culture, will probably take the lead. The berry is a light scarlet in color, about the size of the Wilson when the latter is not overgrown, with fewer small ones, and it will hang on the vines for a week after it is ripe, if the weather is dry, without spoiling, a quality by no means to be overlooked, and as for fruitfulness—it is a marvel to behold.

No. 3 is about as productive as No. 1, late—ten days later than the Wilson. It is a large berry, dark colored, juicy, and sour, which is equivalent to saying that it will not keep, and though hill after hill, set in August last, yielded its quart at the first picking, the finer flavor and better keeping qualities of the other numbers nearly or quite neutralize its value.

No. 6 is probably the most taking sort to the eye, and, possibly, to the majority of people, to the taste also, that I have. The fruit is large, light scarlet, conical, slightly necked, very uniform in size and shape. While none of the berries are as large as you will occasionally find a Wilson, the average will be as large or larger, giving the appearance of having been assorted.

As to quality, it is a rich acid, with just sufficient of the pine aroma to give it flavor, while it does not possess the insipid sweetness that is the characteristic of that class.

No. 9 has also a very distinctive character.

It is the strongest growing sort I have on my grounds. The berries are medium to large, with no small ones; in color, deep scarlet or purple crimson, which adds much to its beauty; in shape, long—about the form of an overgrown blackberry, and in quality it has few compeers. It will hang on a long time, if the weather is favorable, and will do what I never saw another strawberry do before—literally dry into a sweet delicious pulp, like a raisin.—Of the other numbers it is needless to speak, though twenty years ago they would have been great acquisitions.

Of the older sorts, the Russell is of no value—large, productive, soft, and sour—too many small ones—all on the ground, and the plant sun-scalds. The Monitor, too tender. The Brooklyn Scarlet—healthy, hardy, a good grower, sweet fruit—too sweet, but only moderately productive. The Agriculturist is the best of our recently disseminated kinds, so far as I have tried. It produced some of the largest berries on my grounds. It is about as productive as the Wilson under the same treatment—hill culture—and of much better quality, and will keep better than that variety, but not so well as is desirable. Its greatest faults are a want of uniformity in the size of the fruit, and its tendency to cockcomb, and irregular shape.

Of the Wilson it is hardly necessary to speak. That its introduction began a new era in strawberry growing, will not be denied; but it will be superseded, or, at least, hold a divided realm.

Very many of the growers of this fruit found to their cost, the past season, that it was not

wise to set all their eggs under one hen, and we think hereafter the later and earlier varieties will command the attention that they deserve.

I will say that none of these new sorts are offered for sale. Although they may be found valuable on my own grounds, and in comparison with the best, this is not a sufficient guarantee that they are adapted to universal cultivation. They will be put into the hands of leading and reliable horticulturists to be pronounced upon.

In the mean time, that the progress of experiment may not stop with these results, the best plants from the seed of best varieties I have yet grown will go into experimental grounds.

A Trial of Early Peas.

The number of peas named in the catalogues of seedsmen, each claiming to be the earliest, led the Royal Horticultural Society, (England), to institute a comparative trial in 1865. The results of this trial we gave in May, 1866; these were severely criticised, not only by interested seedsmen, but by some of the English Horticultural Journals. This year another trial has been made at the Society's gardens at Chiswick, and we condense the following from a report in the Gardeners' Chronicle:

"The earliest Pea was long considered to be the Early Frame, which varied slightly, although its variations could scarcely be made out as permanently distinct. Sometimes differences were indicated by the designations of Double-Blossomed and Single-Blossomed Frames, and Early Nimble; there was, indeed, no Express in those days, but there was the Early Racehorse, a name indicative of a pea that would quickly become fit for use; and there were more than twenty others which ultimately proved synonymous. From amongst these arose the Early Kent, Early Emperor, Prince Albert, and subsequently Sangster's No. 1, or Daniel O'Rourke.

Among a number of samples, consisting of varieties with differences almost imperceptible, some in the course of repeated sowings exhibited a more luxuriant habit than others; and luxuriance militates against earliness. On the contrary, Dillistone's Early, Carter's First Crop, and Sutton's Ringleader, &c., at the expense of luxuriance, have gained earliness over Early Frame and Early Emperor. Vegetables of all kinds raised from seed are liable to degeneration. Much depends on a careful selection of the plants from which to save the seed; for if the most vigorous plants are selected and grown in succession in rich soil, a more luxuriant but later progeny will result. In this way a variety which is found to be the first in point of earliness this season, may become only second, third, or fourth in the next or subsequent years.

The Committee, at their meeting held on the 25th inst., decided that Dillistone's Early, Carter's First Crop, Sutton's Ringleader, and Veitch's Early, were identical. There can not be any doubt on that point; they were all sown on the same day, and they respectively bloomed, slated, and became fit for use on the same day. They were, moreover, all injured by the frost more than any others, but all in an equal degree; while Sangster's No. 1, Dickson's First and Best, &c., under the same conditions, were not injured in the slightest degree.

Dwarf Waterloo is ten days later than Sangster's No. 1; from 12 to 18 inches high, producing large pods, well filled, excellent, earlier than, and an improvement on, Bishop's Long-pod.

Sudbury A 1, and Nutting's No. 1 wrinkled, are identical. This is a very excellent early

white wrinkled marrow, three days earlier than Alliance, and with larger and better filled pods; about 18 inches high.

Carter's Improved Emperor is very similar to Dickson's First and Best; free bearing, and a very excellent stock.

Sangster's No. 1 and Daniel O'Rourke are synonymous.

Taber's Perfection and Early Perfection (Brown) are identical; a day or two later, and producing more haulm than Sangster's No. 1.

Young's No. 1 (Veitch) is a capital early Pea, of about the same earliness as Sangster's No. 1, but taller and stronger; a good cropper. The ripe seed of a pale olive color; darker than any of the others in the same class.

Washington is the same as Early Emperor.

Carpenter's Express is a run-out mixed stock.

Hooper's Early Rival is a much mixed stock of Sangster's No. 1.

London Conqueror is a third-rate stock of the old Early Frame.

Taber's 63, a shade dwarfer, but is in other respect identical with Dickson's Favorite.

Essex Rival (Eley) is seven to eight days later than Sangster's No. 1; a large pale-podded white marrow, with blotched foliage, about four feet high, of the old Ringwood Marrow class. The peas when cooked are of a nice green color; it is a very productive and most excellent pea.

Sutton's Long-podded Tom Thumb seems very much like the Old Spanish Dwarf.

Carter's Improved Tom Thumb shows no improvement.

Little Gem (Turner), a blue wrinkled marrow, is truly a little gem, coming into use but a few days after Sangster's No. 1, having very large pods, very productive, and of excellent quality. This can not be too highly recommended.

Multum in Parvo (Nutting) resembles Little Gem, but with somewhat broader pods, and is a few days later than that variety."

The Garden and the Farm.

In a somewhat extended journey we have had our eyes open to see the farmers' gardens. We have seen the poor patches, called gardens, in which peas and beans were struggling with mustard and other weeds, and, as far as we could see, the weeds generally had the best of it. Peas, beans, cabbages, cucumbers, beets, squashes, and, rarely, tomatoes, make up the usual variety. How rarely we see an asparagus bed, while spinach, egg plant, salsify, okra, and even sweet corn are seldom met with. How a farmer can do without asparagus and sweet corn, is beyond our comprehension. The one, when once established, will yield for years a supply in early spring, just at the time when all green things are scarce, and therefore the more acceptable; the other, as easily raised as any other corn, and no one who has once tasted its delicious kernels will ever again go to the field for roasting ears. We must mention one notable exception to this general neglect. Not far from Glen's Falls, N. Y., we passed a farm which attracted attention from the excellent condition of its fences and the neat appearance of its fields. Upon nearing the house, our eyes were delighted with the sight of a large and well kept kitchen garden, in which there appeared to be an extensive variety of esculent vegetables. Had it not rained torrents, we should have tried to ascertain the name of this exemplary farmer—we know from the looks of his garden that he reads the *Agriculturist*, and we congratulate him and his family that they can enjoy so many of the

good things that earth affords to those who will take a little trouble to procure them. If farmers would grow a few acres less of corn or wheat, and devote the labor required for these to a good kitchen garden, it would pay in the saving of meat, and doubly pay in the amount of satisfaction and contentment it would bring. Farmers, do you know that the sameness and unattractiveness of the table has much to do with the desire of your sons to leave home? Contentment with daily pork and potatoes, with an occasional variation to cabbage, is hardly to be expected. A family garden is humanizing.

Why Transplanted Trees Die.

"WORTH KNOWING—TRANSPLANTING TREES.—If the Commissioners of the Central Park would give strict orders to mark the north side of trees with red chalk before they are taken up, and when set out to have the tree put in the ground with its north side to the north in its natural position, a large proportion would live. Ignoring this law of nature is the cause of so many transplanted trees dying. If the north side is exposed to the south, the heat of the sun is too great for that side of the tree to bear, and therefore it dries up and decays."

Those worthy gentlemen who are engaged in adorning our Central Park, will be grateful for this bit of advice. They have lost a great many trees there. They die by the hundred every year, and many thousands in all have been lost, and all for the want of "a piece of red chalk." We quote this as a sample of the "profane and old wives' fables" that are circulated in the farmer's column of some of our contemporaries. The assertion that the change of the side of a tree from north to south in transplanting affects the chances of its living, is without any basis of facts sufficient to support it. It may or may not be true. We believe it has as little to do with the life of a tree as the phase of the moon at the time of transplanting, and the assertion is calculated to do injury by diverting attention from the causes which do make new plantations failures. These are the loss of too many of the fine rootlets in taking up the tree, the drying of the roots in removal, the want of drainage and preparation of the soil, careless handling and planting, want of mulching, and the prevalence of severe drying winds immediately after planting. These evils are not to be remedied by a piece of red chalk or the skin of a black cat.

Horticulture in Indiana.

We were agreeably surprised in our recent visit to see so many evidences of progress in this delightful art. Indiana has not only a State Society with its volume of transactions, but several auxiliary societies in the larger towns, which have frequent meetings, and are doing much, with fine fruits and flowers, to awaken an interest in gardens. The State Society is in the sixth year of its existence, and holds two sessions annually of several days each, which are well attended, and occupied with lively discussions. These meetings, reports of which are published in the papers, are diffusing a knowledge of the better varieties of fruit, and encouraging the planting of orchards and vineyards. The influence of these discussions is apparent in all the older parts of the State, especially in the suburbs of the large towns.

The climate and soil of this State are favorable to fruit culture, and nearly all the small fruits flourish in the greatest luxuriance, with ordinary care. The apple and pear are at home,

and can be raised in any desired quantities. Apples are abundant this season throughout the State. We saw but one orchard that had any appearance of disease, or was not well filled with fruit, if it had reached bearing age. There are many young orchards a few years out, or just planted, that are looking in perfect health. Pears are not as extensively planted, but flourish quite as well, and in the opinion of a gentleman of large experience, do quite as well as the apple, and bear with more uniformity. Grapes are cultivated to some extent, and many in the vicinity of the cities are planting vineyards. The Concord is unquestionably the most popular grape in the State, and the vines that have been planted are now so generally in bearing condition, that fruit growers understand whereof they affirm. The Hartford Prolific stands next, but drops its berries from the bunch. The Delaware and Rebecca are superb, but are poor growers. We found one fruit grower who cultivated the latter in the shade, to prevent it from casting its leaves, a calamity to which it is exceedingly liable. The newer varieties are in cultivation, and their merits for the climate and soil of the State will soon be decided. They have a flourishing local Society at Terre Haute, of which Hon. D. H. Scott is President; also at Laporte, of which Hon. A. L. Osborne is President. Monroe, Indianapolis, Danville, Plainfield, Bridgeport, and Fort Wayne, also have flourishing horticultural societies.

Notes on Grapes and Grape Culture.

So much was said last year about grapes that we have but little to add upon the subject until the season of ripening shall have given us more knowledge concerning the merits or demerits of varieties. Many of our contemporaries have opened their columns to a lively discussion of the award of the Greeley Grape Prize, and as about an equal amount of abuse has characterized both sides of the dispute, we assume that the account is square. It seems to us that no good can come from the further agitation of this subject, for no one, with even a limited knowledge of fruits, would expect to find any one variety of any fruit that will be the best in every locality. The mistake was not so much in the award of the Committee, as that they should consent to act at all upon so impracticable a proposition.

As we write, (early in August,) we hear some accounts of mildew and rot, and in some localities the Concord, which is usually free from disease, has rotted and dropped badly. In the only case of this which has come under our observation, the vines were not closely pinched, but allowed to keep on growing; while in those places where the vines were systematically pruned, and the laterals pinched, no rot was visible.

We believe that the early establishment of a strong and robust foliage, by pinching the bearing shoot at three or four leaves beyond the last bunch of grapes, and persistently pinching back the laterals, has much to do with the vigor of the vine, and its ability to resist rot and mildew.

We cannot learn that it has caused much trouble where sulphur and other remedies were promptly applied. One of our editors, finding that mildew had appeared upon his vines, followed the suggestion of Mr. Lazaris, of Athens, Greece, which was published in the *Agriculturist*, for August, 1866. Mr. L. proposed the use of dry clay or any other fine dust, as a substitute for sulphur. He considered that when used in the open air, sulphur acted merely as an absorbent of moisture, and if this were the case, any other

dry powder thrown upon the mildew would dry it up and destroy it. He found dry and sifted clay and fine road dust were equally efficacious with sulphur. Without asserting that the fact is proven, the instance above cited shows that, in that case at least, the use of dust arrested the mildew, and that the matter is one deserving the attention of grape growers. The fact that some cultivators find that a mixture of air-slaked lime and sulphur is better than sulphur alone, seems to point to the same conclusion. Overbearing is also a common fault; it serves to weaken the vine, and while a larger number of bunches may be obtained, they will be inferior in both size and quality.

In some places there is complaint of the failure of the grapes to set well, very large clusters often having but three or four fertilized and growing berries upon them, all the others remaining abortive. This may be owing to heavy rains or cold, and damp weather just at the critical period of blossoming. We look forward with much interest to the grape harvest this autumn, as the status of many of the newer kinds will be better known; and it is our intention to keep our readers advised of all that is likely to interest them in relation to this increasingly important branch of horticulture.

VARIEGATED PELARGONIUMS.—

The Pelargoniums, (often called Geraniums,) with variegated leaves, are now very numerous, and the number is rapidly increasing. Some of them have leaves of such beautiful colors that they have all the brilliancy of flowers. In England, these plants are much employed in bedding, and very fine effects are produced by them. With us their use in this way is attended by very indifferent success, and those who would enjoy the beauty of such fine varieties as Mrs. Pollock, Sunset, and others of that elegant class, must grow them in-doors. Our hot sun is too much for the delicate foliage of these variegated kinds, and the leaves soon curl up, and drop off. Besides this, caterpillars make sad havoc among them, and they need looking over every day to remove these pests. Among a large number tried this year out of doors, the most satisfactory were the Mountain of Snow, which has a dark-green leaf with a broad and well-marked white margin, and the Cloth of Gold, the leaf of which is of yellowish green, bordered with yellow, the two not very distinctly defined. We hope that some of the more richly colored ones will be found that will endure our summer heats.

KEYES' EARLY PROLIFIC TOMATO—was advertised as being thirty days earlier than any other variety—a claim so extravagant that we have watched it in widely different localities with much interest. H. J. Rudissell, of Fort Wayne, Ind., grew them in his market garden, side by side with the Early York, of Henderson, and the Eureka, and they ripened at the same time with these varieties. The plants were all

forced in the usual manner, and the first specimens were picked July 17th. On the other hand, Chas. Downing, as well as cultivators near New York, finds it to be at least ten days earlier than any other variety. Even this is a great advance, and had it been put out as being ten days earlier than others, instead of thirty, the public would have accepted it as a probable statement, and have been more disposed to try it.

THE RABBIT-FOOT CLOVER.—(*Trifolium arvense*.)

The Rabbit-foot Clover.—(*Trifolium arvense*.)

In poor and sandy soil, and in old fields, there is found a plant, the peculiar softness of which, with its dull, gray appearance, is very apt to attract attention. It has many popular names, among which are Rabbit-foot and Hare's-foot-Clover, Pussy-Clover, Stone-Clover, etc. Its botanical name is *Trifolium arvense*, and though in its general appearance it is unlike the other clovers with which we are familiar, its structure in the main corresponds with theirs. It is a much branched annual, that grows from 5 to 10 inches high, and produces upon the ends of its branches flower heads that are at first globular, but which soon elongate and become cylindrical. The engraving, taken from a small plant, gives its general appearance. The three-parted leaves are quite small, the flower heads being the most conspicuous part of the plant. The whole plant is covered with silky hairs, and the heads are especially soft to the touch. A close examina-

tion shows to what this softness is owing. At the lower left hand side we have given a single flower, very much magnified. The corolla, which in other clovers is so showy, is here very small, while the points of the calyx are much elongated, thickly clothed with silky hairs, and the most conspicuous parts of the flower. Though so common with us from Canada to Florida, it was introduced from

Europe. It can hardly be ranked as a troublesome weed, as it is, like other annual weeds, readily exterminated by cultivation.

A WORD FOR THE CURRANT.—

It is very strange that so little attention is paid to this most acceptable fruit. It is easily raised, and brings a good price in market, the supply always being short of the demand. We shall have something to say about varieties and propagation for those who wish to make new plantations. At present we give the experience of the author of "Walks and Talks," for the benefit of those who have old and unproductive bushes: "We have had a splendid crop of currants this year. There was quite a quantity of old bushes on the farm when we came here, but the worms had stripped off every leaf, and they were in a forlorn condition. We set out a number of new ones, and in the meantime undertook to renovate the old ones by pruning and manuring. The old bushes have produced this year five times as many currants as the new ones, and are good for years to come. Currants bring six dollars a bushel in the city, and it would seem that at such prices the crop would be a profitable one. If you have old bushes of good varieties, dig about them and dung them. Cut out all the suckers except one or two that may be needed to take the place of the old, decayed branches. Keep a sharp lookout for the worms soon after the leaves are formed. You will find the eggs on the under side of the lower leaves, and they can be crushed be-

tween the thumb and finger in a moment. And then, especially, look out for the second brood, after the fruit is gathered, and serve them in the same way. It is here where so many fail. Destroy this second brood, and you will have comparatively few to kill next spring. If any escape, dust the bushes with *white hellebore powder*; but don't forget to destroy the eggs."

INCREASE OF FORESTS IN FRANCE.—The forests in France are under the care of the government, and under the new laws for their protection, they have increased nearly one million of acres. Less than one sixth of the area of the kingdom is covered with woodland. This is much less than is desirable for the best interests of the husbandman. It is estimated that from twenty to twenty-five per cent. of a country should be covered with forest, in order to secure uniformly good crops. Our forests, now disappearing at the rate of 3,000,000 of acres annually, demand the attention of government.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

Dashes at House-Keeping with a Free Pencil.

PRIZE ESSAY BY MISS EVA M. COLLINS, ROCHESTER.

THE PLAY-ROOM MADE OVER.

Jennie thinks she is getting to be too large a girl to have a play-room any longer, and quite surprised me a few days ago by asking if I could not help her convert it into a spare bedroom for her. Little

Fig. 1.—PLAY-ROOM CONVERTED.

ousin Helen is coming to spend her vacation here, and probably that was what put the idea into Jennie's head; but at that moment the little black-eyed lady did not occur to me, nor did the possibility of bestowing any of our friends there seem very feasible, so I could only echo the last of her sentence, "bedroom for me," as Miss Betsy Lavender would have done. The play-room is six feet by nine, or would be of those dimensions, only that a chimney occupies a third of one end of the room, protruding eighteen inches into the apartment, which makes it appear even smaller than it is in reality. It was originally a large closet, but had been from time immemorial, so far as I am concerned, given up to the little girls for a play-room, and had now for years belonged exclusively to the baby. And so the baby wanted to convert the play-room into a spare room. "Well! what next?" Whereupon little sister explained herself. It would make such a nice little room, just large enough for Helen—and herself—and very likely the spare rooms will all be in requisition for larger company, especially while the boys are at home. She is sure she and Helen will like the room all the

Fig. 2.—TOILET TABLE.

better for its small size, and it will seem like keeping house in earnest to have the room where she has always pretended to live, for her own. Dim visions of the possibility of having to take one of the children into my room had been hovering in the distance for several days, but this disposition of the play-room dispelled them at once, though I should never have thought of it. Ralph was, as usual, our right hand man. He brought down the oldest cot-bed from the garret, and by shortening it half a foot, removed a large rent in the foot of the canvas, and made the bed fit in the short way of the room, so Jennie has still a passage way from the door to the window, fig. 1, besides the spaces each side of the chimney. In the space back of the door, Ralph has put up a number of hooks, and by hanging a curtain in front of them, it makes quite a respectable wardrobe. For the other space, the one near the window, Ralph has contrived a toilet table, which

Jennie declares is just the thing. It is a board securely fastened over cleats with a curtain in front, and a cloth over the top, fig. 2. Over the toilet table and near the window we hung a case for combs and brushes, made of pasteboard and covered with tissue paper, fig. 3. I tell Jennie she and Helen will have to be very neat, or they will make a deal of washing, as everything in the room is white—bed, window curtains, wardrobe, and toilet table. Jennie thought she wanted a place for a few books, so we hung a little shelf, fig. 4, at the foot of her bed, opposite the "Lord's Prayer," which hung over the head of it. Then she thought "nothing was wanting but a light stand which would not take up any room." Ralph has suited her exactly, fig. 5, and has made the bottom of the stand so much heavier than the top, that it will not easily tip over. The room is enunning enough. The small red and white squares in the matting look brighter than ever before, and the view from the window is lovely either in winter or summer, as it looks off down one of the most beautiful valleys in the world.

Two little sets of hands to keep out of mischief this summer! Jennie has a box at the bottom of her wardrobe, where I am to put work for her and Helen, as I come across anything that will answer for them, the only conditions being that no work placed in the box can be undertaken before the article under way is completed, except by permission. Jennie, and I believe children generally, likes the plan of being obliged to decide for herself, and then of being held to her own

Fig. 5.

decision, even though some different course may appear more attractive. Grandmother has taught her that little girls who are driven about by every passing fancy, almost always grow up into wavering, weak minded, silly women, while it is the privilege, the right, the duty of each little girl to grow into a noble, beautiful woman. It will be entirely optional with the children whether any work in this box shall be commenced or not, but if begun, it must be finished unless there is some very good reason why it can not be done; therefore the pro's and con's must all be considered beforehand. This piece of thick Bristol-board, six inches by eight, will make them a transparency to hang in their window. If I draw the design lightly with a pencil, they can cut it upon a board with a penknife, wherever it is marked, bend all the points out, and paste a narrow ribbon around the edge, fig. 6. Jennie called us last evening to see how the moonlight shadowed the grotesque figures in the window curtains over the bed and wall. The cross among the leaves will form an agreeable variety. Here is a bundle of bright cambrie and silk for linings to muslin bags, which have long been waiting to be made. I will roll the white cotton yarn with this parcel, and put it into the children's work-box. A pattern in the roll, fig. 7, will show them what this is intended for, and please them better than verbal instruction. It seems a little sad to see the play-room thus "converted," as Jennie calls it. I really almost

Fig. 4.—BOOKCASE.

Fig. 7.—BAG.

wish I could have dressed the little people's dolls for one more Christmas, in the play-room; but after all, Jennie is right; it is only the play-room still in a different dress—not very materially different, because suddenly clothed anew. Real changes are slow in their growth, necessarily, because growth requires time. The little room will be the play-room probably for some time to come. Mothers! do not hastily wrest the play-room from the children. It has a mission to fulfill. It teaches them by constant practice how to make the most of every thing; to cover over neatly the most outlandish shapes; to make homely things pretty, and to see all the naughty traits in themselves in their true light, as they are reflected in their imaginary little ones. The lessons learned in the play-room, more than elsewhere, are industry, patience, gentleness, economy, and accuracy, while the taste is cultivated, and affection sacredly cherished. No matter if the hundredth attempt is still rude and unsuccessful, it is yet a step in the right direction. A suggestion now and then will not be lost. The child may be taught, but the lessons can be learned only by itself. The most beautiful painting was, in its first stage, a mere daub, and so the child, in its first endeavors, can not be expected to foreshadow the ingenious woman, which, in a congenial atmosphere, its mature growth may unfold.

Leaves from the Diary of a Young Housekeeper.—No. IX.

PRIZE ESSAY BY MRS. LAURA E. LYMAN, STAMFORD, CT.

Sept. 7th.—On our way home from our delightful visit to Mr. and Mrs. George, I expressed to Edward my unbounded admiration for a farmer's life, such as we saw it in their establishment, and I thought over in my mind some improvements I might make in housekeeping, and especially in the care of my milk, cream, and butter. The secret of Mrs. George's splendid success in the production of butter is, that she has every facility for preserving nearly a uniform temperature in every part of her dairy establishment, the year round. Since coming home I have endeavored to imitate her so far as the arrangements of my house will, as yet, permit. I have no ice chamber for keeping my cream in as she has, but talking the matter over with Edward, he suggested that in one corner of the cellar the soil is damp and cool, and that a little pit might be made there to answer the purpose. So he took his spade and made a little hole about eight inches deep, where I place my cream jar and fill it round with the moist, cool earth, so that I can preserve it at nearly a uniform temperature. My last churning showed the difference; it was as good September butter as I ever saw. I have also put less milk in a pan than I used to, and find the cream rises more perfectly.

Sept. 12th.—The past week has been a very busy one. The apples and tomatoes are ripening rapidly and must be cared for in their proper time; so, early and late, Sue and I have kept our knives in motion, and in the evening Edward has kept the paring machine running. Instead of the old mode of quartering and coring them, we find slicing them in thin pieces, uniform in thickness, is a better and more expeditious way of preparing them. As apples, when drying, very readily absorb flavors, I have observed the utmost care in keeping them where they could acquire no taint. Edward made me a scaffolding of hemlock boards upon which I spread some old sheets that were perfectly clean, and laid over the apples some fly netting to preserve them from the contact of insects of all kinds.

These hot days of September I thought best to improve in drying tomatoes, in imitation of dried

Fig. 6.—TRANSPARENCY.

Fig. 3.—TOILET CASE.

figs. After making a rich syrup and cooking them till they were done, which takes fifteen or twenty minutes, I spread them on plates to dry. Thus prepared they are almost equal to dried figs. My cans are of glass, with India rubber stoppers, and require no cement of any kind to make them air-tight. After using cans of various kinds, mother at last settled upon these as the best, and I use no other. As tomato preserve is so very sweet, I decided to fill but a small jar, and can nearly all I put up. My recipe is half a pound of sugar to a pint of water. This makes the tomato sufficiently sweet, and its flavor is not so much disguised by the syrup as when more sugar is used. I have made a large jar of green tomato pickle, which Edward likes so much, and which is not a very common dish, and after the early frosts, I shall make another of the green tomatoes left upon the vines. No pickle is more easily made, and none better than this. To a peck of tomatoes, sliced about a quarter of an inch thick, add sufficient vinegar to cover them, and of whole spices, one ounce each of pepper, cloves, allspice, cinnamon, and white mustard seed, and two medium sized onions chopped fine. Bring them all to the boiling point for a minute, and then pour into a jar and set in a cool place. In two weeks they will be ready for use. The finest looking of my ripe tomatoes I preserve and dry; the others make excellent catsup.

Sept. 18th.—For a week we have been reveling in ripe grapes, and I have used all my skill in endeavoring to preserve them in jellies, with sugar and by other modes, so as to prolong our enjoyment of them into the winter months. Edward has picked some of the finest clusters, and I prepared several dozen strings of uniform length, with which we tied them to long poles and hung them in the wood-house loft, taking special care to remove all that were imperfect, and not to bruise any or break them from the cluster. Here we will let them remain until freezing weather, when they can be transferred to the cellar without disturbing them on the poles. I feel quite confident that we shall have some delicious clusters to lay upon our table at New Year's, and perhaps as late as February. We experimented also upon the French mode of preserving grapes, with what success remains to be seen next winter. It seems as though it must succeed, and it is very simple. Edward made a thick whitewash of the consistency of cream, straining it, and taking pains to crush all the little pieces of lime. We then dipped a number of the very finest clusters into this whitewash, taking them out very slowly. The dipping was repeated two or three times, until a firm white crust, looking like a rough egg shell, was formed all over each grape, and the stem to which they are attached. We hung these clusters with the others in the wood-house loft.

Sept. 20th.—Three or four days since Edward's sister, Jane, came to visit us. She looked pale and worn, and I found upon conversation with her that she had been sitting in the house all day, instead of breathing this delightful September air under the open sky, and burning the lamp late at night, reading some new French novels, which a friend had sent her. Edward and I talked the matter over and determined to initiate her, unconsciously to herself, into the delight and the wholesomeness of ample out-door exercise and early hours of sleep at night. So every day since she came, we have planned some excursion or some pastime, which has given us all full draughts of this boundless ocean of air the Creator has poured above and around us. The roses are beginning to bloom on her cheek, and she has ceased to inquire constantly for "some interesting book." If our American women would but spend an hour or two every day in the open air, how much should we as a nation gain in health and happiness. The exercise of housework is not sufficient; it is monotonous and liable to become mere drudgery. The wife and mother, if she would ever keep fresh in feeling and firm in health, if she would be always cheerful and a bright and radiant center of home delight, must daily leave her ears and the little routine of her domestic activities and place her spirit in harmony with the perpetual calm and the annual round of nature.

Sept. 27th.—Yesterday and to-day we have made a lounge for our sitting room, and we shall find it a great addition to our comfort this fall and winter. Edward got out the frame and legs, fastened them securely together and nailed some slats on the under side of the long side pieces. Into these, at regular intervals, we put some second hand springs he found at an upholsterer's, and tacked over them an old quilt, tying each spring with twine to the quilt to keep it in place. Then I made a mattress case of tow cloth and filled it with the shucks we saved when we were drying corn, and some others, which were all carefully picked over, and covered the whole with brown calico, and a very presentable article of furniture it makes. I priced a lounge the other day at the store, and the cheapest article I could find, and that a very poor one, was thirteen dollars, so I determined to make one myself. We reckoned up the cost, and find it amounts to just six dollars and fifty cents. The frame timber is worth fifty cents, the springs cost thirty, the ten yards of tow cloth came to three dollars and a half, and the calico cover two dollars and twenty cents. Jane made the cover while I made the mattress, and we finished the whole thing up very quickly.

Sept. 30th.—I thought it would do Jane good to see a little of Sue White's housekeeping, and her excellent management of her boys, so she consented to stop on her way home to visit my excellent friend, if I would go with her. I was curious to learn too, how Sue, who at school had been noted for her love of Plato and the classics, had become so thoroughly practical a woman in all domestic matters. Our conversation naturally fell on the routine of household duties, and I expressed to Sue my surprise at the perfect familiarity she seemed to have with all the little details of nice cookery, and every department of family industry. "It is very true," said she, "that at school I revelled in the ideal world. I dreamed with Plato, I delighted in Shakespeare and the poets, but after marriage my husband placed Bacon's *Novum Organum* in my hands for me to read, and it effected an entire revolution in my daily life. I saw the beauty of utility, and determined to become as Baconian in my practice as a housewife as I had been Platonic in my previous modes of thinking. From that time I have made it a principle and a study to have every article on my table prepared in the very best manner possible, and to perform every task in the most thoroughly practical and sensible manner."

October 4th.—For two days I have been engaged in a task that would have been very heavy had not Edward assisted me. We assorted the wool that we reserved from the spring clipping, taking a few pounds of the best for stocking yarn, washed and dried the remainder, and made it into a mattress, which has cost us only the price of the ticking.

Mrs. George told me of an excellent and cheap way of making a spring bed, by purchasing three or four dozen of spiral coils of wire at an upholsterer's establishment, and setting them into the slats of the bedstead. She has a set of them that have been in use many years, and are now as good as ever. The upper end of the wire is fastened to the last turn of the coil, and the wires covered with an old quilt upon which the mattress is laid.

Leaves from My Journal.—No. VII.

PRIZE ESSAY BY MRS. B. McLELLAN, OF OHIO.

September.—There is much sickness in town from typhoid fever. That is always tedious, distressing, and alarming. When sickness comes, how vain appear our worldly cares and anxieties. We resolve never to be so engrossed by them again. And yet we could hardly bear always to carry about the heavy heart we have now. Nursing the sick seems especially to belong to woman, but man's stronger arms and nerves are quite as indispensable. "Oh," said a daughter, after recovering from a long and dangerous illness, "I felt so at rest when father was in my room." What little things will annoy and distress the sick! The mind is weak with the body, and must be as tenderly cared for and indulged. Some displacement of furniture, a spider hanging

from its web in some corner, music on the street, noise of the children, bread burned instead of nicely toasted, tea not boiling hot, water not just from the well, jar upon the sensitive nerves and create suffering and complaint, which, to one never or rarely sick, appear childish in the extreme. I remember when Nellie was but four, she was sick with a disease affecting the head. The room to which she was confined had a window containing in the lower sash but two frames in depth, while the upper one had three. She often said aloud, "three and two, three and two!" We supposed her mind wandering, but at last discovered it was the incongruity of the window, from which she could not divert her attention. At another time a friend whose shoulder had been dislocated, and who was obliged to lie in one position, suffered greatly from a stray hair that was under the shoulder. I laughingly told her it was only her fancy, until seeing the tears in her eyes, I found and removed it. In health we may call such things foolish—in sickness we had better not. Fresh air and water work wonders in the sick room. Cover the patient, head and all, with the bed clothes, adding more if the weather is cold, and open wide the windows for two or three minutes, when the day is fine. Every time the patient drinks, let the water be fresh. The nerves of taste and smell become as sensitive as any others. Fresh linen is a luxury, and everything about the person and bed should be kept strictly clean.

It becomes, of course, no light task to take care of the sick, and calls for a large stock of patience and endurance. Lost sleep must be made up at odd times, as far as possible, a bath often taken, and fresh air without stint. A good meal, too, is an excellent disinfectant. A cheerful face, a cheerful tone of voice, *never a whisper*, rather quick and decided movements, instead of timid and lingering, all tend to inspire the patient with hope, and produce happy results. These are small things in themselves, but being usually left by the physician to the good sense of the nurse, should not be overlooked by her, or even considered less important than medicine towards effecting a cure.

Our dear father has gone to his rest. Though robust for one of his age, he had not strength to rally again from so long and wasting a fever. My husband was the younger of his children, and his home has been with us for a few years past. We shall miss his gentle quiet ways, his hat by the door, his cane in the corner. His chair at the fireside will be vacant now. No more stories for the children, of the times when he was a little boy, about which they never wearied of hearing. He didn't seem old as he was, for his heart was warm and young. His age was seventy-five. To the child, how far in the future! To him it was "but a span." Has life to him opened again, where death never comes? We trust "All is well."

To-day I was made glad with the sight of Lizzie's dear face peering in through my blind, while she called me to take a view of Georgy, who, without ceremony, had seated himself under an apple tree, and after filling his lap with apples, had commenced the work of eating them all up. How he has grown! I venture to say that grandmother thinks there never was such a child before, though she may have a dozen of her own. Ah, yes, I see it now! Those little socks so gaily shaded and ribbed, are her work, I know. The apron with long sleeves, fitting closely about the neck, and substantial shoes, have come from her good motherly advice. But can it be that baby Georgy has gone, and this stout boy has taken his place? Mr. Beecher says: "Nothing on earth grows so fast as children." I should know, if he had said no more, that his own were leaving the home circle; that he too was growing old! But Lizzie has improved in looks. The rest from care awhile has been just what she needed. Home, too, will seem dearer now than ever, and with new energy she will enter upon its duties. Of one thing I am pretty sure. Her mother never before found an ear more ready to listen to instruction. In all her girlhood days she learned not so much about housekeeping as in these few weeks under her mother's tuition. How often she had heard the same things before! Now they have a real value,

BOYS & GIRLS' COLUMNS.

Breath—How Air is Purified.

In our last talk about the breath, we showed that what passed from the lungs, and the bubbles which rise from the lime and vinegar, are similar; both make clear lime-water turn milky. Such air, or, more properly speaking, such gas, is called *carbonic acid* gas. It forms the largest part of the breath which leaves the lungs, and is a poison if breathed again. Freshly burned lime will absorb this gas from the air, and become "air-slaked." If strong vinegar or other acid be poured upon air-slaked lime, it will unite with the lime, and let the carbonic acid gas pass off again. Wood, coal, and most combustibles are largely made up of *carbon*. When they are burned, *oxygen* from the air unites with the carbon and forms carbonic acid. When air is drawn into the lungs, it mixes with the blood, and its *oxygen* unites with carbon contained in the blood, forming carbonic acid, which is expelled by breathing out. Then the atmosphere around the house is being constantly spoiled by all the fires that are burning, and by every living creature that breathes, for they are all pouring out the poisonous carbonic acid gas. There must be some very extensive apparatus to purify the air, for it has received millions of tons of carbonic acid every day for thousands of years. There is such apparatus. It is found in every leaf of the trees, in every blade of grass, in every weed that grows

under the water, in all vegetable productions. For these are so made, that they take carbonic acid from the air, keep the carbon to increase their growth, and send out the oxygen into the atmosphere again. The wood of forest trees, the stalk of waving corn, the flowers, and all the innumerable parts of vegetable growth, are mostly made of carbon thus drawn from the air. The breath from your lungs to-day may ever long be part of the rose which will bloom in the garden. The wood consumed in your stove will find its way back to the forests; the coal will help to nourish the harvests of coming years. The wheat will be eaten, its carbon will help form living muscle, this, when worn out, will be taken into the blood, oxygen from the air will enter the lungs, find the worn-out particle, and unite with it, the gas will go forth to enter some other form of growth—and thus ceaselessly the wonderful round of growth, change, decay, and new life will be continued to the end of time, as it has since its beginning, ever bearing testimony to the wondrous skill of the Creator, and his goodness in providing for the life of his creatures, and calling for their gratitude.

Ready and Willing to Work.

On the roof of a high building at the corner of a street in the city of New York, stands the statue of a boy leaning against the trunk of a tree. He seems in a watchful, waiting mood; not idly wasting time, but all ready for a call to duty,—hoping for it and expecting it. The boy represented there has grown to be a prosperous and wealthy man. When a boy he was very poor. A tree stood upon that street corner then, and there he would go and wait, sometimes leaning for rest against the tree, but always on the alert; always ready for work, and prompt to answer the first call of any who would employ him. Years passed by and he became the rich owner of that corner and the buildings on it. But he was not ashamed of the days of his honest poverty, and he caused this statue to be made from the old tree, and placed where it is, to show what he had been in his boyhood. And now the statue is constantly proclaiming from its lofty place to all the passers by, what industry and perseverance can accomplish.—There is nothing wonderful in that boy's success. He was *not ashamed to work*, and was *always ready* for it. Here, boys, is a lesson for you. Most of you will probably have to work for a living. Do not regard that as a mis-

fortune. Make up your minds to go at it like *manly* boys; always wide-awake, always willing to do your part as fast as you find out what that is. Such boys make noble men.

UNCLE PAUL.

Terriers vs. Cats.—A sharp-eyed correspondent, "G. H. C.," thus comments on the answer to the "Cat Problem," (No. 265). "Mathematically it is answered correctly, but practically, it is incorrect, for the reason that a cat rarely, if ever, kills two rats in immediate succession. As soon as one rat is vanquished, it is carried to a place of safety, or to the house to be exhibited, or more frequently the cat begins to devour it. Had the problem named *terriers*, there would have been no such doubts as to practicability." We print this note, to encourage all to keep their eyes open, to closely observe every thing going on around them; the above fact in the habits of cats was probably known to most of those who answered the problem, but only one seems to have thought of it in connection with the problem.

New Puzzles to be Answered.

No. 275. *Figure Puzzle.*—What well-known plant can the number four be made to exactly represent?

No. 276. *Double Puzzle.*—The picture below is first a puzzle for the eye. When all it contains is discovered, you may find a rebus to be read, giving a word that has some fame in history. It will be interesting to read the

history describing and giving an account of it, and thus you may get the whole benefit of the puzzle.

No. 277. *Enigma.*—Contributed to the *American Agriculturist* by Mehitabel Duncan. I have a tongue, but never eat; I have a voice, but never speak; I'm sometimes young, and sometimes old, but rarely number more than twelve; and 'though all over the world I roam, I very seldom go alone; at home, abroad, in every place, I wear no stays, but often lace; I have eyes, but never see, and the "Wellspring of Life" is contained in me.

No. 278. *Study in Horsemanship.*—This is not difficult

to solve, as it is only required to get the boys off their horses. Almost any boy can easily tell how that is done.

No. 279. *Illustrated Rebus.*—For the young to remember.

Answers to Problems and Puzzles.

The following are answers to the puzzles, etc., in the

August number, p. 297.

No. 272. *Illustrated Rebus.*—To be over-tenacious in trifles indicates little understanding....

No. 273. *Arithmetical Problem.*—No correct answers received; left open for another month....

No. 274. *Illustrated Rebus.*—Keep malice in your heart, and you harbor a viper there.... The following sent in correct answers to the puzzles,

etc.: Clara L. Rice, Jas. Crockett, Susie and Hannah Otis, J. R. Land, Henry Weber, J. F. B., P. J. Umsted, Isaac T. McLain, Stephen Hatt, Enos Stoneback, Sarah E. Adkins, Joseph Rawson, Wm. A. Smith, "L. A. C.," Mamie and Lena Close, Samuel F. King, J. Milton Snyder, Sarah L. Tyler, Etta Wilson, John H. Coffin, Andrew Jackson, Henry J. Meixell, Eugene A. Baumann, Hugh U. Kay, M. Campion, S. M. Wright,

George E. Clarke, "A. P. C.," Julius M. B. Larabee, Stanford Swords, E. Leonard, T. Gurnee, Frank Botsford, Wm. P. Powell, Student, Beckie R. Morse, William Wilkenson, William H. Rowe, Mary R. Child, Jay Clark, H. J. Porter, F. W. Earl, Frank H. Marston, Anice Cochran, Lebbie Stephens, James B. Marshall.

True Courage.

Bishop Simpson relates the following incident: Before the war, while General Sherman was living in San Francisco, there was a great celebration of Independence

Day. The General was Grand Marshal, and presided at an immense gathering at the theatre, where the Declaration was to be read, a poem delivered, with other exercises appropriate to the occasion. Just as the poem was commenced, one of the General's aids advanced to the platform, looking ghastly pale, and beckoning Sherman to him, whispered in his ear that the side-walls of the building had settled under the great pressure from the crowd within, and there was danger of their giving way and overwhelming them in the ruins. The General instantly directed him to be seated where the audience could not see his frightened countenance, ordered another aid to watch the walls and report if any further settling was noticed, and then calmly took his seat and apparently gave his entire attention to the exercises. He judged that any violent commotion among the assembly would be likely to increase the danger, while if they dispersed slowly, no harm might follow. For an hour or more he remained at his post, and at last the crowd retired safely, entirely ignorant of the great peril they had escaped.

[COPYRIGHT SECURED.]

COMMENCEMENT OF HOSTILITIES.—FROM A PAINTING BY ZACHARIE NOTERMAN.—Engraved for the American Agriculturist.

A Lively Time in Prospect.

An exciting battle is about commencing, as anybody can see by one look at the picture. As usual, greediness and selfishness are the moving causes, and the innocent, as well as the guilty, must suffer. If anybody does not believe animals feel and think much like human beings, let him study the expression of the enraged cat, whose motherly passion is aroused, and who is ready to meet any odds in repelling the invaders of her home. A few vigorous strokes from pussy's claws will send Fido yelping from his intended feast. He certainly counted without his host. No doubt he had often made the cat scamper at a lively rate, when she came near his premises at dinner time, and he foolishly thought she was a poor, cowardly animal, that would submit to anything. Probably he felt encouraged to make this attempt by his rough play-fellow that he became acquainted with in the street; bad company makes bad manners. That is very much like human nature. Perhaps it would be more correct to say, that human nature, left to itself, is, in many, respects very much like dog and cat nature.

Looking through Grandpa's Spectacles.

"Now, I'll be grandpa," said little Charley Wright. He had climbed into his grandfather's easy chair near the window, wrapped himself in the old gentleman's dressing gown, and clapped on his spectacles, which had been left lying on the window sill. "What a funny little grandpa!" shouted his sister Kate, who was busy with her new building blocks on the floor. "Hush, child, you disturb me," said Charley, looking over the spectacles, and trying to keep very sober and to speak in a heavy and slow voice. He was laughing all over inside his plump

little body, and his eyes twinkled with the fun he was having. Kate enjoyed the sport, and "made believe" she was very sorry she had interrupted his meditations, and Charley settled himself back in the chair "to think of old times," he said. In a few minutes he was much surprised to see how different everything looked through the spectacles. His hands appeared large, bony and wrinkled; his feet seemed grown to four times their former size, and in place of his little buttoned gaiters, there were a pair of worked slippers, just such as he had often put on to his grandfather's feet. He started up and stared into the looking glass, where he saw a thin wrinkled face, with sunken cheeks and mouth, and a large head thinly covered with grey hair. "I am grandfather, sure enough," thought he, for his hand trembled as he passed it over his face, and as he walked a twinge of the rheumatism in his limbs made him step very carefully. "Kate, my child, will you please bring some water," said he, turning to the little girl, who was still playing with her blocks. "Yes, pretty soon, grandpa; wait till I finish this church." "I would like it now, dear." "Well, I'll go," said she, pettishly, and left the room. "I'm sorry Kate is so thoughtless and rude," said he, to himself, "she cannot know how such conduct pains me." Just then, a boy came bounding into the room, whom he at once recognized as his former self, little Charley. "O, grandpa, I want a ride on your back," shouted he. "Not this afternoon, Charley, my rheumatism hurts me to-day." "Give me a penny then to buy candy." "You have just had dinner, and should not eat anything more now." "Stingy grandpa," replied the boy. He would not have said it if he could have known how the words hurt. The old man sighed, but said nothing. Just then Kate came in with a glass of water in one hand and a large apple in the other. "Oh, I want an apple," cried

Charley, trying to snatch it from her hand. "You can't have this," said Kate, holding it out of reach. "Go ask Susan, she will give you one." "I want that one," persisted Charley, struggling to get it. The old gentleman here interfered, but Charley turned upon him, and would have struck him, but his arm was firmly held, and he was led to the door, put out, and told to stay out until he could behave himself properly. "Why will children be so thoughtless and selfish," said the old man sadly, as he sank back in his chair. "They make themselves unhappy, and disturb all around them. If they could only feel for a little while as they will when they are older, I am sure they would try to do better." "What did you say?" said Kate. Charley started up from the easy chair, the spectacles fell from his nose—he had been asleep. "Oh, Kate," said he, "such a dream I've had. I'm never going to speak naughtily to Grandpa again. You don't know how bad it makes him feel." Then he told all that had happened, and Kate could hardly help crying, for she remembered how she had often spoken crossly to her "dear grandfather," as she called him, and when the old gentleman did come in, it would have done you good, as it did him, to see how pleasantly they greeted him, and to hear them say how sorry they were that they had ever made him any trouble by their thoughtlessness.

Charley's Question.—A correspondent writes to the *American Agriculturist*: "Our five-year-old Charley asked me the following question: 'If at the icy north they have six months day and six months night—do they have any Sunday?'" How is this, boys and girls?

Queries.—Does a Walrusian go barefoot when he has snow-shoes on? Could a bear-footed animal catch him? And when caught would he say "its snow joke?"

(Business Notices \$2.50 per Agate Line of Space.)

Paris Exposition. — Sewing-Machine Awards.

We recently published a brief telegram from Paris, announcing the award, over eighty-two competitors, to Messrs. WHEELER & WILSON of the Highest Premium, a Gold Medal, for the perfection of Sewing Machines, and Button-Hole Machines. The following are copies of the official documents confirming the announcement:—

EXPOSITION UNIVERSELLE,

PARIS, 1867.

COMMISSION IMPERIALE, CHAMP-DE-MAES, }
16th July, 1867.

Mr. H. HUNTING, No. 139 REGENT ST., LONDON:—

DEAR SIR: Replying to your inquiry, I beg to state that the ONLY GOLD MEDAL for the manufacture and PERFECTION OF SEWING-MACHINES and BUTTON-HOLE MACHINES, was awarded to Messrs. WHEELER & WILSON, of New York.

Yours, respectfully,

HENRY E. Q. D'ALIGNY,

Member of International Jury and Reporter of same.

Another letter, of the same date, says:—

DEAR SIR: Replying to your inquiry, I herewith give you the list of gold medals awarded to my class:

DUPUIS ET DUMERY, for Sewing Shoe Machines.

WHEELER & WILSON, New York, for the manufacture and perfection of their Sewing Machines and Button-Hole Machines.

There is, also, in the list of "Co-operators," a Gold Medal granted to Mr. Elias Howe, Jr., personally, as PROMOTEUR of the Sewing-Machine.

Respectfully yours,

HENRY E. Q. D'ALIGNY,

Reporter of Class No. 57 (Group No. 6.) Member of the International Jury at the Exposition Universelle.

Extract from LE MONITEUR UNIVERSEL, official journal of the French Empire:

"The Wheeler & Wilson Company of New York, manufacturers of American Sewing-Machines, have just received the GOLD MEDAL at the Exposition Universelle, for the good construction of their machines; the new improvement for making button-holes, applicable to their sewing-machines; also, for their machine especially for making button-holes. This award is accorded for the great development that Messrs. Wheeler & Wilson have given to the sewing-machine industry, in bringing their machines to the doors of all, by their cheapness and solid construction, which allows their employment with satisfaction in families, and with great advantage in work-rooms."

THE ONLY GOLD MEDAL

Awarded to AMERICAN SEWING MACHINES at the Paris Exposition of 1867, was given to the Machines manufactured by this Company.

The
Howe Machine
Co.'s Sewing
Machines,

699 Broadway,
Cor. Fourth-st.,
New York.For Families and
Manufacturers.**These World-Renowned Sewing Machines**

Were awarded the highest premium at the World's Fair in London, and six first premiums at the N. Y. State Fair of 1866. These awards, signed by the President and Secretary of the New York State Agricultural Society, can be seen at our office.

These machines are made under the immediate supervision of the President of the Company, ELIAS HOWE, Jr., the original inventor of the Sewing Machine.

The Stitch invented by MR. HOWE, and made on this Machine, is the most popular and durable, and all Sewing Machines are subject to the principle invented by him.

Silvers' Patent Broom

WHICH HAS TAKEN THE FIRST PREMIUMS AT THE NEW YORK, OHIO AND KENTUCKY STATE FAIRS.

Enables every farmer to use Broom Corn brush of his own raising, and have a better broom in every respect than can be bought at the store. It is so simple that a child can put it together. The parts (except the brush), will last a life time, and the brush can be renewed in a few minutes. The American Agriculturist for July, 1867, says: "Silver's Patent Brooms have been tested by several months' use in our families, and the writer has, without instruction, and with entire ease, prepared the brush and filled the brooms to his perfect satisfaction. The ladies pronounce the brooms much superior in elasticity and durability to the old ones, and they are adopted as a family institution."

TO FARMERS—AGENTS WANTED.

The Brass Metallic parts sent to Farmers with full instructions for making their own Brooms, by mail or express (prepaid), for \$1.50.

Agents wanted in every city and county in the United States, to whom exclusive right of sale will be given, without any charge for Patent. Over 300 Agents are already engaged in selling this Broom exclusively, and are making from \$5 to \$20 per day.

For full particulars see Feb. Agriculturist, page 77, and June, page 227, and send for Circular.

Address, stating first, second, and third choice of Counties, C. A. CLEGG & CO., No. 206 Broadway, New York.

**PRINCE & CO'S.
AUTOMATIC ORGANS
AND MELODEONS.
Forty thousand are now in use
BUFFALO, N.Y. CHICAGO, ILL.**

**PRIEST'S PATENT BASKET.**

This basket has a movable bottom made of two pieces, attached with hinges, and connected by cords to a wire in the handle. The upper end of the wire is formed into a hook, by which to hang the basket to a limb of the tree. By means of a cord attached to the hook, the basket, when filled, is lowered to the ground or into a barrel; the cord is then slackened, the basket is gently raised, the bottom opens and the fruit is deposited as carefully as it can be done with the hands.

By using this basket, the danger attending the carrying of fruit from the tops of trees to the ground is avoided, the labor is lessened one-half, and the fruit is not bruised as when poured out of an ordinary basket.

Send price and stamped envelope for sample to Dr. W. M. G. BONWILL, Patentee and Genl. Agent, Dover, Delaware. Agents wanted. Patented June 25th, 1867.

Would call the attention of Dealers and Planters to his extensive stock of Grape Vines, and especially to the

CONCORD AND IONA.

Our Concord vines this year, are pronounced by those who have examined them to be far superior to those ordinarily grown, and we challenge comparison with any other reliable establishment, both in price and excellence of plants.

By our system of growing and in our soil the roots of the vines attain the highest point of perfection, and it is to this in particular that we would direct the attention of purchasers and planters.

PRICE OF CONCORD VINES.

1st Class 25c. each; \$2.00 per doz.; \$6.00 per 50; \$10 per 100; \$75 per 1,000; \$700 per 10,000.
2d Class, 20c. each; \$1.50 per doz.; \$4.50 per 50; \$8 per 100; \$60 per 1,000; \$550 per 10,000.

Our stock of **IONA** vines is also of the highest excellence, and will compare favorably with those of any other grower.

This excellent variety is fast gaining a reputation which promises to supersede all others. No person setting out a vineyard should fail to plant it extensively. The reports which we hear this year from nearly all parts of the country are of the most favorable character. We can furnish vines of this variety in any quantity, by the single vine or 10,000, at as low rates as equally good plants can be obtained from any reliable grower. We warrant all our plants true to name, and of the quality stated.

Of all the other leading varieties we have a well selected stock, which we offer at the lowest rates, for which we refer to our Price List. We would here only mention a beautiful lot of **Hartford Prolific**, which is undoubtedly the most reliable and profitable early market grape which we have.

Also a very superior lot of Diana vines, both 1 & 2 years old.
CLINTON VINES.—Of this excellent and profitable wine grape we have a choice lot of plants. Price: 1st Class, 25c. each; \$2.00 per doz.; \$6 per 50; \$3 per 100; \$65 per 1,000; \$600 per 10,000.

For further information send for Price List, and address
G. E. MEISSNER, Richmond P. O., Staten Island, N. Y.

UNIVERSAL CLOTHES WRINGER.

Cannot be surpassed or equaled by any other Wringer for durability, till the expiration of the patent for the "COG WHEEL REGULATOR" or "STOP-GEAR." No other Wringer is licensed under this Patent. It being now universally conceded that Cogs are necessary to prevent the Rolls from being broken or torn loose, many attempts have been made to get a Cog-Wheel arrangement which shall equal the UNIVERSAL, and yet avoid the "Stop-Gear" patent, but without success.

Any Cog-Wheel Wringer having Cogs, whether at one or both ends of the roll, which can play apart and fly out of gear when a large article is passing through, is COMPARATIVELY WORTHLESS, as the Cogs are then of no aid when most needed, and an arrangement of Cog-Wheels in fixed bearings, the upper one acting on a roll in movable bearings, must prove a mechanical failure in use, and we warn all persons not to purchase such Wringers as an "improvement on the Universal," which they are sometimes represented to be by the salesmen.

Many who sell the UNIVERSAL WRINGER keep also the

DOTY WASHING MACHINE,

which, though but recently introduced, is really as great a LABOR AND CLOTHES SAVER as the Wringer, and is destined to win public favor and patronage everywhere. It washes perfectly, without wearing or rubbing the clothes at all.

Those keeping the Wringer for sale, order the Washer for customers, if they have not got a supply on hand. On receipt of the Retail price, from places where no one is selling, we will send either or both machines from New York. Prices—Family Washer, \$14. One 1½ Wringer, \$10. No. 2 Wringer, \$25.

A supply of the Wringers and Washers is always kept on hand in Chicago, Cincinnati, Cleveland, Jamesville and St. Louis, boxed ready for shipment, at about New York prices. Large profits are made selling these machines. Exclusive right of sale given, with no charge for the patent right. Circulars, giving Wholesale and Retail prices, sent free.

These Machines are adopted by the *American Agriculturist* as Premiums, and endorsed by its Editors as the best in market—for recommendations see back numbers.

R. C. BROWN, General Agent,
No. 32 Cortlandt-st., New York.

STRAWBERRIES.

After a trial of eight years, we unhesitatingly say that for
**Uniform and large size,
Beauty of Form and Color,
Enormous Yield,
Long Continuance in bearing,
Health and Vigor of Plant,
Adaptation to Shipment,
Great Profit,**

and other desirable qualities, the

JUCUNDA—Our No. 700,

is much the most valuable Strawberry of which we have any knowledge.

Plant the Best.—It is poor economy to grow inferior varieties, when the best can be obtained, though the plants could be had for nothing. We can make more money on one acre of **Jucunda—Our No. 700**, than we can on five of **Wilson**.

For full information in reference to this wonderful Strawberry; its uniformly immense crops, fine shipping qualities and high market value; testimonials from different parts of the country; opinions of Dr. Jno. A. Warder, Author of *American Pomology*, Prof. Geo. Thurber, Editor of *American Agriculturist*, Thos. Meehan, Editor of *Gardeners' Monthly*, M. B. Bateham, Sec'y of *Ohio Pomological Society*, Geo. Beeler, late Sec'y of *Indiana Horticultural Society*, A. W. Harrison, and many others, see the

NEW EDITION OF OUR CATALOGUE,

which also contains Complete Lists of best Early, Medium, and Late varieties, for both Home use, and Market purposes. Prices of plants grown in Pots and otherwise—by Mail and Express, and much other valuable information in reference to the Strawberry.

We will furnish strong plants of

JUCUNDA—Our No. 700,

this fall, at following prices:

By Mail, \$1 per dozen; \$6 per 100.

By Express, \$6 per 100; \$50 per 1000.

Pot grown Plants for Bearing a full crop of fruit next season:

2-inch Pots	\$2.00 per dozen;	\$12 per 100;	\$100 per 1000.
3 " "	\$2.50 " "	\$15 " "	\$125 " "
4 " "	\$3.00 " "	\$20 " "	\$150 " "

For prices of other varieties, See Catalogue, which will be sent to all applicants enclosing 10 cts.

A NEW WORK. SMALL FRUIT CULTURIST.

By ANDREW S. FULLER,

PRACTICAL HORTICULTURIST, RIDGEWOOD, BERGEN CO., N. J.

A new work, and the only one devoted to Small Fruits. Special treatises of this kind have the advantage that the author can more thoroughly discuss his subject, and go into greater detail, than in a work embracing both large and small fruits. The work covers the whole ground of Propagation, Culture, Varieties, Packing for Market, etc.

CONTENTS: INTRODUCTION.—I. BARBERRY.—II. STRAWBERRY.—III. RASPBERRY.—IV. BLACKBERRY.—V. DWARF CHERRY.—VI. CURRANT.—VII. GOOSEBERRY.—VIII. CORNELIAN CHERRY.—IX. CRANBERRY.—X. HUCKLEBERRY.—XI. SHEPHERDIA.—XII. PREPARATION FOR GATHERING FRUIT.

We predict that this work will bring Mr. Fuller many enemies, as he has given his opinion about varieties without reserve. On the other hand it will be more strongly endeared to all true lovers of horticulture, as these wish to have the merits of fruit given without reference to the persons who introduce them.

While very full on all the small fruits, the Currants and Raspberries have been more carefully elaborated than ever before, and in this important part of his book, the author has had the invaluable counsel of Charles Downing. The chapter on gathering and packing fruit is a valuable one, and in it are figured all the baskets and boxes now in common use. The book is very finely and thoroughly illustrated, and makes an admirable companion to his Grape Culturist.

SENT POST-PAID.

PRICE, \$1.50

NEW YORK:

ORANGE JUDD & CO.,

41 PARK ROW,

DRAINING FOR PROFIT AND DRAINING FOR HEALTH.

By GEO. E. WARING, Jr.,

ENGINEER OF THE DRAINAGE OF CENTRAL PARK, NEW YORK.

Illustrated.

TABLE OF CONTENTS:

LAND TO BE DRAINED AND THE REASONS WHY.—Indications of the need of draining.—Sources of water.—Objections to too much water.—Wet sub-soil.

HOW DRAINS ACT AND HOW THEY AFFECT THE SOIL.—Characteristics of well laid tile drain.—Surface-water and rain water beneficial, springs and soakage water injurious.—Cracking of stiff clays.—Evaporation and filtration.—Rain fall.—Evaporation.—Temperature.—Drought.—Porosity or mellowness.—Chemical action in the soil.

HOW TO GO TO WORK TO LAY OUT A SYSTEM OF DRAINS.—Amateur draining.—Maps.—Levelling instruments.—Outlets and location of drains.—Main drains.—Spring water.—Fall.—Tiles.—Depth and distance apart.—Direction of laterals.—Collars.—Discharge of water from drains.

HOW TO MAKE THE DRAINS.—Tools.—Marking the lines.—Water courses.—Outlet.—Silt Basins.—Opening the ditches.—Grading.—Tile laying.—Connections.—Covering the tile and filling in.—Collecting the water of springs.—Amending the map.

HOW TO TAKE CARE OF DRAINS AND DRAINED LAND.—Removing obstructions.—Mistake of substituting large tiles for small ones which have become obstructed.—Heavy lands should not be trampled while wet.

WHAT DRAINING COSTS.

Draining, expensive work.—Their permanence and lasting effects.—Cheapness versus economy.—Details of cost.—(1. Engineering and Superintendence.—2. Digging the ditches.—3. Grading the bottoms.—4. Tile and tile laying.—5. Covering and filling.—6. Outlets and Silt Basins.)

WILL IT PAY?

Increased crops required to pay cost of draining.—(Corn, Wheat, Rye, Oats, Potatoes, Barley, Hay, Cotton, Tobacco.)—Instances of profit.—Benefit of draining in facilitating farm work.

HOW TO MAKE DRAINING TILES.

Materials.—Preparation of earthenware.—Moulding tile machines.—Drying and rolling.—Burning.—Kilns.—General arrangement of a tiler.

THE RECLAIMING OF SALT MARSHES.

Extent of marshes on the Atlantic Coast.—The English Fens.—Harlem Lake.—The exclusion of sea water.—Removal of the causes of inundation from the upland.—Removal of rain fall and water of filtration.—Embankments.—Muskrats.—Rivers and Creeks.—Outlet of drainage.

MALARIAL DISEASES.

Fever and Ague.—Neuralgia.—Vicinity of New York.—Dr. Bartlett on Periodical Fever.—Dr. Metcalf's Report to U. S. Sanitary Commission.—La Roche on the effects of Malarial Fever.—Dr. Salisbury on the "Cause of Malarial Fevers."—English experience.—Reports to the British Parliament.—Cause of Malaria removed by draining.

HOUSE AND TOWN DRAINAGE.

Sewerage.—The use of pipes.—The new outfall sewers in London.—The use of steam pumps to secure outlets.—Utilization of sewage matters in agriculture.—Effects of imperfect house drainage on health.—Typhoid fever.—The Westminster fever in London.—Epidemic at the Maplewood Young Ladies Institute in Pittsfield, Mass.—Lambeth Square, London.—Back drainage.—Water supply.—General Board of Health, (England).

Post-paid.....10 cents.

The Horticulturist Almanac for 1868.

Post-paid.....10 cents.

NEW NATIONAL RELIGIOUS PAPER.

A national religious newspaper, to be called "THE ADVANCE," will be published weekly, from the first of September, onward, in the city of Chicago. It will represent Congregational principles and polity, but will be conducted in a spirit of courtesy and fraternity towards all Christians. The form will be what is popularly termed a double sheet of eight pages, of the size and style of the *N. Y. Evangelist*. The pecuniary basis is an ample capital furnished by leading business men and others, to be expended in the establishment and improvement of the paper, which is intended to be second to none in the country, in its literary and religious character. The purpose of its projectors is indicated in the name: their aim being to ADVANCE the cause of evangelical religion, in its relations not only to doctrine, worship and ecclesiastical polity, but also to philosophy, science, literature, politics, business, amusements, art, morals, philanthropy and whatever else conduces to the glory of God and the good of man by its bearing upon Christian civilization. No expense has been spared in providing for its editorial management in all departments, while arrangements are in progress to secure the ablest contributors and correspondents at home and abroad. The city of Chicago has been selected as the place of publication, because of its metropolitan position in the section of the country especially demanding such a paper, and the fact that it is nearly the center of national population, and in a very few years will be the ecclesiastical center of the Congregational churches. Issued at the interior commercial metropolis, THE ADVANCE will contain the latest market reports, and able discussions of financial subjects, such as will make it a necessity to business men in all parts of the country. The editor-in-chief will be Rev. Wm. W. Patton, D. D., who resigns the pastorate of the leading church of the denomination at the West for this purpose, and who has had many years experience in editorial labor. The subscription price will be \$2.50 in advance. Advertising rates made known on application. Address "THE ADVANCE COMPANY," P. O. Drawer 6374, Chicago, Illinois.

Short-Hand without a Master, by which the art of taking down Sermons, Lectures, Speeches, Trials, etc., may be attained in a few hours. Fifty-fourth edition, WITH SUPPLEMENT. Price 25 cents. Send orders to O. A. ROORBACH, 122 Nassau-st., New York.

A PORTRAIT OF HORACE GREELEY.

The publishers of THE TRIBUNE having received many inquiries from time to time for a good likeness of the Editor of THE TRIBUNE, have made an arrangement with Messrs. Derby & Miller to furnish copies of Ritchie's fine steel engraving, size 11x13 inches, from a photograph by Brady, which will be sent to such subscribers to THE TRIBUNE as wish it on the conditions below. This is much the best likeness of Mr. GREELEY that has been engraved. The print sells for \$1. Each subscriber who sends \$10 for THE DAILY, \$4 for THE SEMI-WEEKLY, or \$2 for THE WEEKLY TRIBUNE, the paper to be sent by mail, and who requests the engraving at the time of subscribing, will have a copy carefully mailed, post-paid, to his address. This is not proposed as a premium, but to gratify the many friends of THE TRIBUNE, who feel a desire to possess a good likeness of its founder.
Address THE TRIBUNE, New York.

THE CHURCH UNION.

The largest and best Religious Family Newspaper in the World. It is to be enlarged to twice its present size. It is devoted to the Unity of the whole Church of Christ, and opposes Ritualism in every form. It is the organ of no sect, and it advocates free communion and a free pulpit. It will print Sermons from Rev. Henry Ward Beecher in every issue. Terms, \$2.50 yearly. \$1.00 to Agents for every subscriber. Sold by the American News Company, New York.
Address CHARLES ALBERTSON,
Supt. Church Union, 103 Fulton-st., New York.

CARPENTERS.—SEND FOR CATALOGUE of New and Practical Architectural Works, enclosing stamp.
A. J. BICKNELL, Publisher, TROY, N. Y.

SOLDIERS' CHECK BOOKS, (or if lost, the amount they call for), and all other claims promptly collected by C. S. TIERVITT, (date of the Pay Department), Washington, D. C. Send for Circular.

AGENTS WANTED

for J. T. HEADLEY's Great Work on our Navy, entitled "FARRAGUT and OUR NAVAL COMMANDERS," comprising the early Life and Naval Career of Admirals Farragut, Porter, Foote, Dupont and a host of others—the only work of the kind published. It is highly recommended by the leading Naval Officers, and endorsed by Secretaries Seward and Wells, Governors Fenton, Buckingham and Burdick, and leading men of the country. Our Agents in connection with this work can take orders for four other standard works by the same author. Our terms are nowhere excelled.

Those who wish to obtain 10,000, or more, can correspond, and will be furnished at still lower prices.

All the vines we offer are grown from well ripened wood, and in good, deep soil, not injured by extra manuring.

In classifying we make no *extras*. Our No. 1 plants are the largest and best of our stock, and their average quality is not allowed to be diminished by selecting the largest for retailing as *extras*.

Our vines must speak for themselves, and those who wish to purchase largely are sufficiently wise to accept the evidence of the vines rather than the assertion of the grower. To account for the abundant roots of our plants it is only necessary to say that ours is the *open border culture*, and that we aim to obtain the model roots of our figure.

Our mode of propagation is that by single eyes of well ripened wood, without the forcing caused by bottom heat. Plants thus naturally brought forward have good roots, and when planted in the open ground, commence growing at once. They thus make their growth during the summer, and in September and October are ready to mature their wood and roots. By other modes the plants are late in starting, and thus have a shorter time for growth and maturing their wood and roots.

We can especially recommend our **DELAWARE** of two and three years of age. The success of this variety in New England, and in the lake region of the Western States, renders unnecessary any assertion of its merits.

The **IONA** is succeeding better this season than the last, and in many localities is winning golden opinions.

Of the **IVES** we cannot speak too highly. Its freedom from rot or mildew, and its very rapid, hardy growth, make it one of the most reliable varieties, one of the few which are absolutely safe.

For Catalogues address

FLUSHING, near New York.

SING SING GRAPE VINES.

Hereafter

SPRING VALLEY NURSERIES.

3 Miles north of Sing Sing.

I offer my stock of Grape Vines this fall with increased confidence, being the best I have ever grown. Having bought the neighboring Nurseries of Ryder & Co., it has given me plenty of room and great facilities to grow good plants with small cost.

I would advise the purchaser of good vines, to come and see my stock before buying elsewhere. My sole business is to grow only good vines. Remember, I have not been able to fill all my orders these last five past years. If you want some of my vines, send your orders early.

Good vines are the cheapest at any price. Send for Price List.

J. F. DELIOT, Vine Grower,
Sing Sing, N. Y.

Grape Vines.

ELLWANGER & BARRY'S

Seedling Strawberry.

NICANOR.

Having fruited it for 6 years we pronounce it a decided acquisition to the list of market Strawberries. Plant very hardy and vigorous, surpassing in quantity of fruit and hardness of vine any other variety we have ever tested. It commences to ripen a few days before the Early Scarlet, and continues on up to the latest, thus making it profitable at both ends of the season. Fruit from one to one and a quarter inch in diameter; berry regular and uniform in size, roundish conical, bright scarlet, flesh more firm and not so acid as the Wilson.

Plants will be ready for delivery about the 15th of September, at \$5.00 per dozen.

ELLWANGER & BARRY,
Mount Hope Nurseries,
Rochester, N. Y.

The Great European Strawberry. "DR. NICAISE."

Said to be the largest berry known. From plants set in September last, fruit was picked and exhibited at the **Fruit Growers' Society**, held in Rochester, on the 27th of last June, which weighed $1\frac{1}{4}$ ozs., and measured $6\frac{1}{2}$ inches around.

Plants very hardy, vigorous grower, and productive. From five plants imported in the Spring of 1866, we produced 500 very strong plants. This variety we have imported at a great expense, and will have a fine stock to offer our customers in August and September.

The following are extracts from European Catalogues: "It is of enormous size, the berries weighing over $1\frac{1}{4}$ ozs., (9 to the pound), and early, of a bright red color, very glossy, the flesh white, and of fine quality."

This sort is one of the finest cultivated in Europe, and has the best characteristics of any we have ever introduced. Orders must be sent in early, as they will only be filled in rotation.

We will furnish plants, postage paid, at the following rates: \$1 per plant; \$10 per doz.; \$75 per 100. A liberal discount to the trade. Address

FROST & CO.,
Genesee Valley Nurseries,
Rochester, N. Y.

STRAWBERRY PLANTS.

We offer the following select list of Strawberry plants, which will be ready to send out by Sept. 1st.

at 50 cents per dozen; \$2 per 100; \$10 per 1,000.

Also a large collection of new and foreign varieties including **Lennig's White, Durand's Seedling, Green Prolific, &c.**, at \$1 per dozen; and a limited quantity of

DR. NICAISE, the largest strawberry known, at \$6.00 per dozen.

All orders from unknown correspondents must be accompanied with the cash.

ELLWANGER & BARRY,
Mount Hope Nurseries, Rochester, N. Y.

Strawberry Plants.

Juennia, Rippowam, Metcalf's Early, Lennig's White, Agriculturist, Barnes' Seedling, Napoleon III, Philadelphia, Durand's Seedling, &c., will be sent by mail, postage prepaid, under the receipt of \$1 per dozen. For Descriptive Catalogue and Price List of 60 varieties Strawberries and other Small Fruits, address

REISIG & HEXAMER,
New Castle, Westchester Co., N. Y.

STRAWBERRY PLANTS.—Philadelphia, (early), Barnes' Mammoth, Stinger, Durand, Rippowam, \$1 per doz. Wilson's Albany, 25 ets. per dozen; 75 ets. per 100; \$1 per 1,000. Other varieties. Also, Raspberry, Blackberry plants, &c., for fall and spring planting. Prices to all applicants. **JOHN S. COLLINS**, Moorestown, N. J.

SPECIALTY.—**100,000 WILSON STRAWBERRY PLANTS** for sale, (warranted true to name), by the Dozen or Thousand. For prices address

D. H. BROWN,

ELLWANGER & BARRY,
Mount Hope Nurseries, Rochester, N. Y.

PARSONS & CO., FLUSHING, N. Y.,

Offer a very thrifty, well-grown, and bushy stock of

CAMELIAS.

Assorted colors, including **CANDIDISSIMA**, \$20 per 100.
Larger size, including **ALBA PLENA**, \$50 per 100.
ALBA PLENA, fine and bushy, with buds, \$100 per 100.

AZALEA INDICA.

Best standard sorts, \$20 per 100.
Larger size, \$50 per 100.

Rhododendrons, (of the best sorts and all perfectly hardy,) \$18 per doz \$100 per 100.

ROSES.

Moss, \$25 per 100; \$200 per 1000.
Remontant, \$30 per 100; \$150 per 1000.
Tea and China, \$15 per 100; \$100 per 1000.

The above **ROSES** are all on their own roots, and are not budded or grafted. Their uniform success in different parts of the country is the best testimony we can offer in favor of their character.

They are especially recommended for dealers on account of their low price.

CLARK RASPBERRY, \$50 per 100; \$500 per 1000. This variety, in our own experience, and that of Charles Downing, A. S. Fuller, and others, is the best raspberry grown. Its wood needs no protection in the winter, its leaves, unlike other varieties, are uninjured by the summer's sun, its fruit is most abundant, and its flavor unsurpassed.

Those growing Raspberries for market will find it the only variety worthy their attention.

Kittatinny Blackberry, \$30 per 100; \$250 per 1000.

Wilson's Early Blackberry, \$50 per 100; \$400 per 1000.

These Blackberry plants are grown from cuttings and not suckers, and are thus more safe for transplanting.

Winter Seed Wheat for 1867.

Woodside Garden.

My Annual Catalogue of Small Fruits is now ready, and will be sent free to all applicants. Those in want of Blackberries, Raspberries, Currants, Gooseberries, Strawberries, Grapes, etc., etc., should send their orders, early, to A. S. FULLER, Ridgewood, Bergen Co., N. J.

MIAMI BLACK CAP RASPBERRY.

Superior to Doolittle in every respect, but a week later and keeps in fruiting two weeks longer, thus keeping up the Raspberry season until Blackberries come. Bush, a very strong, stocky grower, with scarcely any thorns. I will give fifty dollars for 1 doz. plants of any Raspberry that combines more valuable qualities. Price of Plants \$1 per doz.; \$1 per 100; \$25 per 1,000.—Doolittle and Purple Cane, both very early, productive and valuable, \$1 per doz.; \$3 per 100; \$15 per 1,000.—Ohio Everbearing, \$1.50 per doz.; \$3 per 100; \$15 per 1,000.—Golden Cap, \$1 per doz.; \$5 per 100; \$50 per 1,000.—Catawissa, \$2 per doz.; \$10 per 100; \$100 per 1,000.—THORLESS, \$1 each; \$10 per doz.; \$30 per 100; \$300 per 1,000.—BLACKBERRIES, Dorechester, \$1 per doz.; \$5 per 100; \$50 per 1,000.—New Rochelle or Lawton, \$1 per doz.; \$3 per 100; \$15 per 1,000.—Wilson's Early, 75 cts. each; \$8 per doz.; \$50 per 100; \$500 per 1,000.—Kittatinny, 50 cts. each; \$5 per doz.; \$30 per 100; \$300 per 1,000.—Crystal White, delicious, beautiful, and fine yielding, \$2 per doz.; \$10 per 100; \$100 per 1,000.—LUGGTON SEEDLING GOOSEBERRY, never mildews, \$1 per doz.; \$5 per 100; \$50 per 1,000.—RED DUTCH CRUENT, 1 year old, finely rooted, \$1 per doz.; \$5 per 100; \$50 per 1,000.—Cherry White Grape and La Versaille, \$1.50 per doz.; \$8 per 100; \$80 per 1,000.—GRAPES, Concord, good roots, \$10 per doz.; best, \$15 per 100; \$150 per 1,000.—Creveling, Ives' Seedling, and Norton's Virginia, 1 year old, strong, \$20 per 100; 2 years old, extra strong, \$30 per 100; \$300 per 1,000.—Delaware, Hartford Prolife, Diana, Iona, Israel, and Concord, \$1 per doz.; \$5 per 100; \$50 per 1,000.—ORANGE QUINCE, very strong, fine rooted plants, \$3 per doz.; \$30 per 100; \$300 per 1,000.—STRAWBERRY PLANTS in large quantities at low rates; see advertisement in August No. of *Agriculturist*. Wholesale List sent on application. Instructive Catalogue, giving information how to plant, etc., sent on receipt of 10 cents.

If any of the above is offered lower in this paper, we will sell for the same. 6 of each at the low rate, \$50 per 100, \$500 at 1,000 rate. Remember, Raspberries and Grapes should be set in the fall. We have had very bad luck with spring setting, and no failures when set in the fall.

Address A. M. PURDY, South Bend, Ind., or M. R. PURDY, Box 125, Palmyra, N. Y.

N. B.—We will prepay Express charges on all cash orders to any point North of Washington or Memphis, and East of St. Joseph, Mo.

Kittatinny Blackberry at the West.

Among the many testimonials received by the subscriber, the following in regard to this splendid berry from a gentleman in Fulton Co., Ill., may suffice:—

"The Kittatinny plants got of you, spring of '66, fruited this season most abundantly,—one week earlier than my Lawtons on the same grounds and location, and the smallest branch withstood the winter without any injury whatever."

The subscriber and several others here have also fruited it thoroughly and most satisfactorily the past season. Strong Plants \$20 per 100; \$150 per 1,000. F. K. PHOENIX, Bloomington, Ill.

THE BEST RASPBERRY

Is now acknowledged by all to be the CLARKE RASPBERRY. Strong plants, warranted genuine, \$3 per doz.; \$33 for 50; \$50 per 100; \$275 per 500; \$500 per 1,000. LYMAN BASSETT, North Haven, Conn.

THE EARLY WILSON BLACKBERRY.—The largest, most productive, and valuable of all Blackberries; early, and ripening rapidly. Twice as profitable this year as either Lawton or Dorechester. My stock is pure and grown in the open field, and all sent out shall have good and abundant crops, averaging six inches in length. Also the Philadelphia Raspberry, which retains all its lusciousness, wherever heard from. Also Kittatinny, Lawton, and Dorechester Blackberries, and Strawberries, etc., in great variety. SAMUEL L. ALLEN, Cinnaminson, N. J.

VERY EXTRA STANDARD PEAR.

Parties wanting, for their own planting, Pear-trees of an Extra Choice Quality, or any other kind of Fruit trees of the best quality, will be supplied in quantities to suit, by the half dozen or ten thousand. Prices low. Tree freshly dug, true to name, and securely packed for any distance. Write for particulars, references and Catalogue. Trade supplied as usual. T. T. SOUTHWICK, Commercial Nurseries, Dansville, Liv. Co., N. Y.

NOW READY.—Washburn's Autumn Catalogue of splendid Flowering Bulbs, containing a list of the choicest Hyacinths, Tulips, Crocuses, Lilies, etc., with full and explicit directions for their culture. It also contains a beautiful colored plate, and many other fine engravings. It will be forwarded postpaid upon receipt of 10 cents to all applicants. Address WASHBURN & Co., Hort'l Hall, Boston.

HENDERSON & FLEMING,

Seedsmen and Market Gardeners,
67 Nassau-st., New York.

THE NEW STRAWBERRY.**CHARLES DOWNING.**

Raised by J. S. Downer, of Kentucky, promises to be far in advance of any other berry known. I have fruited it two years. The vigor of the plant is very remarkable, its leaves are immensely large, and of great substance, which enables it to mature every berry to a large size; all are perfect in shape, no excumbent or ill-shaped fruit. The berry is of the largest size, the productiveness quite astonishing, and the flavor superior to any large berry known. The berry of the Charles Downing, represented in the August No. of this paper, was picked from a young plant set out in Oct. last, and does not represent half the size of the largest berries.

Charles Downing, of Newburgh, has fruited it one or two years, and gives it a high character. For further description and letter from Charles Downing, see advertisement in August No. 1. I am now ready to deliver plants at the following rates: 3 for \$2.00; 6, \$3.00; 12, \$5.00; 100, \$25; 500, \$85; 1,000, \$150. 2 plants of Gloede's Perpetual Pine for \$1.00.

A large lot of that remarkable berry, Romeyn's Seedling, also, President Harrison, Market, Abraham Lincoln, Perpetual Pine, Philadelphia, Starr, Stringer, Great Eastern, Hubbard Seedling, Fowler Seedling, Durand Seedling, Ella, and the Great Rippowam, the King of Berries. For description and prices of all these new berries, see advertisement in August No.

WM. S. CARPENTER, 156 Reade-st., New York.

Bulbous Roots for the Trade.

Our Wholesale Catalogue of Imported Dutch Bulbous Roots, for the autumn of 1867, is now ready for mailing to applicants enclosing a postage stamp.

Important to Owners of Stock.

THE AMERICAN STOCK JOURNAL AND FARMERS' AND STOCK BREEDERS' ADVERTISER.

A first-class Monthly Journal, devoted to Farming and Stock Breeding. Each number contains 35 large double column pages, illustrated with numerous engravings. Only \$1.00 a year. Specimen copies free, for stamp, with list of splendid Premiums to Agents.

Horse and Cattle Doctor, Free.

The publishers of the *American Stock Journal* have established a Veterinary Department in the columns of the Journal, which is placed under the charge of a distinguished Veterinary Professor, whose duty it is to receive questions as to the ailments or injuries of all kinds of stock, and to answer in print, in connection with the question, how they should be treated for a cure. These prescriptions are given gratis, and thus every subscriber to the Journal has always at his command a Veterinary Surgeon, free of charge. Every Farmer and Stock Breeder should subscribe for it. We will send it from June until the 1st of January for 50 cents.

70,000 one-year old Concord, raised from strong cuttings, at \$10 per 100, or \$80 per 1,000. **GEO. SEYMOUR & CO.,**
South Norwalk, Conn.

Prindle's Patent Portable Steamer and Caldron.

The undersigned is now prepared to supply this unrivaled apparatus for steaming all kinds of food for stock, at wholesale and retail. It has been greatly improved, so as to make it impossible to explode or collapse.
PASCHALL MORRIS, Sole Agent, Agricultural Warehouse, 1130 Market-st., Philadelphia, Penn.

TOOL CHESTS! TOOL CHESTS!

PARR'S CELEBRATED, filled with best quality of Mechanics' Tools in compartments, in a strong and durable manner. Suitable for Planters, Mechanics, Amateurs, and Boys, at prices from \$2.00 to \$110.00 each, in cases ready for shipping. For Circular, please address **GEORGE PARR,** Buffalo, N. Y.

Millstone Dressing Diamonds,

Set in Patent Protector and Guide. For sale by **JOHN DICKENSON,** Patentee and Sole Manufacturer, and Importer of Diamonds for all Mechanical purposes. Also Manufacturer of Glaziers' Diamonds, No. 61 Nassau-st., New York City. Old Diamonds reset. N. B.—Send postage-stamp for Descriptive Circular of the Diamond Dresser.

(Business Notices \$2.50 per Agate Line of Space.)

THE GREAT AMERICAN TEA COMPANY

HAVE JUST RECEIVED
TWO FULL CARGOES
OF THE
FINEST CROP OF TEAS.

22,000 HALF CHESTS by ship *Golden State*.
12,000 HALF CHESTS by ship *George Shotton*.

In addition to these large cargoes of Black and Japan Teas, the Company are constantly receiving large invoices of the finest quality of Green Teas from the Moyune districts of China, which are unrivaled for fineness and delicacy of flavor, which they are selling at the following prices:
OOLONG (Black), 50c., 60c., 70c., 80c., 90c., best \$1.10 per pound.
MIXED, (Green and Black), 50c., 60c., 70c., 80c., 90c., best \$1.10 per pound.
ENGLISH BREAKFAST (Black), 50c., 60c., 70c., 80c., 90c., \$1.10, best \$1.20 per pound.
IMPERIAL (Green), 50c., 60c., 70c., 80c., 90c., \$1.10, best \$1.25 per pound.
YOUNG HYSON (Green), 50c., 60c., 70c., 80c., 90c., \$1.10, best \$1.25 per pound.
UNCOLORED JAPAN, 90c., \$1.10, best \$1.25 per pound.
GUNPOWDER, (Green), \$1.25, best \$1.50 per pound.

COFFEES ROASTED AND GROUND DAILY.

GROUND COFFEE, 20c., 25c., 30c., 35c., best 40c. per pound.
Hotels, Saloons, Boarding-house keepers, and Families who use large quantities of Coffee, can economize in that article by using our FRENCH BREAKFAST AND DINNER COFFEE, which we sell at the low price of 30c. per pound, and warrant to give perfect satisfaction.

Consumers can save from 50 cents to \$1 per pound (beside the Express charges,) by purchasing their Teas of the

GREAT AMERICAN TEA COMPANY,

Nos. 31 and 33 VESEY STREET.

Post Office Box, 5643, New York City.

We warrant all the goods we sell to give entire satisfaction. If they are not satisfactory, they can be returned at our expense within 30 days, and have the money refunded.

By our system of supplying Clubs throughout the country, consumers in all parts of the United States can receive their Teas at the same price (with the small additional expense of transportation), as though they bought them at our warehouses in this city.

Some parties inquire of us how they shall proceed to get up a club. The answer is simply this: Let each person wishing to join in a club, say how much tea or coffee he wants, and select the kind and price from our Price List, as published in the paper or in our circulars. Write the names, kinds, and amounts plainly on a list, and when the club is complete, send it to us by mail, and we will put each party's goods in separate packages, and mark the name upon them, with the cost, so there need be no confusion in their distribution—each party getting exactly what he orders, and no more. The cost of transportation, the members of the club can divide equitably among themselves.

The funds to pay for the goods ordered can be sent by drafts on New York, by Post-Office money orders, or by Express, as may suit the convenience of the club. Or, if the amount ordered exceeds \$30, we will, if desired, send the goods by Express, to "collect on delivery."

Hereafter we will send a complimentary package to the party getting up the Club. Our profits are small, but we will be as liberal as we can afford. We send no complimentary package for a Club less than \$30.

N. B.—All villages and towns where a large number reside, by Clubbing together, can reduce the cost of their Teas and Coffees about one-third (beside the Express charges,) by sending directly to "The Great American Tea Company."

BEWARE of all concerns that advertise themselves as branches of our Establishment, or copy our name either wholly or in part, as they are *bogus* or *imitations*. We have no branches, and do not, in any case, authorize the use of our name.

Post-Office orders and Drafts, make payable to the order of "Great American Tea Company." Direct letters and orders to the

GREAT AMERICAN TEA COMPY,

Nos. 31 and 33 VESEY-ST.,

Post-Office Box, 5,643, New York City.

TO The Young and Middle Aged Men of the Country. THEIR START IN LIFE AND THE WORK BEFORE THEM.

Start in Life.—To get a start in life has perplexed the young men of every age. How can I obtain a foothold? What shall I do? Where shall I go? have been problems not easily solved. These obstacles no longer exist.

An Opportunity.—To the many young men of the country starting in life or seeking successful, honorable employment, and to the middle aged men living by small wages and desiring to better their situations by engaging in active, successful business, I offer (at my Institution at Poughkeepsie, N. Y., on the Hudson,) better advantages, at a more reasonable expense than was ever before presented to the people of this country, and guarantee situations in first class business houses, to graduates of merit, who desire assistance.

Farmers and Planters.—My course for FARMERS as well as MERCHANTS, and for those from the plantations and manufactories, is the best in the world, it being THE SHORTEST, THE MOST PRACTICAL, AND THE MOST REASONABLE.

I refer not only to the two hundred distinguished citizens who have just presented me with a complimentary testimonial expressing their appreciation of my services in founding this Institution and introducing practical instruction, and patrons in every State, but to more than Two THOUSAND GRADUATES, who owe their success as Merchants, Bankers, Clerks and Business Men, to the situations obtained for them on the completion of their course here.

Work Ahead! Men Wanted!—The nation, in its new start in wonderful, unprecedented prosperity, calls for new men of practical skill, and great business gifts. They are wanted everywhere. The country is full of money waiting for practical talent to use it. The avenues of Commerce, Agriculture, Trade, and Finance are open wider and more inviting than ever before. Vast crops are being gathered, and their great money value, amounting to more than four hundred millions of dollars last year, will give an activity to trade seldom witnessed in our history.

This Institution, then, with its common sense course of business training, is a natural necessity.

The West and South.—The closing of the Western College at Chicago and its removal here is increasing largely our number of Western and South-western students. The expenses here is more than one-third less than at Chicago, and this difference in many cases more than pays railroad fare and expenses of the Western students coming here. Particularly is this the opportunity for the young men of the South in this important period of their history.

Full information and valuable reading matter in College paper, sent free of charge.

Address the President,

H. G. EASTMAN, LL. D., Eastman Business College,
Poughkeepsie, N. Y., on the Hudson.

NOTE.—The regular Fall exercises, celebrating the fourteenth year of this, the oldest Commercial Institution in this country, will take place Tuesday and Wednesday, Sept. 17th and 18th. Hon. Horace Greeley, Hon. Mark D. Wilber, Rev. Samuel D. Burehard and others will address the College on that occasion.

Gov. Fenton and staff, Gen. Woodford, Hon. Lewis L. Parsons, of Alabama, and other distinguished gentlemen have been invited to be present.

This occasion will afford to those who desire to enter the College at that time or thereafter, an opportunity of witnessing the practical workings of the Institution. This invitation is extended to any Young and Middle Aged Men who desire to educate themselves at a small cost for better positions in life, that they may inform themselves by a personal examination of the superior facilities this College presents over other Commercial Institutions.

It will also be a favorable time for Parents, Teachers and others to visit our beautiful City of Schools, now the Educational Metropolis of the country.

For a programme of exercises address as above.

PERRY'S GRAPE VINES

are worthy of every Planter's and Dealer's particular attention. By the use of my improvement in rooting and transferring vines to the open ground without in the least checking their growth, or disturbing the roots or soil in which they are growing, enables me to keep far ahead of all others in the production of vines best suited for future vigorous growth and productiveness.

Notice the few extracts from letters received from my patrons. See Illustrated and Descriptive Catalogue for a number of pages of the same character; these are given to show those unacquainted with my vines, their real superiority over those grown in the ordinary way.

From Dr. S. Parker, Ithaca, N. Y., April 4, 1867.

"I have had vines from a dozen different propagators of late, but none equal yours. When I saw your propagation last season I was convinced that yours was the true way to propagate."

From W. L. Stroud, Oshkosh, Wis., April 19, 1867.

"I must say that I am not only satisfied but delighted with your vines. My conclusion is that you are the man to buy vines of if one wants his money's worth."

From E. A. Thompson, Cincinnati, O., May 13, 1867.

"The Diana are fine vines; Rogers' first-rate; Iona's best roots I have ever seen."

From A. T. Silsbee, Watkins, N. Y., April 20, 1867.

"Your vines are splendid and more than answer my expectations."

From I. S. Horton, Council Bluffs, Iowa, April 19, 1867.

"I never saw better rooted vines. The Club were all satisfied. Shall send you a much larger order in the fall."

From H. Houghton, West Boylston, Mass., April 13, 1867.

"I like the appearance of your vines very much."

From I. B. Kauffman, Stratsburg, Pa., April 13, 1867.

"I must say your vines are greatly superior to those sent me by * * * * * Those marked extra for the garden are REALLY SPLENDID."

From W. R. White, Wheeling, W. Va., April 10, 1867.

"The roots of your vines are wonderfully developed and of remarkable excellence."

I have a class of vines two and three years old that will fruit next season, if planted this fall, and from which the best results may be expected. The number of this class is limited, and for the garden of the most desirable character. Although my vines come in direct competition with an immense stock of Hot-bed or Glass-frame grown vines, I propose to sell at as low prices as are advertised in the columns of this paper.

I can furnish twenty thousand very fine Standard and Dwarf Pear Trees, two, three, and four years old.

10,000 Clarke Raspberry (True).—The best hardy Raspberry yet introduced. I can furnish splendid plants that will give a good crop next season, at the advertised price of 50c.

Price List sent to all applicants gratis. Illustrated and Descriptive Catalogue 10 cents. This is much less than actual cost. Address

F. L. PERRY, Canandaigua, N. Y.

GRAPE VINES at IONA.

My stock comprises all of the leading kinds, including Ives' Seedling, but principally consists of

IONA, ISRAELLA and DELAWARE.

The performance of the Iona and Israella generally throughout all of the vine-region of the country, leaves no doubt in the minds of those best informed that upon these now rests chiefly the prospect of the eminent success of grape culture in America.

My stock of these kinds is very large, and of surpassing quality. My unequalled facilities and the result of the past years warrant the belief that I can make more advantageous terms to buyers than can be done by any other propagator. Price List sent on application with stamp.

Pices for best vines for Garden or Vineyard, as low as can be afforded.

C. W. GRANT,

IONA, near Peekskill,
Westchester Co., N. Y.

STAMMERING CURED

By BATES' PATENT APPLIANCES. For Pamphlets, &c., address SIMPSON & CO., 277 West 23d-st., New York.

"HINTS TO BEE-KEEPERS," a Practical Pamphlet, sent Free to any address. MORE AGENTS wanted to sell Italian Queen-bees. "The Bee-keeper's Text Book, (3d Revised Ed.), and the American Bee-Hive." For the free Pamphlet, address

H. A. KING & CO., Nevada, O.

HEALTH AND ECONOMY.

PATENT LEAD ENCASED TIN PIPE. Recommended by the medical faculty and approved by WATER COMMISSIONERS. COSTS LESS THAN LEAD PIPE, AND IS MUCH STRONGER. Recent improvements enable us to supply THIS pipe at a less price per foot than common lead pipe. To furnish the cost per foot, please give the head or pressure of water and bore of pipe. Pamphlets sent FREE on application. Address THE COLWELLS, SHAW & WILLARD MANUFACTURING CO., Foot of West 27th-st., New York.

Rural Improvements.

Robert Morris Copeland, author of Country Life, furnishes plans and advice for laying out or improving public or private grounds. Refers to John M. Forbes, Nathaniel Thayer, Boston; Francis G. Shaw, New York; Rufus Waterman, Providence, R. I. Office, 40 Barristers' Hall, Boston, Mass.

Choice Grape Vines at Right Prices.—See G. E. MEISSNER'S Advertisement, page 336.

THE FLUSHED PARTRIDGE. — Drawn and Engraved for the American Agriculturist.

Whirr-r-r-r.—Bang.—Bang.—Not a feather touched! It is hard to miss so fair a shot, yet we do not envy him who can pick up the still warm bird—its flight for life and freedom cut short, without an emotion of regret blending with the pleasure felt in having made a good shot, and bagged the game. Our sympathies for it, as it wings its whirling flight over some barrier the sportsman cannot pass, heal the pang of regret at having touched the trigger with too nervous or careless a finger.

This beautiful dweller in the mountains and forests, common also in the wood-lands and along the embowered rivulets of New England and the Middle States, is familiar to almost

every one, either in the woods or in the markets. It is the Partridge of New England, the Pheasant of the Middle States, and is properly called the Ruffed Grouse, (*Bonasa umbellus*). The dark neck feathers, when spread, form a ruff almost like Queen Elizabeth's, and the tail is banded with black and gray. The motions of these birds, when in the wild woods and unsuspecting of harm, are charmingly graceful and courtly, blending dignity and ease. The step is proud, light, and free, and they daintily poise themselves a second on each foot, as they trip along. During the spring and summer the males are very strutting and fussy, and are apparently fond of a peculiar exercise, namely, standing upon a

log or fallen tree, and beating it with their wings in a way to produce a peculiar sound, which begins slowly and ends like the roll of a drum, and is called "drumming." It may be heard a long distance. The young, until several weeks old, are strikingly like little chickens, and the hen partridge has the same maternal ways as a common hen, as she leads about her downy brood. They remain in or near their haunts the year round, occasionally descending into the orchards and farm enclosures for food in severe winters. They often dive into light snow, burrowing rapidly to escape pursuit, and also shelter themselves in this way from very severe cold during winter nights.

Two Months for Nothing.

All new subscribers to the *American Agriculturist* whose names are received during the month of October for the year 1868, will receive the paper for the last two months of this year FREE. This offer applies to all new subscribers received in October, whether single names or members of clubs. Thus, \$1.50 sent us now will secure one copy of the *Agriculturist* for 14 months, (November 1867 to December 1868 inclusive); \$5 will pay for four copies for the same time, and so of all our club rates. N. B.—This offer is only for October, except for names from the Pacific Coast, and other points too distant to respond by the close of the month.

AMERICAN AGRICULTURIST.

NEW-YORK, OCTOBER, 1867.

October is pre-eminently the month for Agricultural Fairs. We hope all our readers will be able to visit one or more. The problem with many a farmer will be how to get ahead with work enough to enjoy the few days spent away from the farm. To accomplish this—prepare for three or four rainy days, and then noting down, clearly, directions for your hands to follow, rain or shine, throw the responsibility of good work and diligence upon their honor, and leave.—They will not disappoint you.

Make a pencil memorandum of every thing you see, or hint you get, which may be of future use, not as a newspaper reporter jots down everything, but classify what is seen. Some things you can afford to buy at once, others you wish to inquire about. Some tools are better than you now use, and when yours are worn out, you will be glad to remember where they may be bought. So there will be knowledge and useful ideas in a perfect stream flowing into the mind, and your memorandum book may catch a great portion if you will.

No weeds should be cut in dry weather. Clean culture is every man's theory. After a wet season like that experienced along the Atlantic Coast, practice and theory do not agree very well. Almost every farmer will need to mow and burn some weeds. In wet weather the seeds will shell out but little. In dry weather many hedge rows may be burned without cutting. Any use of fire is attended with danger. Take care lest it gets into the grass, or into the woods, or burns beyond control. A high wind may spring up without warning.

Feed the land well, and it will feed you. Manure will not run to waste on most soils; but for all our common crops, except corn, it is an advantage to have it several months in the soil. It becomes more easily assimilable by the plant, and, besides, influences decompositions, which increase the amount of plant food yielded by the soil itself.

Feed stock well. Reduce the amount of live stock to a winter footing as soon as possible. If pasturage is suddenly cut off, a large number of animals will be rushed into market and prices will fall. Stock taken up in good flesh are half wintered, and such animals are not on overstocked pastures.

Hints About Work.

Buildings.—Certain repairs ought to be done before frost, such as require work upon walls, and cement floors, etc., brick laying or plastering. If such work is not greatly needed for the comfort of the family or one's stock, we advise delaying until spring, for it will be rare good luck if it has not all to be done over next season. Done after this month it will hardly stand at all.

Cement Cisterns may be set if below the reach of frost. Bring water to the house for the comfort and convenience of housekeepers and servants.

Fences.—Poor fences are a temptation to cattle, and induce bad habits. Look especially to those around grain fields, which will be attractive.

Fattening Animals of all kinds lay on flesh very rapidly as the weather grows cooler. Keep bees and sheep in pasture as long as the feed is good, but yard them at night, and feed twice a day with grain, if they are to be marketed soon; otherwise simply feed so as to be sure they are constantly gaining. Pigs should have cooked food, and plenty of it. Push forward their fattening as rapidly as possible, for at no season will they gain faster. Keep them clean and give warm sheltered nests. Poultry also gain very rapidly, and it is best to fatten them on scalded meal, with corn, wheat screenings, and other food in addition, at daylight in the morning, and late in the afternoon.

"Store" Animals and Young Stock often get poor usage and no attention till snow falls, and the ground freezes solid, or the pastures give out, so that they begin the winter scrawny and down in flesh. This is very poor policy. If the stock must be half fed before spring, let it be at the close of

the season. Perishable fodder, such as pumpkins, soft corn, common turnips, should be provided in abundance, so that the "stores" and young animals can lay on a good stock of flesh, if not fat. Animals in good condition proverbially winter much more easily than thin ones.

Cows and Butter.—Fall butter may be nearly as good as that made in June. As the pastures fail, feed a little grain, with turnips and pumpkins, removing the seeds, which act on the kidneys and almost uniformly decrease the flow of milk.

Sheep.—The present is often the most favorable time to secure a stock of sheep for fattening, though from the number of sheep marketed in August, it is possible that prices may be higher than usual in proportion. Still, sheep for this purpose should be bought early, while they will have the benefit of several weeks' feeding. Select those in good condition. Provision should be made this month for market lambs to be dropped in March, by crossing a good mutton ram with hardy, good constitutioned ewes. The lambs of such will be strong, grow quickly, and fatten easily. The ewe's time of gestation averages 152 days.

Roots.—Beets, mangels, and carrots, may be dug as soon as the tops show that there is no longer vigorous growth; at all events, before severe freezing. Preserve in cellars, after topping, drying, and laying in heaps, protected by the tops or bagging, a few days, to sweat. If not stored in cellars, put them in dry trenches covered with straw, and banked over with earth. Cabbages may be preserved in the same way. Rutabagas and turnips may stand out longer, but not until the ground freezes. The tops of all these roots are worth feeding to stock.

Grain.—Sow Rye throughout the month, wheat in the early part only, soaking in strong brine to prevent smut, and dry by rolling in lime.

Manure.—Apply, and plow under for spring crops; and dig muck for use in the yards and stables as an absorbent, or get out as much as possible to be pulverized and ameliorated by the frosts of winter.

Plowing done at this season costs usually about two-thirds as much as if done in April and May, and on stiff soils for all crops except corn is just as good, or better. In ordinary shallow plowing, turn sod ground over flat. If in breaking up you plow eight or ten inches deep with the single plow, it makes little or no difference whether flat or lap furrows are turned, as the sod will probably be well covered, and thus rot thoroughly.

Corn.—See article on page 362. After the grain is cured, husk it, and bind the stalks in small bundles. They cure most rapidly when set up in two double rows leaning against poles held in crotched stakes, about 3½ feet high. The poles should run north and south, that the bundles may be better exposed to the sun. When dry, stack, protect under straw-sheds or barracks, or bring into the barn.

Timber.—Cut for building purposes, for fence posts, rails, etc., and for whatever purpose durability is required, and lay it up for seasoning.

Water.—Bring water to house and barn by pumps or by pipes from springs. The pipes must be sunk below freezing, and the pump or spout also protected.

Sorghum.—Strip, top, and cut that not cut last month. Haul at once to the mill, and have it ground as soon as possible. Do not strip or top before cutting, and when cut, bind with two strong bands in bundles of a size for easy handling. The leaves and suckers are good fodder; the seed may be ground and fed to sheep, swine, or cattle.

Soiling Crops.—Sow both wheat and rye for soiling in the spring. The land should be dry and well covered with manure; plow deeply, cross-plow, and harrow in nearly twice the quantity of seed—say 2 bushels of rye and 2¼ to 3 bushels of wheat. The wheat should be sown first, and that early in the month; in fitness for cutting it will be fully two weeks later than the rye. One square rod per day to each cow is the common rule. It is a very liberal one, if no failures occur. Very late sowed rye does well to follow that sowed early, but is not so good as wheat, which excels in amount of leaf and sweetness.

Draining.—As men can be spared from other work, and as others can be hired, get at the drains. There is hardly a farm in the United States, except those on gravel banks, or with leachy subsoil, that might not, in spots at least, be underdrained to advantage. Calculate to drain permanent meadows at least three feet deep, better deeper, and all land that will ever be plowed, not less than four feet on an average. See article in the September number.

Granaries.—Clean out, and make vermin proof in some way—best by setting them on posts capped with flat stones or tin pans. After grain is in, care must be incessantly exercised, lest by some heedlessness the steps are left down, or in some other way mice get in. After that, trapping, fumigation, etc., must be resorted to, and these are always uncertain in operation.

Orchard and Nursery.

The late ripening fruits will need attention. Apples and pears, while they should be left on the tree as long as they derive any benefit from it, ought not to be exposed to frosts. The appearances that attend perfect maturity are easily learned by a little observation. The tree ripens its wood and leaves, and the latter part from the twig with a slight pull. So with the fruit; its stem readily severs its connection with the tree. Careful picking is necessary to good keeping. None but a vandal will ever pull the stem from a fruit. Ladders and fruit pickers have heretofore been described in great variety. Whether the fruit is picked into baskets or bags, assort it at once into barrels, putting in the fruit as closely as possible. Avoid all unnecessary handling, as the waxy exudation or bloom natural to many varieties not only improves the appearance, but aids in the keeping of the fruit. The practice of using packing material is now generally abandoned. The barrels are filled about an inch above the chine, and the head brought down by pressure. A simple lever press will accomplish this, or some of the screw presses sold for the purpose may be used. The fruit, after being packed, should be kept as cool as possible without freezing. We have before insisted on the advantage of assorting fruit. Of apples, intended for sale, never put but one kind in a barrel. Treat winter pears in the same way.

Draining.—Nothing is more essential to success in orchard culture than draining, and nothing is more generally neglected. Drains may be made between the rows in young orchards and in land intended to be set with trees next spring.

Autumn Planting is advisable in localities where a mild season may be depended upon. At all events, order trees in the autumn, as a better assortment is to be had, and there are fewer risks in transportation at this season. If the land is not in readiness, or it is not thought best to plant this fall,

Heel-in the trees, and they will be at hand for setting in early spring. In heel-in, select a dry and rather sheltered place, and open a trench. In this put the trees in a sloping direction, and as they are placed in the trench, fill all the spaces among the roots with fine, mellow soil. Bank up the earth to a depth that will protect the roots from freezing, and slope it to carry off rain.

Cider, to be good, should be made from perfectly clean and sound fruit. Cleanliness is to be observed in every step of the process. Ferment slowly in a cool cellar, and when fermentation is over, bung tightly, and when the cider becomes clear, rack it off into clean casks. Where vinegar is the object, so much pains need not be taken. After the cider is fermented, the addition of some old vinegar, or "mother," and free access of air in a warm place, will hasten the conversion into vinegar.

Apple Jelly may be made by carefully evaporating unfermented apple juice. Some of the sorghum pans are found useful for this.

Drying of Fruit should be hurried up. If there is no drying-house, it will pay to put up a stove in a spare room, and subject the fruit to a fire heat on rainy and cloudy days.

Buds are to be looked to, as in a warm autumn

the stocks will continue to grow, and the bandages must be loosened.

Nursery Stock should receive a fall manuring. In the best nurseries a plow is run between the rows, and manure is placed in the furrow, and covered.

Seeds are saved from the pomace where a large quantity is wanted. Wash out, dry in thin layers, stirring now and then, and keep in a cool place. For the home nursery let all the family save the seeds of the apples and pears they consume. Have a box of sand in some handy place where they may be deposited, and a large quantity will accumulate.

Orchards may receive a top-dressing of compost.

Ornamental Deciduous Trees are to be planted or heeled-in as suggested above for fruit trees.

Labels are to be looked to, and if any are so weather-worn that they are likely soon to be effaced, replace them by new ones.

Fruit Garden.

Prepare the ground for new plantings. Drain, work deep with the spade or plow, manure, and get the land in the best possible condition.

Planting may be done or not; this is a question of locality. In mild regions, cultivators prefer autumn for blackberry and raspberry, for the reason that the shoots start so early in the spring that there is danger of breaking them in handling.

Currants and Gooseberries are readily propagated by cuttings. These are to be made as soon as the leaves are off. Cut them about 6 inches long, and place them in shallow trenches. Put the cuttings about 4 inches apart, with an inch or so above the surface. Press the earth firmly around the lower end, and when the earth is filled in, cover them with litter or leaves to prevent injury by frosts.

Grapes are to be picked, whether for market or for wine, according to hints given on subsequent pages. As soon as the leaves fall, the vines may receive their fall pruning. If it is desired to use the prunings for propagation, cut them into suitable lengths and bury them in an accessible place.

Root Cuttings of blackberries and raspberries may be made. Cut the roots in pieces 2 or 3 inches long, place them in a box with alternate layers of soil, and bury the box below the reach of frost in a well drained place. See article in October last for details.

Raspberries of the tender sorts should not be laid down too early; delay it until there is danger that the ground may become frozen.

Kitchen Garden.

The gardener will find plenty to do this month in securing and marketing his crops, or in storing them for winter, and in preparing his land for spring.

Preserving Vegetables from frost and decay during the cold months is next in importance to producing them. Small quantities of roots may be kept in a cool cellar, and will be all the better if they are covered with earth or sand. When a large quantity is to be kept it is best to make pits out-of-doors. Select a dry spot and dig a pit 3 or 4 feet deep, 6 feet wide, and of the necessary length. The roots, when dug, are thrown into heaps and covered with a few inches of soil to prevent freezing. When heavy frosts occur, pack them in the pit; put in two feet of roots, leave a space of six inches, and then put in a section of two feet more of roots and so on. The spaces left between the sections are to be filled up with earth, so that the trench will be filled with alternate layers of roots and earth. Cover the whole with a mound of earth about two feet high, so rounded as to shed water. A pit of this kind can be opened, and a portion of its contents removed without disturbing the rest. In this manner beets, turnips, carrots, parsnips, horseradish, etc., may be kept until wanted. Success, however, will in good part depend on thoroughly draining all the water away from the pit.

Preparation of Soil.—If land now in sod is to be used for a garden next spring, spread on a liberal dressing of manure and turn over the sod with a

shallow, flat furrow. Other lands, especially if at all stiff, may be plowed into ridges and left to the ameliorating influence of winter.

Draining is almost always needed, and if the soil is at all wet, will be an imperative necessity.

Asparagus.—Cut and burn the tops and cover the beds with coarse manure.

Beets should not be exposed to hard frosts. Store in the cellar, or in pits, as directed above.

Cabbages.—Set the young plants, from seed sown last month, in cold frames. A simple frame is made of planks nailed to posts, the planks at the rear being 1 foot wide, and those at the front 8 inches. It should be wide enough for the sash at hand, and as long as desirable; of course the ends must be closed and the earth banked around the outside of the frame. Set the plants $2\frac{1}{2}$ inches apart each way, down to the first leaf, to cover all the stem. The sash should not be put on until freezing weather. Winter cabbages are best preserved by pulling them before the ground freezes, inverting them on a level piece of ground, and then covering the heads with earth by use of the plow or spade, to the depth of 4 or 6 inches.

Cauliflowers.—Set young plants of early sorts in frames, as directed for cabbages. Store in a light cellar those which have not yet developed their heads.

Celery.—Finish earthing up. Towards the end of the month put the roots away in trenches a foot wide, and deep enough to contain the plants. Pack them closely, and as the weather becomes colder, cover gradually with straw or leaves.

Leaves.—Gather as many as possible to use in hot-beds next spring, and to increase the manure heap.

Lettuce for an early crop next spring is to be had from young plants wintered as directed for cabbage.

Parsnips.—Dig what are wanted for winter use and preserve in the cellar or in pits, and leave the rest in the ground until spring.

Horseradish.—Dig and preserve as other roots, first taking off the small roots to plant next spring. These are to be preserved in boxes with sand.

Rhubarb.—Plantations are better made now than in spring; divide the old roots so as to leave a bud with each. Plant in rich soil, 3 feet apart each way.

Salsify.—Dig what will be needed during the severe weather, and leave the rest in the ground.

Spinach and other crops, to be wintered in the field, should be kept clear of late weeds.

Squashes.—Gather as soon as ripe, and avoid exposure to frost. Keep spread out for a few days to the sun before storing. Handle carefully. Store in a dry place where they will not freeze.

Sweet Potatoes.—Dig on a warm day, as soon as the vines are touched by frost, and allow them to dry off before housing. Handle carefully. Those for winter should be packed in dry, cut straw, or perfectly dry sand, and be kept where they will be at an uniform temperature of about 60°.

Flower Garden and Lawn.

October usually brings us just the weather for all out-door work. New beds, walks, and other improvements in the grounds may be made, ground prepared for spring planting, deciduous trees set, draining and other heavy work done.

Perennials of which the clumps have become too large should be taken up, the mass divided into several parts by means of a sharp spade, and reset. This affords an excellent opportunity to exchange with, or give to, friends. Paeonies, especially, should be moved at this time, if at all.

Bulbs in plenty will be appreciated next spring. A good, deep soil, enriched with cow manure is best. See an article on page 368.

Chrysanthemums.—Keep neatly tied up or they will become straggling. Pot for blooming in doors. Some prefer to delay potting until they are in bloom, thinking that the plants receive less check at this time than when it is done earlier.

Larkspurs.—We seldom see beds of the Rocket Larkspur now-a-days. Seeds sown now will give a fine show in the spring. Indeed, most of the

Hardy Annuals do better if seed be sown in autumn. Every one must have noticed that plants from self-sown seeds are stronger and finer every way than those of the same kind sown in the spring.

Dahlias succumb to the first smart frost unless protected. After the stems are killed, allow the roots to remain a week or more in the ground. Take them up carefully on a dry, warm day, label, and when they have dried somewhat, store in a place that will keep potatoes well.

Hardy Shrubs may be transplanted, and divided if needed, and plants for

Deciduous Hedges, such as Privet, Buckthorn, etc., may be set in well prepared ground.

Bedding Plants and all tender things that are to be kept over winter should be potted preparatory to removal to the green-house, cold frame, or cellar. Provide a good supply of materials for

Winter Protection.—Leaves should be gathered from the lawn and roadsides. These make an excellent covering and are kept in place by a slight sprinkling of earth upon them. Where Red Cedar boughs can be had they will be found most useful to lay over half hardy shrubs and other plants.

Green and Hot-Houses.

Previously to removing plants to the house, they should be put in complete order. Cleanse the pots from dirt and moss, and remove the hardened and weedy top soil, and replace it with a layer of fresh compost. See that no

Insects are taken in with the plants. If proper vigilance be exercised from the start, the task of keeping a mastery over insects will be lessened.

Plants for Forcing should be potted. Many of our common plants force very finely; among these *Dicentra spectabilis*, *Deutzia gracilis*, *Astilbe Japonica*, and Lily of the Valley, make most desirable decorations for the green-house in early spring.

Annuals should be sown for winter blooming, always taking care to have a good stock of Mignonette and Candytuft on hand for bouquet uses.

Bulbs, too, will be needed, and should be potted now and kept in the dark until the pots are well filled with roots.

Rustic Stands and hanging baskets for parlor decoration are to be filled. Some plants suitable for this purpose are mentioned on page 365.

Ventilation must be given freely whenever the weather will allow, and fire heat used only when cold or damp weather makes it necessary.

Cold Grapery.

It is a bad practice to strip the leaves from the vines. They are needed to perfect the wood, and when they have done their work they will drop of their own accord. The ripening of the wood may be aided by keeping the house rather warm, which may be accomplished by keeping the lower ventilators closed and using only the upper ones. Close up all the ventilators on cold and damp days.

Apiary in Oct.—Prepared by M. Quinby.

By correspondence from nearly all the States of the Union, I find the honey crop more generally good than last year. Bees have usually swarmed well, and are prepared for winter. Yet so many bees were lost last season, that there is a less number in the country now than a year ago. This will make it desirable that all good stocks should be wintered. Ascertain the amount of honey by weighing hive and contents, and subtracting the weight of an empty hive of similar size, thickness of boards, etc., and six pounds for weight of bees, wax, and bee-bread. Call the remainder honey, and you will not be far from the mark, unless the combs are very old. Then a little more should be added. Less than 20 or 25 pounds of honey is not enough. Too much is as detrimental as too little. With movable frame hives, if any combs are filled with honey throughout, they should be alternated

with such as are empty. If any stock is too light and has too few combs to hold sufficient stores, at this season, it should be taken up at once. If the combs are sufficient, but bees are few, and there is no condemned colony to reinforce them, they should receive the same treatment. Such hives, after the dead bees have been taken from between the combs, will be of most account set away for use next year. Set right side up, keep dry, and stop all holes that will admit a bee.

Two weak colonies united make a strong one, and may be put together if there is honey sufficient. To prevent quarreling, smoke them out of the combs with puff-ball, tobacco, or what will answer just as well, have every bee fill itself with honey. When a stock has bees and combs, and lacks honey, it may be fed up to the required weight. October is the time, or as soon as the brood is all hatched. Feed all that is required in the shortest possible time, or the bees may use too much in rearing brood. Honey should be fed when it is to be had. West India honey is good and much cheaper than Northern. To be safe from disease, add a quart of water to ten pounds, scald thoroughly, and skim. Feed in a dish on the top of the hive by opening a few holes, and covering with a box to keep out robbers. Put cut straw or shavings in the dish to keep the bees from drowning. See that the sides of the dish are rough enough for them to creep up and down. If honey in the comb is preferred, the caps of sealed honey should be shaved off with a knife. All winter stores should be in the apartment with the bees. They might starve in cold weather with an abundance in the boxes. Where two light, weak stocks in the movable comb hives have enough bees, combs, and honey, for one good one, they may all be put together. Select the combs with honey, and put them into one hive. With bees in box hives after smoking or feeding them into quietude, turn both hives bottom up. Trim off the bottom edges of the combs in one, square across; take off the side of the other, cut loose the edges of the first comb, take it out and set it into the first hive, fitting it upon the base of the first comb; then proceed with the others in the same way, keeping the combs in the same relative position and at a proper distance apart. Rolls of paper between will hold them until the bees can fasten them. Put a stick across the edges as a support when the hive is turned over; let it touch all, and fasten each end of the stick to the side of the hive. Cover, and let it stand bottom up, a week or two, or until a short time before putting to winter quarters.

Any stocks one year old, that have not been examined relative to foul brood, should be attended to at once. On no account allow a hive with foul brood to be robbed. You have no right to let it stand exposed to be plundered by your neighbors' bees. Honey from such hives should never be allowed to go into healthy stocks without scalding. Strain honey before cold weather. See directions in previous numbers and volumes of the *Agriculturist*.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the *American Agriculturist*, show at a glance the transactions for the month ending Sept. 16, 1867, and also for the same month last year:

1. TRANSACTIONS AT THE NEW-YORK MARKETS.						
RECEIPTS.	Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.
27 days this month	218,500	829,000	3,291,000	36,500	53,000	570,000
27 days last month	159,000	611,000	2,534,000	21,300	67,000	102,000
SALES.						
27 days last month.	Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.
27 days this month.	278,000	1,079,000	4,181,000	151,000	1,367,000	1,367,000
27 days last month.	278,000	694,000	3,489,000	98,000	739,000	739,000
2. Comparison with same period at this time last year.						
RECEIPTS.	Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.
27 days 1867....	218,500	829,000	3,291,000	36,500	53,000	570,000
30 days 1866....	237,000	428,000	3,353,000	111,000	105,000	1,281,000
SALES.

30 days 1866....	279,100	733,000	3,153,000	319,000	1,041,000	1,041,000
3. Exports from New York, Jan. 1 to Sept. 14:						
Flour.	Wheat.	Corn.	Rye.	Oats.	Barley.	
1867....	385,063	283,749	6,201,173	135,561	103,179	356,298
1866....	672,135	250,054	5,896,516	187,189	966,508	148,956

4. Stock of grain in store at New York:

1867.	Wheat, bush.	Corn, bush.	Rye, bush.	Barley, bush.	Oats, bush.	Malt, bush.
Sept. 10....	130,532	1,151,892	500	9,376	135,737	61,508
Aug. 13....	99,174	863,724	32,785	12,376	200,349	48,632
July 15....	245,500	160,780	66,986	21,390	206,763	34,700
June 14....	358,279	217,796	117,257	69,613	319,865	16,311
May 15....	731,330	261,092	186,804	145,706	608,494	16,461

5. Receipts of Breadstuffs at the water at Albany, May 1st to September 7th:

	Flour, bbls.	Wheat, bush.	Corn, bush.	Rye, bush.	Barley, bush.	Oats, bush.
1867....	91,100	761,100	9,513,000	175,100	62,000	2,353,600
1866....	187,100	1,820,500	16,085,300	624,800	148,400	5,023,000

Gold has been much more active since our last, especially within the past week. It was as high on Thursday, Sept. 12, as 146%. It has since been down to 144%. The demand has been almost exclusively from speculative buyers....Diminished estimates of the harvest product are now gaining currency, and are tending to stimulate speculation in Breadstuffs, which latter have been in more active request, and generally at higher prices. The inquiry for flour has been mainly from regular buyers for home use and export. Desirable grades have been in very moderate supply, closing firmly. Wheat has been more sought for home and foreign use; as also on speculative account, closing buoyantly. Prime spring wheat is scarce and wanted. Corn has been in lively demand, largely on speculation, at decidedly buoyant, but quite variable, prices. Rye has been quiet, closing steadily. Oats have been more freely offered and purchased, but at lower rates....Provisions have attracted more attention, the leading articles closing firmly, on reduced supplies.... Cotton has been less active and has declined materially, closing in favor of purchasers.... Wool has attracted more attention. Desirable lots of high grades of fleece have been comparatively scarce and held with increased firmness. Other descriptions have been steadier as to price than during the preceding month, though they have been in fair supply.... Tobacco have been active and firm. The export and speculative demand have been brisk.... Hay has been plenty and depressed, with a moderate inquiry.... Hops have been in demand, and steady.

CURRENT WHOLESALE PRICES.

Beef Cattle.—Considering that since early in the month reported upon, the weather has steadily improved, it is not strange that with largely increased supplies there should be also an improvement in prices—at least, no falling off. Prime cattle have decidedly improved, and are

in short supply. The shortness of pastures forces a good deal of inferior stock upon the market, and this, of course, tends to keep prices down. Our citizens are returning from the country, and there is a larger home demand for good beef. The law relative to slaughtering animals within the city limits has had its influence also in determining the price of beef. Now, however, we enter upon a much more regular season, and the usual causes which affect the market will operate naturally. The general range of prices may be stated now as 16½¢. @ 17½¢. per pound, estimated dressed weight, for very fine beef, 14c. being about the average; poor, thin, travel-worn beasts, bringing 8c. @ 11c. **Milk Cows** are cheaper. **Calves** are usually sold by the head, and vary \$8 @ \$10 and \$12 @ \$15 each. They are thin, but big and grass-fed; real good, fat veal is worth 12c. per pound, live weight. **Sheep**.—The supply has been remarkably uniform and very large, prices about as follows: Prime sheep, 6c. @ 6½¢. live weight; medium to poor, 4½¢. @ 5c. Lambs, prime, 8½¢. @ 9c. per pound; common, 7c. @ 7½¢. Many sheep have been bought by the farmers and driven into the country for feeding, while the pastures of this vicinity remain good. **Hogs**.—There has been considerable variation in the quality of the swine, and a proportionate one in prices. Little really good pork comes to market now, and this is quickly taken. Good to prime sell at 7½¢. @ 7c. per pound live weight; ordinary 6½¢. @ 7c.

The Fairs for 1867.

[We give below a list of all the State and National Fairs yet to take place, and of such County, Town, and District Fairs, not yet held, as were not included in our list in the September number of the *Agriculturist*. A few are added which have changed their dates.]

State Agricultural Fairs.

American Institute.....	N. Y. City.....	Sept 12, Oct. 26

The Results of the Harvest.—We

go to press just in the beginning of the corn harvest over most of the country, and still in the midst of one of the most remarkable "spells of weather" that has ever been experienced here. It seems really that the sunshine and showers, and tempests too, have been spellbound—the one to glow and burn, the others to rain and blow, each over a particular region. The seaboard has been rained upon till the farmers begin to feel almost amphibious, while the interior has been suffering from a severe drought. These sections of country have been relieved—the one by a day or two of sunshine almost every week, and the other by occasional showers which have held out hope of relief. To some parts happy relief has come; others still suffer. The result is, that it is very difficult to come at a just estimate of the harvest.

At present the fate of the corn crop is regarded with considerable solicitude. We hear of rains coming just in time to save it in isolated localities throughout the region which has been suffering from drought, which includes Central New York, and westward, especially the southern portions of the great corn and wheat raising States of Ohio, Indiana, Illinois and Missouri. By the time this reaches our readers, we hope that these rains may be general. The corn of the Eastern and Middle States is in danger now from frosts which have already touched the leaves in exposed places. The crop is backward, and shocking can not be done as early as common without serious loss of weight. On the whole, a less than average crop may be looked for. The great wheat region has profited by the dry weather so far as to have its wheat thrashed in excellent order. The crop is decidedly less than average in quantity, but of a very superior quality. Oats have not filled well where the dry weather was severe, but as we usually hear the croakers first we can hardly judge of the results—and very much the same report must be made of barley and spring wheat. Potatoes have rotted distressingly at the East, especially those early planted and well manured; while in the interior the dry weather causes a short yield. Root crops generally look remarkably well wherever it has been sufficiently moist, and on good soils everywhere the crops will be remunerative.

The hay of the dry section is not abundant, while in the wet it has been poorly cured, so that everywhere the cornstalks should be well secured if possible.

Apples are abundant over the great apple regions of the central and western parts of the Middle States, Ohio and Indiana; but many localities at the East are almost altogether without this fruit.

Tobacco has had too much rain for its good in the Connecticut Valley, and a full crop has not set. It is in danger from the frost, also. From the great tobacco region south of Mason and Dixon's line we have, as a rule, unfavorable reports. The cotton region of the Atlantic board has suffered from rain and an inordinate growth of grass. The crop of Arkansas, part of Louisiana, Texas, and Mississippi is quite good. The general crop is esti-

mated as considerably larger than that of last year on account of the greater breadth planted, but the yield per acre will prove discouraging.

The effect of the season on Dairying is what might have been expected. The supply of butter for the New York market was essentially diminished by the drought affecting the greater part of the State and the great dairy region of Northern Ohio, and prices rose accordingly. The same cause affects the cheese products. New England, New Jersey and Pennsylvania pastures have produced abundantly, but the quality of the grass was poor and watery. The amount of milk was large, but the butter not so good as common.

We shall doubtless have an abundance of all staples for home consumption, and a good deal for export. Prices of almost all farm produce are ruling high. Speculation, in part influences this gradual advance, but with the menacing attitudes of European powers towards each other, a possibility that the wheat supplies of the Black Sea region will be cut off, crops falling below the average in Western Europe, and only a moderate crop here, farmers will be foolish if they do not get remunerative prices.

Containing a great variety of items, including many good hints and suggestions which we throw into smaller type and condensed form, for want of space elsewhere,

245

BROADWAY.

After October 1st, the Office of the
AMERICAN AGRICULTURIST

will be at

245 BROADWAY,

with a Branch Office at the old place,

41 PARK ROW.

In our next number we shall say more on this subject.

Mark All Subscriptions sent in, as *New or Old*.

The American Agriculturist, 245 Broadway, N. Y.—It will probably seem as strange to our correspondents to write the above, as it does the figures of the new year; yet by the time this sheet reaches the majority of our readers, the *Agriculturist* and all its belongings will have been transferred from 41 Park Row to 245 Broadway. The distance is not great, the two locations being within sight of one another; yet the removal is accompanied by the regrets that one always feels at leaving a long familiar spot for a new and untried one. It was at 41 Park Row that the *Agriculturist* attained its majority. It came here a successful paper, and leaves it as an institution. It was here that the important part of our business, the publication of agricultural books, had its beginning, and has become a channel for distributing agricultural and horticultural information second only in importance to the paper. Here new relations have been formed in our business and editorial departments, and here we have had the pleasure of meeting face to face with so many of those whom we monthly visit through the medium of the paper. But the *Agriculturist* has outgrown its old home, and notwithstanding these pleasant associations, it must go to a new and more commodious one. We are glad that this change is made while Mr. Judd is abroad, as he would feel it more keenly than any one else. In his absence, we may say that when he compares the five-story brown stone store on Broadway with the obscure rooms on a second floor in Water street, from which the earlier volumes were issued, he may properly congratulate himself on the success that has attended well directed energy and unceasing devotion to business. We hope to carry to our new quarters all our old friends, and shall be prepared to receive large accessions to their number. With increased facilities for producing the paper, we hope that we shall more certainly than ever attain our constant aim—to make each volume better than the last.

Pasturing Clover the First Year.

—"Will a field sown with clover in the spring furnish pasturage for cows during the summer?"—If the ground is well manured, clean, and the season moist, and the clover gets a good start, it will be fine, rich feed by July, and, if not fed off close, will not be injured. On ordinary land the practice is never advisable, and is seldom best.

Fatal Disease among Poultry.—

Lemuel D. Dohbs, of Brownsville, Texas, writes: "My young chickens, ducks, and turkeys are all dying. I have just lost two entire broods. A swelling commences around the eyes, nostrils, and the skin on the under part of the bill. These places rise up like great warts, and in from one to three days from the time that the disease first appears, the chickens die. I think it is the biting of mosquitoes, and have tried to prevent it by cooping them at night under a mosquito bar, but it does no good. All my neighbor's chickens are affected the same way." Whether our subscriber's suspicions are well founded or not, we would recommend the application of warm pine tar, smearing it over all the affected parts, but not stopping up the nostrils. If this does not cure, we would try painting the parts with a solution of nitrate of silver, (*lunar caustic*), applied with a feather.

Incubators, or Artificial Egg

Hatchers.—We have several inquiries for these articles, or for descriptions of them. It is, perhaps, enough to say, we know of none which we believe it worth while to attempt to use. There are several advertised, and used more or less abroad, but none that we know of in this country. It seems to be a fair subject for experiment. What is needed is a tolerably uniform temperature, not far from 100° Fahrenheit, a certain slight degree of moisture in the air, and daily turning of the eggs. Tegetmeier, in *The Poultry Book*, speaks highly of Manasi's Patent Incubator. The French plan is taking hen turkeys, forcing them to sit on false eggs a few days, and, when they are contented, putting good ones under them, as many as they will cover. The chicks are removed as fast as hatched, and other eggs substituted. This plan has been tried by one of our neighbors, with success. A turkey covers twice as many eggs as a hen.

What Birds are "Fowls."—

There is an article "going the rounds" of the press, distinguishing fowls as birds which take their young to their food. The absurdity of this definition is apparent on a moment's thought; for, though applicable to farmyard poultry, in distinction from the birds of the hedge, it will not bear a more extensive application. It is unfortunate that, in English, we have no single word for our hard-door or dung-hill fowls. Even the names cock and hen they share in common with a score of other birds from Cock-robin to Cock-turkey—(Cockroach and Hood's Cock-mermaid included)—Hen Sparrow and Pea Hen as well. Poultry fanciers have, of late, with an unanimity which is remarkable, confined the use of the word *fowl* to this, in English, nameless bird—*Gallus domesticus*.

Killing Animals at the Paris

Abattoirs.—Mr. Judd writes: "To-day, (July 15th.) I visited the extensive new Abattoirs, or slaughter houses, now partly completed, within the city walls, but beyond the thickly-settled portion, on the north-northeast side of Paris. The grand market, not yet finished, is an immense iron structure, with iron and glass roof, supported on iron columns, and to remain open on the sides, I believe. A strict prohibition to visitors, at present, prevented my examining it fully. The roof covers several acres; the pens are small and low, and arranged in streets and avenues, and the bottom is as hard and smooth as rough cut stone. The slaughter-houses near by are nice blocks of stone and stucco building, each apartment opening at either end into the avenues running between the blocks. The whole looks like a village of tasteful houses, joined side to side along the streets, which are bent at a small angle frequently, so as to diminish the sight of too many operations at one view. The floors of both buildings and streets are solid cement, with an inclination to frequent drains, opening into subterranean sewers. Water is arranged to wash the whole surface neat and clean, as often as it becomes soiled. Ladies can walk through the whole establishment without soiling their dresses, except in the vicinity of the actual operations of cleaning the offal. Two masters or journeymen butchers occupy each killing room with two assistants, and dressing eight to twelve beef cattle is a day's work, according to the size of the animal and the activity of the market. I watched the entire process of killing and dressing a hullock, which was as follows. The animal was driven in at one door, the other being closed; a rope was lassoed over his horns, and the other end put through a ring in the floor. When his nose was drawn to the floor, so as to curve his neck, a short, spear-like knife was thrust into the spinal column, just back of the horns. It was done in an instant, and the animal dropped as suddenly as if struck with a cannon ball, and scarcely moved a muscle. A moment or two after, the front of the head was struck with an appropriate long-handled hammer several heavy blows; the animal lay almost perfectly still. Next, the operator cut into the neck, as near the shoulders as possible, and opened the arteries at or near the heart, apparently to give the best outlet to the blood,

which flowed off into an opening in the floor, and was all saved in a clean condition. The animal was then moved and pushed about to promote the entire expulsion of all the blood. One man then skinned the legs up to the gambrel joint, and cut them off. The other, in the mean time, made one small opening through the skin on the belly, just back of the forelegs, and another between the hind legs. Into these apertures he thrust a round-pointed half-inch steel rod, a little curved, and made openings along under the skin in different directions. A large hand hollows was then thrust into each of the openings, and one long lever arm was worked, while the other was held upon the floor with the foot. The air was thus driven in with great power and permeated every part under the skin and throughout the entire flesh and interval fat. The carcass swelled to nearly double size, and when heat with a stick to promote the circulation of the air, the skin sounded like a heavy, loosely strained, bass drum. When the inflation was complete, the skinning was easily and quickly performed. Great tact was exercised in running the knife along so as to have its curved point leave the surface of the meat slightly gashed in stripes, at various angles. A small iron windlass, with ratchet wheel and pulleys, served to raise the carcass as fast as it was skinned. Napkins or towels were kept at hand to remove the slightest trace of filth or blood. The puffiness of the flesh, its clearness from blood, and the line cutting where the red integument appeared, together with the neatness everywhere exercised, gave an exceedingly beautiful appearance to the dressed sides as they were conveyed to the store-room, and hung up for sale. One can eat meat in Paris without any qualm from slaughter-house recollections or associations. The entire absence of apparent pain or motions in the dying animal, and the inflation of the meat, though often read of, were novelties to me in actual observation. Calves and sheep are dressed in the same manner. I priced some of the meats to-day as follows: The best sides of beef, 142 francs per 100 kilogrammes—equal to about 12 cents per pound in gold, or 16@17 cts. per pound U. S. currency. Other qualities ran down to 110@100 francs per 100 kilogrammes. Very good carcasses of sheep were selling at 15 sous per livre, (about 15 cents gold per pound, equivalent to 21 cents currency;) and dressed pork at 17 sous per livre.

Miami Raspberry.—

Mr. W. Johnston, South Bend, Ind., dissents from Mr. Fuller's estimate of this variety, and gives his own experience as follows: "I fruited it in connection with seven other varieties; the time of ripening first berries was as follows: Kirtland, June 30th; Golden Cap and Miami, July 3d; Doolittle and Philadelphia, July 4th; Ohio Everbearing and Catawissa, July 7th. Thus, it has a very favorable season. Compared with the Doolittle, which, Mr. F. says, is 'very large and very productive, and a profitable market berry,' its superiority over it was, in all respects, quite noticeable—the bush larger, more hardy and thrifty, the berry larger, more abundant, flavor decidedly superior, and berry much firmer. I had the Philadelphia in its perfection, I believe, and it is a magnificent berry, giving more fruit during the best days of its season than the Miami, but as the season of the latter is from eight to ten days longer, I think it will yield full as much fruit, and is a more profitable market berry, as the Philadelphia is quite too soft for long transportation. Thus we know of no raspberry superior to the Miami, and if Mr. F. does, we wish he would name it, for it is wanted."

The Kittatinny Blackberry.—

We, two years ago, described and figured this berry. This year it has quite warranted all that we have said of it. Some specimens brought us in August from E. Williams, Montclair, N. J., show it to be the very best berry that is now in cultivation. We have seen plants in localities north of New Jersey, fruiting finely.

Black Caps from Seed.—

Wm. Lawrence writes: "I have a cluster of vines that produce much larger and finer fruit than any other that I have seen," and asks if they can be propagated from the seed. They can be readily grown from seed, but there is no certainty that the same qualities will be reproduced. The resulting plants may produce better fruit, but are more likely to give that of inferior quality. The only sure way is to layer the tips of the branches as soon as they get somewhat firm. See *Agriculturist* for August, page 292.

The One-leaved Strawberry.—

Every one knows that the leaf of the strawberry is three-parted. In 1761, a variety with a single leaf was brought to notice, and afterwards figured in the Botanical Magazine as *Fragaria monophylla*, or One-leaved Strawberry. Just one hundred years after this appearance, Mr. A. S. Fuller, author of the *Small Fruit Culturist*, found (in 1861,) a similar freak among his seedlings, from the Boston Pine, and now Gloede, the great French strawberry grower, gets a

similar form from seeds of Napoleon III. These departures from the normal type are interesting; they, however, show a general debility in the plant, as in neither of the three recorded cases was the fruit of any value.

Grasses Named.—

H. A. Slater, N. Manchester, Conn.—Blue Joint-Grass, *Calamagrostis Canadensis*. . . R. F. Roberts, Woodworth, Wis.—*Eragrostis pectinacea*, an introduced weed, for which we know no common name. . . New Egypt, N. J. (can't read the name)—*Triticum repens*, the Couch, Quack, Quick, or Twitch Grass. Valued in some places for pasturage, but a terrible pest in cultivated lands. . . "Subscriber," St. Paul, Minn.—The purple specimen is Barn-yard Grass, *Panicum Crus-galli*; the long one is Indian Grass, *Sorghum nutans*; that of which two specimens were sent is a Beard Grass, *Andropogon furcatus*; and the most delicate of all is *Sporobolus heterolepis*. When more than one specimen is sent, they should be numbered. With the exception mentioned in reference to Couch Grass, none of them are of any agricultural value, and many of them are so little noticed that they have received no popular names.

Grand Old Plants.—

Recently we visited the grounds of a gentleman near Newburgh, N. Y., and were delighted to see a *Gardenia*, or Cape Jessamine, some six feet high, and well furnished with branches to the base. It had good company in some Pomegranate and Lemon and Orange trees, all of which showed that they had been objects of care for years. We have a great affection for these old plants, as we have for old furniture, old china, and old pictures. These plants are venerable, and it is pleasant to think of the kindly care of several generations that is incorporated with their growth.

Red and White Clover.—

Prof. Way, of the Royal Ag'l. Society, made several analyses of clover hay with a view to determine what substances clover crops extracted from the soil, and thus, if possible, to come at the cause of what in England is called "clover sickness." This is a condition of the soil when it refuses under ordinary treatment to yield good crops of clover—and so is called "sick" or "tired" of clover. We are not, as yet, troubled with this failure of the crop upon land where it once did well, except as we lose the influence of plaster on the crop, which frequently occurs. The analyses show that clover makes great drafts upon the soil for alkalies, especially potash, and no doubt it is the gradual exhaustion of this ingredient which causes the failure of the crop. The great benefit of applications of wood ashes and of plaster to clover are matters of universal experience, and we may safely say that so long as we continue them we will live in ignorance of clover sickness.

Clover in Mercer Co., Ill.—

"E. L. M." writes that in this hot dry summer the red clover is killed out, so that they have to give it up as a farm crop. This is also the case farther south, in many places, and no kind of red clover will grow. Neither will the ordinary grasses, that form the greensward of the Northern States. The only chance to get clover to stand under such disadvantages is to sow it in time for the usual early autumn rains. Thus early sown, it may send its roots deep enough to withstand the summer droughts.

Double Pelargonium—Gloire de

Nancy.—We were gratified to receive from Mr. John Saul, Florist, of Washington, D. C., some flowers of this new variety. It has made quite a sensation abroad, and, apparently, deservedly so. The flowers are very double, and of a brilliant deep rose color. It is greatly superior to the *Ranunculiflora*, figured in December last. Mr. Saul says: "It is a noble plant, strong and vigorous in its growth, and luxuriates in our hot bright sun, blooming freely. The flowers are thrown up well above the foliage, and, being double, are more enduring than single kinds."

Plants with Gray Foliage.—

In the present popular "hedding out" planting, a plant with a gray or silvery tint is very desirable to set off the more brilliant *Coleus* or *Achyranthes*, (*Jessie*.) *Herbstii*. *Centaurea ragusina*, also called *candidissima* is one of the best for this purpose, but it does not propagate fast enough to suit the florists, who prefer to sell the freer growing *Cineraria maritima*, or "Dusty Miller." We have tried this latter, this summer, for a bed in the lawn, and find that by cutting it back freely, it may be made to grow bushy, and we are rather pleased with it. The English gardeners are talking about one of our wild plants for this purpose—*Antennaria margaritacea*, or Life Everlasting. We have never seen it in cultivation, but think it worth a trial. Mr. Peter Henderson has shown us this season a new plant of this style, *Centaurea gymnocarpa*, and from what we have seen of it with him and elsewhere we think that it will become

popular—provided that it favorably answers the florists' great question—"will it cut?"

Toad Flax. "Snap Dragon."

"**Butter and Eggs.**"—E. Stowe, of Wis., asks: "Will you be kind enough to state the best method of destroying that pest of farmers, 'Snap Dragon.'—There is more or less of it in Wisconsin; I have mowed it in blossom, and tried digging it out; this last seems to spread it and make it grow more vigorously."—*Answer.* We know of no way easier than to smother the plant. Make a pile of fresh cut grass or weeds, 8 inches thick, well trodden down over and around the infested locality. If on a lawn or in a garden, after cutting up the plants, cover with old boards, laid close together, and covered with hay to prevent their warping. This is said to be a sure cure in one season, and is the easiest one we know.

L'Illustration Horticole.

—This is a most elegantly illustrated monthly, published by A. Verschaffelt, the horticulturist of world wide reputation, and contains beautifully colored plates of all the floral novelties. The June number is especially interesting to Americans, as it contains a new Passion Flower from Panama, *Tuesonia Buchananii*, in compliment to our esteemed friend, J. Buchanan, of this city, who first cultivated it. The same number contains a colored representation of our native Bird-foot Violet, *Viola Pedata*, one of our common plants, which we pass by unheeded, but one on which our friends over the water lavish a great deal of eloquent French.

The Revue Horticole.

—This periodical is published semi-monthly, in Paris, under the able editorship of M. Carrière. Its "Chronique Horticole" is an admirable resumé of horticultural news, and we cordially recommend the journal to those who read French, and wish to keep advised of European horticultural doings. The *Revue* has one feature which we would commend to the attention of certain American journals—when it copies, as it often does, articles and figures from the *Agriculturist*, it gives full credit for them.

"Sunshine and Showers."

—This is a most fascinating subject. It engages everybody's attention, because it affects everybody's comfort. An English barrister has written a very instructive popular book on the weather, giving it the above attractive title. No doubt the laws which govern the weather of Great Britain prevail over the whole world, and, with a little allowance for the different climatic influences, would form a correct basis for judging of its changes, provided we could give proper relative weight to the indications. Everybody believes that it may be possible to predict the weather with some degree of certainty, and Mr. Steinmetz believes that he can do so generally, and that man ought to do it, as well as the lower animals. In a very pleasant way he discusses the premonitions which storms and showers give of their approach. Certain it is that many birds know when storms are coming, and frogs and leeches perceive it also. The Old Salt has no better reason for predicting a storm than that he "smells it," and the old rheumatic aunt, than that she "feels it in her bones." Hence we fully believe that if we, who are neither "old salts," nor rheumatic, only knew enough, we could do the same. The little book before us has helped us so much towards gaining knowledge about those things, that we have placed it on our book list. It is printed in London, but imported in sheets, and neatly bound by Roberts Bros., Boston, Mass., and is for sale at our counter, or will be sent by mail on receipt of price.

The Osage Orange as a Tree.

Those who have only seen the Osage Orange as a hedge plant, can have no idea of its beauty when allowed to grow into a tree. There are fine specimens at Iona Island, (Dr. Grant's,) and at the place formerly owned by the late A. J. Downing, at Newburgh. It grows to the height of twenty or thirty feet, and has a remarkably clean appearance. The leaves are of a bright green, and its fruit, which grows to the size of a large orange, is very conspicuous. It is put down by botanists as a dioecious tree, *i. e.*, one having staminate and pistillate flowers on separate plants. Our French friends are discussing this point, as they find that trees bear fruit when there is no staminate one in the neighborhood, and suppose that, as is very likely to be the case, it is only imperfectly dioecious. We hope to see this very beautiful tree more generally introduced in ornamental planting.

The Vegetable World,

by Louis Figuier, New York. D. Appleton & Co. A handsomely printed volume of 576 pages, and intended to give a popular account of the structure, and some general ideas of the classification, of plants. Unfortunately it was translated from the French by one who apparently had no knowledge of the subject, and the work is so full of mis-

takes as to seriously interfere with its value as a popular teacher. The illustrations are many of them very beautiful, but as some blunderer has in several instances put the wrong names to them, they are sometimes calculated to mislead rather than to instruct. It is painful to see so handsome a work marred by so many blemishes. While those who have sufficient botanical knowledge to see the errors, will find much instruction in it, we cannot recommend the work as an introduction to the study of plants.

Our Annuals.

—The American Agricultural and Horticultural Annals are in course of preparation, and will be issued before the close of the present year. As these works are in part devoted to recording the progress in Agriculture and Horticulture during the past year, they cannot, on this account, be brought out as early as if they were made up of miscellaneous articles that could be written at any time. The work has mainly to be done when the growing season is over. The favorable reception given to the volumes of 1867 is an incentive to make those for 1868 worthy of general approval.

Conn. Board of Agriculture, 1866.

—The First Report of the Conn. State Board of Agriculture has been for some time on our table, through the politeness of Hon. E. H. Hyde, Vice President of the Board. The chief value of the book consists in the report of the lectures and discussions at the annual meeting in January last, a brief account of which was given in the *Agriculturist* for February. The Board, between their meetings for business, listened to lectures which were open to the public. The report of them is so full as to give the volume a permanent value to all agriculturists. They are, one by Prof. Johnson, on The Source of Nitrogen in Plants; one by Prof. Brown, on Irrigation in California, and two, by the same gentleman, on Diseases of Plants Caused by Fungi. Discussions took place in regard to Draining, Irrigation, and Fruit Culture, and responses to a circular, sent out by the Secretary, asking information based on personal experience on these subjects. The information thus given is of notable value. The Secretary has little to tell about the town and county societies which are known to exist, except their names, and the fact that they spend the \$1600 appropriated for premiums by the State, and it appears as if he collected this meagre information about them much as a newspaper reporter would do. This ought not to be, and the State bounty should, we think, be appropriated only to those societies presenting a detailed report of all their doings, and the amount paid should be graduated according to the degree of excellence of these reports.

Gray's Manual of Botany.

—Fifth Edition. N. Y.: Ivison, Phinney, Blakeman & Co.—About twenty years ago, the first edition of this work appeared, and immediately took the position it has since maintained—that of guide and hand-book to those who wish to gain a knowledge of the plants of the Northern States. That our first botanist should be so mindful of the wants of students as to prepare for them a series of books unequalled by any in the language, is something to be thankful for—a good which those of us, who, in our early studies, struggled along with incomplete and unsatisfactory text-books, can better appreciate than can the student of the present day. We are indebted to the publishers for an advance copy of the new edition, which is in the same neat and attractive style that characterized the former manuals. The present one embodies all the recent discoveries, and contains such alterations as the advance of the science demands. Gray's Manual for the Northern States, Chapman's Flora for the South, and Brewer's forthcoming Botany of California, gives us a series of admirable hand-books for all parts of our extended territory—except, perhaps, "Walrusia,"—and the botanist will be likely to find but few plants not recorded in one or the other of these standard works.

Plants Named.

—Mrs. C. L. Mabbitt, Vineland, N. J.—*Veronica spicata*, the blue; and the white is the delicate Fringed Orchid, *Platanthera blepharigottis*. Mrs. Robnck, Herkimer Co.—*Dicentra Canadensis*, the Squirrel-corn; less common than the closely related *D. Cucullaria*, or Dutchman's Breeches, and worth cultivating. F. W. Earl, Tawas, Mich.—*Kalmia angustifolia*, the Low, or Sheep Laurel. A. Williams, Hillsdale, N. Y.—The common Wiegela rosea, properly *Dierilla Japonica*, a fine ornamental shrub. C. J. Braue, Wabash Co., Ind.—*Solanum Dulcamara*, Bittersweet, a pretty climber, but the berries are suspected of poisonous qualities.

Salmon Fisheries in England.

The work of restoring this noble fish to the rivers of England is in successful progress, though it meets with obstacles from defective legislation, from the refuse of factories poured into the streams, from badly constructed fish ways, and from illegal fishing. Notwithstanding these

hindrances, the fish appear in increasing numbers in all the streams that have been restocked, and best cuts of salmon are quoted in the London market at twenty cents a pound, or about half the price it commands here, in the cheapest part of the season. When we get our rivers restocked, we hope to turn the tables on our British cousins, and quote salmon at ten cents a pound. The best style of passes or ladders at the mill dams is now a theme of lively discussion. One writer proposes "rough rock work, the rougher the better, built against the dam on an incline." He has seen fifteen fish pass such a ladder in three quarters of an hour. The idea may be valuable.

Hatching Shad at Holyoke, Mass.

—Mr. Seth Green, of Mumford, N. Y., is supervising the work of stocking the Connecticut River with shad, at Holyoke. By his system, 95 per cent. of the spawn is hatched while in the river. It is estimated that not more than 5 per cent. live, the most being destroyed by fish and by unfavorable changes in the temperature of the water. He will turn into the river this season more than 100,000,000 of these fish. If they return to their birth-place as their instinct prompts them, there will be fine fishing in that stream next season. Under the new regulations of the New England Fish Commissioners, the fish will be able to visit the upper waters of the River, and Vermont and New Hampshire can eat home-bred shad again. Fish breeding is now as easily managed as the breeding of land animals, and measures should be taken to restock all our streams.

Damp Houses.

—"W. B." These are occasioned quite as often by the surroundings as by the materials of which they are made. An undrained cellar, or too many shade trees, will make a damp house. If brick or stone is used, fill out the walls, and ventilate. The house is then as dry as if made of wood, and cooler in summer as well as warmer in winter.

Longworth's Wine House.

—Some samples from this establishment show that it maintains its well established reputation, and are of a quality to convince even the writer in the Boston Journal of Horticulture that "pure wines" can be produced in the North.

Ox-bows and Yokes.

—H. A. S., of Manchester, Conn., criticises the ox-yoke, figured in the August number, page 284, on the ground that the holes for the bows are too close together. Such narrow bows may do, he says, to draw in, but cattle will not back well in them. Narrow bows chafe the roots of the ears in backing or holding back, going down hill. He formerly used yokes with bows only 10 inches wide, but never found his cattle to back easily until he put the bow-holes 12 inches apart. Cattle will not back well if the yoke hurts them.

Prof. Glover's Work on Entomology.

—Aside from his labors in the Museum of the Department of Agriculture at Washington, Prof. Glover is carrying on his elaborate work on insects, which, one would think, is of itself sufficient to occupy all his time. His plan appears to be as admirable in design as his figures are beautiful in execution. The work is needed, and we hope that a way will soon be found to publish it.

Mosquitoes in Water-troughs.

—A few little brook or pond fish keep water-troughs, open cisterns, water barrels, ponds, etc., entirely free from the larvæ of mosquitoes, by eating them almost as soon as the eggs hatch.

Pickling Cucumbers.

—B. G. B. We have never found any substitute for salting cucumbers. A bag of spices is usually tied up, and put in the vinegar for those who like it. More commonly the vinegar is applied hot upon the cucumbers, but some house-keepers of unquestioned gumption apply the vinegar cold. Cider vinegar, however, is always used, and has a snap to it. Mem.—It is some trouble to have anything nice.

Influence of Climate in North and South America.

—Prof. John Disturnell has given to the public, through the publishing house of D. Van Nostrand, New York, a work with the above title, discussing the climate and climatic changes and influences which prevail in this Western Hemisphere, and their influence upon vegetation, animals, man, diseases, civilization, etc. It is accompanied by an agricultural and an isothermal map of North America. The former shows the limits of profitable culture of our staple crops; the latter, the lines of equal mean, summer and winter temperatures. The work contains a great array of carefully collected facts and observations, with free citations of the opinions of travelers and writers upon the climate. It is an octavo of 324 closely printed pages.

Twelve More Than We Promise.

—The reader will notice that this month's issue of the *Agriculturist* contains 44 pages. In our prospectus we offer a sheet of 32 pages, but in no month of this year have there been less than 36, and for a greater part of the time we have given 40 pages. This month we have so much reading and advertising matter that we increase the size as far as possible, and not exceed legal weight.

Reliable Advertisements.

—From every quarter we receive commendation for the rule strictly and impartially adhered to of admitting "no advertisements into our columns except from parties believed to be reliable and able, and willing to perform what they advertise to do." During the present month several hundred dollars' worth has been rejected, which we see appearing conspicuously in the columns of otherwise respectable papers, both secular and religious. Our course in this respect proves of great value to those who do advertise in good faith, as the public are not afraid to send their orders to those admitted under this rule. Of course, mistakes will occur, and blame should not hastily be bestowed. Mail clerks and express agents are not infallible, and failure to receive goods ordered is often chargeable to their account, if not to that of the person ordering.

A Nursery in every Town.

—The numerous offers made in our advertising columns of vines, plants, etc., to be forwarded by mail, in effect, bring the best nurseries almost to the door of every man. A very large business has been satisfactorily transacted in this way, since the reduction of postage to a point admitting of it. Every family, having the use of ground enough for the purpose, should avail themselves of these facilities to secure a good supply of fruit for home use. Send your orders early, that the nurserymen may provide in time for expeditiously forwarding the articles wanted.

The American Pomological Society.

—The 11th meeting of the Society commenced at St. Louis, on Wednesday, September 11th, the President, Col. Marshall P. Wilder in the chair. Fourteen States were represented by delegates, and it was supposed that several other delegations would come in. A very large show of fruit is upon the tables, grapes being especially numerous. The first day was occupied mainly with preliminary matters. Addresses of welcome were made by Mr. Mudd, President of the Missouri State Horticultural Society; Mr. Bryant, President of the Illinois State Society, and by Doctor Spaulding, in behalf of the Grape Grower's Association of the Mississippi Valley. President Wilder briefly and feelingly responded to these salutations. In the afternoon, the President gave his address, and the election of officers was held. We regret that we have not space for the address. The remaining days will be given to discussions which are likely to be interesting, as such men as Wilder, Downing, Barry, Warder, Knox, Ellwanger, Meehan, Hussman, and a host of other well known pomologists will take part in them. New or interesting facts will be noted for the benefit of our readers.

Grapes at Pittsburgh.

—A visit to Mr. Knox's vineyards shows a condition of the crop in marked contrast with the reports from the grape region of the Lakes and other parts of the West. The main crop is, of course, of the Concord, which, for health of foliage and productiveness, is so much superior to all other varieties that we do not wonder at Mr. Knox's advocacy of it. He planted his vineyard for the purpose of getting fruit, and has it by the ton. Delaware has a good crop, but the leaves have suffered, though enough remain to ripen the fruit. Iona is fruiting, but the foliage in about the condition of the Delaware. Diana shows a good crop, with some rot. Catawba and Isabella very full, and scarcely any trouble. Hartford Prolific and Creveling now, (Sept. 7th,) being marketed. These are two very prolific grapes. The Hartford, as grown here, hangs to the bunch as well as any other grape. The Creveling surprised us with its yield, and pleased us with its quality. It has the fault of not making a compact bunch, but it will nevertheless be a salable grape when known.

The New England Fair.

—Fine weather, proximity to the second city of New England, unusually fine grounds and buildings, and the hearty enthusiasm with which the people of Rhode Island welcomed the society to their State, united in making the Fair a grand success in a pecuniary point of view. The exhibition was well worthy of the society. The show of Ayrshires was remarkably fine; Jerseys were also numerous and excellent, and the cross-bred Jersey-Ayrs of Mr. Fitch, of New London, Conn., noticed some time since in the *Agriculturist*, attracted deserved attention. The Short-horn stables were graced by most excellent stock, and by none superior to that noble animal, 6th Duke of Thora-

dale. If His Grace is not the best bull in this country, we would be glad to see his better. The Lieut.-Governor of Connecticut, Mr. E. H. Hyde, of Stafford, a prominent candidate for Commissioner of Agriculture, was present with the choice of his fine herd of Devons, and took the herd sweepstakes premium. The show of Devons was good, better than can be made in this country, outside of New England. The Dutch cattle of Mr. Chenery, of Belmont, were also exhibited, and Burmese cattle by Mr. Clark of the same town. The horses did not equal those shown in Vermont last year, either in numbers or quality. Among the mutton sheep, Cotswolds were predominant, and very fine, but the fine wools did not make much show. The swine and poultry classes disappointed us, as did also the implements, though there was a good display of mowers and small tools. On the whole, the fair was a very gratifying one, and not by any means so given up to fast horses as was expected, nor as has been represented by the Associated Press' dispatches.

Investments of Money.

—We advise farmers to invest their money in farm improvements, mechanics in better tools and facilities, merchants in advertising. But there is much money which cannot be invested in these ways. Public improvements, really needed and of great utility next to securities for which the faith of the State or Nation is pledged, ought to be the safest and best paying investments. So they are, if well managed. The first mortgage bonds of the Central Pacific Railroad Co. are regarded as first class securities. These bonds are sold by our friends Fisk & Hatch, No. 5 Nassau st., whose representations are thoroughly reliable.

Seed Store at the Agriculturist Office.

—or rather at the place where the Office of the *Agriculturist* was. As announced elsewhere, we have entered our new quarters, 245 Broadway. 41 Park Row, so long associated with Agricultural and Horticultural matters, is, however, to be most worthily filled. It has been rented by Mr. B. K. Bliss, of Springfield, Mass., for a Seed and Horticultural Warehouse. Most, if not all, of our readers have long known Mr. Bliss as a most enterprising, reliable and obliging dealer. By liberal advertising, thorough system, and indefatigable attention to the details of his work, he has built up a business extending all over the United States, and demanding larger facilities. To secure these, he has formed a partnership with his son, S. B. Bliss, under the firm of B. K. Bliss & Son, and made their headquarters here in the Metropolis. Their business at Springfield, Mass., will also be conducted under the same firm. We are greatly pleased that one whom we know to be fully worthy the confidence of the public, which he has already largely secured, is to occupy the premises so long devoted to kindred pursuits, and which otherwise we should more regret leaving. With the numerous friends of Mr. Bliss we wish him success commensurate with his increased facilities.

Egyptian Corn.

—"H. G. C." Bennington, Vt.—The advertisement of F. E. G. Lindsey, of Virginia, about Egyptian corn which bears ears as large as maize, and yields 150 bushels to the acre weighing 65 pounds to the bushel is, on the face of it, calculated to deceive. Nevertheless we have written to F. E. G. L. to send us some seeds, and receiving no answer, know what to conclude. Let it alone; the story is better than the crop.

The Boulevard Skirt.

—The ladies of the household are greatly pleased with this article just introduced into the fashionable world. It is made of all wool, without seam, is light, warm, and of every desirable color. The fabric resembles thick but light French cloth. It is a decided improvement over the "Balmoral."

Draining for Profit.

—Peter Henderson, Esq., the well-known market gardener, thus writes to the author of this recently published work on Draining: "There would have been no necessity for my troubling you with the draining queries if I had carefully read your work, as all my questions are there fully anticipated. Allow me to most sincerely congratulate you on your production. I never before picked up a book on draining that I could read with interest enough to keep me at it ten minutes. Business drives me so that I have little time to read anything; and to wade through a bushel of chaff to get at a grain of wheat is so discouraging that I rarely make the attempt. But 'Draining for Profit' is straight to the point, without a superfluous word." See advertisement of this book on page 376.

Fair of the American Institute.

—This great exhibition of American industry opened in the city of New York, on the 12th. It is certainly the best arranged one we ever saw, and in this particular as well as in the entire exclusion of all large signs, the managers are to be highly commended, and the exhibition regarded

as an example to all industrial fairs. The rule which, rigidly enforced, secures this very desirable result, is this, that while the articles exhibited shall be confined to the allotted space, no sign shall appear above them. The result is that exhibitors are advertised by their wares, and not by flaming paint and canvas. The fair is a great success, being so systematized that any one can go directly to any Department, of which there are seven, viz.: 1. Fine Arts and Education; 2. The Dwelling; 3. Dress and Handicraft; 4. Chemistry, etc.; 5. Machinery, etc.; 6. Intercommunication, (Carriages, Telegraphs, Boats, etc.); 7. Agriculture and Horticulture, each being divided into groups.

The Use of Plaster.

—"W. W. Fuller," of Michigan, proposes a practical question under cover of a theoretical one. Letting the theory go, he admits that by means of plaster he gets greatly increased crops. Those crops contain a proportionately increased quantity of ash constituents drawn from the soil, which, of course, is by just so much the poorer. Hence impoverishment of the soil is certain if the practice is continued long enough. How soon it will come depends on the richness of the soil, both in available plant food and in that which may be developed by tillage and the action of the weather. An equivalent must in some way be returned, if the soil be kept as it is. Plaster works good to the land in several ways, and the wise ones cannot agree upon a theory.

Apples in England.

—A recent Gardener's Chronicle gives a tabular report, occupying several pages, showing the state of the fruit crop in the various counties in England. While there is plenty of small fruits, there is a general scarcity of pears and apples, the latter crop being so bad that it may be set down as a total failure. It is not unlikely that large shipments of apples will be made from this country; which, judging from the appearance of the orchards in the Western States, we shall be abundantly able to do.

Have Done With It.

—Either the Farmers' Club or the New York Weekly Tribune is guilty of a disregard of the health of the community that deserves the severest reprobation. The two form a sort of reciprocally irresponsible concern. Whenever we blame the club, we are told that they are not responsible for the reports, and when the Tribune is called to account, it says that it only reports the proceedings of the Club. In the report of the meeting of August 20th, we find people encouraged to tamper with so dangerous and fatal a disease as diphtheria, by the use of a decoction of bark and roots, and what is worse, if possible, to try the cure of consumption by taking so violent a poison as Lohelia. We see by the reports of the Club that a large proportion of those who take part in the proceedings are Doctors. Can it be possible that they so disregard the safety of the community as to allow these things to go by without a protest? Gentlemen of the Club, you have it in your power to do much good when you stick to matters belonging to Agriculture, but when you meddle with medicine you weaken your influence, and your proceedings become dangerous.

Feed Cutters.

—Cutting or chaffing, wetting, and flavoring with meal or bran, make good fodder go much farther than otherwise, and even very poor fodder palatable and useful. This involves no little labor, but a good machine makes light work of it, compared with any other. We bought Gale's Copper Strip Feed Cutter, made by the Peekskill (N. Y.) Plow Works, several months ago, and use it with great satisfaction, in cutting hay and cornstalks, knowing of none better. The past season has been so peculiar that many farmers, who rarely are so unlucky have this year damaged hay, and that cut after having become old and wiry. The diligent use of the hay cutter is the only alleviation of this state of things. Cut fine, wet down, and, at least, flavor with oil or corn meal, bran, or some ground feed.

Documents Acknowledged.

—Our list of these has been crowded out from month to month. If the friends who have favored us with Reports, Catalogues, and other documents, will for this once accept a general acknowledgment, we will try to do better in future.

How to Cook a Ham.

—We dine occasionally at the table of Mrs. K., and until we tasted it there, we did not know what a ham was capable of. It being too nice to remain a family secret, we asked the recipe for the benefit of our readers. Boil a ham for three hours, remove the skin, and trim it nicely, and then rub into the fat a pound of powdered sugar, or as much as it will take up. The ham is then placed in a dripping pan, in which is put a pint of sherry, or other good wine, and put into the oven, and baked very slowly for two hours. During the baking it is frequently basted with the wine. Try this, and we are confident you will say that you have never before eaten ham in its greatest perfection.

AMERICAN AGRICULTURIST.

ORANGE JUDD & Co., Publishers, 245 Broadway, N. Y. City.

ANNUAL SUBSCRIPTION TERMS (always in advance): \$1.50 each for less than four copies; Four to nine copies, \$1.25 each; Ten to nineteen copies, \$1.20 each; Twenty copies and upwards, \$1 each. Papers are addressed to each name.

EIGHTY-SIX

Valuable Premiums.

We Invite Everybody

To secure one or more of the valuable articles offered as Premiums on our List. All of these Premiums are good and useful, and some are costly and elegant.

Look at the List, and make up your mind to obtain some of the Premiums.

The American Agriculturist, with its 32 to 40 large quarto pages, its profuse and costly illustrations, its practical, reliable, and condensed information, obtained and prepared at great expense, is furnished to its subscribers at a price but very little above the cost of the paper on which it is printed. This can be accounted for,

First, by the fact that but one corps of Editors, one set of Engravings, one setting of type, and one Publishing House managing the business affairs of the paper, suffice for supplying its great army of subscribers; and

Again: While the funds received for subscriptions are expended in preparing the paper and delivering it to subscribers, its immense circulation secures a very large and valuable advertising patronage. For every premium obtained a list of new subscribers is sent in, and the more subscribers of course the more valuable our columns for advertisers.

We are willing, therefore, to pay well, in good Premiums, those who get up clubs for us. While it is true that many persons send to us the names of their friends and acquaintances without premiums, merely from good will and their confidence that they are thus conferring a favor upon their friends, it is also true that we most cheerfully bestow all premiums that are earned, and in every proper way encourage everybody to get up clubs, with the remuneration to be secured in view.

Everybody may be an Agent.—We have no special agents. Instead of this we have made up a list of valuable articles, many of which have been suggested by individuals who have worked for us, and all of which are good and useful; and from this list any one who gets up a club can select the premium desired, and obtain it by sending us the required number of subscribers.

We can Pay much more in Premiums than in Cash.—Our purchases by Wholesale, our arrangements with Manufacturers and Dealers for advertising, etc., enable us to do this. It will be noticed that we give each premium article at the regular price which the purchaser would pay for the same.

Every Premium on our list is to be secured by sending us a definite number of subscribers. There need be no mistake, therefore, on this point; and there can be no favoritism in the matter, since the same number of subscribers for any particular premium is required from every one who secures it.

No person need fail of obtaining some one of our many Premiums. Those who make the attempt to raise a club are often surprised at the ease with which names of subscribers are secured. The paper is very attractive in appearance, (notice the great number of beautiful and costly engravings in the Oct. paper, which is a fair specimen,) and the most hasty glance at its contents often satisfies one of its value. We have many times received subscriptions at our counter from persons

who came in for books or on other business, and who, on looking over the paper for a few moments, have decided that they must have it.

You can make money in canvassing for the American Agriculturist. Many persons take hold of the work as a business. If you do not wish the Premium secured for your own use, it can always be sold; and you will see, upon looking over our Premium List, that but a small number of names obtained each day gives you good wages, while for 10 names or more a day, you will receive very handsome returns. A lady obtained subscribers enough in seven months to secure one of the magnificent Steinway Pianos, worth \$650, and this, too, while attending to the cares of a family.

Beautiful and valuable Presents may be secured by working for us. You will find on our Premium List many articles which are most useful in a family; articles suitable for presents from husband to wife, brother to sister, children to parents, scholars to teachers. Here are opportunities for giving a pleasant surprise to your pastor and his wife, by sending them a handsome tea set, a valuable library, or a sewing machine. Sunday school classes, or scholars in other schools, may secure a beautiful present for their teachers in this way, or a good melodeon for their school room. Several Agricultural Societies have paid for a large club of subscribers, given away the subscriptions as prizes at their exhibitions, or supplied them to members, and sold the premium articles, at auction, for the benefit of the treasury.

Only good articles.—We are careful not to place upon our list anything for a Premium which is not the best, and, in all respects, what is claimed for it. All, therefore, who secure premiums, may be sure that they are not running the risk of getting poor or indifferent goods.

Send in the names of subscribers as fast as you obtain them, not waiting to complete your list; and to save mistakes in accounts, send the exact subscription money with each list; and every name designed for a premium list, must be so marked when sent in.

Begin Now to raise your clubs. It is not necessary that all the papers of Premium Clubs should go to one office. You can get them anywhere.

Old and New Subscribers will be counted in premium lists, but some should be new names, as it is to obtain such that premiums are in part offered. The extra copy, usually offered to clubs of ten or twenty, will not be furnished when a premium is called for.

How to Remit:—Checks on New-York Banks or Bankers are best for large sums; make them payable to the order of Orange Judd & Co.

Post Office Money Orders may be obtained at nearly every county seat, in all the cities, and in many of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, as many hundreds have been sent to us without any loss.

Registered Letters, under the new system, which went into effect June 1st, are a very safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. Observe, the Registry fee, as well as postage, must be paid in stamps at the office where the letter is mailed, or it will be liable to be sent to the Dead Letter Office. Buy and affix the stamps both for postage and registry, put in the money and seal the letter in the presence of the postmaster, and take his receipt for it. Letters sent in this way to us are at our risk.

Specimen Numbers of the Agriculturist, Cards, and Showbills, as may be needed, will be supplied to canvassers. These should be economically used, as each extra copy of the paper, with postage, (2c.,) which must be pre-paid, costs about 12 cents.

Every Premium article is new and of the very best manufacture. No charge is made for packing or boxing any of the articles in our Premium List. The forty-four Premiums. Nos. 1, 2, 6, and from 36 to 39, and from 50 to 86 inclusive, will each be delivered FREE of all charges, by mail or express, (at the Post-Office or express office nearest recipient), to any place in the United States or Territories, excepting those reached only by the Overland Mail.—The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance that may be specified.

Table of Premiums and Terms, For Volume 27—(1868).

Open to all—No Competition.

No.	Names of Premium Articles.	Price of Premiums.	Number of Subscribers required.
1	Garden Seeds for a Family (40 kinds)	\$5 00	13 37
2	Flower Seeds for a Family (100 kinds)	\$5 00	13 37
3	Nursery Stock (Any kinds desired)	\$20 00	80 97

86	A Choice of Good Books (See Terms below.)		

Description of the Premiums.

No. 1—Garden Seeds.—A valuable selection of 40 varieties of the best seeds for a family garden, each parcel large enough for a garden of ordinary size. This premium and the next are put up for us by Messrs. B. K. Bliss & Son, Seed and Horticultural Warehouse, 41 Park Row, (old Agriculturist office,) whose seed establishment is well known as one of the best in the country. This premium will be of great value and convenience to many, especially to those distant from good seed stores, as we shall send the seeds post-paid to any part of the United States (except to those points reached only by the Overland Mail.)—In many cases the recipient will have enough in each package for his own use, and some to spare to members of the club, or others.

No. 2—Flower Seeds.—Like No. 1, this is a valuable premium. It consists of 100 different kinds of beautiful flower seeds, all in separate papers, and includes not only the finer common varieties, but many of the newer and rarer kinds that are costly when bought by the single paper. Each parcel contains the usual amount, and they are delivered free, the same as No. 1.

No. 3—Nursery Stock—Plants, etc.—This premium can be selected in anything desired, from the Catalogues of Parsons & Co., Flushing, N. Y., or of F. K. Phoenix, Bloomington, Ill. Both are well known, very reliable parties, having extensive Nurseries, Green-Houses, Ornamental Trees and Plants, Grape Vines, Shrubs, etc., etc. Send a stamp direct to either of them, for their regular catalogues, stating that it is to look into the value of this premium, and they will be furnished free. Any one choosing this

premium can select from the catalogues \$20 worth, or more in proportion, if more names are sent us, and we will send an Order for the amount on either party named above, in fall or spring, as desired.

No. 4—Iona Grape Vines (12).—This valuable new variety is becoming so well known that we need not describe it here: Only No. 1 Vines will be sent. They will be forwarded by express either this fall or next spring, or by mail, if so desired, and postage is furnished.

No. 5—Concord Grape Vines (100.)—“*The Grape for the Million.*”—This excellent, hardy, early, prolific, grape, is popular almost everywhere, and though not so highly flavored as the Iona and Delaware, its easy culture, vigorous growth, earliness, and productiveness, make it one of the best for general cultivation. It is now so abundant that we can offer a large number of No. 1 Vines. They will be sent by express, well packed, in fall or spring, as noted above for the Iona Vines.

No. 6—Japan Lily Bulbs.—A most beautiful flower, one of the few flowering bulbs that do well even when planted early in spring. Most kinds of bulbs require to be planted early in autumn. One can easily multiply his stock after getting a few to start with. We send them, post-paid, by mail to any place in the United States. We get them of B. K. Bliss & Son.

Nos. 7, 8, 9, 10, 11, 12, 13—Sewing Machines.—We are glad to be able to offer this year a choice of the leading kinds of good Sewing Machines. We can recommend any one of them as of great value. Each of these seven machines has some peculiarities in which it is superior to the others. We have used them all at home during the last half dozen years, except the Tailoring Machine, and that we have watched carefully in the hands of tailors. One has been tried several months, and then another, and so round; and they are all so valuable that we prefer to recommend all, instead of in the slightest degree hindering the speedy introduction of this important household implement by even a comparative word of discredit to any one of them. We would not part with the last one of these, whichever it might be, and be without any Sewing Machine, for \$500! Here are the reasons: The \$500 at 7 per cent. interest, would yield, less taxes, about \$32. Most families require, at the lowest, four months of steady hand-sewing a year, costing, if all hired, not less than \$34 a month, board included, or \$96 a year. With a Sewing Machine a woman can certainly sew as much in one month as in four months by hand. Here is a clear saving of \$72, or of \$60 if you call the seamstress' work only \$30 a month, including board—leaving a net annual saving of \$39 to \$40 above the interest, while any good machine will wear a dozen years. But far above this and all questions of money saving, is that of *health*. The everlasting “Stitch, stitch, stitch,” with form bended over work, and the loss of sleep, have brought tens of thousands to early graves, broken down millions more at an early age, and entailed an enfeebled constitution upon many millions of infants. We say to *every* man, get your wife a Sewing Machine, even if you have to sell a favorite horse or an acre or two of land. A Sewing Machine costing \$55 to \$65 involves an interest of only \$3 or \$4 a year; it will, in the long run, save you five, if not a hundred, fold, in Doctor's bills alone. Get the Sewing Machine any way. If you can get one through our premium list, well and good; it will help you, will enlarge our circulation, and benefit those you induce to read and think more; but get the machine.—Every machine given is boxed and delivered free to any railroad station, or express office, or other place in this city, and costs the recipient only the freight after leaving the city. They go safely as railroad freight. Full printed instructions go with each, and the machine is supplied with a Hemmer. Further particulars may be obtained by sending for circulars to:

Grover & Baker Mfg Co., 495 Broadway, N. Y. City.
Howe Machine Company, 699 Broadway, N. Y. City.
Florence Sewing Machine Co., 505 Broadway, N. Y. City.
Singer Manufacturing Co., 458 Broadway, N. Y. City.
Willcox & Gibbs Mfg Co., 508 Broadway, N. Y. City.
Finkle & Lyon Sewing Co., 587 Broadway, N. Y. City.
Wheeler & Wilson Mfg Co., 625 Broadway, N. Y. City.

No. 14—Washing Machines.—For a long time we have annually tried half a dozen or more new Washing Machines. Some of them have promised well at first, but no one has continued in so much favor as the “Doty's Paragon,” which we have now used nearly three years. It is the only one the “help” will use without being required to do so. Some new improvements have been added within the present year. It is neat, compact, and convenient. Full Descriptive Circulars can be had of R. C. Browning, 32 Courtland-st., New York, or of the Metropolitan Washing Machine Co., Middlefield, Conn. The machine packs in small compass, and can be sent cheaply as freight or by express.

No. 15—Clothes-Wringing Machine.

—A very useful, time-saving, strength-saving, clothes-saving implement, that should be in every family. The wringing of clothes by hand is hard upon the hands, arms, and chest, and the twisting stretches and breaks the fibres with lever power. With the Wringing Machine, the garments are passed between elastic rollers which press the water out better than hand wringing, and with no wrenching of the fibres. It is done as fast as the left hand can pick up the garments, while the right hand turns the crank. It is so easily done that a child of 10 or 12 years can quickly wring out a tub-full of clothes, dropping them from the machine set upon the side of the wash tub directly into a clothes basket, ready to hang out. We offer the family size, “Universal Wringer,” provided with *Cogs* which make the rollers turn together, and which we consider essential to prevent injury to the fabrics, loosening of the rubber, etc. We used a single one of these Wringers, one of the first make, several years without any repairs, and with the greatest satisfaction.—It weighs only 15 lbs., and can be readily carried by hand, or sent by express, or as freight, to any part of the country, ready to be set upon any form of tub, and used at once. We have given over a thousand of these as premiums, with almost universal satisfaction. At least a thousand families may get one this year as a premium. They are made by the Metropolitan Washing Machine Co., Middlefield, Conn.

No. 16—A Tea Set.

—This premium has given the greatest satisfaction for the last two years. There are six pieces, viz.: *A Coffee Pot, two Tea Pots, a Creamer, Sugar, and Slop Bowl*—all of beautiful, uniform pattern, and new style, with raised and embossed figure work. They are not the common silver-washed articles, but the heaviest plate, equal to “Sheffield Plate,” the foundation being white metal, so as not to show, even when the heavy silver-coating may chance to be worn off in any spot by long hard usage.—These Sets are made by Lucius Hart & Co., of Nos. 4 and 6 Burling Slip, N. Y. City. Mr. Hart, “the veteran Sunday School man,” has been in the same place and business for nearly a quarter of a century. We have known him and his work for many years, and take pleasure in commending and guaranteeing its value to be as represented. The amount of silver on plated ware depends wholly upon the will and integrity of the manufacturer. We could give nearly as good looking plated ware for less than half the money. The Sets given as premiums will be boxed without charge, and sent to any place by express or otherwise as desired. (See remarks under No. 20 below.)

No. 17—Castor and Fruit or Cake Basket Combined.

—This is a new pattern, both novel and beautiful. It can be used as a large, showy, Castor, with six cut glass bottles, or be instantly changed into a complete Castor, with Call Bell, and a separate Cake or Fruit Basket, with a colored glass dish inside. Every one receiving it will be delighted. It is from the same maker as No. 16, and of the same metal, plating, etc., and will be sent in the same way. Many cheaper and less beautiful Castors could be obtained, but, desiring only the best things in our premium list, we selected this.

No. 18—Ice or Water Pitcher.

—A large and ornamental article, just such as we recently selected for our own use. It is of the same metal, plating, etc., and by the same maker, as No. 16. For 35 subscribers at \$1.50 each, we will add a round Salver of pattern to correspond (value \$6); or, for 47 subscribers, a large 16-inch oval Salver, (value \$14,) large enough for two goblets with the Pitcher; and for 53 subscribers, the Pitcher, large Salver, and a pair of beautiful Goblets, silver-plated without, and gilded within (value \$38). This complete Set is exceedingly desirable, though the Pitcher alone, or that and the smaller Tray or Salver, will answer a good purpose both for use and ornament.

No. 19—One Dozen Teaspoons.

—These are of fine pattern, “figured tips,” Olive-leaf Pattern, and of the same metal, plating, etc., and from the same maker, as No. 16. They are far cheaper than any thing we have found at half the price.

No. 20—One Dozen Table Spoons.

No. 21—One Dozen Table Forks.—The same description and remarks apply to these as to No. 19. We select as premiums only such articles as we can warrant every way in quality and price. As we explained in Volume XXV, page 147, a silver dollar can be by the galvanic process be spread over many yards of surface so as to deceive the eye completely. Plated ware is valuable when we can trust to the honesty of the manufacturer to put on a coat of silver of given

weight and thickness, and to do it on a good white metal! All these articles come from Messrs. Lucius Hart & Co.

Nos. 22, 23, 24—Knives and Forks.

—This premium is an addition to our list of really useful and valuable articles. A dull knife, with a shabby handle, and a broken or crooked fork, will injure greatly, if it does not spoil, the taste of even a rare beefsteak, but it is next to impossible to keep a poor iron or steel knife and fork in a passably neat condition, and a *shin*e will not come with any amount of brick dust and rubbing. The knives offered in this premium are manufactured by the most celebrated makers of cutlery in the world, Joseph Rodgers & Sons, Sheffield, England, whose corporate mark is dated 1764, and whose wares are known in every part of the world open to foreign commerce. They are of the best refined steel, with ivory balanced handles, and stamped with the full address of the makers, and are of the size known as table knives. The table forks are manufactured by Holmes, Booth & Haydens, on genuine albatra, and warranted double plated with coin silver. The tea knives and forks are by the same makers, but of smaller size. The carving knife and fork are both steel, made by Rodgers & Sons, best ivory balanced handles. For 38 subscribers, at \$1.50 each, we will send the tea knives, of the same make and material, *double silver plated*, forks the same, (value \$26.) For 45 subscribers, at \$1.50 each, we will send the table knives, *double silver plated*, with same forks, (value \$30.) These articles are furnished to us by Messrs. Patterson & Brothers, 27 Park Row, agents for the manufacturers, and a thoroughly established and reliable house, who will furnish the above articles at prices named, and express charges paid to any one who may wish to purchase, and any other goods in the hardware line.

No. 25—Musical Box.—Something for the Boys and Girls. A new and beautiful Premium, and we have provided it specially for our young friends. Come, now, Boys and Girls, we know you all love music, and we have made it easy for you to obtain a beautiful, shell-cased musical box, 2½ inches cylinder, which will perform four tunes, making what we believe you will say is the sweetest music you have ever heard. We wish you could have been with us and listened while we selected these Premiums for you at the importers. We are sure you would have felt like making haste to get up the necessary club, only 22 subscribers, at \$1.50, to make this most pleasing premium your own.

Nos. 26, 27—Melodeons.

—These are excellent and desirable instruments, for the Home Circle, for small Churches, for Sunday Schools, for Day Schools, Academies, etc. Instrumental and Vocal music in a school has a beneficial influence upon the pupils. We have seen the whole tone and character of the pupils of a school improved by the introduction of a Melodeon.—Set the pupils to work and they will raise a club of subscribers, and obtain this premium easier than they can get money subscribed for it. We offer Geo. A. Prince & Co.'s Melodeons, for we know them to be good. A large one in our own Sunday School room has been in use for eight years, and is to-day just as good as when first purchased, though used from time to time by a large number of persons.—Several clergymen have obtained this premium for themselves, their Churches, or Sunday School rooms. The premium clubs of subscribers were quickly raised among the members of their parishes.—Many others can get this premium for their own home use. We have given these instruments as premiums in the past few years, and we believe they have invariably been highly esteemed. Send a postage stamp to Geo. A. Prince & Co., Buffalo, N. Y., and get their illustrated descriptive circular, giving full particulars of forms, sizes, and prices. The premium Melodeons will be shipped direct from the manufactory at Buffalo, ready boxed for safe transportation by Railroad, Steamboat, or by Express, as may be ordered. They go just as safely by freight, as by express, and much cheaper, though not so quickly.

No. 28—Colibri Piano.

—This is a newly invented Piano, the work of Mr. Frederick Mathishek, who has for many years been known among manufacturers as the author of some of the best improvements introduced into this instrument. A particularly novel feature of this piano is its size, being only four feet nine inches long, two feet three inches wide, of the square form, yet having seven full octaves. Before its adoption as a premium, some of the most eminent musicians examined it at our request, and pronounced it an instrument of remarkable power, brilliancy, and sweetness, entirely worthy to rank with the full-sized piano of other makers. H. Mollenhauer, Director of the Conservatory of Music, New York, says: “Their tone is truly astonishingly sweet, pure, and powerful, and so greatly superior

to all others, that they must be heard to form a just conception of their superior excellence." Mr. Theodore Hagen, editor of the leading musical paper of this country, says of the Colibri Piano: "It is a thorough square piano-forte, only very small, but at the same time very proportionate and beautiful—and can speak to such an extent, with such power and sonority, that we must see as well as hear it to believe it possible." Its peculiar construction not only secures improvement in sounding qualities, but seems to insure great durability and long continuance in tune. It is finished in handsome style, with rosewood case, large round corners, fancy scroll desk, legs, lyre, etc., and will be an ornament in any parlor, besides being entirely satisfactory as a musical instrument. Other styles are made by the same firm, but this was selected as especially adapted to the wants of many of our readers. Messrs. Barlow, Doehler & Co., 694 Broadway, New York, are the agents, and will send circulars, giving full particulars, to applicants.

No. 29—Steinway Piano.—SEVEN OCTAVE, ROSEWOOD CASE; SOLID ROSEWOOD DESK, LARGE FRONT, ROUND CORNERS; OVERSTRUNG BASE, FULL IRON FRAME, PATENT AGRAFFE TREBLE, GOTHIC LEGS, AND CARVED LYRE.—This is one of the most elegant Premiums ever offered; regular and only price \$650. That this magnificent instrument comes from the celebrated establishment of Messrs. STEINWAY & SONS, Nos. 71 and 73 East 14th street, is enough to say; but it is due to these enterprising manufacturers to state that, while their pianos have repeatedly received the FIRST PREMIUMS by the award of the most competent judges the world can produce, the crowning triumph has recently been achieved. At the Universal Exposition, in Paris, Steinway & Sons received the FIRST GRAND GOLD MEDAL for American Pianos in all three styles exhibited, viz.: Grand, Square, and Upright. The following is a copy of the official certificate, which was signed by the President and the five members of the International Jury: "Paris, July 20th, 1867. I certify that the First Gold Medal for American Pianos has been unanimously awarded to Messrs. Steinway by the Jury of the International Exhibition. First on the List in Class X." Besides all this, and second only to it in importance, is the fact that the Society of Fine Arts, in Paris, unanimously awarded to Steinway & Sons their *only* annual Testimonial Medal for 1867. The President of the Musical Department of that society says, in his report: "The Pianos of Messrs. Steinway appear to me, as well as to all the artists who have tried them, superior to all that have been made to this day in the entire world." This is to be added to abundant testimony from the best judges in America and other lands. We are able to speak from personal knowledge of the excellence of these instruments, as each of our partners has one at home, and desires no better. This splendid premium may be secured by many persons. Only 540 subscribers are required to do it. The last successful canvasser was a lady—a wife and mother—who, though with the care of a family, and among them at least one bright little child to our knowledge, found time to secure one of these magnificent pianos within seven months. Others, more at liberty, might obtain subscribers enough in 2 or 3 months; and for even a year's labor the compensation would not be small for some persons. Classes of young ladies at school might unite in effort, and thus obtain a present for a Teacher, or a Piano for their schoolroom. We shall be glad to give this premium to a large number. Who will try for it? Send to Messrs. Steinway & Sons for a free circular describing it.

No. 30—Ladies' Gold Watches.—At the request of canvassers, we add this and No. 31.—The Lady's Watch offered is one of the prettiest watches we have seen. It is in a "hunting" or closed case, beautifully engraved, and inlaid with enamel, and is warranted a good time-keeper by Messrs. Benedict Bros., 171 Broadway. (See No. 31, below.) This is a beautiful and appropriate present to a Teacher from the members of a School, who can easily divide among themselves the number of subscribers to be raised. It is also a very neat and beautiful gift for a companion. Not a few gentlemen can get this in time for a Holiday Present. Several have taken this premium and are delighted with it.

No. 31—A Good Watch.—For years past we have been urged to offer a good, reliable, Watch is a premium, and can now do so. We have arranged with Messrs. Benedict Brothers, of 171 Broadway, Dealers in Watches and Jewelry, to supply us with two kinds, and such watches as they will put in first-rate order and warrant. These parties we know to be in every way upright and reliable gentlemen, governed in their dealings by Christian principles, and with their guarantee we unhesitatingly offer these articles with confidence. (As is generally known, Messrs. Benedict Brothers are entrusted with the keeping of the N. Y. City time, and furnish

time to a large number of Railroads and Steamers.) Every watch we send as a premium will be first put in running order by them, and thoroughly tested, and warranted for one year.—No. 31 is a patent lever, full jewelled, in engine turned hunting case of Coin Silver, and manufactured by the justly celebrated Arnold Adams, of London. This premium will give very many a chance to obtain a *really valuable, reliable time-piece*, and at the cost of only a little effort. We have given a large number of these watches this year, and they have proved as recommended.

No. 32—Double Barrel Gun: OR FOWLING PIECE.—These guns are the genuine London "Twist" barrel, Patent Breech, Bar Lock, obony ramrod, and in all respects desirable. Their calibre and length of barrel vary, and may be ordered to suit the kind of shooting to be done. As a special favor they are furnished to us for this premium, by Messrs. Cooper & Pond, of 177 Broadway, and well known as one of the most reliable and best houses in their line of business, and they highly recommend this particular gun, and guarantee it in every respect. It is from one of the oldest and most favorably known English manufacturers, and of a kind which Mr. Cooper assures us he has had so long, and found so good, that it is just the gun he should take if he were going out for a day's shooting. The price is not put on in fancy carving, and useless plating for show, but in the gun itself. We could get almost as good looking guns for half the sum, but we offer only real, substantial, reliable articles, those *cheap* at the price named in our table. This premium includes the Gun, Powder-Flask, Shot-Pouch, and Wad-Cutter.

No. 33—Roper Repeating Shot Gun.—Bang, Bang, Bang, Bang—four times in as many seconds, or even less! What a luxury to a sportsman! With a good flock of ducks, prairie chickens, quails, or snipe, the bag may be filled at once. This gun seems to meet all the wants of the sportsman. It is a splendid shooter, it can be fired four times without re-loading, the cost of ammunition is no more than for a muzzle loader, it is very light, (6½ lbs.) and the charges are waterproof. The barrel is steel, 25 inches long, with a receiver at the breech, into which four charges, each in a steel case, are placed at once, and are carried into the barrel separately, simply by cocking the piece. A Belt, 24 Shells, Wiper, Loader and Loading Block, accompany the Gun. This gun is highly recommended by distinguished sportsmen, and our boys, not accustomed to the use of a gun, found it a very pleasant companion in their summer recreations, showing that there is no difficulty in the management of it. The gun is manufactured by the Roper Repeating Rifle Company, Amherst, Mass., under the supervision of C. M. Spencer, Esq., inventor of the famous Spencer Rifle, who will furnish circulars with full descriptions.

No. 34—Spencer Repeating Rifle.—This Premium is one of Spencer's Repeating, Sporting or Hunting Rifles. It carries 7 charges inside of the stock, which are successively thrown into the barrel and fired, simply by pressing out the trigger guard, pulling it back, cocking and pulling the trigger itself. One can do all this lying behind a log without rising to scare his game. The seven shots can be readily fired *in less than half a minute*, and then you have only to slip seven more ready made charges into the stock—in half the time you can load a common rifle once at the muzzle—to be ready to fire seven times more, and so on.—An exceedingly interesting statement of what this rifle has done during the war, and of what it is, and is capable of, may be obtained by addressing WARREN FISHER, Jr., Treasurer of Spencer Repeating Rifle Company, Tremont-street, Boston, Mass.—Our premium includes the \$45 Rifle, and \$10 more for the Globe and Peep-sights, including 100 rounds of prepared ammunition, boxing and shipping. These are the Company's cash prices. The addition of the Globe and Peep-sight adapts the gun for the longest ranges, for sharp-shooting, etc. Each charge contains powder, conical ball, and fulminate, all in a copper case, and is waterproof. No ramrod, no cap, and little or no cleaning of the gun barrel is required.—The regular size is: bore or calibre, .44-100 of an inch; length of barrel, 26 inches. Any one preferring a length of 28 or 30 inches, can have it for \$1 or \$2 extra.

No. 35—Chest of Good Tools.—For the present year, we have, through the special favor of Messrs. PATTERSON BROTHERS, of 27 Park Row, arranged for a few chests of the *very first quality of tools* of the kinds and prices named below. The same kinds of tools could be purchased for about half the money, but these are all A No. 1, and cannot be procured at any less price. They are for practical use, and worth a dozen common articles. For this we have the word and guarantee of

Messrs. Patterson, which is amply sufficient for us, and for all who know them. They make up assortments of these, or any part of them that may be ordered of them, at the prices affixed, and any one can purchase of them what they desire. We make up only a single premium, which contains a full assortment for all common purposes. The tools are of regular size, and but few additions would be required for a Journeyman Carpenter. The assortment of our premium is as follows: Plain chest, 31x16½x16 inches, with sliding compartment box, \$7; Jack Plane, \$1.60; Smooth Plane, \$1.45; Jointer Plane, \$2.25; Hand Saw, 22 inches, \$1.75; Compass Saw, 10 inch., 70c.; Compasses, 6 inch., 60c.; Warner's Hammer, (adz eye), \$1.50; Hammond's Hatchet, 85c.; Drawing Knife, \$1.25; Try Square, 6 inch., 85c.; Bevel, 8 inch., 70c.; Chalk Line and Spool, 45c.; Mallet, 25c.; Pair of Pliers, (pinchers), 35c.; Sliding Tongs, (pinchers), 55c.; Calipers, 3¼ inch., 35c.; Brace, 65c.; Augur Bitts for Brace, ¼ inch., 25c.; ½ inch., 45c.; ¾ inch., 75c.; Center Bitts, ½ inch., 21c.; ¾ inch., 25c.; 1 inch., 25c.; 1¼ inch., 35c.; 1½ inch., 40c.; Six Gimlet Bitts, assorted sizes, 90c.; Three Gimlets in Handles, assorted sizes, 36c.; Screw-driver Bitt, 25c.; Flat Comersink Bitt, 25c.; Rose do. do., 25c.; Nail do. do., 25c.; Octagon Reamer, 30c.; Taper Bitt, 50c.; 3-inch Screw-driver in Handle, 30c.; 6 inch., do. do., 40c.; ¾ inch Handled Gauge, 50c.; ¾ inch do. do., 60c.; ¼ Handled Chisel, 35c.; ½ inch do. do., 40c.; 1 inch do. do., 60c.; 1¼ inch. do. do., 80c.; ¾ inch heavy Framing Chisel, \$1.10; 1 inch do. do., \$1.25; 1¼ inch. do. do., \$1.50; ¾ inch Augur, 60c.; 1 inch do. do., 70c.; 2 inch do. do., \$1.30; full set of Bradaws, \$1.85; Common 2 feet Measuring Rule, 30c.; File, 3-cornered, 20c.; do. do., 25c.; Flat File, 30c.; Wood Rasp, 50; Soldering Iron, (copper), \$1.15; Solder, Nails, etc., \$1. Total, \$44.50.—The Chest will be locked, and sent as freight or otherwise, and the key sent by mail.

Nos. 36, 37—Mathematical Instruments, for Draughting, Drawing, etc.—Very convenient not only for Architects and Mechanics, but for farmers and others, and for Boys and Girls. These are neatly fitted in beautiful Rosewood Cases, having dividers with flexible joints, and points, semi-circles, pencil and penholders, rulers, etc., etc. All the pieces in No. 36, are finished in brass and steel; those in No. 37, are German silver and steel. The pieces are the same in each, but No. 37 is of extra beauty and workmanship. They are useful in making drawings, plans of buildings, fields, etc. They are valuable to children, to cultivate a taste for, and habit of observing and sketching farms, plotting fields, orchards, buildings, for drawing, etc., etc. Such "playthings" not only keep them from "mischief," but develop their minds, and make them "handy." These premiums will be sent by mail, post-paid, to any place in the United States.

Nos. 38, 39—Dawson, Warren & Hyde's Gold Pens.—WITH EVER POINTED PENCILS, IN EXTENSION COIN SILVER CASES. Premium No. 38 contains the best E Gold Pen, and No. 39 the best F Gold Pen, which is the same style, but larger. These pens are made by Messrs. Dawson, Warren & Spadone, No. 4 Maiden Lane, N.Y., successors to Dawson, Warren & Hyde, whose pens obtained so wide and good a reputation that the original firm name is the Trade Mark, and is still stamped upon every pen made. We have known the makers and their goods for many years, and can recommend both to our readers. Messrs. W. & S. are the largest manufacturers of Gold Pens, Silver and Gold Pencil Cases and Holders in the country, and their wares are fully equal to any manufactured. In ordering, state whether a stiff or limber point is desired, and if the Pen received is not suited to the hand, it may be exchanged at a trifling expense for postage. If a larger desk pen is desired, we will send the G (very large) style, with ebony and silver holder, in leather case, in place of E. with Pencil Case, or the H, (largest,) same style, in place of F, with Pencil Case.

Nos. 40, 41—Mercurial Barometers.—WOODRUFF'S PATENT, made by CHAS. WILDER, Peterboro, N. H. These are the most convenient and portable Mercurial Barometers made. (Send to Mr. Wilder for a circular giving engravings and descriptions of the instruments.) The peculiar form of Mercury cup invented by Mr. Woodruff renders these far more portable than any Mercurial Barometer previously known. They are so easily carried that Mr. Wilder guarantees the safe delivery of every Barometer given by us as a Premium, if not to be sent beyond the Rocky Mountains. The instruments are beautifully made, are about 3 feet long, and are packed and sent direct from the factory, with no expense save the express charges. We offer two forms which differ mainly in the style of case, both being supplied with *Thermometer and Vernier*. A Barometer is to farmers, or others on land, what it is to sailors at sea—an indicator of the weather to be looked for. Many who have received this premium from us in former years have given us definite statements touching its great value to them. We have tested these instruments thoroughly, and have confidence in them as weather indicators. Aside from its direct utility, the

habit of observation and of scientific study, cultivated in children where a Barometer is used, is important.

No. 42—Buckeye Mowing Machine.

—The gratification expressed by those who received this premium last year, and the request of others who wish to get it this year, lead us to continue it on the same terms. The Buckeye Mower is so widely and favorably known throughout the country that we need not describe it particularly. Any one writing to the Manufacturers, Messrs. Adriance, Platt & Co., 165 Greenwich-st., N. Y. City, will receive a circular giving full description, engravings, etc. The experience of last year showed that many a farmer can easily secure this premium by a very few days', or odd hours' and evenings', canvassing for subscribers. A few can unite their efforts, each getting a part of the subscribers, and then own the machine in common, if they do not each need the entire use of a mower.—It would pay a man well to canvass for this premium, and sell it afterward. Ten subscribers a day for 15 days would secure the premium, which sells regularly for \$125.—Many can, at town meetings, fairs, elections, and other gatherings, or during the evenings, secure this premium club without much, if any, loss of time.

No. 43—Cylinder Plow (Allen's Patent).

—We hear very good reports from those who received this premium last year. It is named from the peculiar form of the mould-board. Several improvements have been made upon it within a year or two past. It is an Ohio invention, we believe, but is manufactured by the well known and reliable firm, R. H. Allen & Co., 189 & 191 Water-st., New York City, to whom application may be made for further description, etc. There are several sizes and prices, with a greater or less number of attachments. The kind we offer for premiums is the "Two-horse size, cutting a furrow 12 to 14 inches wide, and 5 to 8 inches deep." It is also provided with wheel, and with a "skim plow," that is, a smaller plow attached under the beam, like the double "Michigan plow."

No. 44—Page's Patent Pump and Sprinkler.

—This apparatus combines most of the advantages of a Hand Watering Pot, a Green-house Syringe, a light Force Pump, and Garden Engine. It is very simple in construction, light to carry, easy to operate, and adapted to a great variety of uses. In every household it will be found most convenient for washing windows, or window blinds. It throws a small stream with considerable force about forty feet, and will be invaluable in case of fire, where places otherwise inaccessible can be easily reached. In the stable it will be valued for washing carriages, horses, etc. In the garden, it gives the readiest means for watering plants. By a very simple arrangement, the stream can be instantly changed to drops, spray, or mist. It is manufactured by the New England Portable Pump Company, 11 Hanover-st., Boston, Mass.

No. 45—Family Scales.

—These scales combine the advantages of counter and platform scales, and are peculiarly adapted to household purposes. They weigh from one-half pound to two hundred and forty pounds. They are provided with a scoop or pan for weighing flour, sugar, and other house stores, and also with a platform for heavier articles, and are, in short, just such an apparatus as is needed for in-door or out-door use, occupying less than two feet square. The advantages of such an apparatus will be appreciated by every housekeeper. In cooking, preserving, keeping the weight of the grocer, butcher, etc., up to its proper mark, and in weighing meats, butter, and other produce sold from the farm, they will save much more than the cost of obtaining them as a premium. These scales are manufactured at the well known establishment of Fairbanks & Co., whose weighing apparatus has for many years been ranked as the standard, and to whom were awarded the highest premiums, two medals, at the Paris Exposition.

No. 46—Crandall's Improved

Building Blocks furnish a most attractive amusement for children. They are very simple in construction, will stand years of children's handling without breaking, and give renewed pleasure daily. Churches, Dwellings, Barns, Mills, Fences, Furniture, etc., in almost endless variety, can be built with them, and when finished, the structure remains firm so that it can be carried about without falling to pieces. For developing the ingenuity and taste of children they are unequalled. Having given these blocks a practical trial in our own families, we are so well pleased with them that we have placed them on the Premium List. The Blocks are put up in neat boxes, each box containing 130 pieces, and a card giving various designs of buildings. The sets used for this Premium are plain. The same blocks may be had

Painted red, white, and blue, by sending to us 3 more subscribers, at \$1.50 each, or 10 more, at \$1 each, than are required for the plain set.

No. 47—Pocket Lanterns.

—This new premium is a very ingenious as well as valuable Yankee invention. It is a complete *Lantern*, large enough to afford light for walking or other purposes, and yet in half a minute it can be folded into a parcel 3 by 4 inches long, and $\frac{3}{4}$ of an inch in thickness, or small enough to set into the vest pocket, and yet contain 3 little sperm candles, matches, etc. We have used one for twelve months, carrying it in the pocket whenever going out at night, ready for use at any moment. It is manufactured by the Merriam Manufacturing Company, (Julius Ives & Co., Agents, 49 Maiden Lane, N. Y. City.) The manufacturers enable us to make the special offer in our Premium List, in order to introduce specimens of these lanterns to general use. A dozen pack in a box $3\frac{1}{2}$ by $5\frac{1}{2}$ by $8\frac{1}{2}$ inches.

No. 48—American Cyclopaedia.

—APPLETON'S NEW.—We can hardly commend this great work too highly. We wish it could be placed in every family in the country. Several were fortunate in securing it through our premium list last year, and we hope many more will do so this. Scholars at our Academies and Seminaries, and members of Library Associations, can easily unite their efforts and secure this important work for their Libraries. Many young men ought to devote their evenings and spare hours to canvassing, and obtain this magnificent and useful work for their own use. The Cyclopaedia is a *whole Library of itself*, consisting of sixteen very large octavo volumes, well bound, averaging 800 large two-column pages in each book, or in the whole, 12,804 pages! They treat upon over 25,000 different subjects. It is hardly possible to name any subject, any country, any person of note, in past or recent time, concerning which pretty full information may not be found in the Cyclopaedia. It embraces every topic of human knowledge, alphabetically arranged for convenient reference.—The British Cyclopaedia, though less comprehensive, and not coming down to recent dates, costs more than twice as much as our better American Cyclopaedia. This premium is worth a year's effort in raising subscribers. The lowest price is \$80.

No. 49—The Great Dictionary.

—WORCESTER'S LARGE PICTORIAL, UNABRIDGED EDITION, containing 1854 three-column pages, with a multitude of illustrative engravings. (The work is 12 inches long, 10 inches wide, and nearly 4 inches thick, and weighs about 10 lbs.) Many of the most thoroughly educated men of the country consider this as far the best Dictionary in the English Language. It gives the spelling and pronunciation of every word in the language with full explanations, and as a source of general information stands next to the Cyclopaedia. The Dictionary can be called for at our Office, or be sent by express or otherwise, to any part of the country. We have given away hundreds of copies as premiums, many of them obtained by quite young boys and girls. It should be in every family. It is published by Brewer & Tileston, Boston.

Nos. 50 to 60—Volumes of the

American Agriculturist (Unbound).—These amount to a large and valuable Library on all matters pertaining to the Farm, Garden, and Household, and contain more varied information on these subjects than can be obtained in books costing three times the money. We have stereotype plates from the Sixteenth to the Twenty-fifth Volume complete, and will have Volume 26 soon after Dec. 1st. From these plates we print as needed. The price of the volumes is \$1.50 each, at the office, or \$1.75 if sent by mail, as they must be post-paid. They are put up in clean numbers, with the Index to each volume.—They are profusely illustrated, the Engravings used in them having alone cost about Twenty Thousand Dollars! Those obtaining premiums for from one to ten volumes, can select any volumes desired, from XVI to XXVI, inclusive. For ordinary use, the sets of numbers unbound will answer quite well.—Many hundreds of these volumes are taken every year as premiums.

Nos. 61 to 71—Bound Volumes of

Agriculturist.—These are the same as Nos. 50 to 60 above, but are neatly bound in uniform style, and cost extra for binding and postage. Sent post-paid.

No. 72—Downing's Landscape Gardening, and Rural Architecture.

—This is a most beautiful Octavo volume, in extra binding, and will be an ornament to the best center table in the land, as well as be practically useful. It contains 108 fine engravings on Wood, Steel, and Stone. It will be sent post-paid.

No. 73—Architecture: A NEW AND PRACTICAL WORK ON ARCHITECTURE, containing Designs for Street Fronts, Suburban Houses, and Cottages, etc., etc., giving in detail Designs and Working Drawings for both the exterior and interior of buildings; also a great variety of Details not in the Designs. It is 11 by 14 inches in size, and contains engravings of 382 Designs, and 714 Illustrations, that would separately cost Hundreds of Dollars. By Cummings & Miller. Sent post-paid.

Nos. 74 to 85—GOOD LIBRARIES.

—In these premiums, we offer a choice of **Books** for the **Farm, Garden, and Household**. The person entitled to any one of the premiums 74 to 85, may select any books desired from the list below, to the amount of the premiums, and the books will be forwarded, *paid through* to the nearest Post Office, or Express office, as we may find it most convenient to send them. We need not enlarge upon these premiums; every one knows the value of good books. Twenty-five or Fifty dollars worth of books on subjects pertaining to the farm will give the boys new ideas, set them to thinking and observing, and thus enable them to *make their heads help their hands*. Any good book will, in the end, be of far more value to a youth than to have an extra acre of land, on coming to maturity. The thinking, reasoning, observing man, will certainly make more off from 49 acres, than he would off from 50 acres without the mental ability which reading will give him.—Our premiums will enable many a family to secure a larger or smaller Library. This is a good opportunity for the farmers of a neighborhood to unite their efforts and get up an Agricultural Library for general use.

No. 86—General Book Premium.

—Any one not desiring the specific Book premiums, 74 to 85, on sending any number of names above 25, may select Books from the list below, to the amount of 10 cents for each subscriber sent at \$1; or to the amount of 30 cents for each name sent at the (ten) club price of \$1.20 each; or to the amount of 60 cents for each name at \$1.50. *This offer is only for clubs of 25 or more. The books will be sent by mail or express, prepaid by us.*

BOOKS FOR FARMERS AND OTHERS.

[For sale at the office of the *Agriculturist*, or they will be forwarded by mail, post-paid, on receipt of price. All these are included in our Premiums, Nos. 74 to 86, above.]

Editorial Jottings in Europe.

Since his absence in Europe, Mr. Judd has written frequently, with permission to publish such portions of his letters as we chose. Several of his notes of travel have been crowded out by other matter, and we briefly say that, after visiting Great Britain, France, and Holland, he is now in Russia, and will go by way of Germany and Switzerland to Southern Europe. We give some of his notes on the northern countries:

"STOCKHOLM, Sweden, August 10th.... We have had an interesting journey of 450 miles up through Sweden, from Malmö, which lies opposite Copenhagen. Around Malmö is quite a fertile section, and we saw some good farms between lakes Wenner and Wetter, and at other points, but the country is generally either wet or rocky. Yet there is a neatness and American look about the farm-houses and the villages that is very pleasing—indeed, rather surprising. In this city (Stockholm,) and its surroundings, we are very agreeably disappointed. The finish and style of the buildings, and the form, physiognomy, and dress, of the people, are more like those of a first class American city of 33,000 inhabitants than we have found anywhere else in our journey through France, Belgium, Holland, Germany, Prussia, and Denmark, and we will not except even Great Britain. In politeness and general good manners the citizens of Stockholm apparently excel us. The city is most beautifully located on a number of islands, divided by small lakes and narrow, swift running streams. The ground of each island rises high above the water, in the center especially, so that the city, as a whole, has a diversified appearance, the houses rising rapidly, one above the other, from the water's edge to the middle. At a little distance, the dividing waters are not seen, and the city appears as a compact mass of buildings. Outside of the city are seen some beautiful fields with growing crops, though the surface is much broken with rocky hills or immense granite boulders, with lakes or lakelets every mile or two. What surprises me most, is a field of tobacco just north of the city, which exhibits as vigorous a growth of leaf and stem as I have ever seen even in the most favored regions. Every hill is perfect, the leaves of immense size, and not a plant is under four feet in height to the curve of the top leaves. This, remember, is nearly up to latitude 60°, or about the same as the southern part of Greenland, the northern end of Labrador, and the middle of Hudson's Bay...."

"Helsingfors, Finland, August 15th.... The passage hither from Stockholm is the most charming one in my experience. I have traveled hundreds of miles to see the "Thousand Islands" of the St. Lawrence, but they sink into insignificance in comparison with what we have seen during the past two days. With the exception of a narrow space of open sea between the Swedish outer coast and Åland, and again between that island and the outer Finnish coast, there is one continued succession of little islands, between which the steamer threads her way for over two hundred miles in coming from Stockholm to this place. Some of these islands are mere rounded granite rocks of an acre or two, more or less; many of them have evergreen and other shrubs or trees, with grass plots. Some of them have dwellings and cultivated fields. Often there are fifty to one hundred of these beautiful islands in sight at a time. The water channels between them vary from three or four rods to a mile or more in width. The passages are so narrow and tortuous, and the under-water islands are so numerous, that no steamer or sailing vessel moves at night. Our steamer left Stockholm at daylight, (two o'clock A. M. here, now!) and made Åbo, (pronounced Obo,) in Finland, by 6 P. M., and stopped until 4 A. M., giving us several hours of daylight to tramp around the town, and climb the old Lutheran church tower, to gain a view of a dozen miles in every direction. In the vaults beneath the church, we examined bodies deposited hundreds of years ago, yet still preserving their forms and features. In this high, dry latitude, they literally dried up, or changed to enduring matter without decay. Åbo, like Stockholm, much resembles an American town in its buildings, and the dress and physiognomy of the people. But here, at Helsingfors, the capital of Finland, our surprise has reached its climax. The neat, well-built city is as lovely an one, at this season, as I ever saw. We find green parks, broad, clean, well-paved, beautiful streets, thriving business stores and shops, magnificent churches, a flourishing University, with its library of 200,000 volumes, etc., etc. The people are vigorous and intelligent, and equal in physique our best class of native Americans. The "guide books" say little of this region; travelers come here but seldom, and so we hear little of Finland, and think of it only as a cold, bleak region, inhabited by a semi-savage race. It is far, very far, otherwise, and I would advise every American traveling abroad, to visit Holland, Denmark, Sweden, and Finland. A single voyage through the "Ten Thousand Islands" will repay a voyage from New York to Stockholm, and a visit to Finland will exceed in interest that usually made to

Middle and Southern Europe. A trip up by rail-road, lake, and canal, into middle Finland, is easily accomplished in July or August, and from all I can learn here, is one of perfect safety and of great interest. I only regret that our large company, including small children, and engagements abroad, will prevent my going further north now. We came from Stockholm in the fine steamship *Anra*, whose captain, Mr. LARS KROGUS, of Helsingfors, Finland, is a model Christian gentleman. He has been in America, speaks our language well, and he has done everything possible to make us comfortable, and aided us greatly in seeing and understanding the various points of interest on the route...."

"WYBORG, Finland, August 16th.... Leaving Helsingfors at 6 A. M., we passed, at the mouth of its spacious harbor, the powerful fortifications at Sveaborg, which are of historic interest, and are well styled the 'Gibraltar of the North.' To-day's sail has been mainly among a succession of beautiful islands, like those met with all the way from Stockholm. At 4 P. M., we passed the Russian war fleet at anchor, and counted among the ships at least nine large turreted 'Monitors,' similar to our own. We then entered through a narrow channel, guarded by extensive batteries, into the eight mile harbor, at the head of which stands Wyborg, a city of 7,000 inhabitants. This, too, is, in many respects, a beautiful town. About 1½ miles north-east of the fortified city is located 'Mon Repos,' (My Repose,) the former residence of Baron Nicolai. This delightful retreat is on the shore of a large lake, and nearly shut in by hills; the grounds are interspersed with little lakes and streams, valleys, and hillocks, which are mainly of immense granite boulders or ridges, covered with patches of trees and green verdure. Bridges, summer-houses, green-houses, graperies, arbors, walks, arched by living trees, extensive flower plots, all in beautiful bloom, etc., abound. Taken altogether, the combination of natural and artificial scenery at Mon Repos excels anything of the kind that we have ever seen elsewhere. It is doubly interesting from the fact that we find it above latitude 60°, away up in Finland. The pen of a Downing, aided by an artist's pencil, is needed to justly describe this exquisite retreat...."

"ST. PETERSBURG, Russia, August 20th.... After leaving Wyborg, on Friday, we had a slightly rough passage, caused by a stiff western breeze over the Gulf of Finland, which sent sundry passengers to their berths. At 2 P. M., we neared the renowned fortifications and ship-yards at Cronstadt, eighteen miles west of St. Petersburg, and our hearts were gladdened, and our eyes fairly glistened with tears of joy, as we saw flying from beautiful ships the 'Star-spangled Banner,' and Admiral Farragut's square, five-starred, blue Pennant, at the main-mast head of one of them. After so long journeying—always, thus far, in foreign ships—the sight of our own flag gallily floating in the breeze, awakened such emotions as none but those who have experienced them can appreciate. We wonder not at the devotion of the seaman to the flag of his country.... Further on, we passed some Russian ships, and then the fleet of Sweden, (the native land of Ericsson,) and here, too, were ten or a dozen monitors—the smoke from a salvo of artillery of all the vessels and fortifications just then fired in honor of a visit from the Russian Grand Duke to our fleet prevented our counting the ships accurately.... Eighteen miles more, and we came to anchor in the Neva, in the midst of the Great City of the North, and, in many respects, the City of the World. The bug-bear of rough, searching Russian custom house and other officials, so graphically written down in the English guide books, was not found. The fact that we were American travelers, with our necessary baggage, secured us a polite reception, and an unsearched and unmolested passage to our hotel. At the 'Grand Hotel,' we found as spacious, clean, and well furnished rooms, as good, well prepared food, as careful, prompt, and polite attendance, and at quite as reasonable rates, as we have secured anywhere else since crossing the Atlantic. No 'Russian bears' walk the streets, in official or other garb, but every class, official, mercantile, shop-keepers, market men—indeed all classes, down even to the cab-men, if not including them also, are as polite and well-bred as we have anywhere found, not excepting Paris itself. I wish to note here, that everywhere on the continent we have seen among all classes a degree of politeness—a touch of the hat, a 'thank you' for the slightest favors, that might well be copied by us Americans far more generally than it is.... During three days past, we have rode 20 miles through some of the broad, beautiful streets, and in one of the parks; have taken a full survey of the whole city, from the top of Isaac's Cathedral, have visited the 'Hermitage,' with its infinite treasures of art, modern and ancient—and from what we have seen and know is to be seen, we are almost ready to write down St. Petersburg as a city more interesting, more instructive, and more pleasing than any we have seen after traversing, (now, or previously,) every country of Europe, north of Spain and Italy. We Americans have seen and known northern and north-eastern Europe too much through

English and French eyes. For myself, though I came hither with much desire, and with many expectations, I confess that what I have already seen, far surpasses my very highest conception. Even an enthusiastic French gentleman, a fellow traveler hither, who has all the way been loud in his praises of Paris, to-day, voluntarily, remarked to us, 'St. Petersburg is a second Paris.' Perhaps after three days more, he may say, 'Paris is almost a second St. Petersburg.'...."

Walks and Talks on the Farm.—No. 46.

We have had one of the most severe drouths I have ever known. I have always been partial to a dry, hot summer—it gives such a splendid chance to kill weeds—but this is rather too good. At the East, I understand, they have had a very wet summer, and the papers complain that the potatoes are rotting in consequence. Here we shall have few or none to rot. Corn will not be half a crop. I did not sow any corn for fodder, but we have been obliged for some time to cut up corn for the cows. As it was drilled in, and was a little too thick, I do not begrudge it the cows as much as if it was planted in hills. There is a heavy growth of stalks, and I am astonished to see how little ground we have to go over for a day's supply. Another season I will not be without a piece of corn fodder, on rich land, near the barn-yard, to be cut up in August for milch cows. Some of my neighbors had a piece this year, but it was sown broadcast, and the dry weather parched it up. In moist seasons, corn sown broadcast sometimes does well, but, as a general rule, it should be sown thickly in drills, and thoroughly cultivated, and the more highly it can be manured, the better. Rich land, thick seeding in drills, say three bushels per acre, and thorough cultivation, are the essentials in raising corn fodder. And in such circumstances it is astonishing how much feed can be obtained from an acre.

How much land does an old-fashioned fence occupy? I have always thought it took up a good deal of land, but never had the curiosity to measure. But this summer we have been building a stone wall along the whole west side of the farm, and after it was completed, and the old fence removed, I was surprised at the quantity of land we had gained. The ground, of course, might have been plowed closer to the fence, but taking the ease as it actually was, the old rail fence, with stones, weeds, rubbish, etc., occupied a strip of land one rod wide. A field, 31 rods long and 31 rods wide, contains about six acres. If surrounded by such a fence, it would occupy a little over three quarters of an acre of land. A farm of 160 acres so fenced would have twenty acres of land taken up in this worse than useless manner. Not only is the use of the land lost, but it is, in the majority of cases, a nursery of weeds, and, in plowing, much time is lost in turning, and the headlands and corners are seldom properly cultivated.

But will it pay to use more capital in farming? If we could calculate on getting present prices, there can be no doubt that it would pay well. And, at all events, you cannot have good farming without the use of a large working capital, or of liberal credit, and it is quite certain that, if good farming will not pay, poor farming will not. And as agriculture is the main business of the nation, farming will pay in the long run, if anything pays.

This question, so often asked, and so seldom answered, "Does farming pay?" is a very absurd one. Of course farming pays. Farmers do get a living, and it is rare that one of them

fails. I have three neighbors. One came from the eastern part of the State, when the country was new. He took up 160 acres of land, cleared it, fenced it, lived, probably, at first in a log house, worked hard, but enjoyed himself. He is a capital farmer, up early in the morning, attends to his stock, always has his crops sown in good season, treats his land liberally, and gets ample returns. He commenced with little, has brought up a large family, given them a first-class education, and he is probably to-day worth \$25,000 to \$30,000. True, it has taken him 40 years to accumulate this amount of property, and nearly all of it has been derived from the advance of real estate. Still he has had a good living, has enjoyed life, is an intelligent, public-spirited, energetic, and generous-minded gentleman, and enjoys the respect of all his neighbors. I am sure such farming pays. I have another neighbor who has a farm of equally good land. He is a well educated man, and seems to work hard, but he is always behind with his work. He occasionally gets a good crop, but the general yield is hardly sufficient to pay even for the little labor bestowed in preparing the land. He is in debt, and seems to depend more on chopping and selling wood to meet his payments than on raising crops. His fences are out of repair, and the land is full of weeds. Still he gets a living for himself and a large family, and, I suppose, even in his case, we must conclude that "farming pays." I have another neighbor, whose land is low, but would be very productive if attention was paid to surface drainage. The same creek runs through it that runs through the south end of my farm. It is choked up with old logs, branches, and fallen trees. The water sets back in the spring, and floods his land. But he makes no effort to clean out the creek. I offered to do it for him, if he would give me the wood, but no, he intended to do it himself. I presume he has been intending to do it for years. A good portion of his land does not produce enough to pay the taxes, and the dryer portions are not half worked, and yield the most meagre returns. I passed his house this morning. He was cutting some coarse hay on the low land. His oats were harvested, but nearly half of them were still lying on the ground among the clods, and his wife was thrashing the other half in the barn with a flail. Now this is rather poor farming, but as the family gets a living, I suppose it "pays."

But *how much* does it pay? Does he make as much as he would if his son and himself worked as hard for some other farmer as they do for themselves, to say nothing of the wife? I do not believe they make half as much, and certainly their land is not improving, though they probably persuade themselves that, owing to the improvements of others, it is increasing in value.

Now, I have no doubt that an intelligent, enterprising man, with the necessary capital, could take this farm, and increase its productiveness fourfold. But such a man cannot live in the style of its present occupant, and his wife would not want to thrash in the barn. And so the real question is whether farming will afford sufficient profits to enable an educated man to live in a style suited to his necessities. *I think it will*, but there are those who contend that it will not.

Can an educated man get a suitable living by making boots? Can he make much more than the illiterate man who sits on the adjoining bench? Can an educated farmer dig more potatoes in a day than a good stalwart Irishman? Can he chop more wood than a French Canadian, or plow better than a Scotchman? Can

General Grant fight in the ranks any better than Patrick O'Flanagan?

The educated shoemaker, as soon as he had learned the trade, would have others helping him, and by and by, if made of the right kind of stuff, he would be the proprietor of a large boot and shoe factory, and call to his aid all the contrivances for saving labor that modern science and invention can afford.

"This is all very well. I see the point. But you cannot make money by farming, unless you work yourself." Very true. I never supposed you could. Neither can the educated shoemaker. He probably works harder than any man in the establishment, although he does not wax his own strings, or hammer out his sole on the lapis. He knows how to do all these things. And so must a farmer be acquainted with all the details of his business, and must give them his undivided attention. But must he necessarily do his own plowing, dig his own ditches, and husk his own corn? Work he must, and so must a manufacturer and a professional man. But what work shall he do? If he has men husking corn by the bushel, he should see that they husk clean, and tie up the stalks well, and make the bundles into stooks that will shed rain, and not blow down in the first wind. He must see that he is not cheated in measuring the corn, and that it is properly sorted. He can make more by attending to such things than by husking himself. And so it is in nearly all the operations of the farm. Especially must he see to his stock. He will find ten men that can dig potatoes, husk corn, hoe, plow, cultivate, and even build a stack, and dig underdrains, to one that can be entrusted to feed pigs or take care of the cows. To neglect to feed regularly and properly—to starve this week, and surfeit the next, will cost you half the feed.

But I am wearying you. I am satisfied, however, that this subject must receive the attention of farmers. Those who intend to make agriculture their business should study it thoroughly, and make themselves masters of every detail. They must know how to do all kinds of farm work, and should study especially how to direct others. It is frequently easier to do the work one's self than to show another how to do it, but it is better, in the end, to bear with a bungler, than to let him stand idle while you do the work. John Johnston is employing contrabands on his farm, and likes them well, though he says, "they cannot set themselves to work." That is precisely my idea. A man with a large farm must know how to set others to work, and see that they do it properly, and he will find that this will give him enough to do without going into the field to plow himself. Nearly all the labor we can now command is unskilled, and this state of things will continue. There are now thousands of Chinese at work on the Pacific Rail-road, and when we think that one-third the population of the globe is in the Chinese Empire, it will not be surprising if the high wages paid in this country, should induce hundreds of thousands to emigrate to San Francisco, and from there over the Pacific Rail-road to the mines of Colorado and the prairies of the Great West. They will not be able to "set themselves to work," and the young farmers of the country should educate themselves for the task. There is not one farmer's son in a hundred that could do it at present. They have not been trained to direct others, and it is time this part of a farmer's education received attention.

If the drouth continues much longer, it will be difficult to get in the usual quantity of win-

ter wheat. It is almost impossible to plow heavy land. I have heard of several farmers who have abandoned the attempt. We are plowing up an old meadow, which, although somewhat mucky, is so hard on the dryer portions that a new cast iron point will not last longer than a day. The men say the point gets so hot from the friction that it will almost burn your hand. The high price of cast iron points will compel us to use steel points. These can be sharpened by a blacksmith at little expense, and although the first cost is about three times as much as an iron point, they are cheaper in the end, and work easier. By taking a cold chisel, and putting it in a vise or having some one to hold it on the top of a large stone, you can, by putting the point on the chisel, cut or break off the worn end of the point, and it will then do almost as good work as when new. Cutting it off square with a cold chisel is far better than trying to break it off with a hammer or a stone, as some do.

I think I told you that I proposed to seed down this old meadow in September, as soon as it was plowed and harrowed. It makes rather a rough job of it, but then it is a rough piece of land, and at any rate it will be far better than it was before.

I have been consulting Flint's valuable work on "Grasses and Forage Plants" in regard to the quantity of seed that should be sown per acre, but he merely advises liberal seeding, without saying how much. This is a too common fault among agricultural writers, and I should have been apt to conclude that the author was not as "practical" as I had supposed, but for the following sentence. Speaking of the improvement of waste land, he says: "The difficulty with most small farmers is to begin. Well begun is half well done; for the moment any real improvement is begun in earnest, the interest is excited, the mental activity is increased, the desire for improvement partakes of the nature of a passion; and hence, though the beginning may be small, the end may be the renovation of the owner as well as the land." This is well said, and eminently true, and the man that wrote it, must have himself tasted something of the pleasure of renovating waste land.

The chemistry of the book is a little out of date. For instance, he says: "Every keeper of stock knows that to feed an animal oilcake, *which is but slightly nitrogenous*, might fatten him, but it would not give him strength of muscle, or size; while, if the same animal be kept on the cereal grains, as wheat or Indian corn, alone, his size rapidly increases, his muscular system develops, and he gains flesh without increasing his fat in proportion." Now, the fact is, of all the foods used for stock, oilcake is the most nitrogenous. It contains more than twice as much nitrogen as Indian corn or wheat.

In the same connection it is stated that Timothy contains more nitrogenous matter than red clover. This may be so in the fresh state, because the clover is more succulent than Timothy, and contains more water. But clover hay contains a good deal more nitrogen than Timothy hay—in fact, nearly double. It is for this reason that clover hay makes so much richer manure than Timothy hay. But it does not follow that it is more nutritious. The old notion that a food is nutritious in proportion to the nitrogen which it contains, proves unfounded. Peas and beans contain twice as much nitrogen as Indian corn and wheat, but they are not twice as nutritious. But they make manure twice as valuable, and this is one of the chief reasons why they deserve to be more extensively cultivated.

The Common Seal.

In introducing the interesting family of the seals to the readers of the *Agriculturist*, we are happy in being able to present so beautiful and accurate an engraving. It represents the common seal of our own coast, so abundant on the coast of Labrador, on the ice islands which, in the breaking-up of the northern winter, float along the north-east coast of America, and the most abundant of the Greenland seals. This seal, (*Phoca vitulina*), is the type of the natural family *Phocidae*, which includes those animals which have the same general form—the Walrus, Sea-Elephant, Sea-Lion, Harp Seal, Hooded Seal, etc. It has a fish-like form, the fore feet projecting from the sides like fins, and the hind feet being nearly united

at the hinder end of the animal, and appearing much like the tail of a fish, or the flukes of a whale or porpoise. The tail extends down to the hind feet, and appears as an inconspicuous appendage between them. The body, which is of a brownish or yellowish-gray color, is cylindrical for a short distance below the neck and shoulders, but tapers rapidly to the tail. The head is much like that of an intelligent dog, and the voice resembles the barking of a dog also; hence the name Sea-Dog is not inappropriate. The great intelligence of the seal is well known, and might be inferred from the size of its brain, which is proportionately larger than that of any other animal, except man and the most intelligent monkeys. The eye is most noticeable for its lustrous brilliancy and calm look, expressive of intelligence far above other brutes. The ears are simple orifices, closed by valves or lids which shut water-tight, and a similar arrangement closes the nostrils, so that, when under water, none can enter to interfere with either hearing or breathing, when they come out again. Besides, the ear valves have the additional advantage of giving seals the ability to hear with great acuteness, while submerged. They have also the

power of diving and remaining down fifteen or twenty minutes, and by their accuracy of hearing they regulate the length of time they stay below, and the place where they come up. The lips are thick, and the large stiff and knotted bristles, or whiskers, which grow upon them, are exceedingly sensitive, and aid them greatly in catching fish, which is their almost exclusive

ing service. The extremities are fin-like feet, with webs between, and nails upon the toes. In swimming, the fore feet are used only in turning, while the hind feet and tail propel the body forward, with a sculling motion, and great power. The skins of all seals are valuable; they make good leather, and many are covered with a very fine and beautiful fur, beneath a complete

covering of longer, coarse hair, which is removed when the fur is used. Some seals yield a valuable oil in great quantity, and these products are the basis of "fisheries" of vast importance. The seals are usually taken upon the ice and in the water, and many are captured by the Esquimaux. To these people they are as important as our flocks and herds are to us, for from them they obtain food, skins for tents, boats, and clothing, and leather

for boots, their most important merchandise, from some of the membranes, window panes, from the sinews, thread and cord, and from the bones, utensils, etc.; besides, they use the oil for light and for fuel, and are fond of drinking it.

The males are polygamous, having three or four wives, to which they are very devoted. During the time of gestation, the seals remain

on shore chiefly, and, if pressed by hunger, feed on vegetables. They have one or two young at a birth, with which they early take to the water. A common seal will often yield eight to twelve gallons of oil; the size of adult animals varies, however, from three to six feet.

Cinnamon Bear.

The animals of that remarkable region of North America, embraced between the different ranges of the Rocky Mountains, are subject to many diverse climates and

conditions of life. It is wet and cold, dry and hot, within the compass of comparatively few miles. It is not strange then, as it seems to us, that variations in color and other characteristics should occur which justify the hunters in considering the animals as different species from those they have known elsewhere, though they may be the same. The Cinnamon bear of the Rocky

THE COMMON SEAL—(*Phoca vitulina*.)

diet. The neck, though short, is very lithe, and a seal can move its head about with the ease and facility of a duck, though lacking in grace.

The limbs of the seal are like those of other quadrupeds, so far as this,—they consist, in general, of the same bones, similarly placed; but, with the exception of the feet, they are concealed beneath the skin of the body. It is curious to

THE CINNAMON BEAR—(*Ursus Americanus*, var. *cinnamonus*.)

observe, when the seal moves its "flippers," the motions of the apparently well-formed arm slipping about under the tight fitting coat. The home of the seal is the sea; on the land it is awkward, and comparatively helpless. In fact, a seal on the land appears to be in a straight-jacket, and as if, could one enlarge the arm-holes of its coat, he would do the animal a last-

Mountains is a variety of the American Black bear, (*Ursus Americanus*), which has a reddish fur, varying also considerably in different individuals, but generally of a cinnamon color. It is, besides, usually more slender than the common black bear, but otherwise has the same habits and characteristics. Baird describes the fur of a specimen from Oregon as longer and softer than that of the black bear, and says that the color is of a nearly uniform dark chestnut or cinnamon hue, with a purple reflection in certain lights.

The Use of the Plow in Draining.

After such a season as we have just experienced—wet in one section, and dry in another—farmers consider thorough draining, to see if the claims of its advocates are really true, and if the distressed tillers both of wet and dry soils may not find in it a panacea for their troubles.

We encounter one stubborn fact at the outset, namely, that draining is expensive, even if we put the drains barely below the reach of frost and the plow. Next, we are forced upon another fact, which no sophistry can budge, and that is, that the most expensive draining is shallow draining. As we make up our minds to do deep draining, the fact is turned up with each spadeful of earth, which, if we heed it, teaches that thoroughness and cheapness in the long run are identical. That is, reasonable expense for thoroughness' sake is the strictest economy.

Referring our readers to arguments in favor of deep laid tile drains, in former numbers of the *American Agriculturist*, and the works on Drainage in our book list, we discuss now the cheapest way of placing a course of drain tiles, four feet deep on an average, in an ordinary soil. Every farmer who wants to dig a ditch, thinks of his plows, for they will turn out the soil ten inches deep with comparative ease. If a man is to have a ditch four feet deep dug with spades, he ought to try to move as little earth as possible, and as sixteen inches has been found about the least width that a man can work in, he should try to have his ditch no wider. If he can use plows to facilitate his work, he need not be so particular about this, although a narrow ditch—the narrowest possible—is best under all circumstances.

We prefer to use, to cut the sod, a plow that will cut eight inches, and lay the slice over true and flat. Then we take a stout stick, like a short bean pole, as long as the plow beam, lash one end to the beam at the nigh handle, brace the other end out sixteen inches from the land-side of the beam, and attach a short chain to this end. The brace is a half-inch strip, three inches wide, made fast by the clevis bolt, and, if necessary, a big iron washer. In plowing, the team is driven so that the chain will drag along the edge of the first furrow, and aids the judgment of the plowman materially in determining the width of the slice. Men must follow and throw the sods out. The trench will now take a plow of the largest size, and it should be drawn by two yokes of oxen, or two pairs of horses, working so as to tread neither in the trench nor on the sod near the edge. This is accomplished in either of two ways. Each team may draw independently, one upon each side of the ditch, being attached to the plow by a log-chain, and the chains being braced apart, so that the draft shall be reasonably true, that is, parallel to the line of draft. The other way is to work the oxen upon ten-foot yokes, and the horses of each pair upon long eveners, they being driven

by outside reins only, and the heads of each pair being held apart by a stick.

The large plow may be run in the ditch two, three, or four times, according to the soil, or it may be best to use a smaller one, and as comparatively little earth can be thrown out by the plow, men must follow, and shovel as fast as the soil is loosened. After the loose earth is removed to the depth of twelve to eighteen inches, according to its character, a sub soil plow will be found of more service than a surface plow. With this, we can work down, little by little, into the hard pan. So large a force of hands is not needed when the sub soil plow is used, for the earth broken up by this plow does not interfere with its deeper working as is the case when a surface plow is used. The successful employment of the sub soil plow is limited both by the difficulty of plowing in very hard ground with the plow two or three feet below the team, and in the handles interfering with the sides of the ditch. There are, however, plows constructed to run deep enough to be of very essential service to a depth of about three feet.

This use of the power of animals greatly lessens the expense of digging the ditches, and various forms of scrapers expedite the filling, so that, after a little experience, the formidable difficulties which at first may appear as insurmountable obstacles to a poor man's doing much thorough draining, disappear, especially when we consider that a moderate outlay of money or labor, expended with discretion, almost immediately begins to make large returns, fifty per cent. per annum being not uncommon.

Earth Closets vs. Water Closets.

The manure wastes of civilization are vastly greater than those of savage or nomadic life. Even on most farms we lose more or less ashes, bones, and other valuable fertilizers. Much of value escapes from the fermenting manure heaps, much is washed away, while four-fifths of all human soil and liquid is lost; and we think if we were to say nine-tenths, we should be nearer the truth. In the cities almost the whole is virtually lost, and were the system of water closets, now so much in vogue, to extend, all would be washed out to sea. Among savages and wandering tribes, the wastes are left upon the surface of the ground, or slightly buried, and so the earth is not robbed to benefit the ocean. The manurial value of the sewage of cities, which is emptied into the rivers and flows out to sea, consists chiefly in the urine and soil of the inhabitants. A great reform has been commenced in England in regard to this subject, and the long known deodorizing and purifying effects of dry earth are systematically applied not only to rendering human excrements inoffensive, but at the same time preserving them for manure, in a form which may be economically transported many miles. This principle has been already explained in the *Agriculturist*, but the way of operating the "earth closets" was not described, the closets being a source of profit to somebody, and hence involved in a little mystery.

A Sewage Congress has lately been held at Leamington, Eng., and at this meeting a paper was read by a Mr. James, in regard to some simple closets which have been introduced upon the estate of the Jewish banker, Baron Rothschild, at Halton. These consist of simple boxes or shallow, tight vaults, which receive the soil and liquid of the family, and into which, at evening, enough thoroughly dried earth is

thrown to cover all, being about a pound and a half per day to each adult. This quantity is found to be sufficient to deodorize the soil and absorb the liquid. The accumulations, when these boxes and vaults become full, are dried in the sun without any unpleasant odor, and when dried and pulverized, may be used again and again, the substance becoming a more concentrated form of manure with each repetition. The author of the paper alludes to the natural instincts of animals, cats for example, and to the instructions of the great Jewish lawgiver to his people, (Deut. xxiii, 12 and 13,) as both precept and example in favor of using dry earth in this way. The advantages claimed are, increased cleanliness, freedom from bad odors, that the waters of wells are not contaminated by privy vaults in the vicinity, that brooks and rivers are not rendered too impure for valuable fish to frequent them, that the closets may even be in the house, without offence, and the saving of great quantities of valuable manure.

These seem to be strong and rather startling propositions, but the writer is able to cite his own experience during the heat and wet of the past summer, to corroborate many of the claims of the advocates of earth closets in England. A privy was built with a simple draw of 2 inch planks, well put together, and on runners set beneath the seats, and the deposits kept constantly covered with sun-dried and sifted garden soil, which entirely suppresses all odors. We have not thought it necessary to re-dry the earth, as fresh soil must be more easily prepared; besides, fresh earth is a more agreeable substance to handle, if one is inclined to humor his prejudices, as most of us are. We secure in this way a rich and concentrated manure, though proportionally more bulky than if passed several times through the closet. This manure is free from weed seeds of course, and may be applied immediately, or, if desired, dried and kept under cover a long time.

Improvement of Land by Grazing.

If the soil can have all its crops returned to it in kind, or in the shape of manure made from feeding them to animals upon it, it will constantly improve. A worn-out soil left to grow up to forest will recover its fertility in due time. Cow pastures decline in productiveness because the cows are usually yarded at night, and a large part of the manure, as well as milk and calves, is removed from the soil. It is different with the grazing of bees or of fattening sheep. Where the object is to make beef for market, bullocks of three or four years of age are bought in the spring in good condition, and turned into the pasture as soon as the grass is sufficiently grown to support them, and are sold off in the fall. It is considered a matter of great importance by graziers that the pasture should be large, and should have only so many cattle as it can carry through the season. It has been found in experience that the changing of bees from one pasture to another has a bad influence upon them. They become restless and lose flesh. In many districts where ground plaster does well, it is sown at the rate of a bushel or two to the acre every spring. Even in this small quantity the effect is often astonishing, bringing in white clover, and on pastures where it has not been applied before, it will sometimes increase the feed four-fold. With this cheap dressing and grazing bees, many run down farms have been brought up to a high degree of productiveness. Some boast that

their meadows will carry a bullock to the acre. With good judgment in buying and selling, this is an easy way of getting rent from land. The stock require very little attention after they are turned into the pasture, until the drover comes in the fall, or they are otherwise marketed.

Sheep are said to improve land more rapidly than bullocks. The manure is more evenly distributed if the land is level; and if it is broken, the most of it is dropped where it is most needed, upon the tops of the knolls. They also crop bushes much more closely than beeves, but in order to keep brush under, all the brush should be cut with the scythe at the start, and the pasture should be heavily stocked as long as the sprouts push. In Harrison County, Ohio, and in other parts of the State, where the winter wheat has become an uncertain crop, we are informed that many of the farmers have resorted to wool as a substitute. This crop has several important advantages over wheat. It involves much less labor, and improves, rather than exhausts the soil. It is found that the sheep pastures are growing more productive. Wool at fifty cents a pound can be carried to market profitably, much farther than wheat at the ordinary prices. A pound of wheat is now worth but three or four cents, and freight on grain is about as expensive as on wool. The latter, moreover, is one of the few products of the farm that can be held over without serious risk of loss. Some of the finest wool in the State is produced in this County, and has been sold from fifty to sixty cents a pound this season. In considering the question of abandoning sheep husbandry, as some may be tempted to do, under temporary reverses or falling prices, we think due credit should be given to sheep as improvers of the soil. The farmer can hardly grow poor whose soil is constantly growing rich.

Barn Plan for a Small Farm.

Small barn plans interest directly many more people than very large ones, and we do not mean to be remiss in presenting too many of the latter in proportion. This month we give one, in the devising of which it would seem that many of the teachings of the *Agriculturist* had been observed. It is convenient, compact, well built, neat, roomy, and economical, but

Fig. 1.—GROUND PLAN OF BARN.

sent the ground plan, and two sections through the center. Enough of the framing is shown to give an idea of the construction. The barn is 36

Fig. 2.—EAST AND WEST SECTION OF BARN.

feet wide and 46 feet long. The thrashing floor crosses the barn in the middle, with stalls for horses and cattle on each side, but on lower and different levels. Fourteen feet above the thrashing floor, but below the level of the plates, are two platforms with a space between them, and above these a space of 14 feet intervenes below another floor framed into the posts just below the purline plates. This forms the granary, up in the very peak of the gambrel roof. It is easily made rat proof, is hot, and dry, if the roof be tight. A pulley (L, figs. 2 and 3,) enables a horse to draw up the clean grain, or corn in the ear, which can be returned to the floor through the conductor, K, in the same figures.

There is an excellent place for a root cellar below the thrashing floor, but this was not in our correspondent's plan, and so he did not carry it out, though he makes the suggestion.

Figure 1 is the ground plan. A represents a stable for one pair of oxen and six cows. There is a door at each end, and a gutter for liquid manure, as seen in fig. 2. B represents the horse stable, 16 feet wide, containing four stalls. C shows double stalls for young cattle. G is the passage way from the thrashing floor, which is 14 feet wide. E is a room open to the thrashing floor, for bins of feed for daily use, for tools, etc. F, F, are openings from the thrashing floor into the mangers, for feeding the stock.

Figure 2 is a section from east to west. Fig. 3 a cross-section, and so far as possible, the lettering in each corresponds. C and E are hay bays over the stalls, extending to the roof. D is the thrashing floor, H the space above the two platforms, over the thrashing floor. Two dotted lines crossing this floor in the ground plan, (fig. 1), indicate the position of these platforms and the space between them for pitching up hay, grain, or straw. M and I are ladders which are boxed for safety, and P is a platform landing between them. T, T, in figure 3, corresponds with E and G, in fig. 1.

It will strike those familiar with side-hill barns having barn cellars, or stables for stock beneath the main floor, that this barn is arranged ingeniously to lose the advantages of a side-hill, by having the thrashing floor run across the slope. But the cattle stable being so much below the floor, the great object of a side-hill barn,

namely, low hay bays, is in part gained. Still we prefer the old plan, and think with the fine slope represented, it would have been better to have had the barn stand facing the south instead of the east, with the whole main floor on one level, and that about as high as the floor above the stable, A. This would give four deep bays and a spacious cattle floor besides. We have no doubt the barn is a convenient one as it is, but it needs ventilation, and a sheltered place for making manure. The ability to drive through the barn would be a great advantage. No doubt sheds and yards, sheep barns, and hog pens, are located near and conveniently.

How Long to Milk Cows.

Some cows settle the question for their owners, and such, unless they are fine large animals, and calf raising is the chief use of the cow, should be fattened and killed at 4 or 5 years old, or sold. As a general rule, it is a poor cow that does not need to be dried off before calving. As

Fig. 3.—CROSS-SECTION OF BARN.

to how little milk will pay for the trouble of milking, that depends upon the number of cows, and the amount required for family use or for sale. If the milk is worth 3 or 4 cents a quart, it will pay to milk every cow that will average two quarts a day. If less than that quantity is obtained, we would advise to dry off the cow. The practice of half-feeding dry cows is execrable. All cows that are worth keeping should be well kept, and any animal with young should be as well fed as when giving milk, though the food need not be so rich (oleaginous) as when the milk is set for cream or used for butter-making. It does not hurt cows to grow fat while dry; but they should not be very fat, as a general rule. The rapid taking-on of flesh at this period is an indication of sound health. When the time of calving approaches, cut off oilmeal or any such rich addition to the feed if the cow is in good flesh; give plenty of sweet hay, and a few, say 3 or 4 ears of corn, daily. If you expect to value the calf enough to raise it, or even to fatten it for veal, stop milking, at all events, six weeks before the cow will come in; but if the calf has little or no value to you, milk two weeks longer before you begin to dry her off.

Some cows will give milk the year round, if you will let them, and it is hard to dry them before they make bag anew; but this should al-

not without its faults. That is, with the same outlay of money and labor, we think it might have been better. This barn was built by Mr. Christian Braunle, of Coudersport, Potter Co., Pa., and as he has great satisfaction in its use, and as it meets the high approval of his neighbors, he sends us the plan. The figures repre-

ways be done. Even in large dairies it will be found profitable to feed cows well, curry them twice a week thoroughly, and milk them *ten months*. This gives eight weeks instead of six before calving, and the amount of milk given the next season will be essentially greater than if the common course be followed. The practice of drying cows early in the winter, and calculating to milk them only about 8 or 9 months of the year, has its origin not in a desire to benefit the cows or coming calves, but in the desire to have easy work during the winter, in taking care of dry cows. Its fruit is a decrease of ability in the herd to give as much milk as otherwise. Especially is this true of young cows, whose milk secreting tendencies should be encouraged as much as possible. To this end also, heifers should come in young; Alderneys at 18 months, Ayrshires and other milch breeds at 2 years.

Prize Fowls of the Great French International Exhibition.

We have already devoted considerable space to the more prominent breeds of French fowls, yet the interest of the poultry raising public in them is so great that we would be inexcusable did we not present new facts and instructive portraits when it is in our power. An enterprising American poultry fancier, Mr. James E. Mallory, of Tarrytown, Westchester Co., N. Y., secured and shipped at once to this country the prize trios of the three prominent French breeds of fowls, namely: Crevecœur, Lafleche, and Houdan, and the prize trio of Rouen Ducks. All arrived in poor flesh, but good health, and are doing very well. Though not in the best plumage, we had drawings made of them, and present engravings of the Houdan and Lafleche trios. They are well formed, the size of all is large, that of the Lafleches especially so. The color of these is black, with white ear-lobes, and slate-colored legs; that of the Houdan is black and white, speckled or spangled, (whichever term is best understood.) The latter have topknots, and

throat-ruffles, a triple comb, lead colored legs, and five-toed feet, like the Dorkings. We congratulate the fanciers of these attractive breeds of fowls on the possession in this country of these fine birds which will, we hope, furnish excellent crosses with the different strains of blood

ever, are hardy and healthy, and Mr. S. gives them the credit of being the hardiest and best hens for eggs he has ever had, although he has bred almost all the famous varieties, importing them from both Europe and Asia. We learn that it is the common experience of importers of

GROUP OF HOUDAN PRIZE FOWLS.

of the same breeds already in their possession.

THE CREVECŒURS FIFTEEN YEARS IN THIS COUNTRY.—We found, a few days since, with surprise and pleasure, a fine flock of fowls, bearing an unmistakable likeness to the fashionable "Creves," on the farm of Mr. J. P. Swain, of Westchester Co. The Johnnie-Crapeau style and air of the cocks, their split combs, the top-knots, the tendency to muffle or ruffle, the color, and the character of the hens as persistent layers, class them unmistakably as, at least, closely akin to the Crevecœurs. The original stock

of the French hens' eggs were nearly equal in weight to ten of ordinary fowls, but the eggshells became thin, and grew thinner constantly.

Harvesting Corn.

In cutting up corn, either cut *close* to the ground, or leave stubs six or eight inches long. The butts are worth nothing for feeding, and though good for manure, may be ignored, since they are turned-under at the first plowing. Corn stubs eight inches long, with the great,

gnarly root attached, are in the way of subsequent cultivation. If the land is put in grain, and grass follows, they often interfere with the haying for a year or two. To remedy this, either cut close, or, as we said, leave long stubs. These may be broken off by hauling some flat drag over the field after the ground is frozen. If the piece is to be plowed this autumn, cut close to the ground. We have used various implements for cutting up corn, and the public has settled upon two or three patterns of corn knives as the best.

GROUP OF LAFLECHE PRIZE FOWLS.

was purchased by Capt. Funk, of the old line of Havre packets, under the name of "Layers," (*Pondeuse*), at Havre. Two importations were made of twenty and thirty-six birds respectively, but few of either importation survived, or long survived, the passage. Their descendants, how-

The writer prefers a good little hoe, ground sharp, with a handle about 14 inches long. The clip should be made a little upward, as it cuts easier, but no great outlay of strength is required, even if the cut be made square across. When the corn is all well glazed, cut and set

up in shoeks, spread out at the butts so as to brace the shock against high winds from which-ever way they may come. If the shocking jack or "corn shoker" is not used, it saves time to make the shock around a standing hill.

The shocking jack is a smooth pole 12 feet long, with two legs about 4 feet from the butt end, spread so as to brace it well. This will stand firmly with its small end on the ground. The big end should be about four feet from the ground, and a foot from this end a hole is bored, through which a stout pin, two feet long, is put. This pin forms a support around which the corn stalks are set up, and when the shock is finished and bound at the top, the pin is pulled out and the jack taken away. It is very desirable that the shock should be very tightly bound, as it is otherwise liable both to blow over and to become wet inside. A straw band can not be put on tight enough, generally, and several contrivances to aid in binding are illustrated in the *Agriculturist*. See page 343, (Nov.) 1865. The difficulty is not in tight binding so much as in gathering the tops in closely before the band is put around. To do this perhaps the best contrivance is a hickory pin with a crank on one end, and a rope attached near the crank. There are knots on the rope at about the distance required to go around the top of the shock. The pin is thrust through the shock, the rope passed around and made fast by one of the knots holding in a slot in the end which passes through the handle. The crank being turned, the rope is tightened up and the shock made ready to be bound with straw.

Silk Culture—New Silk Worms.

Textile fabrics are essential to our present civilization; trade in them constitutes a large part of the commerce of the world, and their manufacture creates and sustains varied and extensive industries, both among the most enlightened, and among semi-barbarous nations. Silk goods are of all such fabrics the most beautiful, the most costly, and the most durable. It is probable also that in their manufacture there is employment given to proportionally more peo-

ple and more capital than in making any other class of goods. For several years, a terrible epidemic disease has destroyed the silk worms of France, and this extended into Spain, spread over Piedmont, then Lombardy, and the rest of Italy; then it attacked the establishments of Turkey, Asia Minor, and Syria, and from these countries on it spread, and continues to diffuse itself among the silk-growing countries of Asia. The French and others obtained healthy eggs from each of these countries in succession before

the disease occurred in them, and thus their manufactures are sustained, but bringing the eggs into the contaminated feeding buildings, the worms are infected, and though they pro-

Fig. 2.—WORM AFTER SECOND MOULTING.

duce silk, yet it is diminished in quantity and quality, and the eggs of the moth, if laid at all, are worthless. The disease is called "Pebrine," and no little anxiety is beginning to be felt for the fate of silk industries, as it appears probable the time will soon come that no more eggs can be obtained. This has led to the close study of

all other silk-spinning caterpillars, spiders, etc. The result has been the introduction into France of two insects which give some promise—the Ailanthus and the Tusseh moths. The former of these, under the name of Ailanthus silk-worm, has been

repeatedly alluded to in the *American Agriculturist*, and numerous experiments were made with it in this country, with such poor success, however, that the culture has been abandoned by most experimenters, so far as we are informed. (See Vol. XX, 1861, page 81; also Vol. XXIV, 1865, pages 76 and 238.)

The Japanese variety of the Tusseh moth, (*Antheraea Yama-mai*), coming, as it does, from a cool country, is the one held in most esteem

by M. Guerin Meneville, who has done more towards this important investigation than any one else. The silk of both of these insects is used in China and Japan in the manufacture of an inferior class of goods to that made from the true silk-worm, (*Bombyx mori*). It is of a brownish color, lack-

ing in brilliancy, and, as usually prepared, the goods made from it have a fuzzy exterior, but are possessed of great durability. Still it is silk, and as such, could it be profitably raised, the fabrics would find an important place among our manufactures. Some qualities of it are carded, mixed with cotton, and spun on cotton machinery into a very durable and handsome cloth.

The cocoons of these two kinds of silk-worms are quite different, and while the silk of the Ailanthus is very hard—almost impossible—to

reel off without constantly breaking, and can only be prepared for spinning by carding, that of the Japanese Tusseh moth is much more easily wound off. Considerable success has attended the domestication of the Ailanthus silk-worm in France, and an Ailanthus farm has been sanctioned by the emperor, and conducted by M. Guerin Meneville. A few years ago, this gentleman felt a good deal discouraged about acclimating this insect, but from the reports of the Paris Exposition, we infer that he has had, of late, better success. Experiments enough have been made to prove the Japanese Tusseh moth hardly in France, and hopes are entertained that it may be domesticated upon the low oaks, and live upon them as the Ailanthus worm does upon the tree, the name of which it bears. Should it prove that either of these insects will do well anywhere in this country, with comparatively little care, and that, when once established in an Ailanthus or Oak plantation, the trees will year after year bear their crop of cocoons, we may yet raise silk instead of wool,

Fig. 3.—FULL-GROWN CATERPILLAR.

and be independent of dog-laws, except to protect the interests of our mutton raisers. It will be a long time, however, before we shall substitute silk for wool for economy.

Fig. 1 represents the perfect Tusseh moth of Japan; Fig. 2 the worm in the third month after its second moulting; Fig. 3 the full grown caterpillar of the natural size, and Fig. 4 shows the cocoon. We believe that successful efforts have been made to breed this silk-worm in the

Fig. 1.—PERFECT INSECT.

Fig. 4.—COOON.

United States, but at present have no facts to present in regard to the results. We copy the engravings, and are indebted for some of the statements to Andrew Murray, Paris exhibition correspondent of the *Illustrated London News*.

A Milking Stool.

The following description of a milking stool is sent by Mr. Benj. F. Wilbur, whose address we have mislaid. He considers it preferable to any other he has tried.

Take a piece of 1½ inch pine plank, 10 or 12 inches wide, and 2 feet long. Put in four legs, in such a manner as to bring the surface of one end of the plank 4 inches, and the other 6 inches high. Then take two strips, 10 inches long, 2

MILKING STOOL.

inches wide at one end, and 3 inches wide at the other. Nail these strips on the edges of the high end of the plank, putting the narrow end of the strips at the upper end of the plank. On these strips nail a board for a seat. This brings the seat level, and leaves a clean platform for the pail, and by its being slanting, inclines the pail towards the cow. It brings the pail at a convenient distance from the ground, relieves the milker from holding it between his knees, and gives freedom to the feet and legs.

INCOME FROM THE DOG TAX IN ENGLAND.—The licenses numbered nearly 700,000 in 1867, against nearly 409,000 in 1866, and in Scotland 80,000 against 36,000 in 1866. This increase in the number of licenses is not to be attributed to any increase in the number of the dogs, but to the more faithful execution of the law. Estimating the taxed dogs in Ireland at 220,000, it would make the whole number for the United Kingdom about 1,000,000. As the tax is twelve shillings, it would make the income about \$3,000,000 in gold. The number of dogs in this country is estimated at 7,000,000, and a like tax, (\$3 each,) upon them by our national government, would give us \$21,000,000 of revenue. This would help pay our national debt, and be a great relief to sheep owners.

Remedy for the Worn-Out Lands of the West.

The cultivator of the river bottoms and of the prairies, where corn has been grown for fifty years in succession, may smile at the idea of exhausted lands, and yet they are to be found in his region, if not in his immediate vicinity. There is much land in Ohio and Indiana, back from the bottoms, that will not yield, this year, more than thirty or forty bushels of corn to the acre—lands that when they were first cleared were good for seventy or eighty bushels. They are not so much exhausted as the New England hill-sides, where nothing but Mullein and Johnswort, Penny Royal and Five-fingers, will grow, yet much of their fertility has gone, and they yield small profit to the owners. The land that produces only half a crop, is what we call worn-out or exhausted. A large part of the cultivated farms in the older Western States, is already in this condition. It has been brought about by constant cropping with grain, and returning no manure. Corn, wheat, oats, and grass, have followed each other in constant succession, and nothing has been done to improve the soil. The whole management

has been with reference to immediate profit, and the expectation of soon selling the farm.

The remedy for this is permanent occupation and a course of husbandry that looks to the increasing productiveness of the soil. We commend to the careful study of this class of farmers, the rotation of crops followed in Pennsylvania, and noticed in our August issue. For the kind of farming pursued in the grain districts of the West, we know of nothing better, and we would only change it in introducing barn cellars or sheds, for the saving and composting of manures.

Lime comes in as a part of this rotation, and in many parts of the West lime rock is quite as abundant as in Pennsylvania, and it can be manufactured quite as cheaply. The same kind of lime rock exists along the line of the railroads in Ohio, where cuttings had been made, and more than half of the State of Indiana is underlaid by lime. Coal, too, abounds, often in the same districts, and where it does not, wood is plenty, and often burned in immense piles to get it out of the way. As we have shown in our September issue, the burning of lime is a very simple process, and any one who can manufacture charcoal, can manage a lime stack. This article is needed upon these partially worn soils, and would work very beneficial changes. In connection with this, or without it, if lime cannot be had, clover should be used as a part of the course. We were surprised to see so few clover fields in the West. The value of the plant as a renovator of the soil is not at all understood in that region. For the class of lands indicated, it is the most remunerative crop that can be sown. It makes good fodder. The seed brings a good price in market. Above all, it is a most valuable renovator of the soil, whether it be fed off or turned under with the plow. More clover means more wheat, more corn, more cattle; and more cattle means more manure and richer land, if the farmer will see to it. Any one who can estimate the difference between thirty and seventy bushels of corn to the acre can tell whether this kind of farming will pay.

The Osage Orange as a Hedge Plant.

This plant has been more extensively tried for hedges at the West, than any other, and with fair success. The verdict of the people is by no means unanimous in its favor, nor was this to be expected in a region where labor is very scarce, and where the training of hedges was an art to be learned. North of forty-two degrees of north latitude, the plant is tender and is liable to be injured during the winter, making sad breaks in the hedge row. We recently passed through the State of Indiana, and were agreeably surprised to see the popularity of this hedge. The plant everywhere seemed in perfect health, and the only fault noticeable was the rampant growth of the hedges. In many cases they had been left to their own course, and had formed a dense screen twenty or thirty feet high. The only fault found with it that we heard of was that it did not make a tight hedge—to keep out pigs and fowls. This we think is entirely owing to the neglect of training in the early stages of growth. It is thought entirely practicable by the friends of this hedge to make it hog proof. Messrs. Fowler & Earl, of Lafayette, Ind., have recently planted many miles of this hedge upon their large farm in Benton County, pursuing the following method:

As the farm was located in a new country, they put the line of the outside hedge 30 feet from the line of ownership, to make room for a

highway. The turf was broken as for corn in the month of June, for ten feet on each side of the proposed hedge. The following May it was harrowed and back furrowed, and one-year-old plants set out on the line, 9 inches apart. The ground for the whole twenty feet is kept cultivated for three years. Then the plants are about one-half cut off, 3 or 4 inches above the surface of the ground, as shown in the illustration. They are bent over at an angle of 45 degrees, and new shoots start from the stumps, crossing the inclined stems and making a very compact fence. This method was pub-

HEDGE AFTER LOPPING.

lished in the *Agriculturist* several years ago, and it is pretty good evidence of its value that it has been adopted by these gentlemen on so large a scale. The Osage Orange hedge can be planted for twenty-five cents a rod, including the preparation of the soil. At three years old it is estimated that the hedge will cost 65 cents a rod. This makes a cheap and durable fence, and answers the purpose of a screen as well.

Storing Root Crops.

Heavy frosts often come the last of this month, and it is quite important that sugar beets and mangels should be housed before the crowns are frozen. Carrots and turnips are not damaged by light freezing, and often grow through the month of November in this latitude, and the only risk in leaving them out is in the sudden setting in of winter. The earlier potatoes are put in a dark cellar after they get their growth the better. They should be stored in small bins where they can be examined easily for the first indications of rot. The tops of turnips, beets, and carrots, make excellent feed for cows, and if the pastures fail they will be found a welcome addition to their bill of fare. They will pay for carting, as one cannot turn the cows into the field where they are grown. The practice of feeding roots in the winter is steadily gaining in all the Eastern States.

Sauer Kraut.

Our native Americans turn up their noses at this preparation of cabbage, and many do at the article itself, no matter how it may be dressed for the table. Yet cabbage is a great institution, and is growing in favor among all classes of laboring people. As an adjunct of the farmer's boiled dinner it is indispensable. The Sauer Kraut is a convenient preparation of the article, easily made, and easily preserved for use where the fresh article cannot be had. By our German fellow citizens it is generally preferred to the cole-slaw, or boiled cabbage.

To save the labor of cutting it by hand, various machines are employed, one of which, simple, and easily made at home, is thus described by a German correspondent: "Common corn knives are used for the cutting part of the machine, and are fitted into a bed plate, or frame, fig. 1. This consists of a heavy oak plank with ledges, shown also in end view in

fig. 3, upon the sides,) and a hole beneath the knives to allow the cut cabbage to drop through. A suitable notch is cut in the ledges to allow of fastening in the knives, which are fixed at the desired angle by means of wooden plugs or wedges. The eorn knives, figure 2, are $\frac{3}{4}$ of an inch thick on the back, and are preferred to a piece of scythe, as they do not bend. Fig. 3 gives the complete machine in perspective; A is a box, upon each side of which are the slats, b, b. It will be seen by the examination of the

Fig. 1.—FRAME WITH KNIVES.

end view of fig. 3, that the parts b, b, belong to the box, and those marked c, d, are attached to the frame. This box enables one to hold the cabbage firmly, and should run freely backward

and forward." It is well, though our correspondent does not mention it, to have a wooden follower to fit the box, and thus avoid all danger to the hands when the cabbage is pressed down. The box should be of the size to hold a large cabbage, and the frame

long enough to go across a barrel or tub. For making the kraut, select the most solid and perfect heads, and after splitting them, remove the stalks and the green leaves. They are then passed over the knives and cut fine. A tight barrel, perfectly clean, is then lined with cabbage leaves at the bottom, and a little way up the sides. A layer of about three inches of the slitted cabbage is then put in and pressed with the hand, and about four tablespoonfuls of salt are sprinkled over it. After four layers are put in and salted in this way, it is pressed down with a wooden rammer as closely as it can be packed. Then follow four more layers and a ramming, and so on until the barrel is nearly full. It should be pounded so hard that the juice of the cabbage and the melting salt will appear on top. Cover with cabbage leaves and with a board or follower, and press down with a heavy stone. Set the barrel away to ferment, and in about three weeks remove the top scum and brine, and add enough water to keep the kraut covered. In four weeks it will be fit for use. It needs a little looking to occasionally, and will keep good for a year or more. The taste is a little peculiar at first, but is much relished by people who have become accustomed to it.

Notes on Grapes and Grape Culture.

These notes are written just at the close of a season, which, at the East, has been an unprecedentedly rainy one. This unusually humid state of the atmosphere and soaked condition of the soil has not only had the effect to retard ripening, but it has given every advantage to rot, mildew, and some kinds of insects. Fortunately this moist condition has not extended far inland, and whatever of ill may befall the crops

there will not be entirely due to this cause. We hear of disastrous rot to the Catawba, and to a considerable extent to the Concord, while the Delaware promises better than it has for several years. A letter from Hammondsport informs us that the prospect for the grape crop is unusually fine at that point, and no complaint is made of rot. It is worth while to consider if this exemption is not due to the remarkable natural drainage of the land at Hammondsport. A loose soil of indefinite depth, intersected every few rods by deep ravines, presents natural advantages rarely to be found. It is, however, too early to judge of the general grape crop, as we usually hear of the failures sooner than we do of the successes.

In looking over a file of letters, all asking questions upon some points in grape culture, we find that the majority of them indicate that the writer has an insufficient knowledge of the way in which a vine grows and bears its fruit. It is impossible for us to give space to answer these individual cases. Every one who has vines should have one of the many excellent works now before the public. There is scarcely any one of them that does not set forth the essential principles of vine pruning, though some do it more in detail than others. To one fond of horticulture, we can conceive no more interesting amusement than the systematic training of a few vines by different methods.

Two correspondents have vines that have blossomed for two or more years, but have failed to bear fruit. As we are not given the names of the varieties, we infer that some peddler has imposed upon them some of our wild vines, which are very often infertile. The shortest way is to dig up the barren vines and put good ones in their places. We have often referred to the dangerous practice of over-bearing, and repeat the caution in view of a letter now before us in which the writer boasts that some of his vines, two years planted, have sixty bunches of fruit upon them. What wonder would it be if we should hear next year that these vines are poor growers and poor bearers?

Grapes are too often prematurely picked; they should be left on the vine until thoroughly ripe. The coloring alone should not be relied upon, as many kinds become colored before they are within a week or two of perfect ripeness. The taste must aid the eye in this matter, and each variety should be left upon the vine until it has acquired the sweetness and flavor and tenderness of pulp belonging to it—characters which will differ in degree according to the quality of the grape. Fruit for wine-making should be left on the vines as long as it is safe to do so, on account of frosts.

Preserving grapes in winter is a point asked about by many. The grapes must be well ripened and laid for a week or two in a cool room. They should not be allowed to shrivel, but only to part with a share of their moisture. The skin becomes tough, and they are then ready to pack in small boxes holding five or ten lbs. The room in which they are kept should be at a low and uniform temperature, as low as may be, without danger of freezing. Grape packers have houses for the purpose, built like an ice-house, with double walls filled with some non-conducting materials. Some varieties will not keep at all, while the Catawba, Diana, Iona, and Isabella, (if well ripened), may be kept for several months in excellent condition. To inquirers about raisin grapes, we reply, that we have not as yet any native grape that may be profitably made into raisins.

Packing Nursery Trees.

In the best nurseries the trees are packed in boxes instead of in bales, in the old way. Mr. J. W. Haggard sends us a model of a contrivance for facilitating packing. It consists of a

standard, fig. 1, which has an iron foot to go under the box, and at the upper end a slot is cut, through the sides of which passes an iron pin which can be moved higher or lower as needed. This standard is placed near one of the cross cleats of the box, the trees put in, and Fig. 1. then pressed down by a long lever which hooks under the pin in the standard, as shown in figure 2. A smaller lever is attached to the long one, and has a curved end. By pressing

Fig. 2.—LEVER FOR PACKING TREES.

down on this, its curved end will crowd against the sides of the box and bring them together, so that the cleats on which the cover is to be nailed can be fastened in place. Mr. H. states that he finds this a great improvement over the usual method of bringing the sides of the box in place by means of a screw clamp

A Group of Orchids.

Many who look at the engraving on the next page will probably think that the artist has indulged in caricature, and attempted to present a group of flowers as unlike flowers as he could, and has even tried to make some of them assume the shape of insects. But this is no fancy sketch. It is a copy of a faithful painting, made by the well known artist Hayes, and could we give the colors as well as the forms, the picture would be still more striking. Most of the flowers, if not all, from which Mr. Hayes made his studies, were from the Orchid House of our friend I. Buchanan, at Astoria, Long Island.

For the Orchis family, or Orchids, there is no popular name, though, as many of them grow upon limbs of trees, and will flourish without any connection with the earth, they are often called air-plants—a name which is not distinctive enough, as other plants live in the same manner, and many of the Orchids are terrestrial. *Orchis*, the genus which gives its name to the family, retains its ancient Greek name. The family contains some four hundred genera, and numbers its species by thousands. In the Northern States we have about fifty species, all of them terrestrial; some of these are of great beauty, such as the Showy Lady's Slipper, figured in July last. The warm, moist regions of the East and West Indies, and the dense forests of Central and South America furnish the species that are so prized in cultivation, and which astonish us with the brilliant color and strange shapes of their flowers, and often delight us with the delicacy of their odor. Some of our own orchids are found in cultivation in Europe, but we have seldom seen them in collections here. Our *Arethusa bulbosa* and *Calopogon pulchellus* are really beautiful, as are all the *Cypripediums*. Several of the *Platantheras* are showy.

It would require too much of a botanical description, to show the peculiarities that distin-

[COPYRIGHT SECURED.]

A GROUP OF ORCHIDS.—ENGRAVED FOR THE AMERICAN AGRICULTURIST, AFTER A PAINTING FROM NATURE BY W. J. HAYES,

guish the Orchids. In a general way, it may be stated that the flowers are irregular, and that one of the petals is usually of a form strikingly different from the others. This is called the lip, and it is often fringed, cut, or curiously dilated. In the Lady's Slipper, already referred to, it forms a large bag or sac. There is usually but one stamen (sometimes two), which is curiously joined with the pistil, and forms what is called the *column*. The pollen, instead of being a fine powder, as in most plants, is all united into a coherent pear-shaped mass.

The mimetic tendency of the flowers of some Orchids is remarkable, and they imitate the

shapes of insects and spiders so closely, that those strong in the belief that animals originally sprung from plants, might look upon some of the Orchids as plants well on their way towards developing as spiders, butterflies, etc. One of the most conspicuous is the Butterfly Orchid, *Oncidium*, of which two species are shown, one in the lower part of the picture, and the other at the right hand, as well as at the top. The parts of the flower represent an insect's wings, and long feelers. Still more striking, as well as more rare, is the white flower in the upper part of the engraving; here the parts of the flower form a shell-like cup of the purest white,

within which is the column, shaped so like a dove as to require no imagination to help out the resemblance. In Central America, this is called *El Spirito Santo*, or Holy Ghost plant, from the association of the form of the dove with the artistic attempts to represent the Holy Spirit.

It was formerly supposed that Orchids could only be grown in a house of high temperature, but of late years it has been found that many of these do as well, or even better, under what is called the cool treatment, and now some very fine species are successfully cultivated at the ordinary green-house temperature. This being the case, we hope to see them less rare.

Going into Winter Quarters.

Every lover of flowers looks with regret upon his pets as the cool nights warn him that frosts will soon desolate them, and naturally wishes to prolong the enjoyment of them through the winter. So he pots his favorites, and at the approach of cold weather, brings them indoors, in anticipation of a continued bloom. Soon the leaves drop, the buds wither, and the plant is an object of pity rather than of admiration. It is in vain to expect roses, etc., to bloom all summer and all winter too; the plants must have rest. So with the half shrubby things, such as geraniums, heliotropes, and the like; if taken up just as they have grown during the summer and transferred to the house, they are pretty sure to bring disappointment. All such plants should have been trained in a compact, bushy shape, with a view to their removal, and should have been potted early enough to have become established before taking them in. Those who have plants which they intend to keep in the dwelling during winter, should make the removal gradually. First place them under a veranda or other shelter, then remove them to a room where there is no fire, and only subject them to a heated atmosphere when there is danger of the temperature of the room falling below 45 or 40 degrees.

Those who are tired of trying to flower plants in the dry air of our often over-heated dwellings, can still derive much enjoyment from

Fig. 2.—TRADESCANTIA ZEBRINA.

growing plants for foliage only. These can be grown in pots, window boxes, rustic or other

Fig. 1.—IVY-LEAVED GERANIUM.

stands, and hanging baskets. In either or all of these ways they will give a room an air of cheerfulness, and if the foliage be kept clean, a well developed mass of it will be much more satisfactory than poorly grown flowers.

We have often alluded to the use of Ivy for this purpose, than which nothing can be more satisfactory not only for its hardiness but for its beauty. In all these internal decorations it should be freely used. We have before noted other suitable plants for this purpose, and now have a few to add to the list. A very good plant is the old Ivy-leaved Geranium or Pelargonium, (*P. lateripes*), fig. 1, which in its trailing habit and smooth, Ivy-like leaves is so dissimilar to other geraniums. In good soil, and with plenty of sun, it will grow luxuriantly and give pleasure not only by the beauty of its foliage, but by its neat, though not very showy flowers.

Another plant often used for hanging baskets is the Moneywort, (*Lysimachia nummularia*). Its round, bright green leaves are produced abundantly along the flexible stems, and it makes a pleasing effect where the room is not too warm. Figure 3 shows a stem in flower, but does not represent as abundant foliage as is borne on those which do not flower.

We give in figure 2, a small branch of the natural size of a common green-house plant, *Tradescantia zebrina*. This will grow in our hottest rooms, and will endure everything but freezing. It has a remarkable tenacity of life, and as its branches root at every joint, it is propagated with ease. The foliage is of a silvery-green, marked with brownish stripes. This is one of the most useful plants for growing indoors. By the tasteful use of these and similar plants, the dwelling will have a cheerful look, an appearance which may be enhanced by the introduction of a Wardian case, some styles of which are given on page 369, while others can be made of panes of glass set in a frame.

Market Gardening at the South.

The cultivation of vegetables at various points in the Southern States had become established before the war; but like many other kinds of industry, it was totally prostrated. It is now reviving, and only needs capital and intelligent labor to make it a leading interest in those States. Thanks to the wide diversity of climate our country presents, and the ready means of transportation furnished by steam, the season of fresh vegetables and fruits is, in our large cities, greatly prolonged, if not doubled. New York, for instance, draws its supplies from a long distance—beginning with far off Bermuda, then, a little later, from South Carolina, Georgia, Maryland, and Delaware, and finally Southern New Jersey pours in its products before the market gardens near the city are able to supply the demand. A gentleman familiar with the subject, writes us the following concerning the peculiar advantages presented by Norfolk, Va., to those who would engage in market gardening. What is said about Norfolk will apply to many other localities both south and north of that point. "The advantages for this kind of farming which Norfolk presents, are somewhat peculiar and very attractive. The season is about three weeks earlier than that of New York, from which it is only twenty-four hours distant by the regular steamers, and still nearer Philadelphia and Baltimore. Norfolk has the command of three of the best

Fig. 3.—MONEYWORT.

markets in the country, and is connected with them by lines of steamers and in part by rail.

It can put all its early products into these markets in the best condition, and realize very high prices for them. Then the soil about Norfolk is a sandy loam, and matures its products with great rapidity. A glance at the map will show that the bay has many arms and creeks running up into the land for several miles. These creeks are navigable for scows and lighters, so that it is very easy for a farmer having a front upon the water to transport his vegetables many miles, and put them immediately on board the steamer, within a few hours of the time of her sailing. This materially diminishes the cost of marketing. Such rare natural advantages have been to some extent appreciated, and a large business has been done. But the demand for early vegetables and fruits is so great, and the prices are so remunerative that, with sufficient skill and capital, the business may be increased many fold, to the advantage of both consumer and producer.

Owing to the desolations of the war and the uncertainty that has hung over Virginia politics, land is still cheap in this region. It can be bought sufficiently near the city for truck farming from \$50 to \$200 an acre, according to the character of the improvements upon it. Land can be rented for about ten dollars an acre, though the owners generally prefer to sell. Cultivators need both more skill and more capital to make their business pay better. The season of renting begins with the year, and the plowing and other preparations for a crop commence as soon after as the weather will admit. The plowing is performed in pleasant weather all through the winter. The manure most used is of the most expensive kind, street and stable manure, and much of it is brought from Baltimore in vessels. This is applied at the rate of about five full cords to the acre. As this article costs a dollar and a quarter a load in Baltimore, and as much more for freight, it becomes a very expensive fertilizer by the time it is delivered upon the field. Stable manure can be had in Portsmouth and in Norfolk for about a dollar and a quarter a load, the carting to be done by the purchaser, but the supply is quite limited. Guano is sometimes used for forcing, and bone-dust on special crops, which pays well. A good article of superphosphate and fish guano would pay much better on these lands than stable manure. Night soil, sea weed, and sea mud, which might be had easily, are not much used. The great want of this whole region is more manure and of better quality.

The planting season opens early in February, and peas are put in as soon as the soil is fit, and early potatoes immediately follow. These, with cucumbers, tomatoes, beans, cabbages, squashes, and strawberries, are the crops most largely raised. Melons are grown a good deal, but are exceedingly liable to depredations on the way. The farmer begins to forward articles to market by the 1st of May, and by the 15th of August the season is mainly over, and he begins to look around him and plan for another year. Hay, oats, and corn, do well enough, and there is no difficulty in growing what forage is needed for stock. The products of the farm are generally sold in the cities that we have named, on about ten per cent. commission, and the commission merchant makes his returns once a week. This makes a cash business, and the farmer is not out of pocket for his outlay in manures more than four or five months. A part of the help is employed by the year, but in the picking season large numbers of women and children are employed by the job. Good

laborers can be had for about twenty dollars per month, with house-rent and fire-wood. Horses and mules are principally used for teams. There are many details of the business that vary so much with different individuals, that no satisfactory account of them can be given here. The profits are considered very satisfactory by those engaged in the business.

Where is the Mixing of Varieties Shown?

Some remarks on this subject in the August *Agriculturist*, have called out the following note from the botanist whose initials will be readily recognized. We know of no one more able to thoroughly investigate this subject, and hope it will receive his attention. It is one of immediate practical interest to every fruit grower.

"As to where the mixing of varieties is shown, I would first ask, why should it be in the seed rather than in the seed-vessel or fruit? Of course we expect the mixture to be shown in the offspring, that is, in the next generation, the principle being that the offspring inherits from both parents. But the seed is not the offspring; it only contains the offspring in an embryo state. If the alien pollen may impress some peculiarity on the coats of a seed—which are a part of the mother-plant—why not upon the seed-vessel as well?

So much for the likelihood of the case. It appears to be well settled that the coats of beans are thus affected. It is generally supposed that the fruits or seed-vessels of melons and squashes are similarly effected. Careful observation and experiment ought to determine the question.

Now in the case of certain plants of the squash family, Naudin found, if I remember correctly, that alien pollen which would not act on the ovules so as to cause an embryo to be produced at all, would yet cause the fruit to set and grow apparently to full size, though not a seed matured within. Does not this prove that the pollen may somehow act on the ovary or pistil as well as on the contained ovules?" A. G.

Apples—American Pomology.

BY LEWIS F. ALLEN, BLACK ROCK, N. Y.

As Doct. Warder's work on Apples was published by the proprietors of the *Agriculturist*, we have not noticed it at the length its importance demands, and we give place to the following communication from so well-known a writer as the Hon. L. F. Allen, the more readily, that while it is an entirely unsolicited tribute to the value of the work, it is a forcible and seasonable plea for apple culture.

"We like this book—for several reasons: It is written by one who knows whereof he writes; it takes the seed, and plants, grows, and cultivates it into a tree for transplanting; it selects the soil, prepares it in the proper way, takes the tree from the nursery, plants it and trains it until it bears; it then shows to what particular uses either variety of the fruit is best applied, how to pick it, and how to preserve it till it is used. All these are told in a practical, thorough manner, that the merest neophyte may understand, and work upon. It also describes the proper soils, elevations, and positions for orchards,—the modes of draining, where it is needed, and the whole system in all its minutest parts.

The book also talks of insects; and not only talks of, but describes them, and the best ways of preventing, or getting rid of them. It classifies the different varieties of the fruits as to size,

shape, color, taste, and quality, and also the habits of the different trees—all essential to be understood by the orchardist. In short, it tells the whole story throughout, in all that is necessary to be known by either the professed grower of apples for market, the amateur, or the small lot owner who grows only for family use.

This is an *apple* book only, and we like it all the better for that, because it is mixed with nothing else, and one's attention in reading is not diverted to a dozen or twenty other fruits, which, in our opinion, are much better to be treated distinctly, by themselves. Apples are not only an important staple in our agricultural productions, but are growing more important every year; and the time is not far distant when even large farmers in our country will make orchards their *specialty*, and rely upon them, as others do on their grain crops, their neat stock, their wool, and their dairies, for a living and revenue.

There are already well known sections of our wide spread country where apple orchards are much more productive, to the acre, and steadily productive too, than any other crops the farmer can raise, let the crop or the price fluctuate as it may; and knowing these facts, the fortunate holders of such land will appropriate considerable portions of them to apple growing. There are also other extended regions where apples are a precarious or contingent crop, and where they will only be grown for family use. Orchards, as a crop, will pay little or nothing on such soils, and with such fitful bearing that it will be no object to attend to them. These facts, with observation and experience, will become better known than now, and the more men observe, and read, the sooner will they know to what extent, and with what success and profit they can cultivate them.

To come to the thing practically, he who lives far from water communication, or a rail-way, or where rail-ways are not likely to be made—no matter how applicable his soil and climate may be for the purpose, will not go extensively into apple growing, unless for cider or vinegar, for the reason that he cannot get his fruit to market cheaply, nor, from the jolting of wagons, with safety to its good keeping; while he who enjoys such advantages can just as safely embark in the business as in any other branch of cultivation. Every one need not suppose he can do so successfully, even with the best advantages of soil and locality. Every one has not a taste for the pursuit. A good pomologist must be somewhat of an enthusiast. He must have a natural taste for the pursuit primarily, and then a fund of acquired knowledge to be a successful apple grower. He must know what varieties best suit his soil, and that is to be ascertained by observation and trial. Let him see what good varieties flourish and give the best and surest crop in his vicinity. Some kinds flourish well in one soil and position, while others, perhaps equally good, do not succeed at all.

The apple, in many of its best varieties, like almost every kind of fruit, is somewhat capricious in its preference, not only of soil, but of position, and climate; and of this fact too many of those who strive to be orchardists on a considerable scale, appear to have been profoundly ignorant in their early attempts at planting. They looked upon an apple simply as an apple, irrespective of what variety it might be, or in what climate or soil it originated. Our best varieties have originated in various parts of the United States. Pretty much all of them were *American* seedlings, for we have not a dozen kinds which came across the Atlantic that are

worth propagating. The nearer a really *good* apple is grown to the place of its origin, the better, as a rule, it is. For instance, the Newtown Pippin, once the best apple in our New York markets, originated on Long Island, and was chiefly cultivated there, and along the lower section of the Hudson River, and the contiguous parts of New Jersey, and seldom grows anywhere else in perfection. It is now the scarcest *good* apple to be found with us. It has been introduced, to be sure, and grows extensively, east, north, south, and west of us. In those distant localities it has ceased to be the Newtown Pippin of *Long Island*, but is quite another thing, hardly to be recognized in either appearance or flavor, by those not intimately acquainted with its original character. So with the Swaar, of Ulster Co., N. Y., the Greening, of Rhode Island, the Roxbury Russet, the Westfield Seek-no-further, of Massachusetts, and many other varieties which originated and flourished in peculiar localities, and of great local excellence and fame. Still, there are many good varieties which hold their original qualities over a wide diversity of soil, climate, and position.

Thus it is that we have so many varieties, sundry of which are favorites in separate markets, each the best for a given locality, and worth very little, as profitable fruits for the cultivator, far beyond them. It becomes a matter of necessity, then, for the orchardist to know what are the best apples for him to grow; and when he ascertains such fact, to take his proper kinds, and cultivate them with all his might.

Those who aspire to become orchardists are prone to grow too many varieties. Ten or a dozen, to range through the various seasons of ripening, are enough for the most ambitious cultivators to plant. Two or three of early, three or four of autumn, and as many of the winter kinds, are sufficient, for the profit of any apple grower who rears them as a market crop, and if the bulk of his winter crop be confined to not more than two varieties, all the better. For early apples, the season is short, and the market limited. One good sweet, and another tart, is enough for the brief time they are in season. Three or four, from September until the middle of November, or the first of December at latest—sweet and tart—will fill the range of demand, when the winter kinds will come in use, from December until the next June or July; and half a dozen of the later varieties will fill the entire season.

We do not say what these varieties should be, for the very reason we have given, that soils, climates, and positions so differ as to make an apple which is quite good for one locality, altogether an indifferent one for another. Find out a few of the very best kinds for the place you occupy, and the market you are to sell in, and then confine your attention to them. A man with fifty things in his orchard, all good *somewhere*, will, perhaps, on trial, hardly find a dozen which give him either profit or satisfaction in their production, and at the end of a dozen or twenty years cultivation, he has to re-graft three-fourths of them, and begins the world again in fruit growing—all too expensive, vexatious, and heart-breaking, to be borne with equanimity.

We might expand into several pages of these remarks, but have not the space. We can only throw out hints for reflection. We started with Doctor Warder's book, and pronounce it a capital one of its kind, full of instruction to every one who wants to know anything of apples, or apple growing. He gives a list and description of apples, and of the best ones all over the

United States, where they originated, and where they best grow. He names some twelve or fourteen hundred varieties. One quarter in number, of the best, would be quite enough, for hundreds of them have been thrown out by the growers, as not of much account, and it is useless to keep a further record of such anywhere. Yet he names a great many of unimpeachable excellence from which every one may select and apply to his own locality with success.

We wish to say more on this prolific subject, but must forbear, merely commending this book to every orchardist. Study it well, and closely. We have no interest in it other than what relates to our brother orchardists, and the welfare of good apples. We are glad that it has been written, and hail its appearance as an indication that its subject is drawing the attention of our pomologists to a degree commensurate with its great economical importance among our agricultural staples."

New Fruits and New Names.

It seems a great pity that the introduction of new fruits, or at least fruits with new names, could not in some way be regulated. It is, of course, a subject beyond the reach of any other law than that which fruit growers make unto themselves. Each year brings such an addition to our "new fruits," or rather new names, that one almost despairs of keeping pace with them. We are not to be supposed as deprecating novelties, for we like them, but we do desire, and the public have a right to claim, that these new fruits have some qualities superior to old varieties. There is too much looseness in the way in which varieties are introduced, and no nurseryman who is a true pomologist will put forth a variety that has not been thoroughly tested, or which has not been decided upon by some pomologist or pomological body competent to judge of its quality.

There is one practice that seems to be increasing among introducers of new fruits, to which we decidedly object, as tending to make confusion, and fill our books with useless synonyms. It is that of sending a fruit out under one name, and then changing it to another. A strawberry that has been offered as Abraham Lincoln, now comes to us as the President; a grape that was exhibited as the Carpenter, is now known as the Out-Door Hamburg, and we can call to mind other instances of the like. There should be no change of name for any possible reason, save that the first one had already been given to another plant, to which it belongs by right of priority. Gentlemen fruit growers, give us as many good fruits as you can, but trouble us with as few useless names as possible.

GUARD AGAINST FROSTS.—It usually is the case that after the first few frosts we have a long succession of golden autumn days, just made for ripening fruit and bringing out the late blooming flowers. A very slight covering will protect a plant, and those who have a choice grape or tomato that is late in ripening, or Dahlias or other plants that are just in the height of their bloom, should have at hand some screen to protect them from the first frosts. A sheet or other cloth put up tentwise, or stretched in any way over the plant, will be all that is needed. In England the amateur fruit growers have regular fixtures, upon which a covering may be stretched when the trees are in flower, as well as when the fruit is ripening.

Wine-Making on the Small Scale.

Those who wish to make wine in any considerable quantities, will, of course, study up the subject in books devoted to it. But there are many, who, having a few grapes, would like to convert them into wine for their own use, or to test the wine-making qualities of some particular variety. If the grapes contain sufficient sugar to make a good wine, the process requires but little care, as the wine will make itself, but with grapes deficient in sugar the process becomes less easy. The theory of wine-making may be briefly summed up thus: Grape juice contains sugar; fermentation converts this sugar into alcohol. If the amount of sugar and the resulting amount of alcohol be small, then further changes take place, and vinegar is the result. If, on the other hand, the grape juice or must be naturally rich in sugar, so much alcohol is produced that the liquid does not readily pass into vinegar—but remains as wine—and if there is a very large amount of sugar, more than is converted into alcohol before fermentation ceases, there will be a sweet wine—a thing not at present likely to occur with us. The first requisite is good grapes. These must be as thoroughly ripened as possible. They are to be carefully freed from defective berries, removed from the stems and crushed. With small quantities this may be done with the hands, or with larger ones, in a barrel with a wooden pounder. The steps after this will depend upon the character of wine desired. The juice may be at once pressed out and placed in the keg or demijohn in which it is to ferment, or, if it be desired to extract color and aroma from the skins, then the unpressed mass is put in a tub or other vessel, covered with a cloth over which some boards are laid, and allowed to ferment for two or three days, or until the color of the skins is sufficiently extracted. At the end of this time, press out the must, and transfer it to the vessel in which the fermentation is to be completed. This will take place in from ten days to several weeks, according to the richness of the grape, and it will go on more or less rapidly, according to the temperature of the room. A weak must will ferment readily at 60°, while a heavier one will require a higher temperature. With rich grapes, the only thing necessary is to fill the vessel to the bung or mouth, allowing the froth to be thrown over. The loss must be supplied from must kept for the purpose. If the must is poor, it is better to close the vessel with a tight bung or cork, with an India rubber tube inserted in its center. This tube, which may be a foot or two long, should have its free end dip below the surface of water in a cup conveniently placed. As fermentation goes on, the liberated gas will bubble through the water, but no air can enter.

When fermentation is complete, which will be known by the liquid becoming quiet, the vessel is to be closed and allowed to remain until the wine becomes clear. It should then be carefully racked off, or transferred to another and perfectly sweet and clean cask or vessel. Another fermentation, less violent than the first, will take place when warm weather returns, after which the wine may be bottled. If sufficient care be used, these experiments may be made on a small scale, but they need careful watching. The best specimen of American wine we ever saw was made from the Iona, by Doct. Grant, who used a demijohn for a cask, and his dining-room for a wine-cellar. The richer the must is in sugar, the more successful will these small operations prove.

Spring-flowering Bulbs—The Scillas.

There is such a freshness and delicacy about the flowers of the early blooming bulbs, that we naturally associate them with the soft showers and gentle breezes of spring, and a garden from which they are absent seems only half

SCILLA HYACINTHOIDES.

enjoyable. Those who plant bulbs seldom go beyond the usual assortment of Hyacinths, Tulips, and Crocuses. The old Crown Imperial is much less frequently met with than formerly, yet it is a grand old plant. Its bulbs and leaves, it is true, are far from fragrant, but then it throws up such a vigorous stem, and when it puts on its coronet of flowers it looks withal so stately, that we like it, even if it is not among the "novelties." We began to say a word about the Scillas, or—despite the medicinal smack the name has—the Squills. These are for the most part hardy, early blooming bulbs, with flowers of some shade of blue, or, sometimes, white. The spikes are but a few inches high, and to produce much of a show, they are best planted in a bed by themselves. The bulbs, which are quite small, are to be planted this month or next, in good, light, rich, earth, at a depth of about two inches, in the same manner that other bulbs are planted. Though most of the kinds are hardy, yet, like other bulbs, they do all the better if the bed be covered with leaves or coarse littersy manure. We enumerate below the species usually kept by the bulb dealers.

S. hyacinthoides is one of the tallest species, free flowering, and of a soft, subdued blue. We saw last spring in the grounds of B. K. Bliss, at Springfield, Mass., a large bed, the effect of which was very pleasing. From this garden we obtained the specimen from

which the accompanying engraving was made.

S. Sibirica is a hardy and much smaller species, with flowers of an intense blue.

S. amena is also deep blue, and is a rather later bloomer than the preceding.

S. Peruviana is another blue species, of which there is a white variety. It is less hardy than the others, and well adapted to pot culture.

The bulbs of the Scillas do not need to be disturbed oftener than once in four or five years, when it will be necessary to take them up and divide the clumps and replant the bulbs.

Ichneumon Flies.—Pimpla Lunator.

BY EDWARD NORTON.

[Some time ago, we received from a correspondent in Indiana a specimen of an insect, which, he supposed, was injuring his trees. Indeed, from the formidable appendage borne by the insect, a stranger to its ways might be warranted to regard it with suspicion. Knowing that Mr. Norton was an enthusiastic student of this family of insects, we gave him the specimen, requesting him to furnish some notes upon it, which he does as follows.—Ed.]

An insect sent from Indiana to the *Agriculturist*, for a name, by Mr. —, proves to be a friend to the farmer instead of an enemy, as was supposed. It belongs to that large family of insects, the Ichneumonidae, all the members of which occupy themselves in destroying other injurious insects. They are so called from the Ichneumon, formerly supposed to be a parasite upon the crocodile, and to deposit its eggs within its body, which served as food for the young when hatched. No tribe of insects is free from these parasites, which are created to keep down the excessive increase of injurious species, and are each fitted with an apparatus suited for the end proposed, as in the case before us. The borers, (or their grubs,) in trees, make their passages, in many cases, so far below the outer surface that they can be reached in no ordinary way. But certain Ichneumon flies are provided with boring instruments, long enough to probe these tunnels. These borers are hollow, and through them, when the proper spot is reached, the insect places its eggs in or near the grub, upon which the young Ichneumons may feed.

The *Pimpla* or *Rhyssa lunator* (fig. 2), belonging to the group *Pimpla* and genus *Rhyssa*, and called *lunator* from the yellow crescents across its ab-

Fig. 1.—INSECT AT WORK.

domen, is one of the largest of these. It has an ovipositor, sometimes as much as five inches in length, which, when not in use, extends straight

out behind the insect, which is not more than two inches long itself, and is enclosed in two hollow sheaths of the same length. This ovipositor and borer combined is apparently quite smooth and solid, but is really composed of three parts, two of which have fine saw teeth and rasps near the end, which are used when boring. When by some wonderful instinct the insect discovers its prey within the tree, often the grubs of the *Tremex columba* or Pigeon Borer, it takes its position, (fig. 1), the head downward, and raising its abdomen as high as possible, curves its end, and bends the ovipositor so that its point touches the desired spot. As this is too long to be applied with power at once, the extra length is coiled at this time in a transparent membrane, which lies between the two last segments of the back, (marked *c* in fig. 1,) and which pushes out like a thin elastic piece of rubber, vibrating with the severe strain upon it from below. The two sheaths do not enter the tree, but rising above the back, pass down upon each side of the ovipositor to give it strength. They are held in position, and stiffened by the hinder thighs between which they pass. In this way, the ovipositor is sometimes introduced four or five inches into solid

Fig. 2.—PIMPLA LUNATOR. wood, although it is often pushed wholly or in part into crevices, or more or less decayed trees, such as borers inhabit. Sometimes it becomes so firmly fastened in the tree that the insect cannot withdraw it, and dies there. A friend tells me that when he could not draw this out without breaking it, he has known the insect to succeed in extracting it when left alone.

I had the pleasure of seeing this whole operation, as above described, performed by three insects, a few days ago, August 15th, 1867, on an oak tree in the City Park, Brooklyn. Two of them, which I captured, were smaller, with the terebra about two inches long, and worked quite rapidly, depositing the eggs in a few minutes. One, which I took, was much longer about it, and I was forced to use some strength to draw out its borer. The wood was dead, and perforated with small holes in many places, but was too solid to be penetrated with the point of a knife. The third insect which escaped, was much larger, and appeared to work more slowly from the inconvenient length of its ovipositor.

This is one of the "wheels within wheels" which we constantly see in nature. Trees, from various causes, die, and their decay is hastened by insects which tunnel the hard wood, and open it to the air, and to other insects. But lest these should become too numerous, they are followed in their deepest hiding by insects, which are parasitic in their habits, and these are often, in their turn, the prey of others.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

Household Ornaments.

The Wardian Case is one of the most entertaining and instructive of home ornaments. It is an ingenious device to keep plants in a thriving and attractive condition, without the constant attention which a bouquet in a vase, or growing plants in pots require. The glass which is put over the little bed of plants retains the moisture of the atmosphere and constantly returns it to the bed, so that no extra watering is required for weeks. For stocking a case, plants are usually selected that flourish in deep woods or in moist, secluded places. The fine velvety mosses which grow upon rocks, along water courses, and all the smaller ferns, especially the Maiden's-hair, are admirable for this purpose.

Fig. 1.—WARDIAN CASE.

One who enters upon the study of suitable material for stocking a case will be surprised at the number and beauty of the mosses and ferns that grow in wet, unfrequented woods. The Twin or Partridge berry, (*Mitchella repens*), a trailing evergreen, with flowers growing in twos, and bright scarlet berries holding on all winter; the Ad-der's Tongue, *Erythronium Americanum*, with its curiously blotched leaves; the Wintergreen, *Gaultheria procumbens*; the Prince's Pine, *Chimaphila umbellata*; the Trailing Arbutus, *Epigaea repens*, fairest and sweetest of all the children of the early spring, are suitable plants for this purpose. The catalogue might be greatly extended, for almost all the plants that flourish in wet, shady localities, do well in the case. Many bulbs flourish here, and you may have your Crocuses anticipate their spring blooming out

Fig. 2.—WARDIAN CASE.

of doors by planting the bulbs among the mosses. The first thing needed is a suitable frame to hold the case. This may indeed be set upon a table or shelf, but it is much more elegant to have a stand made for the purpose, even if it be very rough rustic work. Fig. 1 shows a stand made principally with the turning lathe. The top piece is made concave so as to hold the plate of plants without showing it. The plate fits in closely, and the edge is concealed by the wooden rim of the stand. Three rounds unite the top piece and the shaft below, and this is furnished with three legs. In fig. 2 a platform under the legs makes a nice place for a pot of ivy, which may be trained gracefully about the legs or suffered to climb along the window case. A common earthen plate or shallow tin pan will serve to hold the bed for the plants. The preparation of the soil is a matter of considerable importance. Nothing is better than leaf mould or rotten wood, which is usually found in abundance with the plants. With this, pounded charcoal should be mixed in about equal parts, and a handful of sand be added. The surface should be left evenly convex to show the plants to the best advantage. The moss now goes on as the background of the picture, and the other plants are arranged according to the taste of the operator. When finished, the glass case is put over it, and you have an ornament for the fireside that will give you a fresh bit of summer all through the dreary winter. The divinity who presides in our household adds, "be sure and take off the glass case every day when you are dusting, for the space of five minutes by the clock, and no more." As this injunction is very emphatic, and her case is always the finest in the town, we advise our readers to take heed. The glasses may be had in city stores. A small aquarium, made in a jar or vase, is shown in Fig. 3. Clean white pebbles are put in the bottom of the jar, in which are placed some of the plants that live entirely under water, and which may be found in almost every pond or slow stream. *Anacharis* and *Valisneria* are very good, but any with fine foliage will do. A few small gold fish may be put in after the plants have been established for a few days. This will make a handsome ornament for the center or dining table, and may also be used to hold a bouquet.

Leaves from the Diary of a Young House-keeper.—No. X.

PRIZE ESSAY BY MRS. LAURA E. LYMAN, STAMFORD, CT.

October 2d.—I always hail with enthusiasm the coming of this month! The air is so bracing, and Nature wears her most gorgeous livery of russet and brown and gold. She has just put on the mellow, warm tints that presage the coming frosts. Summer still lingers lovingly in the lap of autumn, arraying herself in her most fascinating garb, that we may more sadly mourn her departure. All the morning I have been in the garden gathering seeds for next spring; they are wrapped up in little packages, carefully secured with twine, labeled and put away in the seed basket for future use. Taking the hint from Edward's practice, I selected the seeds from the largest and most perfect plants, so as to improve the varieties. By continuing thus, I hope in two or three years to have the very best seed of everything which the garden produces.

October 12th.—I am in the midst of my preparations for the Fair which is to take place next week,

and find myself absorbed in the very natural house-wifely ambition to carry off some of the prizes which have been offered. If I fail it will not be for want of effort on my part, but because some more successful competitor has more knowledge, skill, and experience than I possess. For several days the cows have been turned into the wheat fields to feed upon the young clover that has sprung up there since harvest; this will give the butter a richer flavor and a more golden color to the butter than the pasture they have been in lately.

The abundant care I have always taken of my milk and cream is redoubled. Every day I scald my pans in hay water that they may be perfectly sweet, and watch my milk carefully, using my best judgment in removing the cream from it at just the right moment. This morning I churned, and more fragrant, golden, delicious butter I never saw in my life. I have worked it over once, and just before dark shall do so again, and mould it into the shape of a pineapple. Four of the lumps will just fill a little shallow hemlock firkin Edward bought for me, to put them in to carry to the fair. They will weigh about three pounds each. Besides my butter, I am going to take to the fair some Boston brown bread, which is quite a novelty in these parts, and my parlor rug.

October 14th.—To-day I made my brown bread. Last night I sifted two quarts of corn meal, and wet it in warm buttermilk from my last churning, and set it to soak over night. This gives it full time to swell, and extracts all the sweetness of the meal, which is fresh ground, and of this year's growth. This morning I added a pint of the best molasses, two pints and a half of rye meal, some salt, buttermilk sufficient to moisten the whole, and soda to neutralize the acid of the buttermilk. After mixing all the ingredients thoroughly, I put it into a large earthen pan and baked it three hours in a moderately heated oven, being careful to preserve the heat at a uniform temperature. A little of the dough I put in a smaller pan, and Edward declares it is the best brown bread I ever made, but suggests that, as many object to the hard crust formed over the top of the loaf by this long baking, I had better make another loaf tomorrow, and steam it in my pudding pan. There is no crust at all upon bread cooked in this way, and its flavor, too, is different from that which is baked.

My rug, which has been so much admired, and which resembles tapestry carpeting so closely that everybody takes it for an imported article, I made of carpet thrums, purchased at a carpet factory. They cost only two dollars, but such a rug as I made of them could not be purchased for less than ten dollars. My own labor in its manufacture I never count; it was a recreation from the routine of household duties. The pattern, which I made myself, is a double cornucopia, filled and overflowing with flowers of all hues and every variety. I took them from worsted patterns and varied the figure to suit my taste.

Edward is going to take two of the largest and fattest of the Chester Whites we raised with so much care last spring, and we shall carry also some of the handsomest clusters of our grapes, and the largest and finest flavored of our apples.

October 20th.—We returned last evening from the Fair, and a most delightful time we had. My butter, my bread, my rug, each drew a prize. For the butter, I received a beautiful silver cup; for the bread, a silver fruit knife; and for the rug, a silver dessert spoon. They shine on the table as I write, and much as I prize them for their intrinsic value, the honor of which they are the pledge, I rate of far more worth. My butter was pronounced by the judges as at once more beautiful in appearance, and excellent in quality, than any other at the Fair, and it was beautiful; four magnificent golden pineapples in a setting of green leaves; they looked like fruitage from the trees of Eden! The silver cup I shall keep, but the butter that took the prize I have sent as a gift to our excellent pastor.

When our hired man brought back the articles we sent to the Fair, I missed the two pigs from the farm wagon, and saw in it a big square box of pine-

occupying their place. Inquiring of Edward about it, he smiled in a queer way, and said, "women mustn't be too curious; the box was a little private affair of his own." I said no more, but this morning when I went down stairs, I found in the corner of my sitting room, near my sewing chair, the very same sewing machine I saw and admired so much, and which took the prize at the fair. It is a Wheeler & Wilson, just such an one as I have been wishing for. Edward came in and found me standing over it with happy tears of surprise in my eyes. "How do you like the looks of your Chester pigs?" said he. "They are more of an ornament to my sitting room than I thought pigs could be," I replied; and then he told me that the two little pigs had sold for enough, with the prize they took at the fair, to pay for the sewing machine, that I had earned it, and called me a prize wife, and other names which I shall remember, but won't write down here. Ever since I made him that vest, he said, he had intended this surprise for me in the fall, before the time for winter sewing to be done. Now I can make all his clothes except his Sunday coats, and perhaps I shall sometime learn to make even those.

Edward's sister Jane writes me a very pleasant letter, and, among other things, remarks that she has taken, since her visit to us, regular daily exercise in the open air, and is trying to learn how to keep the house in order and have a little more system in their family arrangements. I am afraid she will have a hard time, and accomplish but little in that line. Habits of order and system will be slowly superinduced upon long years of carelessness and disorder. But it is better to begin now than not at all, and she may inspire the younger members of the family with something of her own ambition, which will lead to happy results in their future households.

Sue has become almost invaluable to me; she is learning all the domestic arts, and I find her perfectly reliable. Reliability I regard as among the very first of social virtues, and, in one sense, the corner stone of them all.

October 25th.—I have been collecting for some time all the pieces of calico and woollen dress goods to make some quilts for winter use. For several days I have been busy piecing the calico into squares, and have nearly enough run together for a quilt. I shall line it with partly worn domestic, colored with tea; that is the easiest and quickest way of coloring I know of. The tea grounds of two or three days must be saved, and when there are a bowlful or so, I shall put them into my porcelain kettle, fill it with water and boil it, and after wringing the domestic in alum water to set the color, dip it in the tea dye, wring it out and hang it to dry. When ironed it will be ready for use.

Instead of marking off my quilt with chalk lines, I will do as one of my neighbors suggested: pin a piece of white domestic where I wish to quilt, and run along the edge; this saves the fingers very much in quilting. There are plenty of woollen pieces to make a quilt, and I have given them to Sue to make up for her bed. She will thus become initiated into the mystery of quilt making, and find that she can, by economy and thrift, by and by furnish her own bed by her own labor.

October 28th.—We have a few quinces this year which I have been preserving to-day. There was not more than a peck in all, so I put up a small jar only of pure quince, and selecting twice as many hard russet apples as there were quinces left, and as near the same size as I could find, I cut them up in just the same shape as the quinces, and preserved them together, and the apple is so flavored with the quince that one can hardly distinguish the two.

October 30th.—Edward brought in eight or ten pounds of honey to-day, and after putting about six pounds away in a jar, I made the rest into a delightful honey syrup for family use, which is even more agreeable than pure honey. My recipe is as follows: Dissolve ten pounds of sugar in four pounds, or two quarts of water; when melted, add two pounds of honey, mix well together, and when

cooling, stir in a few drops of essence of peppermint or other flavoring, according to taste.

Leaves from My Journal.—No. VIII.

PRIZE ESSAY BY MRS. B. MC'CLELLAN, OF OHIO.

October.—Henry and Lizzie Mason have well-defined ideas in regard to the discipline necessary for little Georgy, I see. I suppose they have formerly said, (like all the rest of us,) that a child of theirs should be made to *mind*, at any rate. About the propriety of this there can be no question, but only in regard to the best means for producing the result. How quietly and lovingly some parents, with a simple word, gain obedience! Others, worried and angered, it may be with a long contest, obtain at last but a sullen and very imperfect compliance with their wishes. Young parents often err here in judgment, rather than in motive. Though pained to punish a child, they honestly believe it must be done. "The rod and reproof give wisdom, but a child left to himself bringeth his mother to shame." "Chasten thy son while there is hope, and let not thy soul spare for his crying." The admonitions rest upon their hearts like huge weights, that can only be thrown off by administering the punishment. But is not the trouble a more radical one? Do not parents often misjudge as to the *true cause* for correction? For instance: a little child, half in fun, and half in willfulness, disobeys some command. The parent at once threatens punishment. The child, in alarm, runs from the danger. Now, surely, the parent reasons, this obstinacy must be subdued, this dreadful temper conquered. The child, suffering in every delicate nerve, and well nigh beside itself with terror, is in no fit condition to understand what is required, or even to think what wrong thing it has done. Some children have become idiotic, some epileptic, some deaf, and some blind, from such treatment. Positive untruth, and deliberate, wilful disobedience, doubtless demand prompt and decisive punishment, but let not every trifling fault, every accidental failure or delay, be exaggerated into abundant cause for correction. How common for the parent to urge the child, to "be a man," or "be a lady." Oh, let children be children! Let them act, and think, and speak, and play, and dress, as children should. Childhood will swiftly pass, and worldly wisdom and questionable maxims, and fashion, and guile, and strong temptations, will soon enough surround them. Ah, let not the sanctuary of home be so darkened by unreasonable and exacting demands, that it shall not furnish a dear retreat from the snares and pitfalls of this earthly way. Jesus blessed little children, and is not Our Father infinitely patient with His disobedient family?

I have been canning tomatoes and quinces to-day. These about close up that labor for the season, and I am not sorry when it is over. Tomatoes are nicer if cooked for some time. No water should be added, as they contain a superabundance of juice.

Sweet corn and lima beans will find ready market in winter, if put up in generous quantity. The former has been prepared before this, but the latter claim attention now. They are better to be gathered while green, well scalded in water, and dried on plates by the stove, but can be left to ripen on the vines. Both corn and beans should be kept, when dried, in a tight bag. Before cooking, cover well with cold water, and soak over night. One teacupful of beans to two of corn is a good proportion, and sufficient for a family of five or six. Boil two and a half or three hours. Just before taking up, add butter, salt, and pepper, to taste. Some sweet cream is an improvement, and as the corn loses some of its sweetness in the process of drying, two or three teaspoonfuls of sugar will give the original flavor.

As washing was about to-day, and by little and little we are doing something at house cleaning, I thought I would wash the windows, and clean the paint in the bedroom. The tubs were at hand, and plenty of hot suds. "Nothing like killing two birds with one stone," as my dear old grandfather used to

say. After washing one window, I tipped it upon the corner to drain, with good exposure to the sun and air. But how the wind blows! It is almost a hurricane out there. That window go over, I ought not to leave it so, but I'm hurry with the other, and soon have all in safe quarters. Hark, a crash, an ominous rattling of broken glass! "What's that?" said Hannah. Ah, that unlucky window—I have no trouble in knowing the place of the disaster. I could find it in the dark! I dislike to be called careless, or be obliged to pronounce such humiliating judgment upon myself, but, Mrs. Frisby, with the most charitable construction, you must plead guilty to *that* charge here.

It is no small accomplishment for a lady to be a neat sewer. A costly garment, shabbily made, is never ornamental, while a plain one, well fitted and put together, is always becoming.

Instruction in this department should commence in early childhood. The patchwork must be prepared with exactness, and the little girl patiently taught how to set stitches. As she grows older, she must not be allowed to sew carelessly. Dresses, as well as other garments, sometimes get sadly torn. Shall they be thrown aside now? Rather let them be mended so neatly that, if noticeable, it shall only call forth admiration for the way in which it is done. "Why," said a young lady who dressed with refined taste, after examining a rent thus repaired, "I should consider that ornamental rather than otherwise."

I was taught while at school, how to "set in a patch," and probably have never once done it since without thinking of my teacher with gratitude. Cut a square piece out from the place of the rent. Notch each corner diagonally, the notch being just of the depth required for turning down the raw edge, which should be overcast with fine thread. The piece to be put in must be cut enough larger than the one taken out, to allow for the turning down of both sides, and also be overcast. Sew together on the wrong side, over and over, with fine thread or silk of the color of the material. Let the stitches be quite close together, but not deep. The corners, which are now square, must be tightly sewed. If striped or figured, take pains to match. When finished, dampen and press upon the wrong side.

No wonder that Tommy, with great, round, staring patches on elbows and knees, hides behind mother's chair, when fine ladies so splendidly dressed call to see her. No wonder, if, while at play in the yard, some sweet girls going by, peer at him through the railing and try to make his acquaintance, he scampers away behind the wood-pile, wishing all the while, *oh! so much*, that his father was rich, and he might wear his Sunday suit every day. But now let those patches be put in with more painstaking, (for even the Sunday suit, if worn every day, would soon need them), so that these same ladies will notice and praise the neat work, and the dear little girls say they wish their mothers could mend like Tommy's. Won't he stand erect now? Won't his bright, open face beam like sunshine? Won't he think his mother the most wonderful woman in the world?

Preserve Ripe Cucumbers.—Mrs. L. E. L. Take large yellow cucumbers, pare them, take out the cores, and soak in salt water two days. Then take them from the brine, pour over them boiling water, and let them stand over night. Pour off this water, and they are ready for the pickle, which prepare thus: For each quart of sharp vinegar take one pint of hot water, two large cups of sugar, and one tablespoonful of each of the following spices: cinnamon, cloves, allspice, black pepper, mace or nutmeg. Add one handful of raisins or ripe grapes. Scald all together, and boil until the cucumbers are easily penetrated with a fork. Use as little of the vinegar to boil them in as possible, and pour the rest over them when done.

Jelly Roll.—Four eggs, one teacup of sugar, one of flour, one teaspoonful of soda, two of cream of tartar. Spread thin on bread pans; bake quickly. When done, spread on jelly and roll.

BOYS & GIRLS' COLUMNS.

About Perpetual Motion.

Men have spent fortunes trying to invent a machine that would run of itself without winding up or any other help when it had once been started. Probably some are now trying to put wheels and springs and levers together, so that they will make their own power, and somebody will be likely to succeed when he can take hold of his boot straps and lift himself over a fence. If this seems too discouraging to hopeful but inexperienced inventors, we will say they may expect to make a "perpetual motion" machine, when they first discover something which is not really in motion, or when they learn how to keep anything from perpetual motion. "Why, everything keeps still if nobody moves it," says a young friend whose tongue is always ready to move. What will you show us to prove it? Take that stone lying by the roadside. It has lain there, you say, ever since you can remember; it has not moved a single inch. We know it looks so, but when we are seeking to know the exact truth, we have sometimes to use other instruments as well as our eyes. First, we will take the microscope. All over the rough surface we discover that small particles of that stone are missing. They have left marks in the places which they once occupied, but they have gone on their travels. Some have mounted into the air and gone flying through space as dust; some have escaped in the drops of water which fell from the clouds, and carried them down to the ground, where hungry roots of grass and other plants were waiting to draw them in and send them circulating through their veins. If the stone had been accurately measured many years ago, an exact measure of it now would show that many particles on the outside had moved or been carried away. Another examination many years hence would show more to be missing; so we must conclude that they are now in motion, very slowly perhaps, but yet moving. We will apply another test. During a hot day hold the thermometer against the stone; the mercury rises in the tube; the stone is heated more than the air around it. Now we know that heat makes stone as well as other things expand. The little particles of which it is made separate slightly; they move when heat is applied from the sun, or anything else. When the air around the stone grows cooler, then the heat will pass out, the stone will contract, its particles will move up closer together. Now, as the temperature of the air is continually changing from hour to hour, the stone keeps moving, and its particles are never wholly at rest; there is perpetual motion in it. Shall we examine some other object? Do so for yourself, until we have space to say something more about this subject in the *Agriculturist*.

Rats.

Gnaw, gnaw,—nibble, nibble,—day and night, in sheds, cellars and garrets! Surely there are no creatures so greedy as rats; bread, cheese and meat, or books, papers and clothes carefully packed away—nothing comes amiss. Even the hard wood of boxes, floors and doors is not safe from their sharp teeth. This gnawing propensity is therefore very troublesome to us, but perhaps we could change mouths with the rats we should be quite as greedy; for in truth, this propensity is not only excusable in a rat but actually necessary to his existence.

And this is true of many other animals besides rats and mice, namely: rabbits, squirrels, and all the "gnawers," or "rodents," as they are called scientifically.

Instead of chewing on side teeth as we do, the gnawers use four little front teeth with bevelled edges—that is, with one side sharper than the other, like a chisel, and so they file or nibble their food.

The teeth of most animals, once grown, remain of a certain size; but the teeth of rats and other rodents continue to grow like our finger nails, so that constant gnawing is necessary to keep them down to the right length. We cannot, therefore, blame a rat for spoiling our papers and wood, since his comfort, and even life, depends upon it. We are always sorry enough to lose a tooth, but to a rat such a loss is a far more serious misfortune, for the opposite tooth, having nothing to file against, grows longer until it bars the month. If both upper or under teeth were lost, the poor creature could not eat, and in a very short time would certainly die of starvation.

A Wonderful Pump.

The heart of an animal is a miniature force-pump, having supply and discharge pipes, and complete sets of valves. It has a world of work to do during a lifetime of seventy years. Each minute the human heart beats about seventy times, at each beat receiving and discharging two and one half ounces of blood. Thus, it must distribute 175 ounces per minute, 656 pounds per hour, 7½ tons per day; and in 70 years about 200,000 tons. No pump ever constructed by man has continued to work so steadily, without derangement, and without repairs—though that is saying too much; for, by its wonderful mechanism, it repairs its own wear, until the end of life.

Use Plain Words.

Little boys sometimes put on their fathers' boots or their big brothers' clothes, and act as though that had made them larger and more important; but nobody is deceived, and they are only laughed at. Young writers and speakers should remember this when clothing their thoughts with language. Never try to find large or high sounding words. They are not natural, they will be awkwardly used, will often show miss-fits, and expose the author to ridicule. An ambitious young student, in writing his composition, thus attempted to describe a very dark night; "tenebrious gloom obscured the darkening shade." The teacher, on reading it, remarked, "this being translated into plain English, means 'dark darkness darkened the darkening dark'; that is, I suppose, it was very dark." A young lady thus expressed the idea of a fine sunrise; "the royal king of day, clad in glorious golden panoply of dazzling effulgence, flooded the earth with gorgeous brightness." "It is easier to swallow a dictionary than to digest it," remarked the teacher, on reading that outburst. In all writing, strive to express the thought most clearly. Nobody cares to unwrap a dozen or more coverings to get at a small parcel of candy. If you have a pleasant idea, out with it in as few and plain words as possible, and not oblige the reader to strip off a pile of waste word wrappers. Use the language in which you think and converse; that will be entirely natural. In time you may learn to make it elegant. Strive for excellent thoughts, and to express them clearly; they will be valuable even in the homeliest words, just as a beautiful face is attractive in the plainest garb.

New Puzzles to be Answered.

No. 281. *Illustrated Rebus*.—What order of nobility is here represented?

No. 282. *Riddle*.—With two hands, no finger or thumb, I speak plainly, yet have no tongue; my face is attractive, much looked at, yet has neither month, nose, or eyes. I go about constantly, telling neither feet nor wings, but never advance a step without company.

No. 283. What way of cooking bivalves is shown in the above engraving?

No. 284. How does the foot in the engraving below represent that its owner is determined on success?

Answers to Problems and Puzzles.

No. 275. *Figure Puzzle*.—Ivy (IV)...No. 276. *Double Puzzle*.—A cat may be found concealed over the bird's nest. She has the old bird in her mouth. The rebus is "Cat-nibbs." The combs in the beehives, on the fowls, making the fence, and the curly-comb on the ground, fully supply the latter part of the word....No. 277. *Enigma*.—A Shoe, (understanding is a well-spring of life.)....No. 278. *Study in Horsemanship*.—Turn the picture sideways and the boys will evidently be thrown....No. 279. *Illustrated Rebus*.—As twigs are bent, trees are inclined....No. 273. *Arithmetical Problem*.—(Angust number, page 279.) 45.35 yds.

No. 284.

The Catacombs.

In the September *Agriculturist*, page 333, it was stated that the word formed in the puzzle picture was of historical interest, and our young readers were requested to find out what they could about the "Catacombs." As many of them may have no books at hand containing the information, we give the following brief sketch. They were rooms cut under ground in the rocks for the reception of bodies of the dead. The first Catacombs were probably made in Egypt. In that country it was customary to embalm the dead, and the "mummies," as the embalmed remains were called, were then placed in the Catacombs. An entire chain of mountains in the neighborhood of Thebes, is mined by these chambers for the dead. Those belonging to the royal families and wealthy classes were splendidly decorated with costly paintings. Valuable ornaments of gold and silver were also used to adorn the mummies, but these have been despoiled long since by hostile invaders. Many of the paintings yet remain, their colors as bright as when first put on. These paintings represent scenes in the daily lives of the Ancient Egyptians, and give a complete history of their manners and customs. It is estimated that not less than 400,000 mummies were entombed in the Catacombs of Egypt, which gives some idea of their vast extent. The most interesting Catacombs are those of Rome, which are also immensely large, running under ground for miles. In the times of persecution, the early Christians found refuge in their intricate windings, and lived and worshipped unmolested by the enemies of Christ. On this account these places are held in great reverence by the Catholic population of Rome. The Catacombs of Naples are of still greater extent than those of Rome. At Paris, a large part of the city had been undermined in quarrying stone for building purposes, leaving extended galleries and rooms. They were not used for burial places until 1784, when the remains taken from a cemetery were deposited there. Frequent additions have been made from other burial grounds, until it is computed by good authorities that the bones of at least 3,000,000 people rest there.

No. 280. *Illustrated Rebus*.—This is a difficult puzzle: It will require considerable study to solve it.

[COPYRIGHT SECURED.]

THE LOVING SISTER. — FROM A PAINTING BY MERLE. — Engraved for the American Agriculturist by J. L. Langridge.

How lovingly this sister clasps her baby brother in her arms! How naturally and sweetly the artist has told the story! The child's little troubles have given place to peaceful and happy dreams. The little fellow sleeps securely in his place of refuge. He has told his sister his childish grief, and has been consoled. He still holds tenaciously the apple she has given him, and we imagine we can almost see the traces of her kisses upon his pure forehead and plump cheeks. The day will come, perhaps, when his strong arm may support and protect her in turn. It is a fine thing to have a big brother—some one to protect and care for you—but we are sorry to say that big brothers are apt to be selfish and domineering, to have grand ideas of their own personal dignity, and to be very jealous lest their smaller brothers and sisters assume in

any respect an equal footing with themselves. This is much less often the case with an older sister, who, if she is a good girl, can sympathize with the little ones and understand them much more readily than any brother, even if he is disposed to be kind and attentive. If you have a sister, return her love with kindness and affection, and you will always find her a true friend.

Serious Disturbance.—A few nights since, a family in Brooklyn, N. Y., were alarmed by a noise. Several burglaries committed in the neighborhood had made them nervous, and now they thought their turn had come for a visit from the housebreakers. The father of the family attempted to get a light by turning on the gas, but in his trepidation turned it off. The

women, now more frightened than ever, ran screaming to the windows, and the whole neighborhood was aroused. A man armed himself with a broadsword, others seized various weapons, and the police came with their clubs. The family were afraid to venture down stairs, so the crowd below broke open the front door, and entered to capture the robbers. On entering the kitchen they found the faucet to the water-works open, and a full stream rushing out, and right behind this faucet, the rascal that had caused all the disturbance. A large cat had thrust his head into a milk pitcher, but could not get it out. It had "thrashed round" furiously in trying to extricate itself, thus making the alarming noises, and finally got fastened in the place where it was found, its struggles having turned the faucet. The fright ended in a hearty laugh.

(Business Notices \$2.50 per Agate Line of Space.)

PARSONS & CO.,

Flushing, N. Y.

ACROSS THE SIERRA NEVADAS. THE CENTRAL PACIFIC RAILROAD.

The Western Half

OF THE

GREAT NATIONAL TRUNK LINE

Across the Continent,

Being constructed WITH THE AID AND SUPERVISION OF THE UNITED STATES GOVERNMENT, is destined to be one of the most important lines of communication in the world; as it is the sole link between the Pacific Coast and the Great Interior Basin, over which the immense Overland travel must pass, and the

Principal Portion of the Main Stem

Line between the Two Oceans.

Its line extends from Sacramento, on the tidal waters of the Pacific, eastward across the richest and most populous parts of California, Nevada and Utah, contiguous to all the great Mining Regions of the Far West, and will meet and connect with the roads now building east of the Rocky Mountains. About 100 miles are now built, equipped and in running operation to the summit of the Sierra Nevada. Within a few days 35 miles, now graded, will be added, and the track carried entirely across the mountains to a point in the Great Salt Lake Valley, whence further progress will be easy and rapid. Iron, materials, and equipment, are ready at hand for 300 miles of road, and 10,000 men are employed in the construction.

The local business upon the completed portion surpasses all previous estimate. The figures for the quarter ending August 31, are as follows, in gold:

GROSS EARNINGS,	OPERATING EXPENSES,	NET EARNINGS,
\$187,579.61	\$86,548.47	\$401,031.17

or at the rate of about two millions per annum, of which more than three-fourths are net profit, on less than 100 miles worked. This is upon the actual, legitimate traffic of the road, with its terminus in the mountains, and with only the normal ratio of government transportation, and is exclusive of the materials carried for the further extension of the road.

The Company's interest liabilities during the same period were less than \$125,000.

Add to this an ever-expanding through traffic, and the proportions of the future business become immense.

The Company are authorized to continue their line eastward until it shall meet and connect with the roads now building east of the Rocky Mountain ranges. Assuming that they will build and control half the entire distance between San Francisco and the Missouri River, as now seems probable, the United States will have invested in the completion of 865 miles \$23,592,000, or at the average of \$33,000 per mile—not including an absolute grant of 10,000,000 acres of the Public lands. By becoming a joint investor in the magnificent enterprise, and by waving its first lien in favor of the First Mortgage Bond holders, THE GENERAL GOVERNMENT, IN EFFECT, INVITES THE CO-OPERATION OF PRIVATE CAPITALISTS, and has carefully guarded their interests against all ordinary contingencies.

The Company offer for sale, through us, their

First Mortgage Thirty-Year Six Per Cent. Coupon Bonds,

Principal and Interest Payable in Gold Coin,

HERALD OF HEALTH.

This Magazine has met with a great success during 1867. Those who subscribe for this Journal for 1868, NOW, shall get the Oct., Nov., and Dec. Nos. of 1867 free. A Wheeler & Wilson Sewing Machine premium for 30 subscribers, \$60. Those who have never seen this Magazine can have it three months on trial for 30 cents—\$2 a year; 20 cents a number.

MILLER, WOOD & CO.,

No. 15 Laight-st., New York.

Rural Improvements.

Robert Morris Copeland, author of Country Life, furnishes plans and advice for laying out or improving public or private grounds. Refers to John M. Forbes, Nathaniel Thayer, Boston; Francis G. Shaw, New York; Rufus Waterman, Providence, R. I. Office, 40 Barristers' Hall, Boston, Mass.

in New York city. They are in sums of \$1,000 each, with semi-annual gold coupons attached, and are selling for the present at 95 per cent. and accrued interest from July 1st added, in currency, at which rate they yield nearly

Nine Per Cent. Upon the Investment.

These Bonds, authorized by Act of Congress, are issued only as the work progresses, and to the same amount only as the Bonds granted by the Government; and represent in all cases the first lien upon a completed, equipped, and productive railroad, in which have been invested Government subsidies, stock subscriptions, donations, surplus earnings, etc., and which is worth more than three times the amount of First Mortgage Bonds which can be issued upon it.

The Central Pacific First Mortgage Bonds have all the assurances, sanctions and guaranties of the Pacific Railroad Acts of Congress, and have, in addition, several noticeable advantages over all other classes of railroad bonds.

First—They are a first lien upon altogether the most vital and valuable portion of the through line.

Second—Beside the fullest benefit of the Government subsidy, which is a subordinate lien, the road receives the benefit of a large donation from California.

Third—Fully half the whole cost of grading 800 miles eastward of San Francisco is concentrated upon the 150 miles now about completed.

Fourth—A local business already yielding three-fold the annual interest liabilities, with advantageous rates payable in coin.

Fifth—The principal as well as the interest of its Bonds is payable in coin, upon a legally binding agreement.

Having carefully investigated the resources, progress and prospects of the road, and the management of the Company's affairs, we cordially recommend these Bonds to Trustees, Executors, Institutions and others as an eminently sound, reliable and remunerative form of permanent investment.

Conversions of Government Securities

INTO

CENTRAL PACIFIC

FIRST MORTGAGE BONDS

now realize for the holders from

Twelve to Eighteen Per Cent. Advantage,

WITH THE SAME RATE OF INTEREST.

The exchange is effected at the following rates to-day, (September 9th), subject, of course, to slight fluctuations from day to day. We receive in exchange:

A NEW BOOK. THE GRAPE VINE.

By FREDERICK MOHR,
DOCTOR OF PHILOSOPHY AND MEDICINE.

Translated from the German, and accompanied with
Hints on the Propagation and General Treatment
of American Varieties.

By HORTICOLA.

This work is mainly devoted to the most elementary matters. It explains the structure and mode of growth of the vine so clearly that no intelligent person who reads it need be in doubt what to do with his vines. It has been well translated, and a chapter on the propagation of American varieties has been substituted for the original one on multiplying the European grape. As anatomy is the foundation of surgery, so is a knowledge of the structure of the vine to the vine dresser. In both cases it is as important to know when and where to cut, and how.

CONTENTS.

Development and Structure of the Grape Vine.
The Node; The Branch; Reasons for Pruning; Pruning.
Training on Trellises; Treatment in Summer; Plantations.
Vines Trained along the Garden Walk.
Trellises on Walls; Tree Trellises.
Vines Trained to Trellises; Brunner's Method.
Time Required for Covering a Trellis.
Maundering the Vine; Age of Vineyard.
The Rising Sap in the Vine; The Grape Disease.
Treatment of Vines Injured by Frost.
Implements; Proper Time to Perform Work on the Vine.
Constituents of the Vine and their Distribution.
Propagation of the Vine: By Layers; By Cuttings; By Grafting; By Inarching; By Seeds.
Hybridization.
American Varieties—General Management; Planting; Pruning; Pinching; Covering in Fall.

A NEW WORK. SMALL FRUIT CULTURIST.

By ANDREW S. FULLER,

PRACTICAL HORTICULTURIST, RIDGEWOOD, BERGEN CO., N. J.

A new work, and the only one devoted to Small Fruits.

Special treatises of this kind have the advantage that the author can more thoroughly discuss his subject, and go into greater detail, than in a work embracing both large and small fruits. The work covers the whole ground of Propagation, Culture, Varieties, Packing for Market, etc.

CONTENTS: INTRODUCTION—I. BARBERRY—II. STRAWBERRY—III. RASPBERRY—IV. BLACKBERRY—V. DWARF CHERRY—VI. CURRANT—VII. GOOSEBERRY—VIII. CORNELIAN CHERRY—IX. CRANBERRY—X. HUCKLEBERRY—XI. SHEPHERDIA—XII. PREPARATION FOR GATHERING FRUIT.

We predict that this work will bring Mr. Fuller many enemies, as he has given his opinion about varieties without reserve. On the other hand it will the more strongly endear him to all true lovers of horticulture, as these wish to have the merits of fruit given without reference to the persons who introduce them.

While very full on all the small fruits, the Currants and Raspberries have been more carefully elaborated than ever before, and in this important part of his book, the author has had the invaluable counsel of Charles Downing. The chapter on gathering and packing fruit is a valuable one, and in it are figured all the baskets and boxes now in common use. The book is very finely and thoroughly illustrated, and makes an admirable companion to his Grape Culturist.

PRICE, \$1.50

NEW YORK:

ORANGE JUDD & CO.,
245 BROADWAY and 41 PARK ROW.

DRAINING FOR PROFIT AND DRAINING FOR HEALTH.

By GEO. E. WARING, Jr.,

ENGINEER OF THE DRAINAGE OF CENTRAL PARK, NEW YORK.

Illustrated.

TABLE OF CONTENTS:

LAND TO BE DRAINED AND THE

REASONS WHY.—Indications of the need of draining.—Sources of water.—Objections to too much water.—Wet sub-soil.

HOW DRAINS ACT AND HOW

THEY AFFECT THE SOIL.—Characteristics of well laid tile drain.—Surface-water and rain water beneficial, springs and soakage water injurious.—Cracking of stiff clays.—Evaporation and filtration.—Rain fall.—Evaporation.—Temperature.—Drought.—Porosity or mellowness.—Chemical action in the soil.

HOW TO GO TO WORK TO LAY

OUT A SYSTEM OF DRAINS.—Amateur draining.—Maps.—Levelling instruments.—Outlets and location of drains.—Main drains.—Spring water.—Fall.—Tiles.—Depth and distance apart.—Direction of laterals.—Collars.—Discharge of water from drains.

HOW TO MAKE THE DRAINS.—

Tools.—Marking the lines.—Water courses.—Outlet.—Silt Basins.—Opening the ditches.—Grading.—Tile laying.—Connections.—Covering the tile and filling in.—Collecting the water of springs.—Amending the map.

HOW TO TAKE CARE OF DRAINS

AND DRAINED LAND.—Removing obstructions.—Mistake of substituting large tiles for small ones which have become obstructed.—Heavy lands should not be trampled while wet.

WHAT DRAINING COSTS.

Draining, expensive work.—Their permanence and lasting effects.—Cheapness versus economy.—Details of cost.—(1. Engineering and Superintendence.—2. Digging the ditches.—3. Grading the bottoms.—4. Tile and tile laying.—5. Covering and filling.—6. Outlets and Silt Basins.)

WILL IT PAY?

Increased crops required to pay cost of draining.—(Corn, Wheat, Rye, Oats, Potatoes, Barley, Hay, Cotton, Tobacco).—Instances of profit.—Benefit of draining in facilitating farm work.

HOW TO MAKE DRAINING TILES.

Materials.—Preparation of earthen.—Moulding tile machines.—Drying and rolling.—Burning.—Kilns.—General arrangement of a tiler.

THE RECLAIMING OF SALT

MARSHES.—Extent of marshes on the Atlantic Coast.—The English Fens.—Harlaem Lake.—The exclusion of sea water.—Removal of the causes of inundation from the upland.—Removal of rain fall and water of filtration.—Embankments.—Muskrats.—Rivers and Creeks.—Outlet of drainage.

MALARIAL DISEASES.

Fever and Ague.—Neuralgia.—Vicinity of New York.—Dr. Bartlett on Periodical Fever.—Dr. Metcalf's Report to U. S. Sanitary Commission.—La Roche on the effects of Malarial Fever.—Dr. Salisbury on the "Cause of Malarial Fevers."—English experience.—Reports to the British Parliament.—Cause of Malaria removed by draining.

HOUSE AND TOWN DRAINAGE.

Sewerage.—The use of pipes.—The new outfall sewers in London.—The use of steam pumps to secure outlets.—Utilization of sewage matters in agriculture.—Effects of imperfect house drainage on health.—Typhoid fever.—The Westminster fever in London.—Epidemic at the Maplewood Young Ladies Institute in Pittsfield, Mass.—Lambeth Square, London.—Back drainage.—Water supply.—General Board of Health, (England)

UNIVERSAL CLOTHES WRINGER.

Cannot be surpassed or equalled by any other Wringer for durability, till the expiration of the patent for the "COG WHEEL REGULATOR" or "STOP-GEAR." No other Wringer is licensed under this Patent. It being now universally conceded that Cogs are necessary to prevent the Rolls from being broken or torn loose, many attempts have been made to get a Cog-Wheel arrangement which shall equal the UNIVERSAL, and yet avoid the "Stop-Gear" patent, but without success.

Many who sell the UNIVERSAL WRINGER keep also the

DOTY WASHING MACHINE,

which, though but recently introduced, is really as great a LABOR and CLOTHES SAVER as the Wringer, and is destined to win public favor and patronage everywhere.

It washes perfectly, without wearing or rubbing the clothes at all.

Those keeping the Wringer for sale, can order the Washer

for customers, if they have not got a supply on hand. On receipt of the Retail price, from places where no one is selling, we will send either of both machines from New York.

Prices—Family Washer, \$14. No. 1½ Wringer, \$10. No. 2 Wringer, \$8.50.

A supply of the Wringers and Washers is always kept on hand in Chicago, Cincinnati, Cleveland, Janesville and St. Louis, boxed ready for shipment, at about New York prices.

Large profits are made selling these machines. Circulars, giving Wholesale and Retail prices, sent free.

These Machines are adopted by the *American Agriculturist* as Premiums, and endorsed by its Editors as the best in market—for recommendations see back numbers.

R. C. BROWNING, General Agent,
No. 82 Cortlandt-st., New York.
(Opposite Merchant's Hotel.)

Bliss' Seed and Horticultural Warehouse.

B. K. BLISS & SON,

41 PARK ROW, NEW YORK,

(Old Office of *American Agriculturist*.)

Also, 231 Main Street, Springfield, Mass.

The Subscriber is happy to inform his patrons and the public generally, that, in order to better accommodate his numerous customers in New York and vicinity, as well as his rapidly increasing trade in other sections of the country, he has formed a business connection with his son, S. B. BLISS, under the above-named firm, and leased the well-known premises of the *AMERICAN AGRICULTURIST*, 41 PARK ROW, NEW YORK, where it is their intention to keep a well assorted stock of the various articles required by the **Farmer, Gardener, and Amateur Cultivator.** Among these may be found every desirable variety of **Garden, Field, and Flower Seeds, Dutch Bulbous Roots, Summer Flowering Bulbs, Hardy and Exotic Grape Vines, Small Fruits, Roses, and Flowering Plants,** both for the **Conservatory and Flower Garden, Agricultural and Horticultural Implements, Fertilizers,** and other requisites for the **Farm and Garden.**

The Seed Department will receive that special attention which its importance demands. Every effort will be made to sustain the favorable reputation which his seeds have already acquired wherever they have been introduced. With an experience of upwards of Twenty Years in the business, and possessing unrivaled facilities for procuring both Foreign and Home-grown Seeds, he feels no hesitation in

guaranteeing perfect satisfaction to those who may favor them with their orders.

He would take this opportunity to return his sincere thanks to his friends for their liberal patronage, and respectfully solicits a continuance of the same for the New Firm.

B. K. BLISS.

OUR NEW

Catalogue of Dutch Bulbous Roots,

beautifully illustrated, with special directions for the culture of each variety therein enumerated, is now ready, and will be mailed, post-paid, to all applicants enclosing 10 cents.

OUR CELEBRATED

Seed Catalogue and Guide to the Flower and Kitchen Garden,

Containing One Hundred and twenty-five pages of closely printed matter, beautifully illustrated with upwards of *One Hundred Engravings*, and a Descriptive List of upwards of *Two Thousand varieties of Vegetable and Flower Seeds*, with special directions for their culture, will be mailed to all applicants enclosing 25 cents. Orders may be addressed to

41 Park Row, New York,

Or, 231 Main-st., Springfield, Mass.

Dr. H. SCHROEDER, Bloomington, Illinois.

CROSSMAN BROTHERS & COMPANY,

Manufacturers of Fire Brick, Glazed Drain Pipe, Land Tile, &c.

DEALERS IN FIRE CLAY, FIRE SAND AND KAOLIN,

On Raritan River, 2 1-2 Miles above Perth Amboy, Woodbridge, N. J.

We invite public attention to an enterprise having for its object a combination of *practical, successful*, business operations, and valuable inventions; the working of which will have a tendency to revolutionize present systems of drainage, *greatly diminish its cost*, and increase its efficiency by being done in a **SUPERIOR MANNER**; add to the prosperity, profits, and *certainty* of agricultural operations, and by thus increasing the National Wealth in Agricultural Products, the prosperity of all other interests and businesses of the country will be promoted and insured; the volume and cash value of our National Exports will be increased, and tend to avert those monetary crises that succeed poor crops, and consequent diminished cash value of our exports and over trading on credit principles.

In our Brick-making business we found and secured a worn-out farm containing inexhaustible quantities of common brick, DRAIN TILE, Pipe and Fire Brick Clay, that make goods of such **SUPERIOR** quality as the clays of Woodbridge, N. J. are celebrated for. These different kinds of valuable Woodbridge Clays overlie and successively develop each other. They lie accessible and exposed above the level of our Railroad, and reach almost to the surface of the ground.

They are connected with Factory, Ship Channel, and excellent shipping facilities, by a Railroad of about 3,900 feet, with a slight down grade to the river. It is a combination of natural and artificial advantages for manufacturing *superior goods of vital importance* to the country, and for exhibiting our valuable machinery for sale in practical, profitable working operation, that is not known to exist in any other locality.

The machinery that is of such importance to the agricultural and other interests of the country consists in part of the inventions of Mr. Geo. S. Tiffany. They are the only machines known that take unprepared clay from the bank, grind it to *plasticity*, and drive it out at any *desired rate of speed*—not as simple mud—but in continuous streams of very dense, strong, and *polished* round tile, that are only equaled in smoothness by the Glass Tile of Holland. They are precisely the goods that every intelligent and scientific Drainer in the country will have whenever obtainable. They are manufactured stiff enough to wheel direct from the machine, the *only hand labor* required being to shovel clay, handle and wheel away the *ready-made* tile, to be dried and burned, &c., &c. We counted 48 ready-made polished tile issuing per minute, in a continuous stream from the machine of Sword Bros., in Michigan. The different strata in our clay hills that can thus be rapidly made into *valuable and superior goods* by our combination of water and rail transportation and valuable machinery, were formerly thrown away to get the more valuable clays beneath.

Another invention of great importance to this Company and to the country is the Patent of Mr. Henry C. Ingraham. It is probably the first *efficient*, practical, economical, light draft Ditching Machine ever invented and *practically used*. With such little work as it has already done, under *great disadvantages*, and with limited means to develop it, we already have *practical proof* that it will, with a single team of horses, dig from $\frac{1}{4}$ of a mile to $\frac{1}{2}$ mile, 2 to 3 feet deep, of Ditch per day, with the bottom of the Ditch hardened, graded, and *shaped to precisely fit round tile*, in a manner *far superior* to hand labor. It is self-adjustable and self-grading. By driving it a few times across the roughest plowed ground, the bottom of the Ditch becomes smooth and graded, with no loose dirt left in the Ditch. The dirt is deposited on each side in the smallest possible quantities, because the Ditch is cut *precisely of uniform width*, without waste by irregularities in digging. The operator rides as in a Mowing Machine, and it is believed to be of greater value to the country to *increase* Agricultural Products than Mowing Machines, or any other implement, are to secure the crops after being produced. It is difficult to estimate the value of a machine by which farmers can now drive teams and *thoroughly* perform the hitherto disagreeable, expensive, and slow, work of Ditching.

This Company is as yet composed exclusively of the working men and inventors that have developed this combination of business and advantages. The business will be managed by them, and their production will be still improved and developed to a higher standard of perfection, and kept in advance of the times, if the Inventors now comprising the Company should live. These Inventors are young men of integrity, and have not yet attained their proper positions in life.

The Company is not absolutely organized, but it is under consideration to name it the CROSSMAN CLAY AND MANUFACTURING COMPANY, and to be formed of the following Officers:

JACOB R. CROSSMAN, President.
GEORGE S. TIFFANY, Treasurer.

TRUSTEES.

JACOB R. CROSSMAN.
ALONZO G. CROSSMAN.
HENRY C. INGRAHAM.

The Company now possess and are working yards that can produce from two million to five million brick per year. We enclose estimates of what is now being done by Sword's

Brick Machine. It made 52 Brick per minute while we stood by and timed it by watch.

EXHIBIT OF ONE WEEK'S WORK.

Though we can, with ease, with the same number of men, make 153,000 in Six Days of ten hours, we here state the average Week's Work at 150,000.

COST.

2 men at the clay bank.....	\$27.00
2 men on the platform feeding the Machine.....	27.00
1 man taking off brick from the Machine.....	13.50
2 men, (or three boys,) wheeling.....	27.00
1 man helping unload barrows in yard.....	13.50
1 engineer.....	21.00
4 setters.....	60.00
3 burners.....	48.00
150 bushels nut coal, for engine.....	7.50
2 horses, keeping.....	10.00
1,350 bushels Coke and Coal, to burn a kiln of 150,000 brick.....	121.50
Oil for machinery.....	3.50
Delivering kiln of brick.....	235.00
Manager of yard, and contingent expenses.....	50.00
	\$657.00

PROFIT.

150,000 brick at \$12 per 1,000.....	\$1,800.00
Deduct cost of making.....	\$657.00

Net profit of yard for one week.....\$1,143.00

Admitting what every one knows cannot possibly occur, that brick fall to half present prices, and wages remain as high as at present, still, a Machine in a brick market, is a fortune.

The above estimates of cost are much higher than will be found true of many localities. They are above the actual working expenses of our own yard, but we wish to be entirely on the safe side!

The clay that is now made into common brick, can, by the Tiffany Tile Machine, be rapidly made into superior Tile, for a great demand exists at the following prices:

1½ inch, without bands, \$17.....	1½ inch, with bands, \$23.
2 " " " 20.....	" " " 28.
3 " " " 35.....	" " " 45.
4 " " " 50.....	" " " 56.

To show the comparative cost of Brick and Tile made from the same clays, we extract from the work by Geo. E. Waring, entitled "Draining for Profit and Health," page 158, as follows:

"**The Cost of Tiles.**—It would be impossible, at any time, to say what should be the precise cost of tiles in a given locality, without knowing the prices of labor and fuel; and in the present unsettled condition of the currency, any estimate would necessarily be of little value. Mr. Parker estimated the cost of inch pipes in England at 6s., (about \$1.50) per thousand, when made on the estate where they were to be used, by a process similar to that described here. Probably they could at no time have been made for less than twice that cost in the United States,—and they would now cost much more; though if the clay is dug out in the fall, when the regularly employed farm hands are short of work, and if the same men can cut and haul the wood during the winter, the hands hired especially for the tile making, during the summer season, (two men and two or three boys,) cannot, even at present rates of wages, bring the cost of the tiles to nearly the market prices. If there be only temporary use for the machinery, it may be sold, when no longer needed, for a good percentage of its original cost, as, from the slow movement to which it is subjected, it is not much worn by its work.

"There is no reason why tiles should cost more to make than bricks. A common brick contains clay enough to make four or five 1½-inch tiles, and it will require about the same amount of fuel to burn this clay in one form as in the other. This advantage in favor of tiles is in a measure offset by the greater cost of handling them, and the greater liability to breakage."

It will readily be seen there is room for immense profits in Tile manufactures by our combination and application of machinery, even at a large reduction in the price of tile.

Orders for Ditching and Tile Making Machines are solicited, and their satisfactory working will be guaranteed by our Company.

It is proposed to raise \$50,000 Cash Working Capital to develop and extend our enterprise. To do so, the property and business of the Company will be represented by shares of \$50 each. One Thousand such shares are now offered to capitalists and consumers, with the firm belief as practical men that no enterprise in this country holds out equal inducements for investment. Inventories, full explanations, and satisfactory references, will be furnished applicants by addressing or calling on

CROSSMAN BROTHERS,
Woodbridge, N. J.

Three Months for Nothing.

THE METHODIST,

A First-Class Religious Newspaper.
VIIIth Volume Commences Jan. 1st,
1868.

NOW is the time to subscribe, as by doing so you will get the paper for the remainder of this year **For Nothing.**

THE METHODIST

is an eight-page Weekly Newspaper, now in its eighth year of highly successful publication. It is Religious and Literary; Independent, Fraternal, Loyal, and Progressive.

As a Family Paper it is unsurpassed. It commands some of the best Literary ability of the

Methodist Episcopal Church, and of other Christian Denominations, and is largely patronized by all classes of Christians, as a Family paper.

It is Edited, as heretofore, by

REV. GEORGE R. CROOKS, D.D.

Assisted by the following able Editorial Contributors:

REV. ABEL STEVENS, LL.D.

REV. JOHN MCCLINTOCK, D.D. LL.D.

REV. B. H. NADAL, D.D.

REV. H. B. RIDGAWAY, and

PROF. A. J. SCHEM.

Sermons by

HENRY WARD BEECHER,

every Fortnight.

Also, Sermons from

Eminent Methodist Pulpit Orators,

Among whom are the

Bishops of The Methodist Episcopal Church.

Other experienced writers contribute to the various special departments, rendering it one of the most original, thorough, and comprehensive religious periodicals of the day.

In typographical appearance THE METHODIST is unrivalled, being printed on good paper, with the best of ink, from the clearest of type.

It has a valuable Correspondence, both Domestic and Foreign; a fresh Story every week for the Children; a Financial, Commercial, Mercantile, and Agricultural Department; a *valuable* Religious and Secular News Summary brought up to the hour of going to press.

Altogether, as a Religious and literary Weekly Newspaper, THE METHODIST has been pronounced, by disinterested judges, to be without a superior in point of talent, beauty, and punctuality. Its visits to any family will pay back its price, to every careful reader, a hundred fold.

Terms to Mail Subscribers, Two Dollars and Fifty Cents per Year, in Advance; to all Ministers, for their own Subscription, Two Dollars.

Postage prepaid at the Post-office where received, Twenty Cents per year. Twenty Cents must be added by Canada subscribers, to prepay postage. Fifty Cents additional if served by Carrier in New York City.

Any one sending THREE SUBSCRIBERS and \$7.50, will receive a Fourth copy free for one year.

Subscriptions received at any time during the year.

Liberal Premiums and Commissions to persons getting up Clubs. Send for Premium Circular.

Specimen copies sent free on application.

Address

THE METHODIST,

114 Nassau Street,

New York.

For Sale, (pea-combed).
B. F. HOLBROOK, Natick, Mass.

A. N. WOOD & CO., EATON, MADISON CO., N. Y., Manufacturers of their Celebrated PORTABLE ENGINES,

For Farm and Mechanical purposes. They are particularly adapted to driving Thrashing Machines, Circular Saws, Mills of all kinds, Printing Presses, Wood or Iron Lathes, Machinery in Cabinet or Wagon Shops, Boring Artesian Wells, Pumping Water, Corn Shellers, &c., &c.

They are mounted either on leas, like the above cut, for stationary use, or on wheels, with a pole, ready for attachment to a team for moving from place to place.

Mr. W. N. Peck, of Rushville, Yates Co., N. Y., says in the Country Gentleman of Aug. 20th, 1867: "By the way, we are thrashing by steam, using a six-horse portable engine. It works to a charm, just the thing to do a nice job; it does the work of ten horses on a sweep power, and very much better."

The American Agriculturist, in editorial notes, on page 317, Sept. number, 1867, says: "STEAM THRASHERS are a prominent feature in Western husbandry. The horse thrashers are still in use, but are as certainly doomed as the scythe or the hand rake. They are altogether too slow for this age. The steam thrasher is mounted upon wheels, and is drawn by horses from place to place, as it is wanted. The great advantage of the steam thrasher is that it puts the wheat harvest so much into the power of the farmer. As a rule, wheat stands in the shock until it is thrashed, and the first good weather is availed of to clean the crop, and send it to market."

The Manufacturers take pleasure in referring to the following parties, some of whom have used their Portable Engines for years:

Wm. Porter & Son, 271 Pearl-st., New-York.
R. B. Osborne, Poughkeepsie, N. Y.
P. M. Biegen, Dobbs Ferry, N. Y.

Stereopticons and Magic Lanterns,

With the Improved Lime Light, illuminating brilliantly two hundred square feet of canvas, and magnifying the views to that size, at an expense of less than one dollar for a whole evening's exhibition. Easily managed and pays well.

Illustrated price catalogue of the apparatus, with list of over two thousand artistically colored photographic views on glass, of the War, Scripture History, Choice Statuary, etc., etc., forwarded on application. T. H. McALLISTER, Optician, (of late firm of McAllister & Bro., Phila.,) 49 Nassau-st., New York.

A DESIRABLE COMPANION with a good temper and perfection in every point, and will stick by you through thick and thin—MME. DEMOREST'S DIAMOND NEEDLES.

The Iona and Israella Grapes.

ARE THEY HARDY, HEALTHY,
EARLY, and PRODUCTIVE?

(Their claim for quality has nearly ceased to be a question.)

At the great meeting held at North-east Pa., Aug. 28, consisting of about 300 members, coming from an extent of several hundreds of miles, but one only was present "with whom the Iona did not succeed." The general voice was emphatic in its favor in all points, and often where those reputed most hardy had partially or wholly failed. Secretary Champlin reported "50,000 in his vicinity, all very satisfactory." These reports I have very extensively verified by my own travels and personal observations through the principal vine regions the current season.

The coloring generally has already (Aug. 29th) demonstrated that even on young vines the ripening is as early as claimed, but the most interesting sight to all lovers of good grapes and pure wine, was Mr. Griffiths' vineyard of 10,000 Ionas, which, for evenness, sturdy vigor, perfect health and keeping, left nothing to be desired. His 2,000 Israellas were in no degree inferior.

Few, comparatively, have yet had opportunity to verify by their own eating the essential and radical difference which constitutes the distinctive excellence of the Iona for table and for wine, and separates it widely from all other native grapes.

Many thousands will have that opportunity this year, and will also learn that the pure juice of ripe Iona grapes, under the most simple treatment in every family, will afford pure refined wine that has no disposition to acetate fermentation, (souring), and that is vastly better than the Catawba has ever afforded under the most favorable circumstances.

I append three letters as specimens of reports from as widely different points as possible. (See Pamphlet accompanying Price List, for further statements.)

MADISON, Wisconsin, Aug. 28, 1867.

DR. C. W. GRANT,

DEAR SIR: The Iona grape has been growing here under different management three years. That the vines will grow and sustain the winters here does not admit of question. Mr. Ott, of this city, is fruiting a considerable number of vines this season, and both his vines and fruit are satisfactory in the highest degree. We are in latitude 43 degrees.

WM. BROOKS.

[EXTRACT.]

PULTENEY, N. Y., Aug. 28, 1867.

DR. C. W. GRANT,

DEAR SIR: My Israella grapes commenced to ripen on the 14th inst., Iona on the 17th, and Delaware, the 20th inst. The 5,000 No. 1 Iona purchased of you, and planted last spring (all taken from one house), are perfectly splendid, and the admiration of all who see them. They will prove a good standing advertisement of vines from your nursery. Many of them have already grown more than six feet high, with canes at the ground as large as my finger.

Yours truly,

D. S. WAGNER.

HARTFORD, Conn., Aug. 24, 1867.

C. W. GRANT, Esq.,

DEAR SIR: Not having reported to you this summer, I thought it might perhaps interest you to learn how the Iona and other grapes are doing with me.

The Iona has done better than any other variety. * * * The vines set in spring of 1865 are growing splendidly, and a majority of them have a fair crop of fruit, which seems to be entirely free from disease.

Some Iona grafted on Anna, now, the second year, have a good crop of fruit, and canes sixteen feet long and more than 1/2 inch in diameter.

In my oldest Iona vine (planted 1863), I am glad to notice one fact bearing out your promise, that "as the vines grow older they will ripen fruit earlier." It would now seem they will ripen with us at the same time as Delaware, Israella, Adirondac, and Hartford, began to color at the same time. Diana and Concord all got and fall off; we shall hardly have a good bunch of either. Some Iona, grafted upon Concord last winter, have made two canes each more than ten feet, and I fear I shall be obliged to treat all my Concord and Diana in the same way, to get any fruit from them. They are nothing but a disappointment. Delaware are as good as I expected, but the crop will be small.

Yours truly,

C. M. BEACH.

My stock of these kinds is very large and of surpassing quality. Prices for best vines for Garden or Vineyard as low as can be afforded, and my unequalled facilities and the result of past years warrant the belief that I can make more advantageous terms to buyers than can be done by any other propagator.

Price List with Pamphlet, containing "Present State of Grape Culture," and "Bateham's What Kinds to Plant?" etc., sent on application with stamp.

C. W. GRANT,

Iona, near Peekskill, Westchester Co., N. Y.

A large stock unsurpassed for quality, at the lowest rates for which good vines can be grown. Cheaper than inferior vines at no price.

All other varieties, equally well grown.

Send for Price Lists.

We shall be pleased to have parties call and examine stock.

HOLTON & ZUNDELL,

Haverstraw, Rockland Co., N. Y.

THE NEW GRAPE.

"SALEM."—THIS GRAPE IS THE MOST successful result of the Hybridizations originated and carried on by Mr. E. S. Rogers, of Salem, Massachusetts, whose well known character for probity and modesty of statement affords every guarantee for the unsurpassed excellence of this, his favorite variety. His published statement is as follows:

"The subscriber now offers for sale for the first time, a New Grape, named Salem from the place of its origin. This is a variety considered not only superior to any of the former well known numbers, but also to any hardy grape at present before the public, combining as nearly as possible every quality desired in an out-door grape, being one of the hardiest, healthiest and most vigorous of vines, and producing enormous crops of beautiful and high flavored fruit.

Like other well known kinds, Nos. 4 and 15, this is a hybrid between a native and the Black Hamburg; bunch large and compact, berry large as Hamburg, of a light chestnut or Catawba color, thin-skinned, perfectly free from hard pulp, very sweet and sprightly, with a most exquisite aromatic flavor, not equaled by any other out-door grape for wine or table; as early as Delaware or Hartford, having never failed to ripen its fruit, in the most unfavorable season, for the past six years.

Taking all its qualities into consideration, earliness, hardiness, and great vigor of vine, size and quality of fruit, it is pronounced by the best judges who have tried it, to have no equal among all the numerous varieties now before the public; and I can, with confidence, recommend it as the best of all my collection, and now offer it for the first time."

Salem, Feb., 1867. E. S. ROGERS, Salem, Mass.

Notice.—The subscriber would here state that he has disposed of his entire stock of vines and wood of the Salem Grape to J. L. WARRING, of "Amenia Vineyard," Amenia, Dutchess Co., N. Y., to whom all orders for the same must be hereafter addressed. E. S. ROGERS.

Salem, Mass., March 24, 1867.

In addition to the high merits of the "Salem," the undersigned is able to say, from personal experience and knowledge, that the claims put forth in favor of the Salem are in no respect exaggerated. During the present season it has made uniformly a most vigorous and healthy growth, and proved itself hardier and more productive than vines of most of the new and high priced varieties growing by its side and receiving equal care in culture, have been seriously affected. It is believed that, as a paying grape, especially for market purposes, the Salem is without a competitor among out-door varieties.

I take pleasure in announcing that, since purchasing the Salem Vine, I have disposed of my Vineyard and Propagating Establishment, including the entire stock of the Salem, to JAMES A. REQUA, Esq., who will hereafter carry on the business with every facility for its successful prosecution. Amenia, N. Y., August 21, 1867. J. L. WARRING.

Having purchased the above, and having secured the services of a most experienced and successful Propagator, with able assistants, I design to make the growing of vines for sale a specialty, and hope to furnish the public with a class of plants unsurpassed in quality, and in every instance warranted up to standard and true to name.

August 21, 1867.

JAMES A. REQUA,
Amenia, Dutchess County, N. Y.

One Thousand very extra DELAWARE LAYERS.

One Thousand very extra DIANA LAYERS.

Also a few well-grown GENUINE SALEM vines, propagated from stock bought of Mr. Rodgers by F. C. Brohm, before his sale to Miss Waring. Also, Iona, Delaware, and others. Send for Price List. R. P. KENDIG,
Waterloo, Seneca Co., N. Y.

J. W. CONE & CO.,

Vineland, N. J., offer for Sale

709,000 CONCORD,

40,000 HARTFORD PROLIFIC,

15,000 CLINTON,

3,000 IVES' SEEDLING

GRAPE VINES.

And a large stock of CLARKE RASPBERRY plants.

Price List sent free.

1867. To Nurserymen and Grape Growers. 1868.

RICHARDSON & BELLOW, (successors to Moore & Richardson,) Geneva, N. Y., offer for sale a large stock of Dwarf Pear Trees, Plum and Cherry Seedlings and Grape Vines. Send for Price List.

TO GRAPE VINE PURCHASERS!—Grape Vines only propagated! At the celebrated "Mace Grape Vine Nurseries," immediately adjoining the Gardens of Charles Downing, Esq., Newburgh, N. Y. Knowing that good vines will always sell, we have propagated according to our capacity, not for large quantities but for good quality. Having had a good propagation this season, we therefore particularly invite an examination and comparison of our stock before purchasing, consisting of all the known varieties, all of which will be sold low. For Circulars and Price List address JOHN W. HANMORE, Box 81, Newburgh, N. Y.

GRAPE WOOD.—We offer for sale from 3 to 5 million Concord, and 300,000 Ives' Seedling vines.

J. W. CONE & CO.,

Vineland, N. J.

Would call the attention of Dealers and Planters to his extensive stock of Grape Vines, and especially to the

CONCORD AND IONA.

Our Concord vines this year are pronounced by those who have examined them to be far superior to those ordinarily grown, and we challenge comparison with any other reliable establishment, both in price and excellence of plants.

By our system of growing, and in our soil, the roots of the vines attain the highest point of perfection, and it is to this in particular that we would direct the attention of purchasers and planters.

PRICE OF CONCORD VINES.

1st Class, 25 c. each; \$2.00 per doz.; \$6.00 per 50; \$10 per 100; \$75 per 1,000; \$700 per 10,000.

Our stock of IONA vines is also of the highest excellence, and will compare favorably with that of any other grower.

This excellent variety is fast gaining a reputation which promises to supersede all others. No person setting out a vineyard should fail to plant it extensively. The reports which we hear this year from nearly all parts of the country are of the most favorable character. We can furnish vines of this variety in any quantity, by the single vine or 10,000, at as low rates as equally good plants can be obtained from any reliable grower. We warrant all our plants true to name, and of the quality stated.

Of all the other leading varieties we have a well selected stock, which we offer at the lowest rates, for which we refer to our Price List. We would here only mention a beautiful lot of Hartford Prolific, which is undoubtedly the most reliable and profitable early market grape which we have.

Also a very superior lot of Diana vines, both 1 & 2 years old.

CLINTON VINES.—Of this excellent and profitable wine grape we have a choice lot of plants. Price: 1st Class, 25c. each; \$2.00 per doz.; \$6 per 50; \$8 per 100; \$65 per 1,000; \$600 per 10,000.

For further information send for Price List, and address

G. E. MEISSNER, Richmond P. O., Staten Island, N. Y.

Mead's American Grape Culture, AND WINE-MAKING.

Extract from Secretary Bateham's Review.

"I have commended it highly on its general merits, and also on very important special merits entirely its own. I have heard a number of our most experienced grape-growers speak of the work in terms of very high praise, all concurring in the opinion that it is by far the best work on the subject that has yet appeared. The very clear and independent manner in which he treats the subject of varieties of grapes, defining which are really good, bad, or indifferent, and the reasons why they are one or the other, is one of the most timely features of the book, and will be the saving of thousands of dollars to planters. No other author has given half so much sound information in regard to varieties in so little space as Mr. Mead. Indeed, on all points he is rich in information, and there are single chapters that many will find worth the price of the book. The questions as to the 'Morality' and 'Profits' of grape-culture and wine-making must be met and answered by every one who engages in it as a business, and Mr. Mead gives the result of his examination of them."

The book is a very handsome octavo volume, of nearly 500 pages, and nearly 200 most life-like engravings. It is suitable for parlor or library, and interesting for family or student, and is essentially new in manner and matter.

PRICE \$3.00.

I fully concur in Mr. Bateham's high opinion of it, and have made arrangements with Messrs. Harpers, the publishers, by which I can furnish it to Clubs at very liberal rates, and also to single subscribers by mail, where there are no Bookstores.

C. W. GRANT,

Iona, near Peekskill, Westchester Co., N. Y.

Grape Vines & Small Fruits.

Delawares, 1 and 2 years old,	\$10, \$15, \$25	per hundred.

All for the price of \$1.00. Send stamp for specimen copy and Circular, with list of splendid Premiums to Agents. Address
N. P. BOYER & CO., Ginn Tree, Chester Co., Pa.

BEAR IN MIND

That on receipt of the advertised price, I will mail to your address any Book, Magazine, or cheap publication that may be advertised or issued by any respectable publisher in the United States. A Catalogue will be sent on receipt of a postage stamp. Address O. A. ROORBACH, 122 Nassau-st., New York.

Just Published
A NEW WORK ON APPLES.

AMERICAN POMOLOGY.

APPLES.

By Doct. JOHN A. WARDER,

PRESIDENT OHIO POMOLOGICAL SOCIETY; VICE-PRESIDENT
 AMERICAN POMOLOGICAL SOCIETY, ETC.

293 Illustrations.

To pomologists a work by Dr. Warder will need no commendation. Though a citizen of Ohio, he is so sure to be at any pomological gathering, be it East or West, that the whole country claims him, and if any one has a right to entitle his work *American Pomology* it is certainly Dr. Warder. The present is the first instalment of a work intended to cover the whole ground. In it the author has attempted the difficult task of bringing apples into something like order.

This volume has about 750 pages, the first 375 of which are devoted to the discussion of the general subjects of propagation, nursery culture, selection and planting, cultivation of orchards, care of fruit, insects, and the like; the remainder is occupied with descriptions of apples. With the richness of material at hand, the trouble was to decide what to leave out. It will be found that while the old and standard varieties are not neglected, the new and promising sorts, especially those of the South and West, have prominence. A list of selections for different localities by eminent orchardists is a valuable portion of the volume, while the Analytical Index or *Catalogue Raisonné*, as the French would say, is the most extended American fruit list ever published, and gives evidence of a fearful amount of labor.

This differs from any fruit book heretofore published in this country, in its complete classification of apples. The author gives the principal European systems and modestly puts forth his own to be tested by practice. He divides apples into four classes, according to their forms. Each of these classes is sub-divided by other obvious characters, and it would seem that any apple described in the book might be easily identified. We trust that this will prove a great help to the pomologist.

Fruit-growers will welcome this book as a valuable and long-wished for addition to pomological literature, and it will be found equally useful to the novice and the experienced orchardist. The work has 293 illustrations, is printed on good paper and well bound.

A NEW WORK.
GARDENING FOR PROFIT,

IN THE MARKET AND FAMILY GARDEN.

BY PETER HENDERSON.

Illustrated.

This is the first work on Market Gardening ever published in this country. Its author is well known as a market gardener of eighteen years' successful experience. In this work he has recorded this experience, and given without reservation the methods necessary to the profitable culture of the commercial or

MARKET GARDEN.

It is a work for which there has long been a demand, and one which will commend itself, not only to those who grow vegetables for sale, but to the cultivator of the

FAMILY GARDEN

To whom it presents methods quite different from the old ones generally practiced. It is an

ORIGINAL AND PURELY AMERICAN

work, and not made up, as books on gardening too often are, by quotations from foreign authors.

Everything is made perfectly plain, and the subject treated in all its details, from the selection of the soil to preparing the products for market. Frames, Hot-beds, and Forcing Houses, the management of which is usually so troublesome to the novice, are fully described, and the conditions of success and causes of failure clearly stated.

The success of the market gardeners near New York City is proverbial, and this is the only work that sets forth the means by which this success has been attained. Valuable hints are given to those who would raise Vegetables at the South for northern markets.

The following synopsis of its contents will show the scope of the work:

Men Fitted for the Business of Gardening.
The Amount of Capital Required and Working Force per Acre.
Profits of Market Gardening.
Location, Situation, and Laying Out.
Soils, Drainage, and Preparation.
Manures. Implements.
Uses and Management of Cold Frames.
Formation and Management of Hot-beds
Forcing Pits or Green-houses.
Seeds and Seed Raising.
How, When, and Where to Sow Seeds.
Transplanting. Insects.
Packing of Vegetables for Shipping.
Preservation of Vegetables in Winter.
Vegetables, their Varieties and Cultivation.

PEAT! PEAT! PEAT!

FUEL—MANURE.

WHERE TO FIND IT.

HOW TO MAKE AND USE IT.

ITS VALUE.

A NEW WORK ON PEAT,

THOROUGH AND PRACTICAL;

By PROF. SAMUEL W. JOHNSON, of Yale College.

It gives a full history of **PEAT, MUCK, etc.**, telling what they are, where found, and how to estimate their value.

It describes the various methods of using Peat for manure, as an absorbent, as an ameliorator of the soil, etc. and it is especially explicit in regard to the

USE OF PEAT AS FUEL,

describing minutely the various processes employed in preparing it to burn, from the simplest to the most complicated; such as are in use in this country, and Europe. It is illustrated with many Engravings of machines, etc.

The work is invaluable to those having Peat or Muck swamps, or wishing to invest in Peat Companies.

The Miniature Fruit Garden,

OR THE CULTURE OF

Pyramidal and Bush Fruit Trees.

BY THOMAS RIVERS.

Nothing is more gratifying than the cultivation of dwarf fruit trees, and this work tells how to do it successfully.

Dwarf Apples and Pears

are beautiful ornaments, besides being useful in giving abundant crops of fruit; they can be grown in

Small Gardens and City Yards,

and be readily removed. The work also gives the manner of training upon walls and trellises.

Root Pruning

is fully explained, and methods of protection from frosts are given.

Dwarf Cherries and Plums

are treated of as are other dwarf trees. Directions are also given for growing

Figs and Filberts.

This little work is full of suggestions to the cultivator, and like all the writings of its venerable author, bears the marks of long experience in the practice of fruit growing.

SENT POST-PAID. — — — PRICE, \$1.00

ORANGE JUDD & CO., Publishers.

My Vineyard at Lakeview;

Or, Successful Grape Culture.

To any one who wishes to grow grapes, whether a single vine or a vineyard, this book is full of valuable teachings. The author gives not only his success, but what is of quite as much importance, his failure. It tells just what the beginner in grape culture wishes to know, with the charm that always attends the relation of personal experience.

It is especially valuable as giving an account of the processes actually followed in

Celebrated Grape Regions

in Western New York and on the shores and islands of Lake Erie.

This book is noticed by a writer in the Horticulturist for August last as follows: "Two works very different in character and value have just been published and seem to demand a passing notice. The better and less pretentious of the two is 'My Vineyard at Lakeview,' a charming little book that professes to give the actual experience of a western grape grower, detailing not only his successes, but his blunders and failures. It is written in a pleasant style, without any attempt at display, and contains much advice that will prove useful to a beginner—the more useful, because derived from the experience of a man who had no leisure for fanciful experiments, but has been obliged to make his vineyard support himself and his family."

SENT POST-PAID. — — — PRICE \$1.50.

Quinby's Bee Keeping.

By M. QUINBY, Practical Bee-keeper. Fully Illustrated. Entirely new. The result of 35 years' of successful experience—with directions for all contingencies that can ordinarily occur; treating of Breeding, Movable-Comb and other Hives, Pasturage, Robbing, Feeding, Swarming, Queens, Diseases, Anger, Enemies, Wax, Transferring, Sagacity, Wintering, Care of Honey, Italian Bees, Purchasing, etc. Bee-keepers will find this new work of Mr. Quinby's fully up to the times in all practical matter.

Sent Post-paid.

Price \$1.50.

Gathering Opinions of the Press.

From the Christian Intelligencer.

"Quinby's Work is the very best. It has long been regarded as of the highest authority in the matters concerning which it treats."

From Moore's Rural New Yorker.

"This is a newly written and illustrated edition of Mr. Q.'s former work. That has proved of value to thousands of Bee-keepers, and this, with its riper experience and added knowledge, can not fail of giving better satisfaction. Thirty-five years experience!—What beginner in bee-keeping will not bring this to his aid? We notice the author has no Patent Hive to introduce, and expresses his opinions freely on the merits and demerits of the various hives seeking popular favor."

From the Vermont Farmer.

"The book is written in familiar style, with the endeavor to be practical rather than scientific, thereby making it a guide to the tyro in Apian knowledge, as well as a standard work of reference for the more experienced bee-keepers."

From the N. Y. Christian Advocate.

"All bee-keepers should have this manual, and others may read it as a book of wonders."

SENT POST-PAID.

PRICE \$1.50.

THE AMERICAN AGRICULTURAL ANNUAL for 1867.

A New Year-Book,

CONTAINING

AN ALMANAC,

Hints About Work for Each Month,

Recent Progress in Agriculture, and

A Review of the Past Year, together with numerous very valuable contributed articles, and convenient Tables.

The **Essay on Draining**, by Col. Waring, Engineer of the Drainage of the N. Y. Central Park, is by far the most complete presentation of the subject which has been made for many years in this country.

Some of the Newest and Best Potatoes, with his own mode of culture, are described by one of the most successful cultivators of Westchester County, N. Y., Wm. S. Carpenter.

The Culture of Sorghum, with the latest views in regard to the production of Syrup and Sugar, is discussed by Wm. Clough, Esq., Editor of the Sorgho Journal.

How to Train the Horse.—Mr. Headley's Hints on Training and his Views in regard to his Mind and Temper deserve the attention of every horse owner.

The Culture of Wheat, is discussed practically and philosophically, by Mr. Harris.

John Johnston's Practice in Fattening Sheep, like every thing from his ripe experience, is very valuable.

Essential Features of a Good Barn.—Dr. F. M. Hexamer consults durability in the structure and economy in farm labor, security of crops, health and comfort of stock, in this admirable plan.

The above are but a few of the articles comprised in this little volume—and which make it not only

A Record of Past Progress and Experience—but

A Hand-Book for the Present—and

A Guide for the Future.

This volume is the first of a series which we expect to issue annually, intending to make them a record of what happens each year best worth knowing and remembering, pertaining to Agriculture, in a convenient form for preservation and reference.

Price, fancy paper covers, 50 cts.; cloth, 75 cents.

THE AMERICAN HORTICULTURAL ANNUAL for 1867.

A Year-Book for the Gardener, The Fruit Grower and the Amateur.

NOW READY.

This is the first of a series of Annuals intended to give a record of Horticultural progress.

IT CONTAINS

An Almanac and Calendar for each MONTH, giving Hints for Work in the various departments.

Useful Tables, giving amount of Seed to sow a given space; number of Seeds to the ounce, etc.

How Horseradish is Grown for Market, by Peter Henderson. An article worth the price of the work to the grower for market.

Growing Grape Vines from Cuttings without Artificial Heat, by a simple process.

Home Decorations, IVY, HANGING BASKETS, etc. Instructions for the making, planting and management of these beautiful ornaments by A. Bridgeman.

The New Apples of 1866.—The new varieties first brought to notice the past year; as also Southern kinds first fruited at the North, by Doct. J. A. Warder.

New or Noteworthy Pears.—A valuable article, by P. Barry.

Native Grapes in 1866, from Notes furnished by Charles Downing, Geo. W. Campbell, J. A. Warder, A. S. Fuller, and other grape growers.

Small Fruits in 1866.—Accounts of new varieties and older ones not yet fully tested. By A. S. Fuller.

The Newer Garden Vegetables.—The result of experiments with new culinary plants, by Fearing Burr, Jr., J. J. H. Gregory, and others.

The Rarer Evergreens that have proved Valuable.—By Thomas Meehan.

The New Roses in 1866.—Brief descriptions of the novelties, by John Saul.

New Bedding and other Plants of 1866.—An account of how the recent importations have done the past year, by Peter Henderson.

The New Varieties of Gladiolus.—All the new ones noticed, by George Such.

Engravings of Fruits, Flowers, etc.—A useful list of those published in 1866.

Horticultural Books and Periodicals in 1866.—A list giving title, publishers name and price.

Nurserymen, Seedsmen and Florists.—A list of the most prominent Establishments.

With many other articles not here enumerated.

Fully Illustrated,

with Engravings made especially for the work.

A neat volume of 150 pages. Price, fancy paper covers, 50 cents; cloth, 75 cents. Sent Post-paid.

COPELAND'S COUNTRY LIFE.

A Compendium

OF

Agricultural & Horticultural
Practical Knowledge.

Embracing Descriptions, Hints, Suggestions and Details of great value to every one interested in Fruit, Flowers, Vegetables, or Farm Crops. It contains **926 large Octavo Pages, and 250 Engravings.** Describing and Illustrating nearly the whole range of topics of interest to the FARMER, the GARDENER, the FRUIT CULTURIST, and the AMATEUR.

It is adapted not only to those owning large and Elegant Estates, but contains directions for the best arrangement of the smallest Plots, down to the *City Yard*, the *Roof* or *Window Garden*, or the simple *Flower Stand*. It also gives an abstract of the Principles, Construction and Management of *AQUARIUMS*. Among numerous other matters it treats of

Draining. Giving best methods, estimates of cost, trenches, tiles, etc., thus enabling almost any one properly to perform this important work.

Cattle are carefully noticed with reference to the special merits of different breeds for dairying or fattening.

Sheep Management, including Breeding, Feeding, Prices, Profits, etc., receives attention, and a very full treatise on the Merinos is given.

Grape Culture occupies a large space, embracing the opinions of men in all parts of the country, as to best sorts, planting, training, diseases, and general management for home use or marketing.

Full Lists of Ornamental Trees and Shrubs, Fruits, Flowers, Green and Hot-house Plants, etc., are given, with directions for management each month in the year.

The Kitchen Garden receives particular attention, with reference to the best way to grow and preserve each kind of Vegetable.

In short, as its name indicates, the book *treats of almost every subject that needs consideration by those living in the country, or having anything to do with the cultivation of the soil.*

SENT POST-PAID. PRICE \$5.00.

ORANGE JUDD & CO.,
245 Broadway and 41 Park Row, N. Y.

New Book of Flowers.

By JOSEPH BRECK, Practical Horticulturist.

Beautifully Illustrated.

This work, while preserving scientific accuracy, is written in a familiar style, and with the enthusiasm of a life-long lover of flowers. Its teachings are eminently practical, and cover all branches of out of door gardening.

Bulbs.

The cultivation of bulbs, whether in-doors or in the open ground, is clearly described, and such instructions are given as will insure success with these favorite plants.

Annuals.

All the finer annuals are described, and the peculiar treatment necessary for each given in full.

Herbaceous Perennials.

This justly favorite class of plants is given here more at length than in any work with which we are acquainted.

Bedding Plants.

The treatment of the popular kinds of bedding plants is given, together with that of Dahlias, Chrysanthemums and such as usually fall under the head of florist's flowers.

Flowering Shrubs.

A separate section is devoted to the hardy flowering shrubs, including a very full chapter upon the

Rose.

We have no work which is so safe a guide to the novice in gardening, or that imparts the necessary information in a style so free from technicalities. Not the least interesting part of the work is the author's personal experience, as he tells not only how he succeeded, but the mistakes he committed. Thus far it is

"The Book of Flowers."

SENT POST-PAID. PRICE, \$1.75.

ORANGE JUDD & CO., Publishers.**WARDER'S
Hedges and Evergreens.**

This is the only book wholly devoted to the cultivation, pruning, and management of plants suitable for American hedges, especially the *Maclura*, or *OSAGE ORANGE*; illustrated with engravings of plants, implements, and processes; to which is added a *Treatise on Evergreens*, their varieties, propagation, culture, etc. By J. A. WARDER. 12mo, 291 pp. SENT POST-PAID. PRICE \$1.50.

ORANGE JUDD & CO., Publishers.**BUIST'S
American Flower-Garden Directory.**

Containing Practical Directions for the Culture of Plants in the Flower-Garden, Hot-House, Green-House, Rooms or Parlor-Windows, FOR EVERY MONTH IN THE YEAR, with descriptions of most desirable plants, soils, transplanting, erecting a Hot-House, a Green-House, laying out a Flower-Garden, etc., etc. By ROBERT BUIST, a practical Nurseryman and Seed-Grower of Philadelphia. Cloth, 12mo. SENT POST-PAID. PRICE \$1.50.

ORANGE JUDD & CO., Publishers.**BOMMER'S
Method of Manure Making.
COMPLETE AND CLEAR IN ITS DIRECTIONS.**

Carries Conviction of its usefulness, and the correctness of its principles

GIVES GREAT SATISFACTION.

Abundance of Good Manure depends simply upon systematic and well applied labor.

THE
**GREAT AMERICAN
TEA COMPANY**
HAVE JUST RECEIVED
**TWO FULL CARGOES
OF THE
FINEST CROP OF TEAS.**

22,000 HALF CHESTS by ship *Golden State*.
12,000 HALF CHESTS by ship *George Shotton*.

In addition to these large cargoes of Black and Japan Teas, the Company are constantly receiving large invoices of the finest quality of Green Teas from the Moyunc districts of China, which are unrivaled for fineness and delicacy of flavor, which they are selling at the following prices:

OOLONG (Black), 50c., 60c., 70c., 80c., 90c., best \$1 1/2 lb.
MIXED, (Green and Black), 50c., 60c., 70c., 80c., 90c., best \$1 per pound.
ENGLISH BREAKFAST (Black), 50c., 60c., 70c., 80c., 90c., \$1, \$1.10, best \$1.20 per pound.
IMPERIAL (Green), 50c., 60c., 70c., 80c., 90c., \$1, \$1.10, best \$1.25 per pound.
YOUNG HYSON (Green), 50c., 60c., 70c., 80c., 90c., \$1, \$1.10, best \$1.25 per pound.
UNCOLORED JAPAN, 90c., \$1, \$1.10, best \$1.25 per pound.
GUNPOWDER, (Green), \$1.25, best \$1.50 per pound.

COFFEES ROASTED AND GROUND DAILY.

GROUND COFFEE, 20c., 25c., 30c., 35c., best 40c. per pound.
Hotels, Saloons, Boarding-house keepers, and Families who use large quantities of Coffee, can economize in that article by using our **FRENCH BREAKFAST AND DINNER COFFEE**, which we sell at the low price of 30c. per pound, and warrant to give perfect satisfaction.

Consumers can save from 50 cents to \$1 per pound (beside the Express charges,) by purchasing their Teas of the

GREAT AMERICAN TEA COMPANY,
Nos. 31 and 33 VESEY STREET.
Post Office Box, 5643, New York City.

We warrant all the goods we sell to give entire satisfaction. If they are not satisfactory, they can be returned at our expense within 30 days, and have the money refunded.

By our system of supplying Clubs throughout the country, consumers in all parts of the United States can receive their Teas at the same price (with the small additional expense of transportation), as though they bought them at our warehouses in this city.

Some parties inquire of us how they shall proceed to get up a club. The answer is simply this: Let each person wishing to join in a club, say how much tea or coffee he wants, and select the kind and price from our Price List, as published in the paper or in our circulars. Write the names, kinds, and amounts plainly on a list, and when the club is complete, send it to us by mail, and we will put each party's goods in separate packages, and mark the name upon them, with the cost, so there need be no confusion in their distribution—each party getting exactly what he orders, and no more. The cost of transportation, the members of the club can divide equitably among themselves.

The funds to pay for the goods ordered can be sent by drafts on New York, by Post-Office money orders, or by Express, as may suit the convenience of the club. Or, if the amount ordered exceeds \$30, we will, if desired, send the goods by Express, to "collect on delivery."

Hereafter we will send a complimentary package to the party getting up the Club. Our profits are small, but we will be as liberal as we can afford. We send no complimentary package for a Club less than \$30.

N. B.—All villages and towns where a large number reside, by Clubbing together, can reduce the cost of their Teas and Coffees about one-third (beside the Express charges,) by sending directly to "The Great American Tea Company."

BEWARE of all concerns that advertise themselves as branches of our Establishment, or copy our name either wholly or in part, as they are *bogus* or *imitations*. We have no branches, and do not, in any case, authorize the use of our name.

Post-Office orders and Drafts, make payable to the order of "Great American Tea Company." Direct letters and orders to this

GREAT AMERICAN TEA COM'Y,
Nos. 31 and 33 VESEY-ST.,
Post-Office Box, 5,643, New York City.

EVERY FARMER SHOULD HAVE A

STANDARD SCALE.

These Scales have been manufactured by the *Original Inventors* for nearly 40 years, and are regarded throughout the country as the *Standard*; they were referred to as such by the Judges at the

Great Paris Exposition,
who awarded to them the
First Premiums, Two Medals.
Nearly two hundred different modifications, adapted to every branch of business. Among which are:

For weighing loaded wagons, carts, live stock, produce, &c. These Scales may be placed in the barn floor, in the yard, or by the roadside, where they can be made available for an entire neighborhood.

Portable Platform Scales,

With and Without Wheels.

Convenient, accurate, and not liable to derangement.					
No. 7.....Platform, 23 by 30 inches.....Capacity, 2,000 lbs.					
No. 8....." 23 by 31 "....." 1,600 "					
No. 9....." 21 by 25 "....." 1,400 "					
No. 10....." 20 by 28 "....." 1,300 "					
No. 10 1/2....." 17 by 26 "....." 900 "					
No. 11....." 16 by 25 "....." 600 "					
No. 11 1/2....." 15 by 21 "....." 400 "					

Union or Family Scales.

We invite special attention to this modification as being particularly adapted to household use. This fact, and its acknowledged accuracy, led to its adoption as one of the premiums offered by the *American Agriculturist*.

Pamphlets with illustrations and full descriptions of the various modifications of our Scales, furnished upon application by mail or otherwise.

PRINCIPAL WAREHOUSES:

FAIRBANKS, MORSE & CO., 225 Walnut-st., Cincinnati, O.
FAIRBANKS & EWING, Masonic Hall, Philadelphia, Pa.

GRAPE VINES at IONA.

My stock comprises all of the leading kinds, but principally consists of

IONA, ISRAELLA and DELAWARE.

The performance of the Iona and Israella generally throughout all of the vine-region of the country, leaves no doubt in the minds of those best informed, that upon these now rests chiefly the prospect of the eminent success of grape culture in America for table and for wine.

The proof of the hardiness, vigor, earliness, and productiveness of the Iona, and of its adaptation to general cultivation throughout the whole grape region is most abundant.

See these proofs and other matters in advertisement inside page (381).

C. W. GRANT,

**IONA, near Peekskill,
Westchester Co., N. Y.**

PERRY'S GRAPE VINES

are worthy of every Planter's and Dealer's particular attention. By the use of my improved in rooting and transplanting vines to the open ground without in the least checking their growth, or disturbing the roots or soil in which they are growing, I am enabled to keep far ahead of all others in the production of vines best suited for future vigorous growth and productiveness.

WEST BOYLSTON, Mass., Sept. 2, 1867.
MR. F. L. PERRY, Dear Sir:—I see by the last *Agriculturist* that you quote a sentence from my letter of April, in favor of your vines sent me last spring. Had I written you at any time since the vines commenced growing, I should have felt justified in giving my views of them in much stronger and emphatic praise.

My vines have grown splendidly. All but the Allens have grown from eight to twelve feet, with large strong canes, and fine strong laterals.

I shall be disappointed if I do not get fruit from nearly all next year. The Allen has grown only two feet, and all of that during the past month. Mine is a light, gravelly soil, and I am entirely satisfied with the progress my vines have made.

Please send me Illustrated Catalogue as I wish a few more vines and Pear Trees.

I am very truly yours, **HORATIO HOUGHTON.**
Prices from 5 to 20 per cent. lower than any advertised in this paper. Sent on application. Can furnish *fine Trees* of Pears, standard and dwarf, Cherries, Plums, Peaches, Quinces, and small fruits. Climb furnished at liberal rates. Illustrated and Descriptive Catalogue 10 cents. See advertisement last month, page 344.

Address **F. L. PERRY, Canandaigua, N. Y.**

HEALTH AND ECONOMY.

PATENT LEAD ENCASED TIN PIPE.
Recommended by the medical faculty and approved by **WATER COMMISSIONERS.** COSTS LESS THAN LEAD PIPE, AND IS MUCH STRONGER. Recent improvements enable us to supply THIS pipe at a less price per foot than common lead pipe.

To furnish the cost per foot, please give the head or pressure of water and bore of pipe. Pamphlets sent free on application. Address **THE COLWELLS, SHAW & WILLARD MANUFACTURING CO.,** Foot of West 27th-st., New York.

CRESYLIC SOAP.

A PERFECT DISINFECTANT
(Patented).

For Disinfecting, Deodorizing, and Purifying Cellars, Hospitals, Tenement Houses, &c. Also, for Exterminating Roaches, Bugs, and Insects of all kinds.

Manufactured solely by **JAMES BUCHAN & CO.,**
190 Elizabeth-st., New York.

Fuller & Barnum's New Tuck Creaser

AND SELF GUIDE AND BASTER COMBINED.

This grandest of all improvements is by **I. W. Fuller**, the original inventor of all Tuckers. While sewing a tuck, at each stitch, two fingers "pinch up" a crease for the next tuck, the same as by hand, (instead of straining the cloth over a SHARP POINT, by a "NOTCH," as heretofore) and CAN NOT CUT or STRAIN any kind of goods. The light spring of the Self Guide and Baster smooths the cloth, holding it together without basting, and aids in guiding. No measuring or marking. Time saved, and amount of tucking increased from TWO to THREE TIMES. Sold at most of the Sewing Machine offices, and for all machines at the Gen. Office, 613 Broadway, N. W. cor. of Bleeker, N. Y., where all the Sewing Machines are sold. With cut and directions, \$1; by mail, \$1.50.

I. W. BARNUM,
Sole Agent for supplying the trade.

MARYLAND LANDS.—Cheap and Near to Market. Good Chances for Men OF ENERGY.—Persons wishing to purchase should send for full particulars to **SIMON J. MARTENET,**
R. E. Agent, Publishers of Map of Maryland,
6 South-st., Baltimore.

"THE SONG QUEEN,"

A NEW BOOK FOR SINGING SCHOOLS.
Bound in board covers, 75 cents each, or \$7.50 per dozen; stiff paper covers, 50 cents each, or \$5 per doz. Address **H. R. PALMER,** Crosby's Opera House, Chicago, Ill.

STAMMERING CURED

By **BATES' PATENT APPLIANCES.** For Pamphlets, &c. address **SIMPSON & CO.,** 277 West 23d-st., New York.

AMERICAN AGRICULTURIST

FOR THE

Farm, Garden, and Household.

"AGRICULTURE IS THE MOST HEALTHFUL, MOST USEFUL, AND MOST NOBLE EMPLOYMENT OF MAN."—WASHINGTON.

ORANGE JUDD & CO.,
PUBLISHERS AND PROPRIETORS.
Office, 245 BROADWAY.

ESTABLISHED IN 1842.
Published also in German at \$1.50 a Year.

{ \$1.50 PER ANNUM, IN ADVANCE.
SINGLE NUMBER, 15 CENTS.
4 Copies for \$5; 10 for \$12; 20 or more, \$1 each.

VOLUME XXVI—No. 11.

NEW-YORK, NOVEMBER, 1867.

NEW SERIES—No. 250.

[COPYRIGHT SECURED.]

THREE MEMBERS OF THE TEMPERANCE SOCIETY.—FROM A PAINTING BY J. F. HERRING.—Engraved for the American Agriculturist.

We are sure Mr. Herring appreciated water in its clear, cool purity, in its invigorating freshness, in its health-giving, joy-giving, life-giving freeness, in its abundance, showered upon us as one of Heaven's richest boons, welling up from subterranean depths; making glad the pastures, satisfying the cattle, reviving the faint, refreshing the weary.—The group of heads before us is a beautiful conception, and the picture repays study from different points of view. The artist's name for his production is the same which we have given it above, and in this age of excess and whiskey frauds we may well ponder upon the superiority of this natural beverage to all others, and perhaps join the horses in a draught. The characters exhibited

by the three animals are very different. The nearest drank his sip from habit, was not thirsty, and is a little cross. The next has filled himself to satiety and enjoys it to the full; while the later comer, in the earnestness of thirst, is pumping the big draughts down his throat with a real gusto. We see in the first horse a hypochondriac who has joined the temperance society, partly to get some good if he can, partly to have society, and to be able to talk, to carp and criticise. He bears about him the marks of former years of excess. The middle one portrays the member who never committed an excess in his life, and never will. He is a member of the society by nature, genial, honest, good, strong in the right, and by precept and

example wishes to keep others so. Black Hawk is Young America on the right track, now wildly enthusiastic as a temperance reformer, as he was gay among the clicking glasses. He goes in for water on his own account and on everybody's else, and withal is just as good, honest, and exemplary as his friend by his side. Our friends will agree with us that the above is a successful reproduction of one of Herring's most admired pictures. There are many artists who can paint a horse's head with anatomical accuracy, but there are very few who, like Herring, can give the expression that indicates the character of the animal. Every lover of the horse can judge quite correctly of his disposition by looking at his face and eye.

AMERICAN AGRICULTURIST.

NEW-YORK, NOVEMBER, 1867.

There is a chilly sound in the word November, yet to Americans it is a cheerful month. We read Hood's lines, "No sun, no moon, no dawn, no noon," and so on, through his description of an English fog, to his conclusion, *No vember*, while we rejoice in the bland noons of our "Indian Summer," and in the mellow sunlight, dusky and softened by the thin smoke which veils the distant hills. The brown leaves are in windrows by the fences; the mornings are frosty, but bright and bracing, and the sunsets have that ruddy glow which promises other days as perfect as the one just passing. So the early part of the month goes by, giving time for all necessary labors before the days and nights are colder, and the plastic and crumbly soil becomes stone, and the storm clouds give us snow instead of showers, and the ringing of the skates, and the shouts of the skaters, come up from the ponds.

The labors and pleasures of the month are various, being in part a continuation of those of the past month, but chiefly those of that preparation for winter, which it is dangerous to postpone.

The harvests are gathered and secured. In part, no doubt, they are already marketed, and paid for. The country has been doing, of late years, much more a "cash business" than used to be the case, and it especially behooves producers promptly to check the tendency to any other course. "Short credits make long friends," and the payment on the spot for value received is better still.

The winter brings with it pleasures to those prepared for it, but suffering to the improvident, and to those who, from sickness or no fault of their own, are not provided to meet its rigors. If our hearts rise in thankfulness to the All-Father for His mercies to us, let our hands and hearts go out to His children, our brethren, who are likely to suffer. He trusts us with good things this year, and we should be the almoners of His bounty, good stewards, kind, tender, and judicious in sharing our surplus, if we would enter into the joy of our Lord, be more widely useful, and more trusted by Him in the future.

Hints About Work.

Buildings.—It is of prime importance that the fair weather of the early part of this month should be employed to put the farm buildings and their surroundings in good order for winter, and it is well to be a little ahead with such work. Go carefully over old buildings, tightening weather boards, renewing eaves-troughs and spouts. Clear surface ditches, to keep water out of the barn-yards, and away from the foundations. Roofs may be temporarily patched without much, if any, nailing, by simply driving shingles here and there between the courses to carry water over actual holes. Old roofs are often more damaged than benefited by mending, unless it is very thoroughly done. A little careless hammering and nail driving will split shingles and start nails, and open more holes than it closes.

Roads that are to be used during the winter must be put in order before frost; the stones picked off, gravel or earth put on where they have washed, good side drainage made,—on both sides, if possible,—the surface well rounded to turn water, and to make easy turn-offs for the wash that follows the wheel tracks down the hills.

Bridges.—If the rains and freshets have moved stones in the brooks and runs, and deposited an unusual amount of gravel anywhere, it will most likely be where they are contracted to pass through bridges or culverts. These should be carefully examined and cleaned out, for when ice forms, and an unusual flow of water comes, serious damage may result. It is more important that there should be a chance for water to flow off rapidly in passing and after passing a bridge, than that it should have easy access; a single stone will dam up a stream greatly.

Plowing.—Plow lands that will not be subject to wash. The more plowing is done in the fall, the more will the hurry of spring work be relieved,

and, as a general rule, the better will the land be prepared for the crops. Fall plowing kills weeds; it kills grubs; it exposes the soil to the action of the frost, and if manure be plowed in, which is best if the land is prepared for root crops or corn, it becomes better incorporated with the soil. Clay lands and heavy loams are especially benefited by fall plowing; the action of the frost, or rather thawing and freezing, benefits such land as much as many loads of manure. Plow such land in ridges, turning two furrows together. Good loamy soils may be plowed with flat or lap furrows. We prefer the former, and sandy or light land, or rich and dark mould, should be plowed flat.

Grain Fields.—In plowing furrows to carry off surface water, where this may be necessary, take care that their direction is such that they will not collect too much, wash deep gullies, and thus do more harm than good.

Draining.—So long as we do not have real winter weather, the work of underdraining may be pushed forward. It is more important to keep well up with the tile laying, for we may be caught by heavy freezing rains and snow-storms, and so all work be stopped suddenly.

Manure.—Bring in all muck sods, surface parings, forest soil, and leaves, that you can, to be used in composts, and lay up good even heaps of these materials, alternated with stable manure, in layers, using at least twice as much vegetable mould in whatever form you have it, as of the stable manure. The compost heaps should be of assorted materials, all, of course, vegetable matter, like potato tops and swamp grass, or other long litter, put together with a sufficiency of manure to make the whole ferment, or leaving the nitrogenous stable manure out, and adding instead freshly dry-slaked lime, or wood ashes, at the rate of about one bushel to the cart-load. Composts of coarse, porous, materials, not made with lime or ashes, should stand over a sunken hogshcad or other vat for containing liquid. This should be pumped every few days over the heap, and allowed to run back again to the vat, which should be supplied with water if there is any lack. In all composts, hog manure goes further than that of the horse, which is much more powerful in starting and maintaining fermentation than that of milch cows and young cattle, but hardly equal to that of fattening cattle or well fed oxen.

Fences.—We cannot too strongly present the evils of bad fences. The freezing and thawing of winter will almost surely develop the weak spots in old lines of fences, and breachy cattle will be sure to find them, if they are allowed either in the highway or in the fields. Grain fields are a strong attraction. The fences, therefore, should be looked to, weak posts staked up or renewed, sound rails or boards put in place of failing ones, and all secured against cattle, wind, and frost.

Horses, if well fed, enjoy cold weather. Although they show a natural preference for the sheltered side of the barn-yard, they seldom manifest any dislike to exposure to severe cold, unless they have been blanketed, and habituated to warm stables. When horses are warm, always blanket them, either in stables or in the open air; take care that they are exposed to no draughts. When cooled off, remove the blanket. Carriage horses, which it is desirable should have a shiny coat, may wear linen covers buttoning round the breast, and having a crooper attached. Give good daily grooming, plenty to eat, water regularly, provide good ventilation, and let the sunlight into the stable.

Beeves.—Feed freely, but uniformly, all they will eat with a relish, changing character of the feed according to your judgment, if there be any failure of appetite. Keep salt always before them or accessible. Prepare the feed in another apartment from the one in which the cattle stand, and be punctual to the minute in feeding. In increasing the amount of grain or oil-meal, do it gradually, watching the effect. Use the card and brush frequently, and litter freely. Beeves need pure air and clean stables as much as horses; warmth is more important than light to them, as to all fattening stock.

Cows, however, need light, clean, stables, with good ventilation. Warmth is desirable also, as well as great quiet. Give them an hour or two in a sunny yard daily, if the weather be pleasant.

Young Stock.—Keep in warm sheds or stables, with the range of yards exposed to the south and east. Feed, water, and salt, regularly.

Sheep.—See "Walks and Talks" on sheep feeding. Keep in dry, roomy, sheds and yards; give plenty of litter, but accommodate them with some hard ground. Feed in racks and troughs protected by sheds. Increase the feed gradually. Oil-cake will probably be found as economical as any feed, more so than any other you can purchase. Sheep feeders are satisfied if they get the manure clear, the sheep selling for their cost with the value of the feed added.

Hogs may be pushed forward as rapidly as possible, and marketed according to the feeder's best judgment. Prices often rule much higher early in the month than later, but the difference is often made up by the increase in the manure pile. The value of manure is in almost direct proportion to the quality of the food of animals. That of fattening hogs is very rich.

Poultry.—See article on page 403. Keep in warm, light, houses, and feed a little meat or serapeake daily, and hens will soon begin to lay.

Orchard and Nursery.

In a mild November, planting may advantageously be done, but if the weather be very frosty, it is better to postpone it until spring.

Heel-in trees received from the nursery after cold weather sets in, rather than attempt to plant them in half frozen ground.

Fruit in barrels should be kept as cool as possible without freezing. Do not close up the cellar of the fruit room, except there is danger of frost. A detached cellar, or one under an out-building, is much preferable for the storage of fruits or vegetables to that under the dwelling, as fruit, in ripening, gives off a quantity of unwholesome gas.

Cider should be made from good fruit only, as suggested last month. Where vinegar is the object, so much pains need not be taken. See page 410.

Labels will need looking to, and the defaced ones replaced. Go over the newly planted trees, and see that the nursery labels are not wired on so tightly as to injure the limb. Do not trust entirely to labels, but have a record of every orchard.

Cions may be cut, labelled, and stored in sawdust in the cellar.

Stocks for root grafting are to be taken up, assorted, tied in bundles, or packed in boxes, and put away in the cellar.

Nursery Rows should have the plow run between them. See that surface water will run off.

Plowing, Draining, and other preparatory work, may be done as long as the ground is not frozen.

Fruit Garden.

Most of the general directions given under "Orchard," apply here. Much may be done to prepare for next spring's planting, and in many favorable localities plants may be put out now.

Covering of tender raspberries with earth, mulching of strawberries, and such work of protecting, is usually done too early, and the plants suffer from being smothered. It is better to defer the operation until freezing weather.

Fruit should be kept cool. Grapes, if kept at a low and even temperature, may be preserved for a long time in an eatable condition.

Blackberries and Raspberries may be propagated from cuttings of the roots. These should be prepared before the ground freezes. Cut the roots in pieces two or three inches long, and place them in a box with alternate layers of soil. The box should have holes in the bottom to allow any superfluous moisture to pass off, and should be buried in a dry spot below the reach of frost.

Grape Vines.—Prune when the leaves have fallen.

Those who wish to propagate vines from cuttings should try the plan given on page 409. It is not practical to give directions for pruning in these brief notes. There are now many excellent treatises giving the philosophy and practice of grape culture.

Currant Cuttings may be set, if the ground is not frozen; otherwise they may be tied in bundles, and treated as noted for grape cuttings, on page 409.

Kitchen Garden.

It will be necessary to hurry up all unfinished work, secure the crops that are still in the ground, and put everything in order for winter.

Plowing and Spading can continue as long as the ground is open. Land upon which the sod was turned over early in the fall, may, if the sod has sufficiently decayed, be cross-plowed.

Level inequalities as far as practicable, put down drains where needed, and get through with as much preparatory work as possible.

Roots should be dug before frost has injured the tender ones, and stored in pits, as noted last month, or, where the quantity is small, in the cellar. Do not cover the pits until there is danger of freezing. Horseradish, salsify, and parsnips, being perfectly hardy, may be left until the last.

Manure will be needed in large quantities in spring, and the stock should be on the increase. Accumulate not only stable manure, but brewers' and sugar-house waste, muck, leaves, and every available fertilizer. See that sinks and privies are in condition to save all the soil.

Cover asparagus and rhubarb beds with several inches of coarse manure or other litter; the crop next spring will be enough earlier and better to pay.

Cold Frames, containing cabbage and lettuce plants, will need to be covered on cold nights, but the sashes must be removed in the day time, or the plants will start to grow, and become tender. They will endure a moderate freezing without harm.

Soil for Hot-beds.—Get ready a supply for use in February, by mixing good loam with one third its bulk of well rotted manure. Place it near the place where the hot-beds are to be made, and cover with boards or sods, to keep it in good order.

Celery.—Store in trenches a foot wide, and deep enough to contain the plants. Pack the plants in upright and close together without any soil between them. When hard frosts occur, put on a covering of leaves or straw.

Cabbages.—Invert as directed last month, and cover with earth when freezing weather comes.

Rhubarb.—As long as the ground is open, new plantations may be made; cut the old roots with a sharp spade into as many pieces as there are eyes, and set three feet apart each way in rich soil.

Spinach.—In exposed places, or where the climate is severe, it will be necessary to put on a covering of leaves or straw to protect it.

Flower Garden and Lawn.

It is one of the advantages of a light soil that work can be continued well towards winter. New walks and borders may be made, and if the weather continues suitable, deciduous trees and hardy shrubs may be set. The grounds should always present a neat appearance, and all decayed stems, useless stakes, and other rubbish, be removed.

Bulbs.—Plant all the spring sorts that are still left out. Take up *Tuberose*, *Tigridias*, *Gladoluses*, and the like, before hard frosts. Japan Lilies are perfectly hardy, and need not be lifted; these and the other bulbs will bloom all the better if they have a covering of coarse manure by freezing time.

Chrysanthemums.—See that they are not beaten down by heavy storms, and note, while in flower, those that it is desirable to propagate from next spring. Those that have been potted for house blooming, when past flowering, may be set in a cool, dry, cellar, or turned out into the grounds.

Dahlias.—If the roots still remain in the ground,

take up as directed last month. Label, and handle carefully, as the freshly dug roots are very brittle.

Frames and Pits.—Half hardy plants, placed in these, should at present only be covered at night. See that the drainage is good, and that the pits are mice-proof. Set poison if any get in.

Lawns will be benefited by a top dressing of well rotted manure, to be applied as soon as convenient.

Leaves.—Accumulate a good stock of these from lawn, roadsides, and the woods.

Roses.—Lay down the half hardy varieties, and cover with sods placed grassy side upwards.

Climbers, such as *Roses*, *Wistarias*, and others not remarkably hardy, should be taken down, and covered with earth.

Perennials, even the hardy ones, will bloom all the finer next year, if a forkful of littery manure is put over them. Protect half hardy shrubs by laying cedar or other evergreen boughs over them.

Green and Hot-Houses.

The temperature of the house will demand the attention of the gardener. The heat of the sun will for a good part of the month enable him to do without fire. Everything should be ready to start a fire in case of a cold night or a sudden change. The thermometer should be consulted. Plants merely stored in the green-house, may get as cool as 40°, or even 35°, but if flowers are wanted, the temperature should not be less than 60°. Collections of tropical plants, of course, require more heat.

Bulbs.—Continue to pot, and keep in a cool place until they have formed an abundance of roots.

Cumellias.—Syringe frequently, and look out for the first appearance of insects. Keep rather cool unless early flowers are wanted.

Propagate stock for winter blooming, especially of climbers for decorating the house. *Tropæolums*, *Lophospermums*, *Maurandias*, etc., will grow quickly and their flowers soon make a fine display.

Seeds.—Sow annuals for winter blooming, if not already done. Candytuft, Sweet Alyssum, and Mignonette are always wanted for bouquets. *Nemophilas*, *Lohelias*, and other annuals, soon flower.

Cold Grapery.

If any fruit remain upon the vines, look to it, and remove any berries that show a tendency to decay. Keep the atmosphere of the house as dry as possible, by closing entirely in damp weather.

Apiary in Nov.—Prepared by M. Quinby.

The cool weather of this month renders the bees more stupid than they usually are in much colder weather. Consequently, anything heretofore neglected, should now be attended to. All empty surplus boxes, or those containing so little honey as not be worth removing for the table, should be taken from the hive. Leave the combs whole, except the edges that are near the glass, if in glass boxes. These should be trimmed off, the glass scoured clean, replaced, and the boxes set away, holes down, making it impossible for the mice to enter. Hives standing out for the winter should be fully protected from mice by wire cloth, nailed on with small tacks, over all passages, leaving room for the bees only. Ample ventilation must be secured. Holes equal to two or three square inches must be made—if possible, at the bottom. Mr. Coe says, "it should be in the center of the bottom board." When covered with wire cloth, some device to prevent dead bees from falling on, and covering it, is needed. A box, two or three inches deep, of the same size as the bottom of the hive, put under it, is very good. The hole in one of its sides, covered with wire, will do. Let it be on the back side, or where the wind will not drive directly through.

Hives may be painted now, with the bees inside; take a day cool enough to keep the bees at home. Use several colors for the hives, such as nearly white, light green, lead, yellow, etc., that each bee, another year, may know its own hive at a glance, and avoid mistakes by making visits out of place.

AMERICAN AGRICULTURIST.

ORANGE JUDD & Co., Publishers, 245 Broadway, N. Y. City.

ANNUAL SUBSCRIPTION TERMS (always in advance): \$1.50 each for less than four copies; Four to nine copies, \$1.25 each; Ten to nineteen copies, \$1.20 each; Twenty copies and upwards, \$1 each. Papers are addressed to each name.

A FEW WORDS FOR EVERYBODY

WHO WOULD LIKE TO OBTAIN

Our Valuable Premiums.

More than \$20,000 is expended every year by the Publishers in procuring the best, most reliable, and practical reading matter and beautiful and instructive engravings for this paper. The cost of producing the *American Agriculturist* is divided among so great a host of subscribers that it amounts to but a trifle to each above the cost of the white paper on which it is printed.

Tens of thousands of persons, old and young, in city and country, and in all the various trades and professions,—owners of farms and those who never have owned a foot of ground,—gardeners, fruit growers and others,—have not only subscribed for the first time, but continued to be subscribers for years thereafter, and remain so to-day. No better proof than this fact is needed of its great value. The circulation to actual subscribers is doubtless larger than that of any monthly journal in the world.

Every paper contains from 30 to 50 beautiful engravings, all of them by the best draughtsmen and engravers, and many of them very costly. Special attention is called to the engravings in the volume for the present year. All who are at all familiar with the difficulty and expense attendant upon the production of such pictures will, we are sure, acknowledge that the subscribers to the *Agriculturist* receive much for a little. And while these engravings are in the highest style of the art, they are so varied in character as to interest every member of a family, even the youngest.

A great amount of interesting and instructive reading matter is provided for all.

Farmers find here thousands of hints and suggestions about all kinds of farm work.

Mechanics find much that interests them in the engravings and descriptions of implements and machinery; also in the directions for culture of their garden lots, if they have them.

City Merchants find a large amount of valuable information for the management of their country places, or which at least helps to keep bright in their minds the pleasing ideal of a beautiful place in the country, to which so many are looking forward when they shall retire from business.

Country Merchants keep the paper in their stores where customers can see it, and many of them secure large clubs.

Children are delighted with the sketches and beautiful engravings found in the Boys' and Girls' Department.

Everybody finds something to please, interest and instruct; and by the constant and thorough exposure of humbugs in this paper, it is not too much to say that thousands of dollars have been saved to the unwary from their being thus put upon their guard.

Now Look at our Premiums.

DO YOU WANT

A finely assorted lot of Garden Seeds, 40 kinds; or a lot of Flower Seeds, 100 kinds, just such as your wife or daughter would select; or that most useful article, Page's Patent Pump and Sprinkler, which combines most of the advantages of a Hand Watering Pot, a Green-house Syringe, a light Force Pump, and Garden Engine? You can have either one of these three Premiums by sending to us 13 names with their subscriptions for one year, at \$1.50 each. Eleven subscriptions at the same rate will secure for you a first-rate, E. Gold Pen, with silver case, from one of the best manufactories in the country; 14 subscriptions, at \$1.50 each, give you the F. Gold Pen, which is larger, and by the same makers. The right hand column of the Table gives the number of names required at the lowest club prices, (\$1 a year), to get any of the Premiums referred to.

DO YOU WANT

A dozen best plated Tea Spoons, or Table Spoons, or Knives and Forks? Do you want a set of Tea or Table Knives and Forks of Rodgers & Sons' make, or an elegant Ice Pitcher, or Castor and Fruit Basket? Look at the list and notice that for a comparatively small amount of labor you can obtain any one or all of these. Many have received these Premiums, and others are working for them. A lady who has already secured a part of them writes us that she means to have the rest. We are all ready; and for only 66 subscribers at \$1.50 each, we will give one of those beautiful, extra-plated Tea Sets made by Lucius Hart & Co., and comprising six pieces, viz.: Coffee Pot, two Tea Pots, a Creamer, Sugar, and Slop Bowl, of uniform pattern, new style and embossed figure work.

DO YOU WANT

Something which shall at once lessen the necessary labor of your family, and which will be a pleasant surprise at home when it reaches there? Look over the list of first quality Sewing Machines which we offer as Premiums. Here, too, are the Washing Machines, and the best Clothes Wringers. Many a husband and father has made glad hearts at home and brought rest to weary hands by a little effort in bringing the *American Agriculturist* to the notice of persons who only needed that little effort to induce them to subscribe for it.

DO YOU WANT

To provide for yourself and your family a library of most useful Books,—the latest and best for the Farm, Garden, and Household;—Books which will do more to interest your sons and daughters in Agriculture and Horticulture than could be done by any other means? Or do you want to secure a set of the Back Volumes of the *Agriculturist* for the last eleven years, or any part of the set,—each volume being most valuable for its thousands of hints, suggestions, and items of information, and for the pleasure and instruction it will give to your children? Look at the 37 Premiums, No. 50 to No. 86, and see how easily you can obtain such a Library. See Book List, page 421.

DO YOU WANT

Musie in your home? Who does not? You can have it; for among our Premiums you will find the beautiful little Musical Box;—the Melodeon, for the Home Circle or for the Hall; the Colibri Piano, an instrument of remarkable power and sweetness; and the elegant Seven Octave, Rosewood Case, Steinway Piano. Which will you take?

DO YOU WANT

Any one of the Eighty-Six valuable Premiums on our List? Then make up your mind to have it. Go out among your friends. Sit down beside them and tell them what the *Agriculturist* is, and show them a paper. We will give a specimen number to any one who asks for it, in order to obtain subscribers.

Table of Premiums and Terms, For Volume 27—(1868).

Open to all—No Competition.

No. Names of Premium Articles.

No.	Names of Premium Articles.	Price of Premiums at \$1.50	Number of Subscribers required at \$1.50
1	Garden Seeds for a Family (40 kinds)	\$5 00	13
2	Flower Seeds for a Family (100 kinds)	\$5 00	13
3	Nursery Stock (Any kinds desired)	\$30 00	30
4	Iona Grape Vines (12 of No. 1)	\$18 00	27

86	A Choice of Good Books (See Terms below)

Only good articles.—We are careful not to place upon our list anything for a Premium which is not the best, and, in all respects, what is claimed for it. All, therefore, who secure premiums, may be sure that they are not running the risk of getting poor or indifferent goods.

Send in the names of subscribers as fast as you obtain them, not waiting to complete your list; and to save mistakes in accounts, send the exact subscription money with each list; and every name designed for a premium list, must be so marked when sent in.

Begin Now to raise your clubs. It is not necessary that all the papers of Premium Clubs should go to one office. You can get them anywhere.

Old and New Subscribers will be counted in premium lists, but some should be new names, as it is to obtain such that premiums are in part offered. The extra copy, usually offered to clubs of ten or twenty, will not be furnished when a premium is called for.

Every Premium article is new and of the very best manufacture. No charge is made for packing or boxing any of the articles in our Premium List. The forty-four Premiums, Nos. 1, 2, 6, and from 36 to 39, and from 50 to 86 inclusive, will each be delivered FREE of all charges, by mail or express, (at the Post-Office or express office nearest recipient), to any place in the United States or Territories, excepting those reached only by the Overland Mail.—The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance that may be specified.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the *American Agriculturist*, show at a glance the transactions for the month ending Oct. 17, 1867, and also for the preceding month:

1. TRANSACTIONS AT THE NEW-YORK MARKETS.
RECEIPTS. Flour, Wheat, Corn, Rye, Barley, Oats.
27 days this month 437,000 2,246,000 1,750,000 189,000 805,000 1,210,000
27 days last month 412,000 2,290,000 1,701,000 183,000 750,000 1,170,000

SALES. Flour, Wheat, Corn, Rye, Barley, Oats.
27 days this month 441,000 1,802,000 2,911,000 350,000 2,916,000
27 days last month 284,000 1,079,000 4,181,000 151,000 1,367,000

2. Exports from New York, Jan. 1 to Oct. 16:

Flour, Wheat, Corn, Rye, Barley, Oats.

1866.....133,100 2,448,100 21,117,000 713,000 537,300 6,835,600

Gold has been as high as 146½, since our last closing yesterday at 143½. Breadstuffs have been in much better request for home use, shipment, and on speculation; and prices have advanced materially. The foreign inquiry is unexpectedly active for flour, wheat, corn, and rye; and but for the very marked rise in ocean freights, an unusually extensive anti-raid movement would have been fairly begun by this time. As it is, despite the scarcity and dearth of freight room, the shipments are increasing rapidly, encouraged by the highly favorable market reports from England and the West of Europe. The break in the Canal seriously checked receipts at the seaboard, but these are now comparatively liberal. Provisions have been quiet, and depressed in price. Cotton has fallen materially, but closes in favor of sellers, on a reviving demand. Tobacco has been actively sought after at full prices. Wool has been in light request, and tending downward. Hay, Hops, and Seeds, have been in moderate demand, at about steady rates.

Average per Week.....	7,017	44	1,751	93,750	35,262

A glance at the above table will show that there has been a very large increase in all kinds of live stock destined for slaughter, except beef, and the same is probably

true of the receipts of slaughtered meats and poultry. The wonder is that prices have not seriously fallen off.

Beef Cattle.—The supply has been fully up to the demand of the market, and prices have fluctuated but very little, except during the first week of October, when the receipts (reported on the 8th,) were very large, and of a quality not to sustain the previous prices. They came up again promptly with the smaller receipts of the next week, the last that we report, and we may now put them down about as follows: The very best steers, well fattened, sell at 17c. @ 17½c. per pound, estimated dressed weight; excellent beef, 16c.; general average, a little above 14c.; poorest, 9c. @ 11c. **Milk Cows.**—The market seems a little more active, especially for family cows for citizens returning from the country, though most of these purchase in the country. \$90 to \$100 is paid for a really good cow, readily. **Calves.**—Those classed as prime sell at 11c. @ 11½c. per pound, live weight. Fat calves bring 12c. @ 12½c., while grass fed ones bring 9c. @ 10c., according to quality. "Hog dressed" veal sells at 14c. @ 17c. A good many calves are sold by the head, some to farmers for raising, others to butchers at prices all the way from \$8 to \$25 each. **Sheep.**—

The rush of sheep to this market has been unprecedented though hardly unexpected. Prices have come down somewhat, but hardly in proportion. Extra sheep bring this week, 6½c., good, fat sheep, 5½c. @ 6½c., while the poorer qualities range from 4c. to 5½c. Common lambs bring about 6c. @ 6½c., prime, 7c. @ 7½c. **Swine.**—The supply has been most extraordinary, a great part of the hogs being of very poor quality, entirely unfit for slaughter. Such brought only 5c. per pound on the 4th week reported, when the receipts were so much in excess of the demand that all grades fell off in price. The closing quotations this week are about as follows: Prime, heavy hogs, 7½c. @ 7½c., good, 7½c. @ 7½c., common to poor, 6½c. @ 7c. per pound, live weight. The cause is the shortness of the corn crop.

Containing a great variety of Items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

13 Months in a Year.

All new subscribers to the *Agriculturist* for 1868, whose names are received during November, will receive, free of charge, the December number, which will be beautifully illustrated, and very valuable. This will give 13 months for a year's price. The offer applies to all new subscribers, singly, in clubs, in premium lists, etc. Sufficient time will be allowed for responses to this offer to come from the Pacific States and Territories, and other distant points. All new names must be marked new to secure the extra number.

Mark All Subscriptions sent in, as New or Old.

How to Remit.—Checks on New-York Banks or Bankers are best for large sums; make them payable to the order of Orange Judd & Co.

Post Office Money Orders may be obtained at nearly every county seat, in all the cities, and in many of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, as many hundreds have been sent to us without any loss.

Registered Letters, under the new system, which went into effect June 1st, are a very safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. Observe, the Registry fee, as well as postage, must be paid in stamps at the office where the letter is mailed, or it will be liable to be sent to the Dead Letter Office. Buy and affix the stamps both for postage and registry, put in the money and send the letter in the presence of the postmaster, and take his receipt for it. Letters sent in this way to us are at our risk.

Specimen Numbers of the *Agriculturist*, Cards, and Showbills, as may be needed, will be supplied to canvassers. These should be economically used, as each extra copy of the paper, with postage, (2c.), which must be pre-paid, costs about 12 cents.

Cheap Ice-House.—"B. W. B." Wind-sor Locks, Conn. In former years we have given plans. Select a dry spot having perfect natural drainage, if possible. Throw out the earth not more than a foot deep, over 14 feet square. Lay a foundation of brick, about 18

inches high; on this lay sills 14 feet long, 10 inches wide, and 3 inches thick, halved and pinned together at the ends; on the sills set posts or uprights, 7 feet high on the sides, and higher on the gables. For these use two-inch spruce or hemlock planks, 10 inches wide, nailing them to the sills, and also to the plates. Board up, nailing to the uprights on both sides. Fill in with tan bark, dry sawdust, planing mill shavings, etc. Put on a roof shingled or thatched, and board on the under side of the rafters, filling with sawdust, if you please. There must be a sliding shutter in the gable for ventilation, and the earth thrown out of the cellar should be banked around the foundation. There must be perfect drainage, and if a drain is laid opening in the floor of the ice-house it must be covered by a bed of gravel or a trap. The outside boarding may be spruce boards, the inside two-inch hemlock. Bank up against the foundation with earth so that no draft of air shall have access. The door should be in the gable end, some feet up from the ground, and double; or movable boards may be used instead of an inner door. The house will be 12 feet square on the inside, and will keep ice enough for any ordinary family.

Postage.—To our published terms for the *American Agriculturist*, postage must in all cases be added when ordered to go out of the United States. For Canada, send twelve cents besides the subscription money with each subscriber. In the United States, three cents, each quarter, or twelve cents, yearly, must be prepaid at the post office where the paper is received.

Subscription Letters.—Write the Name, Post Office, County, and State, plainly, and separately from all remarks, questions, etc. Any communications for the editors should be on a different part of the sheet, or on another piece of paper.

Renew Subscriptions Now.—Many of the subscriptions expire with the next number, December. It will secure prompt delivery for January, 1868, to renew now; besides, it will aid us much in getting the names all properly on our books in good season.

State and other Fairs.—Some representative of the *Agriculturist* has been present at most of the important exhibitions held this autumn. While we present brief notes on several of these, our space does not allow of extended reports. We visit these fairs to gather information for the benefit of our readers in all parts of the country; this is used from time to time much more to their advantage than it could be in a single report. Besides the brief sketches of those given this month, we have been obliged to leave out several already in type, including those of the Pennsylvania Horticultural Society, Illinois and Pennsylvania State Fairs, and Fair of the American Institute, New York.

Sundry Humbugs.—The list of humbug letters for the last month is quite long, but most of them have been previously shown up in the *Agriculturist*, and others are so precisely similar that it would seem to be impossible for any one to mistake their character. Follow our advice, and do business, as far as possible, with those only who are well known and reliable dealers. Wright Bros. & Co. are filling the country with their circulars, offering rare chances to obtain fine watches valued at from \$45 to \$1000 for only a \$10 greenback, and a trifle for a case and postage. Among other styles is a Silver Hunting Chronometer, valued at \$100, recommended as a splendid article. With a pocketful of tickets we "dropped in" to their place, or rather, we climbed up, and found their very small rooms on the top floor, and examined some of their stock. It is the kind known among dealers as *bogus*, and that word means the same all over the country, though it may not be in the dictionaries, —that is, not what it is represented to be. We purchased the Hunting Chronometer, valued at \$100, as a curiosity. It has a little silver in the case, perhaps two dollars worth; the movement is very showy, and it will tick a few times if shaken very hard, and kept bottom upwards; turn it over, and it is dead as a hammer, and as a time-keeper it is utterly useless. The "American Watch," described as retailing at \$35 to \$45, with 2 oz. solid silver hunting cases, we saw, and "the man" told us that both case and movement were made in this city; it was stamped "Union Watch Company, New York." There is no such institution in the city, and no such watches were ever made here. An importer in Maiden Lane examined our \$100 Duplex, and offered to sell the same article, which he had in stock and showed to us; for \$6.75 gold, or \$9.50 greenbacks. The Union Watch Company's Watch in Hunting Case, precisely like the one at W. B. & Co.'s, and which we were informed was white metal, and not silver, was offered for \$8.25 greenbacks. We warn our readers again, that those parties who are induced by private circulars and tickets to buy

watches or other articles, represented as worth several times the price asked, will find their money gone and themselves sold.... C. L. Van Allen, who told us a while ago that his name was A. D. Bowman, now assures us that there is *no such person*. He is advertising, however, in the name of A. D. Bowman & Co. Mr. Van Allen advertises also to sell rights to make "Eureka Oil," which is represented as very cheap, not explosive, can be made by everybody, etc. We received a letter from a chemist, stating that this article is very dangerous, so we obtained a sample bottle of the "Eureka Oil." It is simply benzine with, perhaps, slight additions, and *explodes as readily as gunpowder*. Any man who recommends the manufacture of such stuff by unskilled hands, deserves the gallows or the penitentiary for life. Don't touch it, or the advertiser of it, in any way.... Kelley & Co.'s Grand Gift Concert is *again postponed*. Keep the tickets as a warning to make no more such investments, which not only reduce capital, but generally good nature too.... We have numerous inquiries about Concerts for Soldiers' Widows and Orphans, Libraries, etc., where tickets are sold and prizes drawn by some means "strictly honest," and "entirely legal," etc. We class them all together, without any exception, as *lotteries*, and all *lotteries* as *humbugs*.... Beware of parties who take *great pains* to assure the public that they are "licensed by United States authority." All respectable business men pay for U. S. license, and many who are not respectable, and *such license gives no authority to disregard State laws*, as has been decided over and over again.... The medical humbugs are still extant, though we have not given them much attention of late. The most recent demonstration that we have seen is that of Dr. H. R. Burner, whose four page circular is a curiosity in its way. It informs us that the "Union Combination Medical Association of Great Britain" has invested \$275,000 "in the United States, to aid and assist suffering humanity," which is a very handsome thing of them to do. They publish a certificate from "the Executive Department, Washington, D. C.," signed "G. F. Attendon, General Surgeon." Now we would like to know just what the "Executive Department" does with a surgeon, though if it must have one, "Attendon" is a good name for him. "Remember," says the circular, "he, (Dr. Burner,) is not to be classed with the Traveling Impostors of the land." Very likely not, but as he "guarantees a cure in every case undertaken," we class him with those belonging abroad. This Doctor B. is endorsed by the "President" of the "Union Combination Medical Association," "branch office, No. 209 Broadway." The seeker after this office on Broadway would appropriately bring up in St. Paul's Church-yard, which is where 209 would be, if there were such a number. The superstitious might think this indicative of the fate of those who take the "French Remedies," or try to prove the statement of the circular that "the Doctor has a halm for every wound."

Personal Inquiries.—We have had of late more than the usual number of letters asking questions of interest only to the writer. We usually answer as many of them as possible, but the absence of the editors during the season of fairs, together with the interruption caused by our removal, has made it necessary to leave many unanswered. Every one must see that we cannot occupy half a day in looking up information for his benefit, and that many letters are for this reason unanswerable.

Safe Pipe for Drinking Water.—Lead poisoning from water brought in lead pipe is the often unsuspected cause of disease and death. Galvanized iron pipe, wood, and cement pipe, are expensive and inconvenient substitutes, so that people will risk their lives and use lead. The Lead-encased Block Tin pipe is even cheaper than lead, and we believe perfectly safe. Our faith in it has led us recently to lay some 80 feet of it, through which all our drinking water is drawn.

Shade in Pastures.— "Welchman."—Certain trees, like Elms, Maples, Basswoods or Lindens, Willows, etc., interfere with the growth of grass or any crop, their roots being near the surface. Hickories, Oaks, Pepperidges, and Beeches, send their roots deep, and grass grows well in their shade. Still we would not cut down the former class. Cows give milk better the more quiet and comfortable they are, and cool shade contributes essentially to their comfort. Cattle will soon fill themselves if the pasturage is good; then they want shade to chew their cuds under, and do proportionally better for it.

Horse with his Foot in his Mouth.—Dr. G. W. Booth, of Harrison Co., Ind., relates the following singular occurrence in a letter to the *Agriculturist*: "A neighbor, passing the stable, observed that one of my riding horses was lying down, and appeared to be in distress. He came to the house and told me. We immediately went, and found that he had his left hind foot fast in his mouth, the outside caulk of the shoe baked in the

roof. I ran to the blacksmith shop to get something to pull off his shoe, and just as I got back to the stable door, the horse made a violent effort, and jerked the foot out, loosing one tooth, and tearing his mouth badly, and cutting his foot just at the top of the hoof, so that he was lame for several weeks. I had to shell his corn, and feed him cut-feed for three weeks, till his tooth grew fast."

When to Plow for Corn.—W. S. K. A rolling field of mellow soil, long in grass, is to be broken up, and put in corn next spring. The corn will do quite as well if planted on a fresh turned sod. Grub worms will suffer if the plowing be done late this fall. What shall be done? We think it depends on the answers to two questions. Will the land wash if the winter is open and we have hard rains? If so, let it lie in sod. Will you have plenty of time to do the plowing next spring, or will you be crowded with work?

Bringing up Sandy Land.—"R. W. C.," Carroll Co., Ark. You say your sandy land has a red clay subsoil. The means of renovation are then close at hand, provided you can touch the clay with the plow. All you have to do is to bring it up and mingle it with the surface. If the clay lies too deep, then try green manures. Sow rye now and plow it under in the spring, then sow Indian corn and plow that under after about three months. If you can not trust corn after the rye, sow buckwheat. Lime alone would probably be of little or no benefit, unless the clay comes up.

Broom-corn Seed—Value.—"J. W.," Westmoreland Co., Pa.—Good seed should weigh about 50 pounds to the bushel, and it may be used on the farm to take the place of oats for sheep and poultry, and ground, it is good feed for pigs and milch cows. Plump seed will go as far as oats, and probably farther, but nri-ripe seed is very inferior. Chickens eat it as a variety, but are not fond of it. The probable reason why there is so poor a market for it is that the *quality* is so variable.

A Well in a Quicksand.—Lafayette Erskine, Oneida Co., N. Y., anticipates trouble in digging a well in a quicksand. His neighbors have used a plank curbing, but this makes the water taste. What can he do? He can surely brick up inside a curbing of plank, lay in the bricks in cement, but leaving the bottom open and finally draw out the planks one at a time. Will not our readers suggest better ways?

Coal Tar and Gas Tar.—"H. N. S.," Substances composed in whole or in great part of hydrogen and carbon, such as bituminous coal, rosin, or even wood, when exposed to high temperatures, are usually decomposed, becoming part gas, part tar and oils, and part a thick or coaly residuum, according to the degree and continuance of the heat. The presence of water and of oxygen causes other substances to be produced, wood vinegar, etc., and there is frequently nitrogen enough to cause the formation of a notable quantity of ammonia. The gas formed is a mixture of several gases; the tar is a very complex mixture, varying in its composition not only with the substances heated, but with the temperature. From whatever source these tars come, they possess peculiar and similar properties. Among others, remarkable anti septic qualities. So far as we are aware, there has been very little difference found in the relative values of the various coal or gas tars for preserving timber, painting, etc., and we presume that tar from rosin is just as good as that from Cannel coal, for these purposes. If not, we hope to be set right.

How to Get Rid of Briars.—Blackberry bushes, both the high and the running kinds, wild rose bushes, and other briars, are, when young, very palatable to sheep, and if they are cut close in the winter or in the spring, and sheep are turned on to the land before the thorns become stiff and woody, a single season will nearly eradicate them. This will not do upon very wet land, for the sheep will not thrive. On such ground mowing in August must be resorted to in addition to the winter or spring cutting.

Value of Bones.—W. P. E. Ground bones are worth about \$40 a ton. The uncrushed article bears various prices. Shin bones and some other pieces are used in the arts, and bring high prices. Such as are thrown out from the kitchen bring what the boys can get for them. We have paid twenty-five cents a barrel for a great many barrels, delivered at the barn, and should have considered them cheap at twice the price. We would rather pay \$10 a ton for old bones than be without them. They are indispensable in planting fruit trees in the older parts of the country, and are good for all crops. A pile of them should be kept constantly under the shed,

and if a bone-mill is not handy, break them with a sledge or stone bammer on rainy days. Such rainy days, we think, will pay the farmer better than clear ones.

Destruction of Horses.—In the annual report of the Belt Railroad, in this city, it is stated that 279 horses out of 988 died during the year. The average life of a horse in this service is said to be only 3½ years. The city is a great market for horses. The average price paid by this company was about \$156. For those sold in a broken down condition, it received a trifle over \$30 each.

Rotting Stumps Speedily.—There is an idea abroad that oil of vitriol poured upon a stump or into an auger hole in one, will cause it to decay rapidly. So far as we can ascertain there is no ground for such a notion. Nitric acid, *aqua fortis*, as a highly corrosive body containing much oxygen, would appear to be better adapted to this purpose, for decay is oxidation. The surest way to promote the quick decay of stumps we should think would be to gash the main roots with an ax or bore holes into them, and also into the top of the stump, which might be cut dishing with a few well directed blows, in order that water might settle in the holes and work into the heart of the tree. This will surely cause more or less rapid decay, and substances like the droppings of birds and little animals, or even leaf-mould, would soon wash in, and expedite the process.

Short-horns Homeward Bound.—Eight of these animals, from the herd of James O. Sheldon, of Geneva, N. Y., were recently shipped from this port to England. John Bull cannot resist the temptation of fine cattle even in America. Third Duke of Geneva, who heads the list, will be heard from across the water.

"Chicken Cholera."—"S. V." recommends the following remedy, and has the good sense not to call it infallible. "Take two eggs, a tablespoonful of powdered alum, and a sufficient quantity of flour to make a thin paste. Force the fowl to take a portion of it, if it will not eat voluntarily. Powdered alum, mixed in the food, is a good preventive. Feed no swill or sour messes."

Churning in Cold Weather.—Mrs. Spicer, of Peoria Co., Ill., gives the following sound directions: "Procure a common thermometer, costing from fifty cents to one dollar. Set the cream in a warm place, and stir occasionally, until the thermometer indicates a temperature of 64°; rinse the churn in hot water, put in the cream, and churn immediately. Do not let the hot water stand in the churn, as the heat from it should not raise the cream over 65°, or the butter will "come soft." We practised the above during the past winter, and were not detained at the 'crank' over ten or twelve minutes, on an average, securing good hard butter in every case—while under the same circumstances in other respects we have previously been from one to five hours churning during the cold months.

Dogs.—It is estimated that 6,000 dogs are legally drowned in this city annually. Vermont, one of the best protected States in the Union, lost 500 sheep by dogs last year in five counties.

Questions Proposed by Readers to Readers.—1. *Milk-house.*—"What is the best mode of building a *Milk-house* above-ground. One that can be put up on a cheap plan by a common carpenter or ingenious farmer himself?"

2. *Spring-house.*—"J. W." asks for the best way of employing the water of a spring that would fill a three-quarter-inch pipe in a farm dairy or milk-cellar, or in a house built for the purpose over the spring?

3. *Bake Oven.*—A plan for a Pennsylvania "Out-oven" is called for. That is, we presume, a brick oven large enough for the wants of a large family.

The European Rook for Insects.—Is there any objection to the introduction of this bird into this country? With all our warfare upon insects, they are increasing. "Aliquis," of Michigan, writes: "I think that a remedy, (for insects,) is to be found in the English rook. This bird may be considered entirely insectivorous. The only exception I ever knew was in a severe and long continued snow-storm, when some of them paid a visit to a solitary wheat-stack. I am aware that they are badly accused, and many a day I have kept watch with a gun to keep them off the newly sowed grain, and many of them I have dissected, but I never found anything but insects in their crops. They are constantly in attendance on newly stirred land, and hundreds may be seen following the plow and harrow within two or three yards of the plowman's heels. Indeed, if they were a grain-eating bird, no grain could be raised in the neighborhood of rookeries, where millions are congregated. I believe the

intelligent part of Scotchmen do not believe they eat grain, and they won't touch earlorn. I was told by a relation that, (it must now be 80 or 100 years ago,) he was one of those employed to kill off the rooks, which they nearly effectually accomplished, but ere many years they were glad to get them back, the laud having become entirely overrun with grubs and wire-worms."

Fine Bulbs.—The stock of J. M. Thorburn & Co. is this year very full and fine. We have no doubt that of other dealers is fine also, but we happened to see theirs just as it was opened, and were struck with the great variety and the excellent quality of the bulbs.

Coal Ashes.—I. F. H. Will pay for carting a short distance. They contain the mineral constituents of the plants from which the coal was made, and as they are usually found in cities and villages, small quantities of potash and lime from the wood and charcoal used in kindling. Judging from the rapid disappearance of kindlings in our kitchen, this must be an important item. We have often used them for top dressing for moist grass lands. They are particularly good for muck lands and for heavy clays, serving to make the soil more friable.

Compost of Forest Leaves.—"Crawford." Gather the leaves in dry weather, use them as litter for cattle or penned hogs, and compost them with manure. If you have not enough manure, pile leaves by themselves with a small quantity of wood ashes or lime.

House Drains.—The best are glazed earthen pipes with socket collars, (each pipe fitting into the next,) with cement mortar filling around the joints water tight. The pipe for an ordinary family should be the smallest that comes, which is two inches in diameter. Small pipes will keep themselves clean. They should be laid not less than two feet deep. Large pipes give space for filth to accumulate. All house drains should be as small as will carry the water, and be laid in cement, so that all the water will run through, and should be uniformly inclined as much as one inch in 10 feet, that the flow may be rapid, and wash out all sediment.

A Request Repeated.—Advertisers are always gratified by learning in what paper their notice was seen by parties writing for circulars or sending orders. We repeat the request that our readers will please give information, when writing in answer to advertisements in our columns.

Coal Tar for Fence Posts.—Immerse them in coal tar, as far as they go in the ground, and sand afterwards; it will make them much more durable.

About Lime.—A. R., MeVeytown, Pa., asks: "Does lime made from stone gathered on the surface of the ground possess the same fertilizing properties as that made from stone taken from the quarry?" Undoubtedly, if the stone found in the two places is the same. Some limestone contains much siliceous and other impurities, and these may occur more abundantly in the surface stone than in that taken from below. As far as the mere fact of exposure goes, it can make no difference.

Cheap Lands in Virginia.—In Fauquier, Culpepper, and Albemarle Counties, are some of the finest lands of the State. Here the desolations of the war were severely felt, and the farmers are anxious to sell a part of these lands to get money to work the balance. This is a good field for the northern capitalist.

The Trapper's Guide.—This is a neat octavo volume of 416 pages, illustrated with a large number of good engravings of the fur-bearing and game animals of America, together with articles of the hunter's outfit. It is written by Mr. S. Newhouse, an experienced trapper, and published by the Oneida community. Mr. N. is the manufacturer of a very good style of steel traps, and "The Trapper's Guide" was originally written to extend their sale by instructing in their use; now it is much enlarged. There is so much in the book likely to interest many of our readers that we place it upon our list; but must say that neither Mr. Newhouse or his editors have much of the spirit of true sportsmen when they recommend the practice of taking in traps animals which the world over are recognized as "noble game," and entitled to a chance for their lives. Trapping deer is heathenish. It is far worse than taking trout in nets, which is justly punished by heavy penalties in some of the States.

Plants Named.—E. S. Resh, Pa. No. 1. *Mitchella repens*, or Partridge-berry; it could only be cultivated in a shady place. No. 2 is our commonest blue Violet, *Viola cucullata*. J. J. K., Afton, Maine. The

Cockspear Thorn, *Crataegus Crus-galli*, one of the finest of our native thorns. The Buckthorn is a widely different plant. E. H. Stiles, Lake Mills, Wis. The Pasqueflower, *Anemone Pulsatilla*, not known east of Wisconsin; very beautiful. Mrs. A. A. McElwee, Ulster Co., N. Y. Two species of *Trillium*; the purple one is *Trillium erectum*, and the white one with purple stripes on the petals is *Trillium erythrocarpum*. J. H. Clendenin, Galiopolis, Ohio. The common English Plantain, *Plantago lanceolata*, often called Rib-grass, though it is no grass at all; neither is the one sent us "a grass." It is one of the Sedge Family, of a species too young to determine. O. W. Fuller, Blackstone, Mass. No. 1 is Velvet Grass, *Holcus lanatus*; No. 2 is Reed Canary Grass, *Phalaris arundinacea*; neither of them of any great value. M. W. Phillips, Chatawa, Miss. *Arrhenatherum avenaceum*, or Oat Grass, both specimens the same, though unlike in appearance, probably from difference of situation. Not valuable at the North.

Beautiful Lobelias.—Messrs. B. K. Bliss & Son have sent us specimens of some very fine hybrid Lobelias. They are hybrids between *Lobelia cardinalis* and *L. syphilitica*, our two most showy native species; the flowers present every gradation of shade between the intense scarlet of the one and the equally intense blue one of the other. These hybrids have attracted much attention in England, and are a fine addition to our list of hardy herbaceous perennials.

Pond Lilies.—P. L., New York, wishes to know how to destroy "Pond Lilies that infest fresh water ponds." If he means the white lily, (*Nymphaea odorata*), we cannot conceive how he can have too many. If the yellow ones are in question, (*Nymphaea advena*), a few would content us. To get rid of these or any other water plants is an easy matter, if the pond can be drawn off, and the bottom cleaned. The roots of the lilies are large, and might be dredged up without much difficulty.

Osage Orange Seed. — Machine Wanted.—A. D. Chase writes from the Chickasaw Nation, that the old method of getting out Osage Orange seed is very tedious, and asks if there is any machine for the purpose. We never heard of one, and the demand for such is likely to be so small that there is little inducement for machinists to get up one. Some of the mills for crushing grapes do the work without breaking the seeds, and we should think that a mill like the "Improved Buckeye" might, with a little adjustment, do the work.

Ditching Plows.—We know of two which give good promise; neither is yet fairly offered to the public, we believe, but both will be as soon as their owners are satisfied that they cannot essentially improve them, that they will do good work, and the demand can be supplied. One of these plows, which is intended for swampy or boggy land of a peaty character, cuts the whole ditch at a single furrow, and lays the slice at one side like a wall. The other is for any land not very stony, and will cut a ditch about three feet deep.

Substitute for Stable Manure in Market Gardening.—"A. M. K.," Poulney, Vt. You can probably, by exercising reasonable vigilance, pick up many fertilizers which now go to waste in your vicinity. The manure and ashes compost with guano would be good, but no doubt you can secure the contents of privy vaults for the trouble of clearing them out, and perhaps even be paid for doing it. Then, too, there is probably a brewery, paper mill, tannery, or some similar establishment near, in the wastes of which you may strike a mine. The first and last have each peculiarly fertilizing wastes which must be used with care. Make friends with the butcher for blood and offal useless to him, and so before you buy much guano, exhaust home resources.

Soap Suds on Melon Vines.—Walter S. Knight, Ohio. Your fault doubtless was the deluging the cucumber and melon vines with soap suds once a week, during the drouth, and doing little else. If you had dug about the hills and thoroughly mellowed the soil, and then poured the water into one or two depressions near each hill where it would gently soak away, wetting the ground not so much on the surface as at a depth below, the vines would probably have thriven. Soap suds from the tubs on washing day, has with it much seum which will not follow the water into the ground. This should be raked, or stirred into the soil in some way, or it will be very likely to form an incrustation impervious to air and moisture upon the surface.

Rats.—Mr. Langstroth, (see May number, p. 178,) catches rats easily after getting the first one. Alex. H. Haller says, he will find no difficulty in taking the first rat, if he will try a little of the oil of Rhodium on his bait. We know this is very attractive to many animals.

American Poultry Society.—At a recent meeting of this society, the following officers were elected for the ensuing year. President, O. C. Poole, Methuen, N. J.; Vice President, S. M. Saunders, New York; Recording Secretary, J. H. Fry, Staten Island, N. Y.; Corresponding Secretary, A. M. Halsted, Rye, N. Y.; Treasurer, W. A. Fitch, 151 Nassau-street, New York; Auditor, J. G. Finnie, 11 Wall-street, New York. As will be seen by advertisement, in another column, the first exhibition is to be held the third week in November. Arrangements are made for a very successful show.

Ice-House in a Cellar.—R. M. M. This arrangement is often more convenient than any other, and fails generally from imperfect ventilation and drainage. If these matters are properly attended to, ice will keep well in a cellar. The ventilation should be with the air from the outside of the cellar. If otherwise, it would make the atmosphere damp, and affect the temperature in the rooms above. The drainage is the most difficult thing to manage in a cellar. The side walls of an ice-house here should be made with the same care as above-ground. We recently saw a very ingenious device to turn the drainage water to practical account. The bottom of the ice-house was made tight, and a little sloping, with gutters to conduct all the water into a trough in an adjoining room. The trough was made large enough to hold a dozen milk-pans or more. It was exceedingly convenient in keeping cream, butter, and other perishable articles. The temperature of the room in which the trough was kept was also very much reduced, which made it a safer place for fruits and meats. We prefer an ice-house wholly or in part above-ground where it can be had.

Where to Locate?—Wants a Farm.

—We have large numbers of letters, of which the above is the purport—some of them accompanied by a strong personal appeal. Advice as to where to locate is very difficult to give, as so much depends upon individual peculiarities, capabilities, prejudices, and previous occupation. Were we to advise one who had never raised a strawberry or a blackberry in his life, that Southern New Jersey was a favorable locality for small fruits, he would probably go there, fresh from rough farming, or from some mechanical or mercantile occupation, try it a year or two, fail, and then blame us for our advice. All this matter of location for fruit and vegetable growing is mainly a question of markets. A small sum expended in personal exploration will be more satisfactory than any advice a stranger can give. As to undertaking the buying or selling farms, that is not in our line; either can be readily accomplished through the medium of advertising.

Hop Culture.—A dozen or so ask us to send them by letter a detailed statement of the methods of hop culture. To meet this very want of information concerning special crops, we offered liberal premiums for practical essays on Hop, Tobacco, Onion, and Flax culture. The best essays, several on each subject, we have published in the pamphlet form, and offer them at a low price. The work on Hop Culture is 40 cents, and contains, (as do the other essays,) fuller information than is to be found elsewhere. We could not afford to write out the matter for as many dollars as we ask cents for the treatise. As to the sets, they are frequently advertised in our columns, and we doubt not that any of the writers of these essays would furnish them.

Gypsum.—C. G. Reed, Wayne Co., Pa. Gypsum is sulphate of lime. Agricultural plaster is ground gypsum, more or less impure. It will keep indefinitely if not subjected to the action of rains or water, for it is unalterable in the air at common temperatures, but soluble in water, 400 to 500 pounds of water being capable of dissolving one pound of gypsum. Gypsum contains a little more than 20 per cent. of water, and this it loses if heated for a time, at a temperature much less than a red heat. When unground gypsum is thus heated, it crumbles to a powder. Ground gypsum heated or "boiled," as it is termed, becomes Plaster of Paris. It gradually absorbs water from the air and becomes gypsum again. Plaster of Paris then is damaged by keeping, though unhurt for agricultural purposes.

"Do you believe Toads, Fish, and Worms, rain Down?"—Ralph G. Pratt, Minn.

There is every reason to suppose that fish, worms, etc., are occasionally sucked up with water by the force of water-spouts, and whirlwinds. Ponds and river beds are often emptied of water almost in an instant, by a whirlwind passing over. The same power has often lifted men, women, and children, sometimes conveyed them long distances, and set them down unharmed. After the passage of whirlwinds or hurricanes, fish are frequently found still alive on either side, and perhaps miles away from its track. Toads and worms might, and very likely would be taken up and suspended a much longer time.

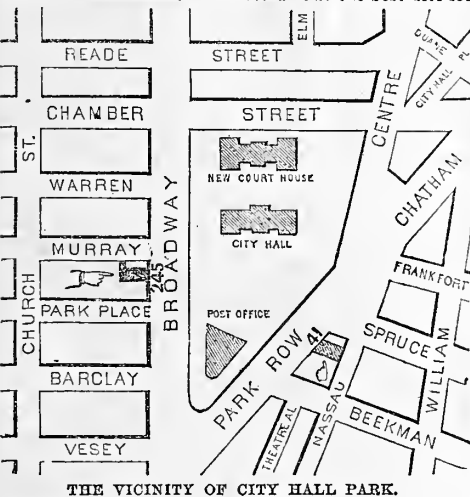

THE NEW STORE OF ORANGE JUDD & COMPANY, 245 BROADWAY, NEW YORK.

The New Building, 245 Broadway.

This month we present a "Basket Item" of unusually large size—a view of our present quarters. Last month's *Agriculturist* announced our intended removal, and the present issue dates from 245 Broadway. At the present time we feel like a boy with a new pair of boots, as we are undergoing the process of "breaking in." We shall, however, soon be at home in the new place, which is as far superior for our purposes to the old one, as that was to the quarters occupied in the early days of the paper.

In the *American Agriculturist* for October 1860, seven years ago last month, Mr. Judd wrote as follows:—"The friends of this journal will be pleased to learn that we have secured and removed into large and beautiful rooms, in one of the most eligible positions in this city." This was on the occupancy of 41 Park Row, as the office of the *Agriculturist*.

He little thought, at that time, that a change would be made so soon, but the increase of the business of the *Agriculturist* has required new partners and an enlarged working force, and now its necessities demand enlarged room. Since the time the above quoted remark was written, we have added an entirely distinct branch of business, that of book publishing, to that of the paper; this alone requires a large space, and removal became an imperative matter. The new store is a fine brown-stone building, directly opposite the old one, across City Hall Park. Every one at all familiar with New York knows that the Park is the center of the business part of the city, that it is the point of arrival and departure for most of the local travel. Indeed, so central is the situation that the U. S. Government has selected it as the best site for

the new Post Office soon to be built. The diagram will give an idea of the relations of our new building to the City Hall and new Post Office. Its situation is such as to face the open space between these two edifices, and is just below Murray-street, on Broadway. Our friends from abroad will have no difficulty in finding us, while the thousands of our city subscribers can reach us more readily than they could when on Park Row.

It will be seen, from the view on the opposite page, that the new store is five stories in height; it has a front of 25 feet, a depth of 114½ feet, with an L projection, which gives us a wide entrance on Murray-st., with a spacious basement extending under the whole. The front portion of the main floor is occupied as a sales-room for our large stock of Agricultural and Horticultural works, where we have ample room for this important and increasing branch of business. Farther to the rear are the subscription and other business desks, while the basement is devoted to the important work of folding and mailing the paper. The printers' room, engravers' room, and editorial "sanctum" are on an upper floor.

If the change to our new location has made this month's issue a few days later than usual, we trust that our friends will overlook it. We are sure that they will be glad to know that we have such ample facilities for serving them all the better hereafter. We do not entirely give up the old place, though it is leased to B. K. Bliss & Son as a seed store. We still retain there a desk for subscriptions, and a counter for the sale of our books, to accommodate those who find it more convenient to call there.

At our new home, we shall be glad to see all our old friends, and to make hosts of new ones, and we hope that to our increasing thousands of readers, 245 Broadway will become, as 41 Park Row has been, "familiar in their mouths as household words."

Fair at Staten Island.—The Richmond County Agricultural Society had their horse trotting show at the race-course of the Richmond Club, in Southfield.

Mr. R. W. Cammeron showed excellent Short-horn and Jersey stock. Mr. Saunders had a number of coops of poultry, including Brahmas, Buff Cochins, Houdans, Crevecoeurs, and Gray Dorkings of great excellence, also Bremen Geese and Aylesbury Ducks, and other good poultry was shown. The manager of the County Farm, (poor-house,) made a fine display of vegetables, grain, etc. The open selling of "pools" at the race-course was permitted as on any other race day, and the show was little besides a horse-race with plenty of liquor and its accompaniments. We plead in behalf of the farmers of Richmond County and their families for a festival free from these corrupting associations.

Justice to the Partridge.—When the cock partridge drums, standing upon a log, he does it by beating his body with his wings, as we knew from personal observation, yet we carelessly allowed an old and incorrect impression that he beat the log, to sway the pen, in the November number, and were not a little chagrined to discover the error too late to change it. We ask Mr. Grimes' pardon, and are much obliged to those friends who so promptly suggested that he had a right to demand the *amende honorable*.

The New York State Fair at Buffalo.—This was held from the 1st to the 4th of October, and, notwithstanding the jealousy of other parts of the State, and the location at the extreme west end of New York, was a marked success. Some 40 or 50 acres were inclosed for the exhibition, and ample provision was made for the feeding and shelter of the animals, and for the display of fruits and vegetables. The show of fruit was not what it ought to have been in Western New York, but was creditable, especially in the department of grapes. The Pleasant Valley Grape Growers' Association, from Hammondsport, had fine samples of wine, both bottled and in the original packages, and took the first premium. They exhibited eleven samples of wine and twenty varieties of grapes. The show of agricultural implements was particularly large, as might have been expected, and was some index of the rapid progress making in improved husbandry. Horse hoes and cultivators were of numerous and excellent patterns, and among the prominent exhibitors were F. F. Holbrook, of Boston, and Alden & Co., of Auburn. In Pennsylvania and the West, these have long been popular, and in New York and New England, they must soon drive out the hand hoe. If stones and stumps are in the way, they must be cleared out. The reduction in the cost of raising corn by the use of these implements is so great that no farmer can afford to do without them. Gov. Holbrook's Universal Plow attracted much attention. They are in various styles to admit of different kinds of work. Each plow changes its mold-board for stubble, for sod, and for subsoil plowing, and for turning flat and lap furrow slices. This saves both the money and the time of the farmer. An admirable feature of the fair was the arrangement for addresses and discussions. Too often the evenings of the fair days are lost. Thousands of people come together to learn, and there is no suitable opportunity for the interchange of experience. The show of ideas is always the best part of an agricultural fair. Maj. Brooks' address upon the apple, and the discussion that followed, were worth far more to the public as an incentive to apple growing than the whole show of apples upon the tables. The attendance upon the great day of the fair, Thursday, were estimated at 35,000, and the receipts for the whole four days were \$21,500, which is said to be more than has been taken in any year since 1859, at Albany. This vindicates the wisdom of our Buffalo friends in insisting upon having the fair there. We hope it paid them as well as the society.

Sheep in Oregon.—N. O. This promises to be one of the best wool-growing States. Sheep are very healthy, and the wool is of excellent quality. Crosses of the South Devon and Merino are abundant, and sell for a little over a dollar a head. Six woolen factories are established, or under way, in the western part of the State.

Weight of Merino Fleeces.—In a recent number of the *Country Gentleman* a report is given of a public shearing this spring, under the auspices of the Springfield, (Vermont,) Agricultural Society, which took place April 25th, and is remarkable for the great weight of cleansed wool reported as yielded by some of the animals. The sheep were all merinos or merino grades. One two-year-old ram, weighing 116 lbs., sheared 17 lbs. 8 oz., which, cleansed, weighed 7 lbs. 8½ oz.; fleece 369 days old. Another, two years old, weighing 120½ lbs., sheared 18 lbs. 8 oz., which cleansed 6 lbs. 12 oz.; 355 days old. A four-year-old, weighing 123 lbs., sheared 20 lbs. 8 oz., cleansed 6 lbs.; 365 days. Not less remarkable is the weight of cleansed ewes' fleeces, of which the heaviest three weighed 5 lbs. 14½ oz., 5 lbs. 1½ oz., and 4 lbs. 11 oz. The average shrinking of rams' fleeces was 67.76 per cent.; that of ewes' fleeces 51.32 per cent. Why have we not

reports of equally heavy fleeces where different breeds and families are shorn in competition? Part of the fleeces were cleansed at one mill, but, on account of a misunderstanding between one of the committee and the proprietor, they went to another factory to have the rest cleansed. It would be interesting to know, in connection, which fleeces were washed at the first mill.

The Agricultural College of Pennsylvania.—The circular of this institution has been sent to us, containing its programme and list of officers. We are glad to see in the faculty a number of men who have a well established reputation, and as the college seems to have made an effort to become a first class institution, we wish it all success. We are quite surprised to read one thing, however. The circular says: "For the benefit of the farming community, an Agricultural Journal, under the editorship of members of the College Faculty, will be commenced in the course of the current year. In the journal will be published the experiments made at this college." Now we advise the "Board of Trustees" to consider, in the first place, how much money they have to lose in amateur publishing, and whether, with the extensive courses laid down, their professors have not quite enough to do without editing a paper. If the professors have anything to say that is of value, there is no lack of channels of communication by which they can reach the public much more effectually than by any publication like that proposed. We advise the trustees to confine their "experiments" for the present to the establishment of the college in the favor of the people of Pennsylvania, before they experiment in journalism.

The Drought at the West. has been very severe. They are shipping stock hogs from Illinois to Western Missouri, on account of the scarcity of corn. The estimate of the Agricultural Bureau is that Illinois will be 14 per cent short of the previous year, Indiana 17, Kentucky 28, and Ohio 30. These are the great corn-growing States, and the large crops of the Southern States will hardly make good the deficiency. Corn was worth 20 cents a bushel more in Cincinnati than in Nashville October 1st, and this difference in price led to large shipments.

Wheat on Wet Land, Drained.—Wet clay lands, when drained, make the best wheat lands. In mucky soils, the plant, especially the winter varieties, would not probably do as well, as the surface would sooner feel atmospheric changes. Spring wheat does well on black prairie soils where winter wheat fails, and we should not hesitate to try that variety on reclaimed swamp, if thoroughly dry. The wheat should be sown early in the spring, before the deep frost is out, even if you have to get it in with a harrow. Early sowing is regarded as a matter of the first importance by those who have thoroughly tried it.

Rye for Spring Feed.—The sowing of rye early in the fall, for this purpose, is quite common at the West, and can be introduced with advantage in all the dairy districts. The rye can be sown among corn at the last hoeing or cultivating, and still later, by plowing specially for the purpose. It starts very early, and gives the cows their first bite of green fodder in the spring.

New Jersey State Fair.—The State Agricultural Society held its exhibition at its new grounds, at Waverley, midway between Elizabeth and Newark. We have rarely seen grounds better adapted to such purposes. They are gently rolling, include a grove, a beautiful lake, and a hill of considerable height, upon which is level land enough for the exhibition tents and buildings, and where everybody can see the whole trotting course, and all the rest of the show. The future exhibitions, if well managed, ought to be among the most interesting people's festivals of this part of the country. The show was a very pleasant one to visit, but very small. The Jerseys were the only breed of cattle present in any force, and of these there were very fine specimens. The show of poultry included most excellent Rouen Ducks, Black Polands, White Dorkings, very good Brahmas, Black Spanish, and Silver-spangled Hamburgs, and other varieties above mediocrity. There was one hog and six sheep. The horticultural tent, in charge of Mr. P. Quin, was arranged with great taste, and contained a very fine display of pears. Other fruits, flowers, and vegetables were good, and all were well labelled. The other departments of the exhibition contained, of course, much to instruct and interest, and would compare favorably with a good county fair in New England, New York, or Ohio. We were interested in a Buckeye Mowing Machine, shown by the President, which has been in use ten years on his farm, cutting, annually, over 100 acres, and having, as he testified, required but \$5.85 for repairs. Of one thing we think the public have a right to complain, and that is the almost entire absence of the names and

addresses of exhibitors attached to the articles of most interest to farmers. This forced some of the exhibitors to withdraw their articles from competition, in order that they might display their names. This is done, we suppose, to make the judges honest. Well—they know their men probably; other societies appoint as judges men they think they can trust. At any rate, a great part of the interest and value of the fair, both to the public and to exhibitors, is thus lost by the suppression of the names even of successful exhibitors. The practice is all wrong.

The Ohio State Fair, held at Dayton, the same week, was in almost every respect a splendid success. It came much nearer to our ideal of a State Fair than anything we visited the present season. The grounds were so near the city that almost every one could walk, and most people preferred walking to the exactions of the hackmen, who were only half as brazen as their thrifty cousins of Madison. The grounds, belonging to the Montgomery County Agricultural Society, were ample, embracing forty-six acres, and were fitted up with everything needed except water, which was so poorly distributed that multitudes suffered from thirst, and other multitudes were driven to the drinking saloons. There were 104 sheep pens, 70 for swine, 200 stalls for horses, 45 for mules and horses, 102 for cattle, and these were nearly all full. The show was worthy of a great Agricultural State. The poultry pens were not full, and the show was not very good. The select breeds may not have had their day, but they do not make much sensation at the fairs. Horticultural Hall had a good display of fruit, though it was not so full as we had anticipated. Apples were very fair, what there were of them. These were mostly from the northern part of the State, where this fruit is quite abundant. In other parts, the crop has been injured by the drouth. Grapes were more abundant than any other fruit, and in these the fruit growers of the Lake Region bore off the palm. There was a good show of vegetables, and the potatoes, as was meet, took the front rank. L. D. Scott & Co., of Huron, exhibited a large number of varieties, and had 71 named sorts, which they offer for sale. This is a little too much of a good thing. We are glad to see, however, that our gardeners are not content with the old favorites, most of which are hopelessly diseased. The display of agricultural implements was large, as might have been expected in this great State. Mowing machines and reapers, horse hay rakes, plows and grain drills, covered a large area, and men who appreciated their excellences were generally on hand to explain. Conspicuous among these for its perfect finish was the Champion mower and reaper, a self-raker, which passes the bundles off of the apron of any desirable size. There were several patterns of self-rakers upon the ground, and this is getting to be a very necessary attachment to the reaper. It saves greatly in labor, and is one step in the right direction. The machine will not meet the wants of the harvest field until it binds the bundles. Besides these, there was an almost endless variety of contrivances for aiding the housekeeper's work, washing machines and wringers, fruit dryers and clothes dryers, all very ingenious and helpful to human muscles. The house will soon keep itself, and go by steam, if Yankee wit can accomplish it. It was a goodly sight to see the tens of thousands swarming here, and enjoying the show beneath the shade of the grand old trees. There could not have been less than fifty thousand people in attendance, and the receipts were over \$20,000. The managers certainly know how to get up a fair, and we congratulate them upon their success.

The Wisconsin State Fair was held at Madison, the capital of the State, on the 23d, 24th, 25th, 26th, and 27th of September. In location nothing can be more charming than this city, on high land between two crystal lakes, overlooking them both, and a wide sweep of territory beyond. The view from the top of the State University is one of the finest in the West. The fair grounds are just on the edge of the city, perhaps a mile from the center, and about the same distance from the depot. The omnibus drivers charged fifty cents for this brief distance, which we should have considered extortion, if we had been obliged to pay it; but, being blessed with an excellent apparatus for locomotion, we fell back upon Nature's own, and went up to the show, independent, with mild meditations upon human nature, and without putting down the hackmen of Madison among the "extortioners and unjust," where they, no doubt, belong. The fair grounds were admirably arranged, and the stables and pens for the accommodation of horses, cattle, sheep, and swine, all that could be asked. The fair ran quite too much to horse flesh. Premiums of \$100 to \$300 for fast horses, and only from \$30 to \$25 for cattle, are out of proportion. We like to see Short-horns put upon the same footing with Black Hawks, and swine and sheep fairly encouraged. Large halls were put up for the display of horticultural products, and for domestic goods and the fine arts. The show of agricultural implements was uncommonly good for so young a State. Among the

best things on exhibition in this department was a binder, attached to one of Marsh's reapers. It is the invention of S. D. Carpenter, of Madison, and represents five years of hard work to bring it to perfection. The straw is cut, passed up on an endless apron to the back part of the machine, where it falls into a hopper, and when a sufficient quantity is gathered, it is bound with a wire, and thrown out behind. It is a self-raker and binder, and in addition to this, saves in the hopper several bushels of seed daily, which is lost in the ordinary mode of gathering. A pound of the annealed wire, costing twenty-five cents, will bind about 800 bundles. As it takes about eight men to rake and bind after a reaper, this machine must save the farmer about \$16 a day. If this machine works as well as it promises, it cannot fail to make a revolution in the harvest fields of the West, almost as great as the introduction of the reaper itself. It ought to make flour a good deal cheaper. The West is making rapid strides in the improvement of agricultural implements, and will soon drive the Eastern manufacturer out of its markets. The receipts of the fair were about \$10,000, and were quite satisfactory to the managers.

The Michigan State Fair was held at Detroit from the 10th to the 13th of October. The vicinity of a large city, and the ease of access by rail and steam, and the fine weather, conspired to make the attendance large. Had there been better facilities for reaching the ground from the city, the multitudes would have been much greater. By water, old tugs and propellers of the most moderate speed were employed, and by land, horse railroads running half way, and omnibuses the other half. A little more enterprise would have put the rails up to the grounds, and accommodated everybody. With all the defects of arrangement and of material, there was a grand show, and the people were paid for going. The representation of horses eclipsed everything else upon the ground, and shows the continuance of the horse fever. There were 200 stalls for horses, and 300 animals in them and outside. There were only 90 for cattle, and 144 for sheep and swine, and many of these were empty. The racing was quite too prominent, and attracted the principal attention. Large numbers of light horses, whose chief excellence was speed, were exhibited, and the fast men had it on the track their own way. There were, however, some good farm and carriage horses, by whose legitimate use a farmer could make much more money than by betting. In the cattle pens, the Devons were well represented. Mr. Cole, of Batavia, N. Y., showed a herd of them, and there were about fifty in all. Mr. Cole took six of the prizes. There were several very fine Short-horn bulls, and some showed their offspring in adjoining stalls, which was a very good feature. David Uhl, of Ypsilanti; H. A. Pillotson, of Marshall; T. Dinsmore, of Danville; P. C. Bush, of West Jersey, were among the exhibitors in this department. The Michigan State Agricultural College showed a Galloway Bull, weighing 1,900 pounds, and several other good animals. The feature of the cattle stalls, however, that attracted most attention, was a lot of eighteen fat cattle, exhibited by Wm. Smith, a west-end butcher of Detroit. They were gotten up for the occasion, and were manifestly a butcher's ideal of what a ripe beef ought to be. They were triumphant animals, and we all enjoyed the sight, and Mr. Smith as much as any of us. They were grand to look upon, but we thought a little too fat to eat, considering them from the consumer's point of view. The same gentleman also made a fine show of Suffolk pigs. The Chester Whites were well represented, and there were specimens of the Essex and the Berkshire. There were many more of the long-wool varieties of sheep than we expected to see—Canada was on hand with her Cotswolds and Leicesters, and the show of these animals was one of the best we have ever met with. Even the Southdowns outnumbered the fine wools. We ought not, perhaps, to infer from this that the fine wools are on the decline, but that mutton sheep are better appreciated. The show of agricultural implements was uncommonly good. In this department alone there were 478 entries. The fruit was not at all up to the mark, though there were some fine grapes, and specimens of apples and pears. We have seen a better show at County societies. In the hen coops there was abundant evidence that the hen fever has subsided. There were a few good Brahmas, and these fowls seem to be at all the fairs the most popular of all the Asiatic importations. There were quite too many small shows, monkeys, cross-eyed puppies, fat women, and things of that sort, to suit the public convenience. The room was needed for something else, and the time and money spent on malformations were wasted. The receipts at the gate were about \$10,000, and from other sources, we understood, nearly enough would be realized to cover expenses.

The Kentucky State Fair was held near Louisville, at the grounds of the Louisville and Jefferson County Association, about three miles from the

edge of the town. Some forty acres or more had been enclosed with a fence, embracing among other fixtures an old farm-house with its accompanying buildings. A few of the primitive forest trees were still left, and other fruit and ornamental trees adorned the grounds. A large amphitheater, capable of accommodating ten thousand or more people, was admirably arranged for the display of horses and other stock. The ring was well lined with tan bark, and here the famous horsemen of Kentucky displayed their not less famous steeds. This was the chief attraction of the fair, as might have been expected, and though not at all to be compared with the displays before the war, as we were informed, was still very fine, and well worth the journey of a thousand miles to see. There was much less trial for speed than we had expected to see. The judges occupied the center of the ring, and the competitors for the premium drove or rode their horses round the track, under the direction of the judges, until they were satisfied. The object seemed to be to display the action and all the good points of the horse as well as his speed. The audience took a lively interest in the awards made, and announced their approbation with loud acclaim if they were pleased with the decision. The points of a good horse are so well known and appreciated in this State, that the audience almost invariably decided with the judges. We like this association of the people with the verdict of the judges. It is eminently fair, it fixes the attention, and improves the taste of the multitudes who come to the exhibition for the purpose of learning something useful. We understood that the merits of the neat stock were decided upon in the same way, though we were not present on the first day of the fair, when they were exhibited. This confining of the show cattle to a single day is not a good arrangement. The majority who attend a fair can go only one day, and they want to see every department well represented. Arrangements should be made to keep all the animals upon the ground until the last day. A few good Short-horns were exhibited, but the display was not at all what the State ought to have afforded. There were a few good pens of Long and Middle Wool sheep. The show of swine was small. The arrangements for exhibiting them were not good. There was a great want of good pens, both for sheep and swine. The show of fruit, though small, was of superior quality. C. C. Cary, H. S. Duncan, and L. Young were prominent among the exhibitors. The fruit of Mr. Young was not only very fair, but of high color, said to be secured by enclosing the specimens in muslin, while ripening upon the tree. This enhances their value for show, but would hardly pay for market purposes. The peaches were magnificent for size, and in quality superior to any thing grown upon the sea-board, where the excessive rains of the season have made all peaches deficient in flavor. Specimens of the White Head Heath and of the Grand Admirable, both clings, were about twelve inches in circumference. There appeared to be a considerable confusion in the names of the pears, but that difficulty time will remedy, especially if the society follows the very good practice of distributing standard books upon fruit growing for premiums. Although the arrangements for reaching the fair by railroad were very good, the attendance was quite limited, showing that the State has not yet recovered from the effects of the war. There were probably not more than five thousand people present on the best day of the fair. But these were Kentuckians, fine specimens of men and women, that would have made any fair a success. When the next one comes off, may we be there to see.

Nijni-Novgorod Fair—Moscow—General Notes about Russia.

[Our readers will doubtless be interested in the following extracts from Mr. Judd's home letters, the first dated at Nijni-Novgorod, August 24th. This place is on the Volga River, near the eastern boundary of Europe, in latitude 56° north, and longitude 44° east of Greenwich, or 113° east of New York.]

.... "If Americans generally knew how easily and cheaply one can travel, more of them would visit the Old World. The money that many families expend on extra carriages, furniture, and dress, during a year or two, for mere show, would pay the expenses of a trip across the Atlantic, and a considerable distance into the continent. If many of those who do come knew how comfortable and convenient are the traveling facilities, they would not stop merely at London, Paris, and Switzerland, but would strike farther east, and get a glimpse of the Oriental people and customs. I am now nearly seven hundred miles east-southeast of St. Petersburg, and have with me a lady, and children of 8, 11, and 13 years of age, and we have come the last 700 miles with just as much ease as in traveling the same distance anywhere in America, and with better facilities for obtaining good food at the rail-road stations than we should find thoro.... Here we see a condens-

ed picture of eastern manners or customs. At this point, or near here, for 500 or 600 years past, there has been an annual fair, lasting from four to six weeks, at which the people of the East and the West have met for the sale or exchange of their respective productions and manufactures. The great Volga River, as you will see by the map, empties into the Caspian Sea, 1600 miles below this point. That sea has no outlet to the ocean for communication with the outer world; so the various peoples and tribes around the Caspian Sea, as well as the Chinese, from the east, and the Siberians, from the northeast, or northern Asia, bring their products here, and meet the western people, who bring their goods from Western Russia, Germany, France, and Great Britain. The sales amount to from \$70,000,000 to \$100,000,000 worth annually. The River Oka, from the west, here unites with the Volga, and the locality of the fair is on the point of land between the north shore of the Oka and the southwest or right bank of the Volga. The city of Nijni-Novgorod is on a high bluff, between the Volga and Oka, on the south side of the latter. The rivers are full of boats of all descriptions imaginable, many of which have been poled up the whole length of the Volga. From the tower on the bluff, I can, at one view, see thousands of these boats, many of them landing or taking in merchandise. For three or four miles up the right or west bank of the Volga, there are immense piles of goods, covered with mats or skins. I never before saw such quantities of merchandise collected in one place; it is as if you should remove all the buildings in New York, and expose the contents upon the banks of the rivers. The bales of cotton and hogsheads of sugar, (beet sugar from Europe,) seem innumerable. The trading ground consists of hundreds, perhaps thousands, of one-story bazaars, arranged along regular streets, running at right angles. Each nation has its own quarter, or streets, but during the hours of trade the different peoples are of course much commingled. Each nation adopts its own peculiar style in the construction and arrangement of the bazaars. In the Chinese quarter, for example, all the bazaars are in the pagoda form, and all the people coming here retain their peculiar modes of dress. As we walked around the fair, our intelligent polyglot guide pointed out the different races, and interpreted for us as we chattered and made some small purchases as souvenirs of our visit. Here were Siberians with minerals, precious stones, furs, etc.; there were Chinese, with their stocks of Oolong and Souchong, their ivory and wood work, cloths, silks, etc.; here were Persians, with their richly wrought gold and silver fabrics; there were Tartars, Kalmucks, and so on—an endless variety—Georgians, Circassians, Caucasians, Cosacks, Arah, Armenians, Syrians, Turks, Russians, Germans, French, English, etc., etc.—making all together the most novel gathering in the world, I suppose. The jargon of languages scarcely falls below what must have been heard around the tower of Babel itself. These fairs usually extend from July 23d to September 23d of each year. The second class fare, (fully equal to the American first class,) by railroad, from St. Petersburg to Moscow, (400 miles,) is 13 Roubles; and from Moscow to Nijni-Novgorod, (273 miles,) 9¼ Roubles. A Rouble of Russian paper money is at present worth about 63 or 70 cents of American gold, or a little less than \$1 of United States currency. The Rouble is divided into 100 Kopecks, so that the Russian Roubles and Kopecks correspond with our dollars and cents, but 5 gold Roubles are just about equal to 4 gold dollars, when the paper money of both nations is on a par with gold."

"Moscow, Russia, August 26th.... Taken all in all, this is the most interesting city we have visited. We have been out to the 'Sparrow Hills,' two or three miles west, on to the high ground, where Napoleon's army, in 1812, caught their first glimpse of the city, after the long, tedious march of more than a thousand miles, the latter part of it fighting their weary way over the vast plains of Lithuania or Western Russia. No wonder the poor fellows shouted in wild delight, 'Moscow! Moscow!' Few of them lived to carry home the vivid impression made upon them by their first view of the goal of their toilsome pilgrimage.... The view from these hills is grand, glorious! Spread out over a wide plain, which is encircled by the serpentine Moskva River, lies the curious city of 460 churches, mostly with green roofs, and each surmounted by from one to a dozen domes or minarets. Of these domes I counted 506, visible from one point. A large number of them are covered with gold and silver, and the reflection of the setting sun gives a resplendency excelling my highest previous conceptions of even the 'new Jerusalem' itself!.... Near the center of the city is the far famed Kremlin. This is a semi-circular space, enclosed by a high wall, nearly 1½ miles in length, surmounted with curiously shaped towers, a hundred yards or so apart, besides which there are five large gateways. Within this wall are the three ancient palaces, the treasury building, four gorgeous churches, the high tower of Ivan Veliki, (John the Great,) at the foot of which is the Great Bell or Isar Kolokol, (Isar of bells.) Within the

Kremlin, also, is the arsenal, around the outside walls of which are arranged over 800 cannons, the trophies of war—a larger part of them taken from or left behind by Napoleon; the Senate House, some smaller buildings, and paved open spaces fill up the rest of the Kremlin. The treasury building contains an immense amount of curiously mingled gold and silver plate and precious stones, presented by the sovereigns of many nations, the crowns, and thrones, and regal insignia, not only of ancient and modern Russia, but of captured and subjugated nations, as Poland, Kasan, etc. The larger one of the three palaces, built by the late Emperor Nicholas, excels even the palaces of St. Petersburg and Paris, in the gorgeous decorations of some of its larger rooms. Of the four Kremlin churches, the Cathedral of the Assumption, where all the emperors of Russia have been crowned, is the most noted. Its walls, its ceilings, and even its interior columns, are entirely covered with richly gilded paintings, most of them full size portraits of prelates of the church, saints, and scripture characters. Standing within the great nave, one has peculiar sensations when he finds himself thus gazed upon, from every point above and around, by so many renowned personages, whose real presence is so well represented by the artist's brush and pencil. In the second church, St. Michael's Cathedral, the main floor is largely occupied with the tombs of the Emperors down to Peter the Great, since which time they have been buried at St. Petersburg. In the third, the Cathedral of the Annunciation, the Czars have long been baptized and married. The floor is paved with jasper and agate. In the fourth church, the Metropolitan, is manufactured the holy oil which is distributed throughout the empire, and which is used in the baptism of every child born in the Greek or National Church. In this cathedral, also, is shown a great number of robes, mitres, diadems, etc., wrought with costly pearls, diamonds, and other precious stones of untold value. One robe alone contains over 50 pounds weight of these precious stones and gems. These few items must suffice to give you a faint idea of the immense treasures contained within the Kremlin. The great bell is worthy of its name and fame. It is now raised upon a circular stone wall, five feet high. Its proportions are perfect, its height over 20 feet, and I measured 63 feet around its base. (To get a full idea of its size, drive down a center stake, and with a cord, 11 feet long, as a radius, mark out a circle 22 feet across. A 20-foot pole, set up in the center, will help the conception of its great size.) It weighs 441,000 pounds, or 222 tons! A fragment, about 7 feet high and 6 feet wide, is broken out of the rim, and stands down against the wall, so that by climbing upon the wall, one can walk in through 'the crack of the bell,' as it is called. The Ivan Veliki tower, from which one has a good view of all the city, contains 40 bells, one of them half the size of the great bell, and others of somewhat smaller proportions. The chiming of only six of these, of medium size, produced painful emotions in our heads, and gave a benumbing jar to the whole body.... Some distance outside the Kremlin wall is another, the old city wall, and beyond this, the city extends two to three miles each way from the center. There is everywhere an odd commingling of spacious public and private edifices, and the mean abodes of the poor. Log structures, neatly framed and trimmed at the corners, however, are frequently seen within the city. There is everywhere an ancient air and slowness of movement, with beggars and people in rags, unpleasantly frequent—quite different from the thrift and activity visible at St. Petersburg."

"St. PETERSBURG, August 29th.... Of this city I have already written somewhat. Returning here two days since, we have been around the public parks, and to Peterhof, etc., and my first impressions of the city are fully confirmed. Taking into account its inland position, its high northern latitude, its comparatively recent foundation, and the natural difficulties to be overcome in its low alluvial soil, it is a marvel of enterprise, unequalled elsewhere in the world! The palaces and public buildings are spacious, and exhibit within a solid magnificence hardly to be found elsewhere in Europe—not even in Paris. With a continuance of the policy and plans of the present Czar, Russia must continue to advance rapidly in civilization and refinement. The education of the masses now emerging from slavery and serfdom, and a shaking-off of the more superstitious or idolatrous rites and ceremonies of the established church, are most needed, and the tendency is in this direction. Great freedom of religious belief and worship is already granted, and education is making rapid strides."

GENERAL NOTES ON RUSSIA.... "GRANITZA, South-western Russia, August 31st.... During the last two days, we have come down from St. Petersburg, nearly 800 miles, to this point, stopping only a night in Warsaw, as the cholera is somewhat prevalent there. I am now awaiting the train that will take us across the Austrian border, and out to Cracow, to visit the salt mines.... I have traveled over 2000 miles in Russia during the present month—with all the ease, comfort, and convenience, and with as much

personal freedom as I have ever found in America or Western Europe, and any American can do the same. The espionage of our passports and luggage has been merely nominal, and at only two points—viz.: on entering Finland, and on passing through Warsaw.... European Russia, throughout, is more level than I expected to find it. In its general surface it corresponds with our Western prairies, but is generally covered with forests where not under cultivation. The trees are mainly white birch, spruce, and pines, though other kinds are frequently met with. From St. Petersburg, via Moscow, to Nijni-Novgorod, I estimate that about half the land visible from the railroad is under cultivation. From St. Petersburg southwest, for the first 400 miles perhaps, one third of the country is still in forests. Russian Poland is almost one vast fertile field. Wheat is the staple crop everywhere, though pasture lands abound on the route south-east from St. Petersburg. Highly fertile soils are apparently of rare occurrence, and pine lands of a somewhat sterile character are frequent; yet, on the whole, I judge that four or five times the present population could be readily sustained with improved modes of tillage. There are many indications of the introduction of a better class of agricultural implements, and I believe American inventors and manufacturers will find in Russia an excellent opening, not only to improve their own financial interests, but to benefit this country as well. The hand sickle, everywhere seen in the harvest fields at this season, as well as the rude hay scythe, will readily yield to the mowing and reaping machines; and the same may be said of the rude plow and other implements. The policy of the government is liberal towards all foreign improvements.... The relics of serfdom are everywhere visible, though rapidly dying out. As a rule, the small huts of the serfs are gathered in clusters or villages around or near the more stately dwellings of their former proprietors, and the smaller or larger Greek church, with its green roof and gilded dome, is close at hand. The liberated serfs generally work for their former masters, a part of the time at least, at mutually agreed upon wages, though every one is at liberty to go and come at pleasure. Mutual interest is at present the only bond that keeps these people in their original localities. Each peasant is allowed a plot of ground of his own, in fee simple, and without any payment except the past services of himself or ancestors, and each can purchase as much more as his accumulated earnings and savings supply the means for. Schools are opened in most of the serf villages. As far as I can gather from observation and from frequent conversation with intelligent Russians, I judge that the political and educational condition of the Russian people is being rapidly assimilated to that of our own country, though, of course, still far behind us in the degree of advancement. A generation or two will do much to lessen the difference. I look forward to the period as not far distant when Russia will become, in many respects, the United States of the Old World...."

The Use of Plaster on New Land.

The announcement in our August issue, in an article on "Top Dressing Grass Land," that two bushels of plaster produced over two tons of hay, by a accurate measurement made at the State Agricultural College of Michigan, took most of our readers by surprise, and awakened in others a strong feeling of incredulity. The sentiment was not much softened by the statement that the cuttings were made twice a year, and the experiment extended over two seasons. We are not surprised at this, for we have used plaster by the sea shore, without the slightest perceptible effect. This is the general testimony of sea shore farmers. Probably, the soil gets gypsum, or its equivalent, from the sea manures so commonly used near the shore, or blown inland from the sea itself, for sulphate of lime is contained in sea water. In the grazing districts, remote from the shore, on the contrary, plaster is highly valued, and produces wonderful results, even when applied at the rate of one bushel to the acre.

Michigan is greatly blessed in its supplies of plaster. Besides the extensive deposit at Grand Rapids, a new bed has recently been opened at the town of Alabaster, in Josco County, on Saginaw Bay. This deposit has remarkable facilities for quarrying and marketing. It lies immediately upon the shore of one of the best harbors in the State; it has no overlying rock, and

but little earth to be removed above it; it is split into small masses, making a great saving of labor and powder; it is of remarkable richness and purity, and is practically inexhaustible. Prof. S. P. Duffield, of Detroit, has analyzed it, and gives the following results: Lime, 36.08; Sulphuric Acid, 54.25; Water, 8.89; Impurities, 0.78. The use of plaster in this State is rapidly on the increase, as its value becomes better understood. About 14,000 tons from the mine referred to were sold last year, and the sales are much larger, thus far, the present season. We have seen the idea advanced that the use of plaster is likely to exhaust soils. There is very little ground for this fear, though the use of small quantities annually, without other manure, and without proper tillage, would tend finally to exhaustion. In plaster we add only two articles of plant food, namely, lime and sulphuric acid. The effect of plaster upon the soil is said to be stimulating, that is, it enables larger crops to be secured, than could be removed otherwise, without the use of much manure. With these large crops much plant food is taken from the soil, and in time this will tell against the land, if it is not in some way made good by manure. It is found that grazing lands are for many years increased in productiveness by its use. The plaster brings in clover, and stimulates the growth of all the grasses. Exhausted lands have been brought up to a high state of productiveness by the use of plaster and grazing alone. The roots of the plants strike down into the soil with greater vigor, and a good portion of the inorganic matter of the soil, which would constitute their ashes, if burned, is returned to the land in the droppings of the stock. Over a very large portion of our country, remote from the sea, plaster is no doubt the cheapest fertilizer that can be applied to pastures. It is easily transported, and a small application of two bushels to the acre broadcast on the surface has usually all the immediate effect of a much larger quantity.

The Side-hill or Swivel Plow.

This implement, invented to avoid the difficulty of turning furrows up hill, is likely to be as great a boon to the plain as to the hill-side. It affords great facilities to the farmers who have uneven soil to cultivate. The plow turns on a swivel at the bottom, and the mold-board may be changed in a moment from one side of the team to the other, and held tight to its place by a hook. Any plowman can do this while the team is turning round at the end of the furrow. The plowing is begun at the bottom of the hill, and the furrow is turned alternately to the left and to the right, as the team moves back and forth. All the furrows are turned down hill, and the surface is left smooth as upon the plain.

In plowing level land in the ordinary way, we have the disadvantage of making dead furrows in the middle of each land plowed, and at the diagonal lines where the team is turned. These dead furrows yield scanty crops, and are unpleasant obstructions to the mower and reaper, besides marring the beauty of the meadows. They may be mainly avoided by the use of a swivel plow. With this, you begin at one side of the field, and plow the whole length, turning all the furrows in one direction. At the next plowing you begin where you left off, reversing the furrows, and leaving the field as level as be-

fore it was plowed. All dead furrows are avoided, and time is saved in the turning of the team at the ends of the lands. These plows are exhibited in much larger numbers at the fairs, and are coming rapidly into favor. They are made of any desirable pattern, embrace most of the good points of other plows, and have the advantage of turning the furrow to the right or to the left, according to the wish of the plowman.

The Manufacture of Fish Oil and Guano.

The use of fish as a fertilizer in this country is of early origin. The Aborigines are said to have understood their value and to have applied them to the old fields where they raised their limited crops of Indian corn. The colonists along the shore began to use them as soon as their exhausted farms showed the need of fertilizers. Large seines were owned by companies of shore farmers, and every interval in the

GROUP OF MENHADEN.

cultivation and gathering of their crops was improved in fishing. The fish were applied to the land broadcast, and either immediately plowed in, or left to decompose upon the surface and to be turned under in the fall. This was a very wasteful process, but it produced such wonderful effects upon the crops that every farmer within reach of the shore was eager to secure fish. It was not, however, until a very recent period that the attention of the fishermen was turned to the value of the oil. Perhaps the waning of the whale fishery and the increasing price of the oil first suggested the idea of extracting the oil from the fish commonly used as fertilizers.

The *Alausa menhaden*, of Mitchell, known under the various names of Bony-fish, White-fish, Moss Bunker, and Menhaden, swarms along our coasts from the Carolinas to Maine, in immense shoals, numbering millions. The average weight is about a pound, being lighter in the spring and heavier in the fall, when they are most valuable for the manufacturer's purpose. Other fish are frequently caught in small numbers in the seines, such as blue-fish, mackerel, bass, sturgeon, shark, and stingrays. Those which are not valuable for food are thrown into the common mass and pass through the factory. As fish guano is rapidly coming into use and is considered one of the best of our fertilizers, it will be interesting to our readers to learn something of the process of manufacture, and of the statistics of the business. Let us look in upon one of these establishments. Here, on the Long Island Sound, are plain substantial buildings, sheds, boilers, tanks, railways, and the boats and seines necessary for carrying on the business. The fishing is a business by itself. The company furnish the

boats and seines, and take one-half of the catch of fish as a compensation. The rest they purchase at the market price, which is from \$1.50 to \$3.00 a thousand, according to the season. As the yield of oil is four or five times greater in the fall than in the spring, the fall catch is much the more valuable to the manufacturer. As the factories are usually established near each other, the fishermen have the advantage of competition and fair prices. This company employs four gangs of men with five boats to each. The seines used are from six to seven hundred feet long, and from eighty to ninety feet deep. With such a breadth of net-work, it is easy to surround a large shoal of fish and capture them in the midst of the Sound. The seines are contracted at the bottom after the fish are surrounded, and all escape is prevented. When the fish are drawn into a sufficiently small compass, they are thrown into the boats with scoop nets, and the whole catch is carried to the factory. Here the fish are transferred to a carriage upon a rail track upon which they are drawn directly to the tanks, into which they are dropped for the purpose of steaming. The tanks hold about 20,000 fish each. The fish are covered with water, and the steam is let on by a pipe at the bottom of the tank. After cooking $\frac{1}{2}$ of an hour, the water is drawn off and the fish are put into cylindrical curbs, made of $\frac{1}{4}$ -inch boiler iron, lined with stout wooden slats, and placed within a hydraulic press of 1200 tons capacity. A curb holding 3000 fish is deprived of its oil in about five minutes. The average yield of oil is from 4 to 6 gallons a thousand. The mingled oil and water from the fish is conveyed by gutters from the press into a large wooden tank,

where, after settling, the oil is skimmed off and conveyed by a pipe into the bleaching tanks, holding about 200 gallons each. Here it remains about 24 hours exposed to sun and rain, which makes it of a lighter color. It is then drawn off into the casks in which it is sent to market. At the bottom of the bleaching tanks a substance remains called "gurry," which is used for making a coarse kind of soap, chiefly employed in factories for cleansing wool.

The refuse thrown out from the curb is pressed a second time, and is then carried to a shed where it lies in a large heap until the fall or winter, when it is barreled or bagged for market. The barrels hold about 250 lbs. of the green scrap, and are sold by this weight, though they grow lighter by the evaporation of water.

This company also prepares a fine ground article by the following process. The green scrap is taken immediately from the curb and thrown into a picker making 1600 revolutions a minute, where the flesh and bones are torn into very fine shreds. It is then spread upon a platform a hundred feet square, and exposed to the sun and air until it is dry. By this process about forty per cent. of the weight is evaporated, and the mass is nearly pure flesh and bone. It is then put into a mill and ground very fine. This makes a concentrated fertilizer of great value, admirable for drilling with the seed.

There are about one hundred of these fish oil manufactories along the coast from Newbern, N. C., to Mt. Pleasant Bay, Me., producing not far from 30,000 barrels of oil, worth about a half million of dollars, and about 20,000 tons of guano, worth nearly as much more. It is a thriving and increasing branch of our industry, and as it is immediately helpful to good husbandry, we wish it the best success.

Flying Quadrupeds—Bats.

These little animals, which are more innocent and friendly in their relations to mankind than any other of the untamed species with which we are acquainted, are unfortunately very commonly regarded with a sort of superstitious dread, or, at least, strong antipathy. No one can accuse them of any evil deed. They require, although small, a large amount of food, and, living entirely upon insects, which they take upon the wing, are the means of destroying vast numbers of the most annoying kinds. They fly in the night, or dusky twilight, and so are especially the foes of mosquitoes, which they often follow even within our dwellings. Bats belong to the class *Mammalia*, because their young are born alive, and are suckled. Their anatomical structure is very peculiar and interesting, and they are possessed of some most wonderful faculties, especially an acuteness of the senses of smell, feeling, and hearing, which renders the deprivation of sight, as it would seem, of comparatively little moment. They all have small, clear, beadlike eyes, with which they can see tolerably well even in broad daylight. From observations made originally, we believe, by Spallanzani, it appears that bats whose eyes have been put out will catch insects, fly about, avoiding obstacles, and even fly through narrow spaces without touching. This remarkable faculty is attributed by some to the extraordinary delicacy of the nerves in the membranes which are used as wings, by others to their very acute sense of smell and of hearing. The species which we figure is one of the most common in all parts of this country, and is appropriately called the Little Brown Bat, (*Vespertilio subulatus*.) Our engraving was taken from one which was arrested, a few nights since, in its useful career of fly catching, for the benefit of the readers of the *Agriculturist*. Observe its little body covered with long, soft, brownish gray fur; notice the great development of the muscles of the chest, used in flying; see, also, that the almost useless

hind legs, if we may so call them, are the merest sticks, with apparently neither muscles nor joints, except the little five-toed feet. The forward or upper extremities are the most remarkable. Tracing the bony frame from the shoulder, we follow a perfect arm-bone, (or *humerus*), to the elbow, from the elbow to the next joint—"wrist," if you please—there are the two bones

of the fore-arm. There, just at this wrist joint, is the little thumb, projecting upward, and terminating with a strong hook; from this point, the long, slender, regularly jointed fingers spread out, tapering to the minutest little threadlike bones at the tips. The little bones corresponding to the first and second fingers of our hand are close together, forming the stiff upper rim

of the wing, like a spider's web. The ears are, proportionally, very large, and directly in front of each there is a long, stiff point, called the anterior lobe of the ear, which seems to have been placed there to prevent insects lodging in the ears, should any escape the mouth in the rapid flight of the bat. The eyes are very small and bright, and deep set; the nose rather broad at the tip, and the nostrils peculiarly dilated. The mouth opens wide, and displays an efficient though minute set of very sharp, pointed, teeth. When taken, the bats all bite fiercely. The specimen from which the drawing was made measured nine inches from tip to tip of the wings, and weighed only 86 grains—that is, it would take more than eighty similar ones to weigh a pound. When at rest, bats fold their "wings" very closely, and suspend themselves by their little hooked thumbs. In winter, they collect in great clusters in hollow trees, deserted buildings, or eaves, and thus hibernate. They have two young at a birth, which cling to the mother in her flights.

THE LITTLE BROWN BAT.—(*Vespertilio subulatus*.)

The American Otter.—(*Lutra Canadensis*.)

The Otter produces the most valuable fur of any animal now found in the older States of the Union, and though its range is wide, extending, or having formerly extended, through all parts of the Union east of the great plains, it is now becoming exceedingly scarce. Among our native furs the skins of the beaver, if fine, are alone superior to those of the otter. It is an animal of considerable size, weighing often from 20 to 25 pounds, and measuring three to four feet in length, exclusive of the tail, which is 15 to 18 inches long. The otter lives altogether

THE AMERICAN OTTER.—(*Lutra Canadensis*.)

upon fish, which it takes in the water with great adroitness. It possesses great intelligence, and is capable of very thorough domestication, and it is probable that, like its European congener, (*Lutra vulgaris*), it will breed in confinement, and that the young may be trained to hunt for fish, and to be of essential service in fishing. The otter of India is used, as is learned from the journals of

the whole to appear to be covered with the fin-

travelers, by fishermen much as dogs are in hunting. A peculiarity of the American otter is its habit of making smooth tracks upon steep banks, down which it slides into the water. In the summer time, clay banks are preferred to any other, and in the winter they do not forego this pleasant recreation, for they have their sliding pastime upon the snow-banks as systematically as the boys have their coasting parties. Traps are usually placed at the foot of these slides, in the water, or near the entrance of frequented burrows which always open under water, at ordinary stages. The fur of the otter is of two kinds, one fine and dense, the other coarse and glossy. The color is brown, varying somewhat, being nearly black in summer, and in autumn and winter quite dark and very glossy, the head light colored, and the chin and throat often whitish. Otters bring forth two young early in spring.

More Barn-room Wanted.

Shifts are allowable in the early history of the farm that ought not to be tolerated later. The farmer in the clearing, or upon the prairie, has everything pressing upon him at once, and must meet his most imperious wants first. He must have shelter for his family, and food for himself and stock. The log-house and barn upon the most limited scale will answer for a while, but both are temporary expedients to be superseded at the earliest moment by something better. The new house and barn are not merely matters of taste, but of economy. An ample barn for the storage of crops and the shelter of stock should be regarded as a necessary investment of capital in all farming in the Northern and Eastern States. This is better understood in Pennsylvania than in any other part of the country, and the barn that bears the name of the State is, in many respects, a model. It contemplates the shelter of all stock, and the storage of all crops raised upon the farm; and if it also provided shelter for manure, it would, with abundant light and free ventilation, meet every want.

Such a barn upon every farm where mixed husbandry is pursued would soon pay for itself. It prevents the deterioration of crops and of manure. The loss from this source is immense in all parts of the country. Even in thrifty New England, where a barn of some kind is found upon every farm, a large part of the hay and corn fodder is stored in stacks, and the open yard is still often met with as the only receptacle for manure. There is waste of labor in the topping and securing of stacks, and waste of fodder in all that part of the stack that is exposed to the ground and to the weather, and, judging from the fact that barn hay always brings the higher price, there is deterioration through the whole mass. In the West there is much more loss from this source, for there is much less barn-room, and, in addition to this, great damage from the exposure of the grain crops to the weather. The wheat crop for this year has been gathered in excellent condition, for very little rain fell in all the grain growing districts during harvest. But this is an exceptional season. If those districts had been visited with the rains and cloudy weather that have prevailed along the seaboard, we think the grain crop would have been damaged to the amount of one-third of its value. This sometimes happens, and there is much more damaged than sound wheat in the market. Ordinarily the wheat is left in small shocks, with two bundles laid crosswise for a cap, until the thrashing machine comes, which may be within two weeks or two months

after cutting. If the weather is bad, the grain moulds and sprouts, and the market is crowded with damaged wheat. The straw also is injured for feeding purposes. The loss to the country from this source amounts annually to many millions of dollars. If it could be saved, it would pay all the taxes laid upon farmers.

Then, a good barn saves immensely in the expense of keeping stock and in the convenience of feeding them. It is a common estimate that shelter saves one-third in fodder. This estimate is certainly not too high for the northern half of the Northern States. The consumption of food to keep up animal heat in freezing weather is very great, and this does not benefit the farmer. He wants an increase of flesh and fat, articles that a stack-yard regimen rarely gives. With a plenty of grain, an animal will thrive out of doors, but he does not thrive as he would under shelter. It is too expensive, even in the grain districts, to substitute corn for boards. Without barns, also, the farmer is very much at the mercy of the grain speculator. With them, he can store his hay and grain, and sell when the market suits. The speculator knows the situation, and visits the regions where the barns are yet to be built. He knows the farmer must sell; for he has no place to store his grain. He generally prefers the tender mercies of the speculator, whom he knows, to the commission merchant in the city, whom he does not know. He wants the cash in hand and takes what he can get. As wheat often advances fifty per cent. in a season, the farmer ought to be able to take advantage of the rise. If grain could be kept more in first hands, it would benefit consumers, for it would tend to make uniform prices. Nobody but speculators would suffer. In the plans of barns that we frequently present in these pages, some of them giving the results of years of study by practical farmers to meet their own wants, our readers will find many profitable suggestions.

What Shall the South Do for Manure?

The great want of Southern Agriculture is manure. It is the want of systematic agriculture everywhere. Some land gains fertility, if left fallow, or from crops which may be turned under for manure, or if left in grass, which forms a sward of matted roots that readily decay when plowed under. For land too poor for grass to make a good sward, and too light to bear tillage without a crop, (clay land will be improved by simple tillage,) manure is an absolute necessity. Unskilled laborers must be employed usually at coarse, common, field work; hence there is a tendency to cultivate a few, chiefly market, crops. This makes the demand for manure the more imperative, and the call from the Southern States is at present absolutely painful; this is the universal need. The eagerness with which manures have been bought the past season, in the hope of making or saving a crop of corn, of cotton, or tobacco, has opened wide the door for extensive frauds, ruinous to many of the victimized planters. We are gratified to learn that some of these purchasers of fraudulent manures are combining to institute suits against those who make and deal in them.

The question presents itself, then, with peculiar force, "What shall the South do?" The problem has a simple solution, but the cure is applicable at first over but a small area upon each farm. It is, to make more manure. This may be done. The labor of the place may be profitably employed during a considerable part

of the year, in taking care of, working over, and increasing, the amount of manures and composts.

Keep hogs confined. The northern farmer saves himself the expense of guano by keeping his hogs always penned and supplied with all kinds of weeds and litter, thus making tons of excellent manure every year. Five tons of manure, worth not less than \$5 per ton, if Peruvian guano is worth \$80, may be made from one hog in a year, provided a sufficiency of muck, straw, or litter of any kind, be supplied. A fair proportion of the manure thus made should be saved for fertilizing ground for a large crop of pumpkins or squashes, corn sowed in drills, yams, or whatever else will grow rapidly and produce surely and freely, good feed for the hogs, whose numbers should be each year increased, until large quantities of manure are made.

Control all the Poultry, at least so far as to make them roost always in convenient places where their manure may be saved and composted with dry muck, gypsum, coal ashes, or other good absorbent. Thus a fertilizer may be obtained in moderate quantities of exceeding richness, admirable for exactly those purposes for which Peruvian guano is employed.

Make dead animals into compost. Many an old horse is actually worth more in the compost heap than in the stable or pasture. One dollar a hundred pounds is a low estimate of the value of any living animal for manure alone. Every farmer who is buying fertilizers can well afford to pay that, and usually the carcasses may be had for their removal. The way to handle them is to cut them up, using axes and butchers' saws, into pieces of, say 20 pounds weight, and then to compost them in layers with plenty of swamp muck, crumbly peat, grass sods, or loamy soil. Do this in an out of the way place, and while it is attractive to dogs, be on the lookout with a rifle and add to the heap every dog that comes near. Otherwise drive stakes around the place, making a compost yard, inaccessible to those "vermin." It is some little trouble, but will stand the financial test, and surely pay. Within six months or a year, the heap may be overhauled, mixed, the hard bones thrown out, and these put into the next heap, or into any manure, or compost heap. The hardest will become soft in a year or two, so that they may be mashed with a shovel.

Make poudrette. Hints are given in previous numbers of the *Agriculturist* on the subject of earth closets. Offer to the foremen of gangs of hands, to those who keep the houses where the hands are boarded and lodged, and to such as have their own cabins, a moderate price per barrel or per load for all the poudrette of good quality which they will make, using a definite quantity of dry earth or muck. So far as our observation extends, every particle of human soil is lost to the agriculture of the South, and we hesitate not to say that were this saved it would have ten times the value of all the high priced fertilizers which the people of the Southern States import from year to year.

How to Yoke Oxen.

The hints we drop now and then in regard to the sounder philosophy in working oxen by the head instead of by neck yokes, bring occasional responses of corroborative views, one of which we give below, from Mr. Josiah M. Hubbard, of Middletown, Conn. Until we can fairly try the experiment ourselves, which may not be for years, we wait patiently for a fair test of the two systems on the same cattle. Mr. H. writes: "Your remarks concerning the defects in the

usual apparatus for working oxen call to mind the case of a German neighbor of mine in Kansas, whose one pair of oxen were trained to draw by the forehead. His apparatus was quite simple, consisting of a padded stick placed across the forehead of each ox just below the horns, and kept in place by straps around them, the ends of the stick extending a few inches each way beyond the head. The draft was by means of a rope on each side of the animal, passed through a hole in the end of the stick and knotted in front, hitched to the whiffle-trees and eveners, and kept in place by a strap over the back and another under the belly of the animal. I do not recall his method of fastening his animals together, or of supporting the tongue when worked on a wagon; but I do recollect that his animals worked with much more ease and freedom than oxen in the ordinary yoke; and also that their owner was very confident that they could pull (or as he phrased it) 'push' a much heavier load than if yoked by the neck."

The Wheat and Chess Question.

The position taken by intelligent agriculturists that such a thing as wheat turning to chess is impossible in the nature of things, hence not a question to be argued (like the assertion that 2 and 2 make 5), is entirely unacceptable to many sensible farmers. They think they have the evidence of their senses that it does happen. We are firmly and kindly remonstrated with for taking the position that we will not argue the point. We know $2+2=4$; and so decline to discuss the matter. However, one of our German readers, Mr. Geo. Kunz, has worked out this problem much more correctly than many American farmers, who claim to have tried experiments which convinced them that the change takes place. We invite attention to his reasoning.

"As the wheat last winter was more or less winter-killed, we could only count upon half a crop; but some farmers have from one-quarter to one-half chess in their wheat, which causes a great many to think that wheat is changed into chess. After many years of experience, I can say that it is an error, and, if held, of injury to the farmer. He who asserts that wheat changes to chess, is not anxious to have his seed free from chess. The superficial observers who assert that wheat turns to chess, (three-quarters of the farmers belong to that class,) say they do not sow chess; they also say that chess changes into Timothy, etc. If such is the case, why do we pay \$2 and \$3 per bushel for Timothy seed? Why not sow chess, for which we only pay 5 cts. per bushel for thrashing? If wheat could produce chess, it would long since have run out, and we would have as many varieties of chess as of wheat. Why we have more chess when wheat is winter-killed may easily be shown. Take one bushel of wheat and mix with it one quart of chess; the latter can hardly be detected. Supposing the wheat is sown and produces 20 bushels, and chess also 20 quarts, it cannot be detected any more than before; but then, suppose the wheat is winter-killed badly and yields only 5 bushels instead of 20, the chess is not affected, gives every year a full crop, and increases more than wheat; therefore, more chess could be seen after gathering the crop in the 5 bushels of wheat, than there could be seen in the 1 bushel before sowing. If every farmer would convince himself that chess does not come from wheat, all disputes would cease upon that point. Sow clean seed on clean soil, and you will have no more chess; and if every body

was to do so, in five or six years very little would be found in the wheat fields of the country."

Canada Thistles and Railroads.

In our recent travels to attend the State Fairs, we noticed almost everywhere in the West, the steady advance of this scourge. The West had once clean fields; but now, in many sections, the pastures and meadows are as foul as in the oldest part of the country. Most of the older railroads are already well stocked with the Canada thistle at their northern extremities, and every year carries them further south. The seed is furnished with a tuft of down, which makes it float in the air like a feather. Growing in close proximity to the railroad track, these winged seeds are drawn into the current of air made by the passing trains, and every year distributed more widely over the country. The railroad embankment becomes thickly stocked with them, and from this line they are distributed over all the adjoining fields.

This is a great evil, and demands the immediate attention of all our State legislatures. If it is left unchecked, the thistles will spread over a wider territory every year, until they take possession of the whole country. The cost of every crop cultivated will be increased, pastures will be diminished in value, and the quality of hay will be depreciated. It is true, there is some nutriment in thistles, and asses are said to be fond of them, but these are not the wisest of beasts; and if they were, they are not likely to become popular stock in America. It is an unmitigated curse in cultivated fields, increasing the cost of farm produce to all consumers. More Canada thistles means dearer corn, wheat, rye, oats, and potatoes. They increase the cost of living to every man in the country. Railroads are a great blessing, but they have no right to spread this pestilence over our fields.

Legislation is needed to compel the railroads to keep their tracks clean. The State Commissions, which have the oversight of these institutions, should be instructed to see that this pest is kept under. If there were frequent mowings to prevent the seeding of the plant, it would soon disappear from the tracks. And while the legislatures are considering the case of the railroads, they may as well take in hand those slovenly farmers who allow these weeds to overspread their fields without hindrance. What right has a man to make his farm a seed bed of Canada thistles? What right has he to make himself a nuisance among his neighbors? The harboring of this pest should subject the farmer to fines and penalties. We must have legislation, or Canada thistles will possess the land.

A National Dog Law.

Congress is soon to assemble, and the great interest of the nation will be likely to receive just so much attention from our legislators as the people compel them to bestow. There is no money for Congressmen in this measure unless they happen to be sheep owners, but a good deal of money for their constituents. On the contrary, our honorable Senators and Representatives, who affect dogs and sporting circles, might find their taxes slightly increased. We have shown, in our past issues, the great necessity of this law to the sheep interests of the nation. England taxes her dog owners three dollars for each dog, and raises a revenue of \$3,000,000 from this source. In England, mutton is a

great institution by reason of this very efficient protection. If we want like protection, we must legislate against dogs. Wool-growers' associations should take the lead in this matter, and make their influence felt at Washington. Agricultural societies and farmers' clubs should start their petitions, and send them up by the cartload to the Capitol. Sheep owners who have political influence should write to their representatives, urging the measure. By timely effort we may secure what we need. Wool and mutton can have no secure basis until the relations of sheep and dogs are permanently reconstructed.

Fattening Poultry for the Table or for Market.

The difference between the flesh of a well-fattened fowl and one that has not been cooped is so great that we venture to say that no one who really enjoys this excellent food, and raises his own poultry, will allow those destined for the table to run at large for some two or three weeks, at least, before killing them. Young birds grow finely with a free range and plenty to eat, but we have never found rapidly growing fowls or turkeys to take on fat readily when confined. They grow rapidly, perhaps, for a while, but then are very apt to pine, and often even lose flesh. As soon as the rapid growth peculiar to the first four or five months of chickenhood has been made, and the young birds begin to have a mature look, they may be put up in airy coops for fattening. The coops should be such as can be kept clean easily, and in which they will have some chance to move about; while all should be able to get at their food, when fed, without crowding. The two long sides, at least, should be of slats, and the bottom made of split poles, half round, about three inches wide, put on round side up, and with two-inch spaces between them. On such a floor, the birds will keep cleaner than on any other. Turkeys ought to be cooped upon the ground, and the coops shifted every few days. Geese should be in close boxes, with plenty of litter, which should be frequently changed, and the geese allowed a run of half an hour, and a bath every morning. Ducks should be penned, but let out daily to run to the pond, and take their regular "ducking," and eat a little grass.

As to food, it is a mistake to suppose because poultry usually prefer whole grain, especially corn, that it is best for them. Boiled potatoes mashed, with the addition of about one-sixth part Indian meal, make excellent feed for all kinds of poultry. If the proportion of Indian meal is increased, a little suet added, together with stale bread or crusts, soaked soft, it will be the more relished, and of much higher fattening quality. Chickens and turkeys should have some grass frequently, and occasionally some meat scraps chopped fine. Almost any raw vegetables may be substituted for grass, like cabbage leaves, beets, the inside parts of pumpkins, etc., chopped quite fine. Geese ought to have grass daily. Ducks do better, also, for similar green food, but for the water fowls, meat is unnecessary. The food for all may be greatly varied, but ground and cooked grain will go much farther than the same fed whole or raw. Birds confined for fattening, should be fed all that they will eat, as often as four times a day, and fresh water should be always before them. Every two or three days it is well to make one meal actually red with Cayenne pepper, sprinkled on in powder, and mixed with the food. A

few drops of Chloride of Iron in the water, occasionally, has a beneficial tonic effect.

In case there is the least suspicion of lice, we advise to take out the fowls, and dust them thoroughly with the "Persian Insect Powder," holding them each by the legs, and sprinkling it in among the feathers. We have found this cheap, innocuous, and efficient, in removing lice from nests and sitting hens, and presume it would be equally efficacious in other cases.

Thus treated, in general, all poultry will fatten very fast. The fatness of a fowl may be ascertained, generally, by feeling the rump, and judging of its general plumpness and weight. When killed for one's own table, it makes little difference how it is done, provided it be well done. The bird must be fasted 8 to 12 hours; the head may be chopped off, and the fowl hung up to bleed, or the throat may be cut from the outside, passing a narrow, sharp blade through the neck crosswise, just below the chaps. The blade being pressed backward, and moved a little, will sever the veins. This is the common New York market practice. It is poor policy to wring the necks, for, though the most agreeable way, there being no spitting and splashing of blood, nevertheless the bleeding is not so perfect, and the bird will not keep so long. When killing for market, the neatest way is to take a straight, sharp, knife, pass it into the mouth, and cut across the back of the throat on either side. This quickly severs the large veins and arteries, and if the fowl be tied by the legs, and hung on a peg, the feathers even will not be much besmeared with blood. When plucked, a fowl, so killed, shows no mark of the knife. Pick dry, while still warm, then dip in scalding water, just enough to shrink the skin tight all over the body. This gives a very plump look, and secures a better price or quicker sale, while it is of no injury to the keeping, unless the fat is melted.

Draining Facilitated and Cheapened.

The cost of underdraining lies chiefly in the necessarily great amount of skilled labor required to do good work. If any common hand could be economically employed to dig trenches, it would be a great saving. Many of us have been forced to try the experiment, and know if such labor is paid by the day, as it usually must be, the draining is very expensive. Unless digging the trenches can be done by contract, the work must be overseen by the proprietor himself, or by a very trustworthy foreman. When the digging is done by the rod, the finishing must be under the immediate inspection of the foreman, and to this end it should be understood that the last inch or two of the ditch should not be dug until he directs.

As soon as the bottom is graded ready for the tiles, (which operation, as it requires care and time, will not be done by common trench diggers on a contract, without compensation by the hour), the tiles must be laid and the trench partly filled. The care requisite in the first filling of the ditch prevents the employment of scoops or scrapers worked by horse-power; but as soon as about 18 inches have been filled with clay or stiff loam, and rammed down hard, some form of scraper will come into play.

More real farm drainage is done in the autumn than at any other time of the year, and the present season is a peculiarly favorable one for this work. We of the seaboard have had much wet, and that followed by an autumn, dry in its beginning, and very likely to be so in its

continuance, and so long as real winter weather holds off, draining may profitably be done.

Some time since, at a time when subjects more appropriate to the season crowded our columns, we received a communication from Asa Engle, of Gloucester Co., N. J., containing useful hints and a description of his own practice. He writes:

"In return for valuable ideas from the *Agriculturist*, I suggest an idea or two that I have proved to be advantageous in underdraining.

"My manner of laying tiles is to begin by breaking a plastering lath in half, and laying it in the bottom of the ditch. Then take whole laths and place them side by side upon the floor, thus,  so as to break joints, laying the tiles immediately upon them. In this section drain tiles are all made with flat bottoms. The laths cause the tiles to settle on a line, and by the time the laths decay, the tiles are so firmly bedded that they are not likely to get out of place. After the tiles are

DITCH-FILLING SCRAPER.

laid, I shovel in a few inches of earth, treading it down firmly as I proceed. I then take a scraper or reversed "snow plow," made by bolting two planks to the inside of an A harrow, (see figure,) long enough to extend outside the ditch on both sides. I hitch a *quiet* horse to each end, and start the "plow" backward astride of the ditch, having a rope attached to the point by which to guide the machine and keep the open space between the ends of the planks immediately over the ditch. After passing a few times back and forth, it will expedite matters to take a horse and plow and loosen the earth on the bank, as by this operation it will have become somewhat packed."

Convenient Farm Hooks.

The difference between what "will do well enough," and what is really convenient and exactly adapted to its use, may be measured by hours and days even of useless labors, and miles of travel on many farms every year. We were struck with the simplicity of a hook for use as a clevis attached to a harrow, cultivator, stone boat, or any such thing. It is a strong flat hook, (Fig. 1,) having a flat eye with a small hole for

Fig. 1.—CLEVIS HOOK.

a bolt with a large flat head, to attach it to the implement. The point of the hook is drawn out, bent back, and welded fast, enclosing a harness ring of such a size that, when it lies in the bend of the hook, it cannot be brought out. This is well seen in the little engraving. When the hook is put on, it is, of course, turned upward, and it will be seen that the ring of the whiffletree, or ox-chain, will easily slip in, but of itself cannot slip out again. This hook may be attached to many articles, and used for sundry purposes, but is especially convenient for the use suggested, for it takes a good deal of time to undo a clevis every time the team is attached to, or taken from, the harrows and other tools. Then, too, the clevis is in two independent parts, and often three,

(clevis, bolt, and ring,) either of which is liable in careless hands to be lost or out of the way.

The almost universal custom of using hooks upon the end of farm whiffletrees indicates some superiority to other contrivances for attaching the traces. Still, going down rough roads, in the woods, and on other uneven ground, there is a liability of the traces getting unhooked, accompanied, at times, by no little danger. Figure 2 represents an unpatented

hook which we have at Fig. 2.—WHIFFLETREE HOOK.

tached to a new whiffletree that is now on probation; the hook, however, proves itself. As clearly shown in the cut, the eye is large and open, the bend short, the point coming back nearly opposite the middle of the eye, where it is bent at right angles towards it, and left just so close to the eye that a ring or trace-eye of the usual size will slip, when held at right angles, into the hook. It appears to be impossible for a trace to become detached of itself from this simple contrivance.

Fences Across Streams.

Among the many minor perplexities which in the aggregate are serious hinderances to the farmer's peace of mind, are fences across streams. When a brook is so large that a single length of fence will not span it, and especially if at times this 12-foot "creek" becomes a torrent, bearing large trees and logs upon its turbid tide, then the problem how to put a fence across becomes a formidable one. Cattle must not pass it at low water, and it must not be swept away at any time. Mr. Matthew M. Campbell appeals to the editors and readers of the *Agriculturist* in his perplexities. A large creek flows through his farm, which will be greatly increased in value to him if he can fence it across. He describes the "Kentucky crossing," which is thus made: "One, two, or three, large logs are laid on the bottom of the creek, and the ends made fast in the banks on either side, and weighted down with stones. Rails, with sharpened ends, are then driven into the bottom of the creek above the logs, and project above them from 12 to 18 inches. This, if three feet high, or less, is a good fence so long as it can be kept from floating." Another plan suggested is that of stretching a three-quarter inch iron rod across the creek between two trees, and suspending thereon a succession of light gates reaching down to the water at ordinary stages. Yet another plan is to stretch the rod across close to the surface of the water, and hang battened planks upon the rod, just so that they will touch the water at its lowest stage, but be floated when the water is high enough to bring down much floodwood. We quite agree with our correspondent that "neither hog, horse, nor cattle, would be likely either to jump over, or dive under, such a fence,"—but think it would be subject to a strain, when the water is high, to which it would assuredly succumb after a short time.

Some time since, an acquaintance, in following a suggestion of ours, stretched a rod across a small stream which annoyed him by carrying off the poles which were placed across it as a fence. To this rod, which was of about three-quarter inch iron, as we judge, he suspended three small trees, the smaller branches and twigs of which had been cut off and the boughs sharpened with a drawing knife. The trees were hung so that a natural curve in them caused the limbs to point down stream, and any that

pointed directly against the current were cut off. The result has been that at high water the fence floats up more or less, and the swiftness of the current keeps it entirely free from everything except an occasional bush which gets entangled, but does no damage. All large things pass along unhindered. We propose, therefore,

A FENCE ACROSS A STREAM.

to Mr. Campbell to try hanging small trees or branches of larger ones in the way we suggest. The engraving shows a combination of the hanging gates and trees, the latter being where the current is swiftest, the stream deepest, and where, almost certainly, the heavy drift will come down. The rod is attached on one side to a tree, on the other it passes through one, and is continued at an angle to a stump, where it is fixed, making a very strong anchorage. Provision is also indicated for tightening up the rod in case it stretches or slackens, which is important.

Cultivation of Corn.

A LESSON FROM NORTH CAROLINA.

We passed over a fine farm in Westchester Co., N. Y., a few days since, in company with its proprietor, a liberal minded farmer, who showed with great satisfaction a fine field of corn in which no hoe had been used this season. It was remarkably free from weeds, and that, rather than the condition of the corn, (except on wet land), is the test of good culture this season. The few weeds were good vigorous specimens, however, showing that they were such as the plow had not covered entirely at the last plowing. Once passing through to pull these weeds would be a small job, and then the field would be clean. Our friend says he

MANNER OF PLOWING CORN.

learned during the war the practice which we describe from a North Carolinian refugee.

The corn was planted in hills a little less than four feet apart—the proper distance depends upon the variety—and as soon as it was well up, it was cultivated with Share's horse-hoe, in one direction. Any good horse-hoe or cultivator will do. This cleans the land well, but does not destroy the weeds in the hills. After about a fortnight, or as soon as the weeds began to grow pretty well among the corn hills, and the brace roots began to show rows of little points around the lower joints, boys were sent through

to pull out all the weeds in or near the hills. This is work which would have to be done by hand, were the corn hoed. The simple pulling, without previous plowing, and without hoeing at the same time, is not a labor requiring much skill, faithfulness being especially necessary. As soon as this was done, the field was

plowed in the direction opposite to the way the horse-hoe was used, turning the furrows towards the corn, going four times to each row, and thus turning all the ground between the rows, and leaving the land ridged. The plow was run pretty deep, and nearly all the weeds were thoroughly buried under a heavy mass of mellow soil.

This is exactly the place where weeds are wanted, and it is much better than to leave them on the surface, where some seeds may mature, and where, if wet weather follows, many will surely root again. The only chance for weeds to live is if they are not thoroughly covered up, and in the field we passed through, such were the only ones seen.

The accompanying diagram shows a section of two rows of corn, plowed as described; the corn plants with the brace roots (b) thrown out into the fresh turned soil, the main roots in the undisturbed portion of the soil. The line, a, a, indicates the general level of the ground.

The past wet summer has been one to put to the severest test any method of killing weeds among corn. The contrast between the field we refer to, and another treated in the usual way, is most notable. Last year an experiment, to ascertain the actual difference between the two systems, was faithfully, but rather roughly, made. Half a large piece, which was all manured and planted uniformly, was hand-hoed (three times we presume); the other half was treated as above described. The result was that five bushels per acre more corn was harvested from the ridge-plowed part of the field than from that which was hand-hoed; the larger yield with least labor.

The good effects in dry weather are explained, first, by the thorough removal of the weeds close to the corn, then by the conversion of those that are left standing into a green manuring, as they rapidly decay, and finally, by the broad mass of mellow soil which the ridge presents for the brace roots, and for the others also, to riot and revel in. The corn so quickly covers the ground after this that seedling weeds starting upon the fresh turned furrows have little chance of life, and none of vigorous growth.

A Double Entrance Gate.

An impracticable gate, one difficult to open and equally troublesome to shut, is a very common thing, but its frequent occurrence makes it none the less annoying. There are several "self-opening" gates upon the construction of which a great deal of ingenuity and machinery

have been expended. Some of these work well enough for a while, but we never saw one that, from some derangement of its parts, was not, after a few months' use, opened by hand in the old fashioned way.

A correspondent, Doct. Henry Breiner, Alleghany Co., Pa., finding no gate to suit him, had one constructed after a plan of his own, of which he sends us a sketch. Having but one entrance from the road to his grounds, it was necessary to make a gate that should answer for carriage, horse, or foot passengers, and one of which either half could be opened independently.

The gate presents no improvement over the ordinary double gate, except in its fastening, which is simple, easily made, and apparently efficient. It will be readily understood from the engraving, with but a brief description. A bolt (a) of oak, $\frac{3}{4}$ inch thick and two inches wide, runs the whole length of the style of the gate, and slides freely through staples. To the upper end of the bolt is attached a lever (b) by which it is raised. This lever works through a mortise in the style of the gate, and a tenon on the end of it enters a mortise in the bolt. To support the lever a piece of wood is mortised into the upper rail of the gate opposite the first pale, having a mortise to receive the lever, which is held in its place by a wooden pin. This is the only fastening the lever needs. The lower ends of the bolts are received in a mortise in a piece of 2-inch plank (c), 20 to 24 inches long, which is spiked to two locust posts set in the ground at the proper point. The plank is bevelled in two directions and kept well oiled, so that when the gate shuts, the bolts will readily slide over it and drop into the mortise, which should be half an inch wider than the bolts. The hole in the plank should be over the space between the posts to which it is spiked, to facilitate clearing it from dirt. The gate is hung to swing either

DOUBLE ENTRANCE GATE.

way, and is easily unfastened by depressing the handle of the lever; it will fasten itself when it swings to again. Doct. B. says if there is any better fastening for a double gate he would like to have it communicated to our readers.

How to Get the Boys to Stay on the Farm.

The exodus is not yet arrested. We have been doing our best for ten years to make the labors of the farm attractive and profitable, so that the old homestead might at least retain one of the sons, and remain in the family. The labor has not been lost, for no business in the country has made more substantial and visible progress during this period. We have our State and County Fairs well organized and doing a good work in all parts of the Northern States; we have model farms and farmers, better drainage, better implements, better tillage, and larger crops, in part as a consequence

of the good seed that has been sown in these pages. Yet the outflow from the farm goes on, and about as many boys are strapping their trunks and saying good-bye to the farm, this fall, as ever. Some few of the number have their faces turned in the right direction, but many, we know, are making a great mistake, and have before them much less of thrift and happiness than they could find in the calling of their fathers. This restless spirit is owing somewhat, doubtless, to the general diffusion of education among the masses, to that love of adventure which is a characteristic of the Yankee race, and to the apparent profitableness of other callings.

But with all due allowance for these things, there are causes still at work upon the farm that early alienate the affections of the boys, and drive them to other pursuits. The boys catch new ideas much more rapidly than their fathers, and, with the impulsiveness of youth, want to test them. They go to the fairs, and see the fine stock, the new tools, the premium fruits and vegetables. They read the papers, if they have them at home, and if they have not, they borrow them. Agricultural papers are greatly multiplied, and no religious or political paper quite does its duty without furnishing a column or two, weekly, of agricultural matter for its readers. People who read at all cannot very well keep themselves in the dark in regard to the changes that are coming over our husbandry. If the father keeps up with the times, has agricultural papers and books, reads, thinks, and practices, he retains the confidence of his boys, and can readily guide them. But if he is a man of routine, and keeps in the ruts, the boys soon become disgusted with farming. They do not want to break their backs over the scythe, when a mowing machine can do the work better, and at a tithe of the expense. They want tedders, horse-rakes, and horse hay-forks. They want subsoil plows, tile drains, and barn cellars. They want blood stock in the stable, and in the sty. They want to move a little faster, and to do business on a little larger scale. The boys have the facts and the argument on their side, and if you want to retain them upon the farm, you must keep up with the times, and make farming a live business. The subsoil plow has spoiled the ruts for this generation.

Another thing, the boys want an interest in the business, and the sooner you give them an investment in the farm or its stock, the more likely you will be to make farmers of them. It is true, the law gives you a right to the avails of their labors until they reach their majority. It may be true that these services are no more than a fair compensation for the expenses of their childhood. The intercourse of parents and children should not always be graduated by the legal scale. You do not want your son for a servant, but for a companion, and a support in your declining years. You want to attach him by affection and interest to the soil that he cultivates. Begin, then, early to identify his interests with your business, as if he was under no obligations to you. If he fancies stock, give him what he likes, and let the increase be his. Especially encourage him to plant orchards or vineyards of the finest varieties of fruit. Teach him to bud, graft, prune, ripen, and market, all the fruits of your climate. Furnish him with all the books and facilities that he needs to study and to practice pomology and horticulture. If properly encouraged, he will take an interest in these things very early, and before he is old enough to think of leaving your roof, his tastes will be formed, and his course in life will be determined. His

heart will go down into the soil with the roots of every fruit tree that he plants, and the orchards and gardens of the old homestead, or of another close by, will be his paradise, from which nothing but necessity can drive him.

Walks and Talks on the Farm.—No. 47.

Sheep can be bought in this section for nearly half what they could be sold for at this time last year. And yet, low as wool is, it is worth nearly as much as it was a year ago. Then the depression in the wool market was thought to be merely temporary, and wool growers hoped for remunerative prices in the future. Now, however, there is a general feeling that wool will rule low for some years, and many farmers are selling their sheep at any price that is offered. Butter and cheese pay better than wool growing, and thousands will quit the business in disgust. Observing men predicted such a result during the sheep fever, and were laughed at as old fogies.

If the best time to engage in a business is when others are leaving it, the present is a good time to buy sheep. It would be strange if the United States, with its almost unlimited extent of territory, should not raise its own wool, and if we are to raise wool, we can hardly expect to see a time when sheep can be bought at lower rates. The duty on wool is now as high as we can reasonably ask for, and if there is any business in which we can compete with the cheap labor of foreign countries, it is in wool-growing. There is less labor required to raise a dollar's worth of wool than to raise a dollar's worth of any other farm product. It is not so much the cheap labor of other countries that the wool-grower has to fear, as the cheap land, and the low rates at which so concentrated an article as wool can be transported. And this competition with cheap land we cannot escape from. Those of us who have farms that cost \$100 to \$150 per acre must compete with the farmer on the prairie, who paid only \$1.25. If we cannot compete with him in growing wool, we must grow something else, the freight on which affords us sufficient protection. Buffalo skins are high, but I do not think, when land is worth \$100 an acre, we can raise buffaloes, and feed them for four or five years simply for the skins. If we wish to engage in this kind of business, we must seek cheaper land.

I do not say that we cannot keep sheep on land worth \$100 an acre, simply for their wool, for the probabilities are that the profits cannot be very large. Take one of my three year old Merino wethers that I sold the other day for \$2.75, and how much do you suppose it has cost to feed him? He sheared four pounds the first year, and five pounds the next, and five pounds this year—say fourteen pounds. I sold the first two clips for 60 cents. The last clip is not sold, but would not bring more than 40 cents. This sheep therefore has brought me in, say \$2.40 for the first year, \$3.00 for the second year, and \$2.00 for the third year—\$7.40 in all. The sheep sold for \$2.75, so that the gross receipts for three and a half years' keep amount to \$10.15. Washing, shearing, tying up the wool, and marketing the three clips, would cost 50 cents, and it will be liberal to say that I have received \$9.65 for feed and attendance. Now, such a sheep would probably consume in three years and a half, a ton of hay, or its equivalent. Of course he was not fed exclusively on hay, and I only put it in this form to enable us to get some idea of the amount of food such a sheep would eat. An acre of good clover would furnish food enough for half a dozen of such sheep for a year—part mown and part

grazed. To keep a sheep three years and a half, therefore, we should need as much food as seven twelfths of an acre would produce in a year. In other words, this sheep which has brought me \$9.65, has eaten food equal to what could be obtained from a little over half an acre of good clover. This makes a better show for the profit of wool-growing than I expected, and when we take into consideration the fact that the manure will do nearly as much good as if the clover had been plowed under, I am not sure that there is any kind of stock which, for the care and labor bestowed, will pay much better.

The time has arrived in our agriculture, however, when we must bestow more care and labor in feeding stock, and enriching our land. I think farmers are becoming convinced of this. High prices are a great incentive to improvement. We can all see that if our farms were in condition, we could make money. I was on a farm, the other day, where the wheat crop went 37½ bushels per acre, and being very clean and nice, was all sold to the neighbors for seed, at \$2.75 per bushel. Most of us, on land naturally just as good, only raise 15 bushels per acre, and that not of the best quality. In a ride of some twenty-five miles, through two of the best towns in this county, in search of some good seed wheat, this was the only wheat I found that was clean! It may be that I did not happen to fall in with the right men. One farmer, who has always been noted for careful culture, and who, I was told, would have clean seed if it was to be found, had wheat no better than my own. "I have had such dirty wheat," he said, and I do not doubt it, for, on going to the barn, where he had been cleaning some thirty or forty bushels for seed, there were lying on the floor five or six bushels of stricken grains and foul stuff that had been cleaned out. This was on one of the best wheat farms in the State. Unfortunately such cases are not rare. Where one farm has improved during the past five years, ten have run down. Uncertainty in regard to future prices, and the scarcity and inefficiency of laborers are among the chief causes of this deplorable state of affairs. I did not see during the whole ride a *single clean piece of corn*. Most of the corn was cut up, and in every case the rows could be traced by weeds running to seed, and not unfrequently the whole land was covered with weeds from six inches to three feet in height. In a dry season, like the present, it is not easy to understand how land could get so foul, where even nothing more than ordinary cultivation is employed. Next spring, this land will be sown with barley, followed by wheat in the fall. Is it to be wondered at that clean wheat is so scarce? Many farmers plow their land twice for wheat after the barley is off, and harrow, roll, and cultivate their land very nicely, in order to get it clean and mellow. But this does comparatively little good. The time to clean land for wheat is while it is in corn. If it cannot be made thoroughly clean with one corn crop, plant it two years in succession, and cultivate it every week or ten days from the time the rows can be traced till the corn is set. You will then have clean wheat.

There are two objects in working land. First, to kill weeds, and second, to enrich it by promoting decomposition, and rendering it capable of absorbing ammonia from the atmosphere. These chemical changes require time. If you have two heaps of manure piled up last spring, and one heap has been turned over three times during four or five months, and the other has not been

turned at all, the one would be well rotted, and in fine condition to put on the land, while the other would most likely be lumpy, with some parts heated too much, and others not fermented at all. Now then, if you should make a spasmodic effort to get this last heap into good condition, and should turn it over a few days before you wished to use it, three times or even six times, do you suppose the heap would be as fine, and as well rotted, and as rich as the other? So far as enriching the land is concerned, stirring it over three or four times in as many days, does comparatively little good. Such treatment may be necessary to get the land ready for the seed, but by doing the work all at one time, you lose one of the chief advantages of working the land. It should be understood that decomposition or oxidation in the soil or in a manure heap is a kind of slow combustion. Now, any good housewife who bakes in an old-fashioned brick oven proceeds in strict accordance with scientific principles. She turns the fire from one side in the oven to the other, and thus exposes the black embers to the air, and when there are all aglow, she exposes another portion. If she should neglect to do this till the bread was all ready, and then should knock the fire back and forth half a dozen times in as many minutes, she would exhibit no more sense than her husband, who is, with plows, harrows, and cultivators, trying to get his land ready for wheat in a hurry. In heating the oven, the fire heats the opposite side from that on which the wood is placed, and so in the field the effect of working the land is not felt wholly on the first crop, but on those which follow. Cultivating corn benefits the crop. This is not all; its effects will be felt for two or three years.

The Doctor says, he "never knew a man to sell his farm who did not regret it." This is perhaps stating it a little too strong. But being one of the oldest pastors in Western New York, he has had good opportunities for observation. I think men engaged in other pursuits, who buy farms, expecting to find nothing but pleasure and profit in agriculture, are generally very glad of an opportunity to dispose of them. Such men seldom regret selling. But with a farmer the case is very different. He either sells because he thinks he can buy a better or cheaper farm, or because he is tired of farming, and proposes to live in the city. In the latter case he is almost certain to wish himself back again on the farm. I heard of such a case the other day. A farmer was offered last spring what he thought a high price for his farm, and accepted the offer, thinking he could live comfortably in the city on the interest of the money. After trying it six or eight months, he offered the purchaser \$1000 to let him have the farm back again, giving him the summer crops and the wheat into the bargain. A farmer who sells expecting to buy another farm, finds it not so easy to suit himself as he expected. If you must sell the better plan is to know beforehand where you are going.

Like some of the other editors of the *Agriculturist*, I have been enjoying a rather long vacation the past summer. I took it at home—in the "stump lot!" We have had a right good time, pulling up stumps, piling old logs, tearing up the bushes, and making lots of bonfires. We have cleared about twenty-five acres of land that was chopped over fifteen or twenty years ago, and which has been allowed to run pretty much to waste ever since. It had never been plowed, and probably never seeded. The drier portions afforded good sweet pasture, but

not much of it. The low, mucky parts were occupied almost exclusively with tall, rank weeds, sedge, rushes and logs. It was a rough looking place to take a plow and team into, but we managed to strike out a couple of furrows and then worked on both sides of them, removing stumps, rotten logs, etc., and piling them in heaps on the plowed land. I believe I knew what a "rolling hitch" was before; at all events I do now! But my performances did not escape good-natured criticism from some of the old settlers. It was said that I should burn up all the land, and even the Deacon thinks the new ditch I am digging through it, from the creek, "will drain the creek instead of the land." There *may* be some truth in this. But what of it? The only outlet for the water is the creek. It can go no where else, and if when the creek is high the water flows on to me, when it lowers it will flow off rapidly. It will not be as stagnant as it was before the ditch was dug. I have burnt some of the land—did it on purpose. I had three acres of the roughest land, where it was almost impossible to turn over the tough sod, and where the plow pulled up the old sedge roots and much soil into heaps. I set fire to the whole thing and the "burnt district" is now the smoothest land in the field. "But will it not spoil the land?" I think not. "Paring and Burning" is an old practice for enriching land. Hundreds of acres are burnt, or charred, every year in England. At all events the land produced nothing of any value before, and it can scarcely be any worse now. I have sown the drier portions of the field to wheat, sowing Timothy seed with it, and the rest I have sown with Timothy alone, at the rate of a peck per acre. The work could doubtless have been done better, but at all events it is done. And if I had let it lie as it was for another twenty years, it is not probable that I should have done it then to the entire satisfaction of every passer-by. The whole, I think, has not cost me over \$10.00 an acre, and if the drier portions of the land produce a fair crop of wheat, it will more than pay the whole expense, and I am mistaken if the low land will not yield some tall Timothy.

This low land was in front of the house, and was an eyesore. There were three or four "knolls" in the field, but they were hid by brush. Since we have pulled up the bushes and cut down some of the young trees, this rising ground comes into view, and the whole field seems to have risen up ten or fifteen feet! I dare not tell an old farmer so, but between you and me I think this effect as viewed from the front piazza is worth at least \$20 a year, or more than the interest on the whole cost. A fine view has a cheering, invigorating influence on any man who can appreciate it. It gives tone to the mind. A farmer, more than most men, needs pluck, faith in himself and in nature, and above all patience. He must wait for results, and while doing so it is important that his surroundings should be as pleasant as he can afford to make them. A cheerful, healthy location, is of more value than a fine house.

"I thought you advocated small farms and thorough cultivation," said a visitor some time since, in a tone that implied a doubt as to my consistency. "That field of corn," I replied, "has been cultivated ten times. Is not that thorough cultivation?" "Yes, but you have a large farm." "That depends upon circumstances. A 'truck' grower near New York, who finds ten acres enough, would call it large, while Mr. Alexander, of Illinois, would call it a mere pad-

dock for young calves, to run and graze in." It is a mistake, however, to class me with those who indiscriminately advocate small farms. I have never said that it was better to have a small farm than a large one, provided you have sufficient capital and experience. The cost of fences on a small farm is far greater per acre than on a large one. The amount of land occupied by them is proportionally much greater. You cannot plow, harrow, cultivate, mow, or reap, (with a machine,) to as great advantage. In cultivating corn on a small field, you injure a greater proportion in turning at the headlands than you would in a large field. One of my Dutchmen, to whom I was paying \$1.50 per day, said he must have \$1.75. I asked him how much he got in the old country, and, after considerable cross-questioning, he admitted that that he only received \$8.00 a month and board. Now, hitherto the price of many of our farm products, such as wheat, corn, cheese, butter, and pork, has been determined by the price in the European markets, and we have received for them what they will sell for there, less the cost of transportation, commission, insurance, dockage, etc. In other words, we have to compete with the cheap labor of Europe. How can we do this? We have had cheap land, and we have been able to grow crops without paying much attention to manure. This is still true of a considerable extent of country in the Western States at the present time. But as compared with the States on the Atlantic, this advantage is in part counterbalanced by the expense of transportation. Much of our land is now no richer or better in any respect than that in Europe. We shall have to manure as highly as they do, pay at least double the wages, and sell our produce in the same market. True, we have cheaper land, but this is in part counterbalanced by a higher rate of interest for money. The only advantage we have is that we make our labor more efficient by the use of better tools, implements, and machinery, directed by active and intelligent men.

We cannot use machinery to its fullest extent and with the greatest economy on a small farm. We shall have larger farms. The tendency is already apparent. We may deplore it, and argue against it, but cannot stop it. Fortunately we have a country almost boundless, and we can have large farms here, if anywhere.

It is certainly far better to have a small farm highly cultivated than to have a large one half tilled. But a large farm *may* be cultivated as highly as a small one—and at less expense per acre. In England, as a rule, the largest farmers are the best farmers. One of the most highly cultivated farms I ever saw contained over 3000 acres, and I do not recollect ever seeing a farm of fifty acres or less, that would at all compare with the more liberally managed large farms. This is very different from what it is here, and one main reason is, a deficiency of working capital.

Peart, the butcher, who is a close observer, and has gone the rounds for a great many years, thinks the permanent meadows in this section are rapidly deteriorating. "It will not do," he says, "to keep them down so long. When Benjamin bought his farm, it had been in grass for fifteen years, and the meadows produced a kind of June grass with a little Timothy not over a foot high, hardly worth mowing. I told him the farm was not run down, only neglected. He plowed it up, worked it well, put on plenty of plaster, and now see what a lot of stuff he raises! I know of several such cases, and you will find, this year especially, that all the heavy grass is on the meadows most recently seeded."

SHORT-HORN BULL "CONJURER," 5476. — FROM A PHOTOGRAPH.—Engraved for the American Agriculturist.

Short-horn Cattle.

Our engraving is from a photograph lately taken of the magnificent Short-horn bull Conjuror, A. H. B., 5476, owned by Mr. Geo. F. Wilson, of East Providence, R. I. He is a red roan, was bred by Mr. T. L. Harrison, of Motley, St. Lawrence Co., N. Y., was three years old Jan. 26th, and weighs now, in moderate flesh, 1930 lbs. His sire is Hotspur, 4030; dam, Curds, by Barington, 1229, etc. Hotspur was by Duke of Gloster, (11,382) 2763, one of the best bulls ever imported, out of Daphne, by Harold.

We have never before attempted to engrave a Short-horn from a photograph. The one from which the above is copied was sent to us. It shows in a measure the distorted foreshortening so common in large photographs, yet has so much of the grandeur and nobility of the animal in it that we have essayed to reproduce it as accurately as possible. The bull is not coarse in the head, and his muzzle is remarkably fine.

The visitor at our State and County Fairs, is always attracted by some representatives of the Short-horn breed. This can perhaps boast a less antiquity than any other distinct race of British cattle, and has, besides, more decidedly artificial characteristics. The stock from which the improved breed has sprung was that of the counties of York, Lincoln, Northumberland, and Durham. These cattle were famous for

their early maturity, large size, quick fattening, and smallness of offal, and large yield of milk. They became famous, and were taken to all parts of the kingdom, while the breeders of that and other regions were stimulated to still more careful selection and judgment in breeding.

The aim with Short-horn breeders has ever been to raise animals which would grow rapidly, attain a large size, and fatten easily. It is, therefore, preëminently a beef producing race. Deep milkers are occasionally found among the Short-horns, but the production of milk has been ignored by eminent breeders, in perfecting the beef points. Crosses of the Short-horns with common stock or other breeds, are often very large milkers, and almost always quick feeders.

The Short-horn bull is the noblest and most majestic of his kind. The cow is the most queenly, the most perfect in form, and, considering her great size, the finest in bone; and as the race excels in "handling" qualities, it has, naturally, more admirers than any other.

Animals of a very similar character to the Short-horns, were introduced into this country as early as 1783, but it was not until 1791 that the first authentic importations were made. Since that time, until the rinderpest laws were passed, frequently, and, latterly, almost every year, some of these animals have been imported. Much of this stock has been carefully bred, and the animals are as good as any of their race,

while some of it has run out to a great extent, so that, though sprung from the best blood, many of the animals are really inferior.

The Short-horns are of large size, red, white, or white and red, in color, the mixture being most common and most prized. The head is small, the muzzle moderately fine, the nose nearly white, the horn waxy, small, and, in cows, usually turned downward, or pointing forward and toward each other. The brisket projects forward, is very deep, and almost free from dewlap. The neck is fine, and free also from superfluous skin. The chest has great depth and width. The shoulder is very well developed, and covered with muscle, and the lines from the shoulder over the crops, back and loin are very full and fine. The carcass is round, the ribs extending far back, the hips wide, pelvis large and broad, the tail at the roots strong, but rapidly tapering, and very fine at the brush. The lines of the back and belly are nearly straight. The hide is soft and mellow, yielding and elastic to the touch, and the hair is soft and abundant. The beef of the Short-horns is not equal to that of several of the other breeds, but they are very profitable animals to the feeder, because they grow and fatten so rapidly, and to the butcher and consumer, because they have so little offal. The breeders have endeavored constantly to increase the most valuable parts, and to reduce those of the least value.

The Hoop-petticoat Narcissus.

(*Narcissus Bulbocodium*.)

Among the bulbs enumerated in the books and catalogues, there are some that we very seldom see in cultivation; one of these is the little *Narcissus Bulbocodium*. The reason for its rare occurrence may be that the dealers in their catalogues usually say "fine for pot culture," which leads to the inference that it will not do well out of doors. It is true, it is an excellent bulb for pots, but it will flower if treated like other spring bulbs, where the climate is not very severe. Our figure is taken from a plant that we found last spring in the collection of Mr. L. Buchanan. Mr. B. has a great fancy for old things which have, for the most part, gone out of fashion, and we seldom visit his place without seeing something that is novel because it is so old.

The engraving gives the leaves and flowers of the natural size. The flower is of a lively yellow, very delicate in texture, and of a shape that is well expressed by its popular name. Those who limit their list of spring bulbs to Hyacinths, Tulips, and Crocuses, are not aware how much it may be extended.

Grape Cuttings in the Open Air.

Mr. Wm. Patrick, of Terre Haute, Ind., furnished us for the Horticultural Annual for 1867, an account of his method of starting grape cuttings without the aid of artificial heat. Several have experimented with this process, and have been much pleased with the results. At Mr. J. M. McCullough's, near Cincinnati, we saw good plants of Norton's Virginia—a variety notoriously difficult to start even in the propagating house—successfully grown by this method. As the present month is the one in which the cuttings are to be prepared, we reproduce here the substance of Mr. Patrick's article:

"Before the ground freezes, I make the cuttings, from four to six inches long, with one or two eyes on each. I prefer to have two eyes, as such cuttings seem to be better able to withstand the drouth we are apt to have the last of May or the first of June. The cuttings are tied in bundles of about fifty each, and their lower ends are puddled by dipping them half their length in mud made of loamy soil mixed with water to about the consistency of cream. A cold frame has been previously prepared with good sandy loam, but not rich. In this I place the cuttings, top end down, and sprinkle in fine earth, so as to fill all the spaces in and between the bundles. The crevices all being filled, sufficient earth is put over the cuttings to cover them about four inches deep, and they are left in this condition until they have been rained upon, and it begins to freeze. I then cover the bed with a mulch of leaves or straw, and over this put a shelter of boards. If I wish to plant early in the spring, I remove the boards and mulch, and place a sash over the bed, taking care to leave an opening for ventilation; water is to be given as needed. In about five weeks the cuttings will almost all be found to have formed roots from one to three inches long, while the buds are just ready to burst.

"The cuttings are now in a condition in which they require careful handling, and they should not be allowed to dry. I usually set them, as

they are taken from the frame, in a bucket containing some water, and in this way carry them to the place where they are to be planted. In planting, I set the cuttings so that the upper eye is just below the surface, and press the soil firmly around them. Treated in this manner they will nearly all grow and make very strong vines.

"If there is no cold frame at hand, another plan may be followed. The cuttings, being prepared as above directed, are buried, lower end up, and four inches deep, in some place sloping towards the south, with the ends inclining towards the south; they are to be covered with a

THE HOOP-PETTICOAT NARCISSUS.—(*Narcissus Bulbocodium*.)

mulch, in the same manner as described for those in cold frames. The mulch is removed in the spring and the earth exposed to the sun. Cuttings treated in this way will not be quite so early as those in frames, but I think they are about as good. There is some danger that those in frames may get too much advanced before the ground is ready to receive them.

"By either of the above plans, Delawares can be grown, and make fine plants.

"Sometimes, when roots have not started on the cuttings, I remove, with a sharp knife, a small strip of bark, one or two inches long, from opposite sides of the cutting at its lower end. This is done just as they are planted, as they should not be exposed to the air. Cuttings so treated will usually throw out a mass of roots along the edge of the cut, if the surface of the wood is not injured, and make strong plants."

Mr. Knox is very successful with the Concord and such freely rooting kinds, by simply setting out the cuttings in rows and heavily mulching during winter to prevent the frost from throwing them out. The cuttings are of

two eyes each, and set with the upper bud just at the surface of the ground. We should judge from the appearance of the bed that the failures were less than ten per cent.

What Trees to Plant on the Roadside.

No better rule can be given than to choose the best varieties that flourish in the neighboring forests. The White Elm, (*Ulmus Americana*), and the Sugar Maple, (*Acer saccharinum*), are more commonly planted in New England than others, because they are very fine trees, and bear removal well. They can be taken from the forest without previous preparation, and with careful handling are quite sure to live. But tap-rooted trees are quite as sure to die, unless they are taken from the nurseries, or have a previous root pruning in the forest. Nursery grown trees are much more likely to live, and in the end are generally cheaper if they are in the immediate vicinity. They are much better furnished with fine, fibrous roots, and are already accustomed to the sun. We would add to the list of trees for the wayside the White Oak, (*Quercus alba*), the White-wood, (*Liriodendron Tulipifera*), the White Beech, (*Fagus Americana*), the Black Walnut, (*Juglans nigra*), the Hickories, etc., and, where it is possible to protect them, the Evergreens, especially the Spruces. The White and Norway Spruces and the Hemlock, where they can be kept from the depredations of cattle, make a very beautiful border to the highway. The most of these trees flourish in the West, besides others nearly or quite as desirable.

The Kentucky Coffee-tree, the Catalpa, with its snowy white blossoms, the Sweet Gum or Bilsted, the deciduous Magnolias, are admirable trees for the West. The South has treasures peculiar to itself, as well as many of the magnificent trees that flourish in our northern climate. What could be a more appropriate adornment for the village street, or the plantation avenue, than the *Magnolia grandiflora*, or the live oaks, which flourish in their bottom lands, and are every year destroyed by the new clearings for cotton, as if they were rubbish? The South would be rich in ornamental trees

if it had nothing more than these, which are worth a journey across a continent to see.

We by no means advise a restriction to the trees we have named, but have simply indicated them as available for the planter's purposes. Variety is as desirable by the roadside as in the park or pleasure ground. It is by no means a difficult thing to make an arboretum of deciduous trees along the wayside. If a whole neighborhood could be waked up to the enterprise, it would be quite desirable to attempt it. There are more than a hundred desirable deciduous trees upon our nursery catalogues, many of them foreign ones, quite as hardy and beautiful as our native trees, and no more expensive. And if the nursery is to be the source of supply, it is better to have a variety. The Norway and Sycamore Maples are quite as fine trees as our native maples, and the oaks and elms of British soil flourish quite as well here as at home. It would do much for the intelligence and good taste of a town to undertake an enterprise of this kind. It would redeem many a waste by the wayside. The wilderness and solitary place

would be glad for such labors. Future generations will rise up and call the planters blessed.

APPLES FOR VINEGAR.—The high revenue tax upon whiskey has made a change in vinegar making. When whiskey was at a low price, it was largely converted into vinegar, and cider vinegar was a rarity. Now Pomona claims her own again, and cider vinegar with all its superior aroma is in demand. Some apple growers find it more profitable to convert the greater part of their crop into vinegar in preference to barreling it as fruit.

Mr. J. D. G. Nelson, of Indiana, stated at the recent meeting of pomologists, at St. Louis, that he never allowed windfalls to remain on the ground in his orchard more than one day. This not only prevented the increase of insects, but the fruit being converted into vinegar yielded him profitable returns. Whenever apples brought less than a dollar a bushel, he preferred to make vinegar rather than sell the fruit.

Clapp's Favorite Pear.

This variety was at first extolled by some in a manner that seemed extravagant, and by others denounced as a nearly valueless addition to our list of fruits. It has proved to be nearly, if not quite, all its introducers claimed for it, and now that the trees may be obtained at comparatively moderate prices, we can commend it to those who wish to increase the number of their choice varieties. This pear originated in Dorchester, Mass., and is supposed to be a cross between

CLAPP'S FAVORITE PEAR.

the Bartlett and Flemish Beauty. The tree is a fine grower and strongly resembles the Flemish Beauty in habit. The fruit is of good size, somewhat resembling the Bartlett in shape, being frequently broader at the neck than the one from which our drawing was taken. The skin,

when fully ripe, is yellow, with a red shade on the sunny side, making it a very showy fruit. In quality it is much better than the Bartlett, being very sweet, and perfumed, without the disagreeable muskiness that variety so often has, and besides it ripens about a week or ten days earlier.

A Raid Into Missouri.

The meeting of the Pomological Society, at St. Louis, allowed those from the East to see something of Missouri as a fruit growing State. That many parts of the State present superior advantages for vine culture has been made known through the writings of Husmann, Münch, and others, but probably few were prepared to see other fruits in such perfection. We speak not only of the specimens on exhibition, but of the unselected fruit as we saw it in the markets, and on the trees in the orchards.

A large party visited the fruit farm of E. R. Mason, Esq., at Webster Grove, about nine miles from St. Louis. The grapes were mainly in excellent condition, though some vines, as well as most of his apple and pear trees, had suffered from the attacks of grasshoppers. Concord, Crevelling, Delaware, and other standard varieties, were grown for market, but the chief interest centered in his specimen vines of kinds less generally known. We noticed particularly fine Alvey, Maxatawny, and Rogers' No. 4. The last named variety is properly regarded by Mr. Mason, as it is by most other growers, as one from which much is to be expected.

The gentlemen who visited Mr. Mason gave expression to their gratification at his success in fruit culture, as well as to their appreciation of the hospitality with which they were entertained. Through the combined courtesies of Mr. Husmann and the Pacific R. R. Co., a party of nearly a hundred visited Hermann, which has long been known as one of the principal centers of grape culture in this country.

Hermann is about 80 miles from St. Louis, among the bluffs of the Missouri River, and seems to be a most favored spot for fruit growing. Were it not celebrated for its grapes, it would be for its peaches, and were its peaches less fine, we could sound the praises of its apples and pears. There may be such peaches elsewhere as grow at Hermann, but we have yet to see them. Mr. Husmann's vineyards and wine cellars were duly inspected, nor were his orchards neglected; probably not since General Price visited Hermann, has there been such a raid upon its products. Mr. H.'s grape crop was generally good, his favorites, the Norton's Virginia and Concord, being the leading varieties. Here, as at the other vineyards we visited, we made notes for future use. Mr. Rommel's vineyard showed the finest crops of Norton and Catawba that we saw, and here were also specimens of some new varieties. We visited also the grounds of Melchior Poeschel, Poeschel & Scherer, and Mr. Lassal, where the grape was being successfully grown. A sail up the Missouri, then very low and full of snags, of sixteen miles,

brought us to Bluffton, where a large tract of land has been secured by the Bluffton Wine Company. This company, of which Mr. Husmann is President, is composed of some of the responsible capitalists of the State, and has for its object the development of grape growing on

easy terms to actual settlers. It owns some of the best grape lands in the State, which are situated upon a singularly romantic portion of the river. Already extensive propagating houses are built, and the enterprise is being pushed with energy. Of course, at a new place like this, matters were a little in the rough, but the exertions of Mr. Sam. Miller, the Superintendent, and Mr. Wesselhoff, the Agent, were equal to the disposal and care of a large party.

The Ailanthus, Economically and Horticulturally Considered.

This journal has been one of the few, if not the only one, that has defended the Ailanthus from indiscriminate condemnation; and we are glad to find that evidence in favor of our position is accumulating. We do not claim that it is the best tree to grow everywhere, but do hold that its merits—those of growing in the poorest soil, and of tenacity of life, are qualities that give it a real value in many places. Many years ago the steep hills near Cincinnati were sown with Ailanthus by the direction of the late Nicholas Longworth. The prime object was to prevent the washing down of the hill-sides, which was accomplished, but another purpose was served. In a year of fuel famine, the growth afforded a most welcome supply of firewood to the poorer people who dwelt on the outskirts of the city, and this without interfering with the original object, as it is scarcely possible to kill an Ailanthus by cutting it down—it rather likes it.

Mr. J. M. McCullough, nurseryman of Cincinnati, informs us that he depended upon the Ailanthus for fuel all one winter, and states that it burns readily when green or dry, with a bright cheerful flame, gives off a great deal of heat, and never throws out sparks. There is another use to which Mr. McC. puts the wood, which is worth knowing—he finds it to make most excellent vineyard stakes. He says: "For grape stakes it should be cut when of suitable size, and allowed to season, and before setting, the part coming in contact with the ground should be well charred. When this is done, its durability will compare favorably with any other grape stakes in use."

A Live Horticultural Society.

We found a society of this stamp at Fort Wayne, Ind., and as it is managed very much to our taste, we hold it up as a model. It has about two hundred members, fruit growers and farmers of Fort Wayne and vicinity. They have a reading-room, library, and lecture-room in the Court-house, where meetings are held weekly on Saturday afternoons. The exercises consist of essays or reports on horticultural topics, followed by discussions. A good collection of books has already been placed in the library, and steps have been taken to procure a collection of birds, insects, etc., natives of the country, that are injurious to the farmer and horticulturist. They will be nicely prepared, named, classified, and arranged in cases, for the instruction of members. The President of this Society is Hon. J. D. G. Nelson, and the Secretary is H. J. Rudissell. The average attendance at the meetings is about twenty-five, though in the winter, when farmers are at leisure, it is much larger. The influence of such a society, with its frequent meetings and exhibitions, in cultivating the horticultural taste of a people, must be happy, and we heartily wish that every city and

village in the country had such an association. Every fruit grower has his peculiar experience and difficulties, and it would be a great help to him to have easy access to the experience of his fellow workers. In such an association much knowledge would be thrown into common stock, and made available for all. It only needs about a dozen men or women in a village, with a decided taste for horticulture, to start such a society, and to make it go. A room for meetings, and the exhibition of fruits, flowers, and vegetables, will be the largest item of expense. We think it exceedingly desirable that there should be weekly free exhibitions, at least during the summer and fall, where the members could show their best products in their greatest perfection. These would attract attention, excite interest, and spread the knowledge of new horticultural products in the community. In the winter, a course of lectures in the cities would be very desirable. Such a society, once organized, would almost take care of itself.

A "New" Old Violet.—(*Viola cornuta*.)

It is curious to see how fashions rule in floriculture as well as in other matters. Over three-quarters of a century ago, the old Botanical Magazine figured an unpretending looking violet, from the Pyrenees,—*Viola cornuta*. For the past two or three years the advertising columns of the English horticultural papers have been eloquent in the praise of this old plant, each

it. It remained in bloom from June to October, and was in all respects satisfactory. There was no day in which there was not a profusion of modest mauve-colored flowers. The past season has, however, been an unusually moist one, and we cannot infer from this year's experience what it would do in our very dry summers. Gen. Negley, of Pittsburgh, informs us that he has been much pleased with this violet, while Peter Henderson, of New Jersey, does not give it high praise. The individual flowers do not amount to much, though we figure one that our readers may see what they are like. The great merit of the plant is its free blooming character, and the modest tone of its flowers.

Notes on Grapes and Grape Culture.

In our visits to numerous vineyards, East and West, such a mass of notes has accumulated that we are obliged to omit those relating to the less known and less promising varieties, and give only such as will interest the general cultivator.

Creveling.—We hear uniformly good accounts of this wherever it has fruited. Mr. Knox had a very large crop ready for market early in September. The finest specimens were at the vineyard of Mr. E. R. Mason, Webster Grove, Mo., where the bunches were more compact than we have seen them elsewhere. Mr. Husmann predicts that the Creveling will be one of our leading wine grapes. It is certainly one of the best, healthiest, and most prolific, early varieties.

Norton's Virginia.—This is pre-eminently the red wine grape of all those that have been fully tested, though it requires a long season to perfect it, and it will be limited to particular localities. Vine healthy, bears abundantly, but not so great a weight of fruit as some others. Mr. Rommel, of Hermann, had particularly fine specimens. The fruit sold last year in St. Louis at 22½ cts. per lb. for wine-making.

Cynthiana.—In general appearance this resembles Norton, but the berry is larger and more juicy. Good judges consider that it makes a better wine than that variety.

Ives' Seedling.—Perhaps no grape at present excites more attention than this. It originated with Mr. Ives, an amateur, in Cincinnati, some thirty years ago. Col. Waring, of Indian Hill, cultivated the vine for fifteen years, allowing the grapes to be picked before they were ripe. By accident a bunch was allowed to remain until fully matured, and it so commended itself to him that he commenced propagating it, and soon established a vineyard. Since it became well known, it has spread with remarkable rapidity, and a great number of acres have been planted with it. The vine propagates easily, is hardy, healthy, and very productive. The grape has some resemblance to the Isabella, when fully ripe is intensely sweet, and some-

what foxy. Though a recent writer has expressed his doubts about its making wine, the Ohio people think differently, and esteem it highly as a wine grape. We asked an old German vigneron if he were to plant a vineyard of a hundred

acres what vines he should set, and he replied "25 acres each of Delaware and Norton's Virginia, and the rest in Ives' Seedling."

Martha.—We saw this in bearing at both Pittsburgh and Hermann. In growth and healthfulness of foliage it much resembles the Concord, of which it is a seedling. It appears to be a good bearer; bunch medium or small, berry medium, round, pale yellow, intensely sweet and rather foxy.

Rogers' No. 4.—Those who have experimented with the Rogers' Hybrids seem to be settling upon a few numbers as being desirable varieties, and where a preference is expressed for a single number, in the majority of cases it is for No. 4. It is a large black berry, and makes a good sized bunch; sweet, and of very good quality. Should it prove healthy and hardy over a wide range of country, it will become a formidable rival to the now popular Concord, as it is a more showy and a better fruit.

Iona.—This year, the record of this, the best of our native grapes, is all favorable. Except in some localities, where from the excessive rains, grapes have generally failed, the Iona has done well. The poorest specimens we have seen were in Missouri. In our talks with western grape growers we found that plantations of young vines had generally done well, and we cheerfully accord to Doct. Grant great praise for this contribution to American grapes. We once told him that it was equal to the best Catawba we ever saw. We now say that it is better than the best Catawba, as we have (without his knowledge,) tried them side by side,—the only test that any native grape need fear is a comparison with a well-ripened Catawba.—As to the vine, previous years have given an adverse report. This year the reports are much better. Our position has always been that the standing of any fruit should not be governed by its success or failure in a single locality.

Concord.—This has generally done well, and while we cannot put it in the list of best grapes, it has a hardiness and prolific character that entitle it to commendation. If one wishes to raise grapes by the ton, the Concord will more generally give the weight than any other that we know of. On a given space of ground, one can almost surely calculate on a certain yield of Concord grapes as he can of a yield of corn. Concords at five cents a pound will pay.

PROPAGATING THE BLACKBERRY AND RASPBERRY.—Those who wish to increase their stock of plants can do it much more rapidly by making root cuttings than by waiting for the natural formation of suckers, and besides obtain much better plants. In February (page 61) of the present volume we gave a detailed account of the manner of preparing the roots, and now wish to call timely attention to that article, as the present is the proper season to prepare for a stock of young plants next spring. So valuable was the information contained in this article considered by the owner of a new raspberry, that he sent Mr. Fuller a hundred dollars' worth of his plants as an acknowledgment of the benefit he had derived from it.

THE PEACH AND ITS VARIETIES.—It was only a few years ago that horticulturists were brought to admit that the Nectarine was only a variety of the peach. M. Carrière, editor of the Revue Horticole, had already suggested that the Almond was also a variety of the peach, and he now states that there are specimens at the Paris Museum which prove this to be the fact.

VIOLA CORNUTA.

seedsmen claiming that his was the "Original Jacobs." Knowing that, in the words of the advertisers, "no place could be complete" without a bed of this plant, we tried it this summer, and, much to our surprise, were pleased with

Green-house Shrubs in Common Culture.

There is one class of house plants that we see much less frequently than we did many years ago—the larger green-house shrubs that are not very particular as to their treatment, and which, being kept from year to year, become as much a part of the household as the furniture. It used to be common to see large plants of Orange, Lemon, Oleander, Pittosporum, Laurestinus, etc., in both city and country houses. Our modern modes of heating have done away with most of these. They will endure rough treatment of almost every kind, save drying up. Those who have rooms that can be kept about 45°, without the dry heat of a coal stove or furnace, can do very well with the above named, and even with Camellias. Summer blooming shrubs are easily managed by wintering them in the cellar. Among the most satisfactory shrubs of this kind are the Oleander, Pomegranate and Crape Myrtle. The Oleander, so well known and so easily raised, is more generally grown than either of the others. In St. Louis it is a common plant on the market stands. The Pomegranate is fine, both in foliage and flower, and though less common in cultivation than the Oleander, is much more frequently met with than the Crape Myrtle. Any one who has visited New Orleans and other Southern cities in summer must have noticed the great profusion of this plant in the door yards and on the verandas. It will not stand the winter with us, but it may be enjoyed here if given proper protection during that season. The Crape Myrtle, *Lagerstræmia Indica*, is a native of Southern Asia; it is not a Myrtle, as its popular name would indicate, but belongs to the Loosetrife Family (*Lythraceæ*). Its foliage is very clean and neat in appearance, and its flowers, which are borne in clusters at the ends of the branches, are of a lively rose color, with purple and white varieties. The petals are six, each on a long claw or stalk, with the broad part singularly erumped in such a manner as to give the flowers an exceedingly beautiful appearance. The engraving shows a flowering branch of the natural size, but of course lacks the color which gives to the plant so lively an appearance. In the Southern States it needs no protection, but at the North it must be wintered in the cellar and somewhat closely pruned. The Coral Tree, *Erythrina Crista-galli*, is another very showy plant that only needs winter protection to make a grand show in the summer. The Oleander, Crape Myrtle, Pomegranate, and Coral Tree, may be put in the open ground in summer, but they particularly commend themselves to those city dwellers who have no "grounds," as they may be grown in tubs or boxes, to decorate the veranda in summer, and allowed to pass their season of rest in the cellar.

Books and Papers as Premiums.

We are glad to notice the increase of this pleasant and profitable custom. In the arrangement of the horticultural premiums, what could be more appropriate than a "Warder" for the best collection of apples, or the *Agriculturist* for one year for the best show of butter, or "Gardening for Profit" for the best collection of vegetables? The money secured in successful competition at the fairs is pocketed, and

soon forgotten. But a live book, treating of practical matters, lying upon the shelf or the center table, is a perpetual fountain of pleasure. The paper that comes weekly or monthly, freighted with profitable suggestions, is a happy reminder of our success, and an incentive to do better next year. Much as our farmers need money, they need knowledge more. Nothing pays so well as the knowledge of the best way

CRAP MYRTLE.—(*Lagerstræmia Indica*.)

of doing things. The societies that disseminate the most knowledge by means of their exhibitions and their premiums will have the most zealous supporters, and do most for agricultural improvement. In the arrangement of the premium lists for another year, let us have a liberal sprinkling of agricultural books and papers.

A Curious Experiment in Grafting.

In the *Revue Horticole*, for Sept., M. Verlot gives an account of an experiment in grafting that is so novel that we think it will interest our readers. Two pear trees on quince roots were united by inarching, and the roots (quince) of one of the trees left exposed to the air. Of course, in order to reach the quince roots of the tree thus exposed, the sap had to go from the other tree and traverse the tissues of the one grafted upon it in a reverse direction. This it did, and the quince root then put out quince shoots three to four inches long. Upon the branches of this root, now for a year exposed to the air, pear grafts have been placed. Two of these grafts have succeeded, so that now this curious tree consists: 1st, of a quince root; 2d, a Beurre d'Arenburg pear; 3d, a Beurre de Charnay pear that was inarched into No. 2;

4th, of quince roots; 5th, of pear grafted upon these quince roots. Should these last named grafts bear fruit true to its kind, it will puzzle those who claim that the stock has an influence upon the graft, as the sap will have passed through the tissues of four other trees before these grafts were reached, and in two instances through inverted tissues. The experiment is also interesting in showing that roots may adapt themselves to circumstances, and being exposed to the air, become to all intents and purposes like branches. We hope that M. Verlot will keep watch of this remarkable tree and let us know more of the results of one of the most interesting experiments ever made in practical horticulture.

The American Pomological Society.

The meeting held at St. Louis, in September, was both a success and a failure. Socially, it was a success, as it afforded an opportunity for long separated pomologists to meet and exchange greetings; it afforded eastern men a view of one of the fine cities of the West, and gave them a taste of western hospitality, but beyond these its results were meagre. In no spirit of fault finding, but with the desire to avoid a similarly unsatisfactory result at the next meeting, we would make a few suggestions. Let there be no exhibition of fruit in connection with the meeting; it serves only to distract attention. If any member has a new fruit, let him bring it up at the meeting, and exhibit specimens at the same time. We can see quite as good fruit shows without going so far. Essays, papers, or communications upon particular points in pomology, should be referred to a publishing committee, and, if acceptable, printed in the transactions. An essay, however able, is at such times a bore. Let nurserymen forget their avocation for once, and be pomologists. A good share of the time of the last meeting was consumed in advertising the small fruits, to such an extent that pears were briefly mentioned, and apples, the most important of all fruits, omitted altogether. We should not so much regret this had the discussion on small fruits elicited anything new, but it was the same talk that we have heard over and over again, and merely went to show that certain fruits did well in some places, and not in others. In view of the unsatisfactory results of the St. Louis meeting we would suggest that in future the business be arranged long beforehand, and that all branches of pomology be allowed an equal share in the deliberations. Two and a half days are all too short a time in which to discuss new fruits. In future, let us have no more essays, no more advertising, and just a little pomology.

RICINUS SANGUINEUS.—The common Palma-Christi, or Castor-oil Plant, is an exceedingly ornamental object when well grown, but it is far eclipsed by the varieties introduced within a few years. *Ricinus sanguineus*, whether a garden variety or a species, is a most stately and pleasing plant. Its stems are of a dark red color, and its long spikes of flowers and fruit of a lighter red, while its leaves have a tropical luxuriance that is quite charming. This, as well as the other varieties, only attains its best development in the long seasons of the Middle and Southern States, though if started under glass, it proves very satisfactory at the North.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

Household Ornaments.

Fig. 1 shows a very neat card basket made of paper. The material is cut in pieces from half an inch to an inch square, according to the size of the basket wanted. Each piece is made into a double roll, as shown at A, the paper being kept rolled by applying a little gum arabic. The rolls are then

Fig. 1.—PAPER CARD BASKET.

gummed together by their sides, and set up endwise for the bottom of the basket. The sides are built up in the same manner, laying one roll upon another. By using paper of several colors, a pleasing variety of figures may be wrought into the sides.

Fig. 2 represents the manner of covering a box with mosaic of colored straw. The straws are first dyed of various bright hues, then carefully split

Fig. 2.—MOSAIC BOX COVER.

and pressed flat. A plain wooden box may be marked with any patterns to please the fancy; the straws are then cut of suitable lengths and gummed on. This is very neat work for young people on winter evenings. Many pleasing articles for sale at Ladies' Fairs may be easily made in this way.

Leaves from the Diary of a Young Housekeeper.—No. XI.

PRIZE ESSAY BY MRS. LAURA E. LYMAN, STAMFORD, CT.

November 2d.—At intervals for two weeks past I have been learning to work my Wheeler & Wilson. My excellent neighbor has one of the same patent, and whenever I have been puzzled, has helped me out of my difficulties. I have already made Edward two shirts, and yesterday I cut out for him a pair of pantaloons which are now nearly done. In half an hour I stitched up seams that would have occupied me with hand sewing nearly half a day; the making of clothes after they are cut out and fitted is reduced to almost nothing, and the relief of mind it gives to know that in a short time a big piece of work can be accomplished even better than by the old slow mode of stitching by hand, is immense. I can appreciate the remark of a recent writer, who says: "If a man has but three acres of land, he had better sell one and buy a sewing machine." In a family of children it is quite indispensable. Slavery to the needle need no longer be the sad lot of woman, and many a wife and mother can devote the time thus saved her by the ingenuity of this wonderful invention, to the improvement of her own mind, and the minds of her children, and to the cultivation of social and domestic enjoyments. How many families seem to live only to work, work, work! It is true that Adam was commanded to earn his living by labor, and that lot is upon most of us, but who believes that when Adam came in from his daily toil he did not enjoy the society of "the fairest of her daughters, Eve," and try to reproduce in some faint degree the happiness of their lost Eden; that he did not play with his twin boys, Cain and Abel, and tell them wonderful tales of the beauty of Nature, before thorns and thistles

marred its perfection? Every wife and mother should strive to make home a happy place, sunny, cheerful, attractive; and the numerous labor-saving inventions of these modern times afford her far more leisure than she formerly enjoyed, which she ought to devote to that very sacred object, family happiness.

I never made a pair of pantaloons before, but Edward got the pattern of a tailor, and with his best pair as a model, and the advice of my neighbor, I had but little difficulty. The best way to cut them out is to fold the cloth double, if there is no nap to it, as is the case with the Harris goods which I am making up, and after having the patterns ironed out smoothly, pin them all down upon the cloth before using the shears at all. In this way one can cut to the best advantage, and save the residue in as large pieces as possible; they are useful not only for mending, but for slippers, caps, and gaiters. Mother made all the boys' caps from pieces saved in this way. Pockets are put in first, then the "dress" of the pants finished, then the seams stitched up and pressed, then the waistbands put on, and last and most difficult of all, the part around the foot lined and hemmed. I find that pressing a long time makes a great difference in the "finish" they have. A "goose" would no doubt be the best thing to press with, but a heavy flat-iron answers very well, if it is used long enough.

November 10th.—There is an old-fashioned fireplace in the sitting room, and Edward says we shall have the luxury this winter of sitting before an open hickory fire. So I have got down an old pair of brass andirons that were stowed away in the attic when Edward bought the place, and Sue has rubbed them up with silver soap until they shine like gold. "The wrist is parted from the hand," probably, that polished them last, and they are most refreshingly old style in their appearance, so suggestive of big log fires, of glowing warmth and radiant cheer in the happy olden time, before Franklin ever thought of stoves. These last are a wonderful convenience and great economizers of fuel, and must continue to be in universal demand, but they are very dull as companions, and hopelessly black and uninteresting, while the open fire is a fountain of light, and warmth, and cheerfulness, to all in the house. One of our neighbors has thirty cords of wood cut and rotting on the ground, yet he and his family sit all the long winter evenings around a great, ugly, black, iron box, filled with burning coal. Surely they cannot know what *fire-side* enjoyment is! A recent writer inquires in a very happy article about home happiness, "who ever heard of men fighting for a stove or a big black hole where heat comes up into the room?" The thrilling appeal of Bozzaris to his Greeks, "Fight for your altars and your fires," loses its force in these days of modern improvement.

Many, I know, must economize and cannot afford an open fire, but those who prefer to go without some other article of luxury and indulge in this, will find health of body and mind much promoted, and their home enjoyment vastly increased.

We shall use our sitting room this winter much more than we did last. It seems better to us, upon talking the matter over, to use our house more; we have a very pleasant sitting room, and why should we stay all day and all the evening in the same room? The custom is a very prevalent one when a family occupy an ample house, to keep all the rooms shut up and use only an ell, perhaps, or some snug room in the rear of the house, when the general comfort and health of the family would be much increased if they permitted themselves to expatiate in an ampler space, and allowed the hospitable firelight to gleam through the front windows not too closely curtained.

November 25th.—In the midst of preparations for Thanksgiving, which is to-morrow, Edward purchased a beef's heart and a large hock, and I have made up mince meat enough to last until spring. Reserving what I wish for immediate use, the rest is packed down in a large jar, and covered over the top with molasses, to exclude the air, and put away down cellar.

We have been fattening a turkey for two weeks

to grace the occasion. Sue is picking him now. I have directed her to save the quills carefully, for I vastly prefer a good turkey quill to all the steel pens, and even to Morton's celebrated gold ones. Some skill is required in making a good quill pen, but one soon learns.

We shall have a chicken pie for dinner, among other things, and I shall try and make it digestible as well as palatable. Rich pastry is always dyspeptic, and I shall use as little lard as possible in my crust, and yet have it tender and flaky. We shall certainly feel more thankful with stomachs filled with food that they can digest, and which is adapted to our bodily wants, than when they are overloaded with a rich and indigestible mass, pleasant in the mouth, perhaps, but ruinous to digestion. Edward bottled some cider two months ago, and we shall indulge in a glass of our own manufacture. The grapes we preserved with so much care repay all our trouble, and some of the clusters are almost as beautiful and fresh as when they were taken from the vine. This evening, Edward will carry to our excellent pastor a basketful of good things—a chicken, some grapes, a glass of currant jelly, a couple of mince pies, and a dozen eggs. He ministers to us so graciously in spiritual things that it is a delight to send him these tokens of our appreciation of his labors. Sue will take a basket of "goodies" home to her mother and the children, to make Thanksgiving a happy time for them. Some day I may be poor and unable to give, but while I have the power I will enjoy the luxury of beneficence.

November 30th.—It is now a year since we commenced housekeeping, and I have this morning been looking back over twelve months of busy, industrious, and successful life. Though I can see points in which my housekeeping can be improved, and in which I am determined it shall be, I cannot regard my first year's experience at all in the light of a failure. My success, such as it is, and certainly I have some very tangible proofs of it, is attributable to three causes.

First: I am under unspeakable obligations to my excellent mother for having drilled her daughters, almost from the cradle, in habits of economy, neatness, and dispatch. Her instructions were as incessant as they were valuable. For instance, if we went down cellar for anything, as butter, she would remind us to think if there were not something else we needed to bring up at the same time, so as to save steps. When we took off our bonnets and cloaks, she insisted upon our putting them at once in place; when breakfast was over she gave us half an hour as the time in which the dishes were to be washed, wiped, the knives scoured, and everything put away in good style; and all the time we were at work, the principles that should guide us in matters of economy and thrift were constantly reiterated in such homely, but valuable proverbs as

"Once well done is twice done."

"A place for everything, and everything in its place."

"A time for everything, and everything in its time."

"Waste comes to want."

"Keep a thing and in seven years it will come in use."

"Any slut can clean, but it takes a neat woman to keep clean."

Second: No young housekeeper was ever sustained in all her plans and wishes by a husband more thoughtful, more provident, or more apt in all matters about the house, than I have been. Edward's philosophy on this subject is, I think, eminently sound. He says that the policy of good farming and bad housekeeping is one that is tight at the bung and leaks at the tap, and that he has seen farmers' wives that could "throw out with a spoon as fast as the man could throw in with a shovel." Thinking thus, he is just as ready to assist me to make good butter as he is to cut clover hay for the cows in winter; for he says it is better to gain five cents a pound on account of superior quality of the article sent to market, than to have another cow and make more, but poorer, butter.

Third: I believe I am an enthusiast in housekeeping. I love it. The mental exercise of keeping all the interests of my household in my mind

and making all the ends meet; the skill to be evinced in extracting the greatest amount of comfort from supplies on hand; the ability to make every hour of my time tell upon the happiness of those I love, or the growth of our fortunes—these seem better to me, and happier, than all the fashions of cities, the delights of theatres, the vanities of dress, or the splendors of wealth.

The substantial results of my first year's industry I can sum up as follows: With Edward's rainy-day assistance, I have made a mattress, and an extremely neat and comfortable sitting room lounge. My needle and sewing machine have done my own sewing and made all my husband's and my own new winter clothing. I have made three hundred and twenty pounds of butter, and twelve fifteen-pound cheeses. I have four dozen and a half cans of preserved fruit. On the lower shelf of my store closet there is a large jar of tomato preserve, a smaller one of strawberry, one of quince, a large jar of quince and apple, and several quarts of manufactured honey. A large paper bag I have filled with dried corn, and another with dried apples. The pigs we saved from infantile death stand in my sitting room in the form of one of Wheeler & Wilson's best. A rug so handsome that every one considers it bought at the store, lies before our sitting room fire. Two quilts add warmth to Sue's bed, and that of our hired man.

Have I been happy? I've been too happily busy to think whether I was enjoying myself or not, but upon retrospect, I must pronounce it by far the most delightful year of my life.

Leaves from My Journal.—No. IX.

PRIZE ESSAY BY MRS. B. MCLELLAN, OF OHIO.

November.—The glory of the Dahlias has departed. They look as if mourning that their reign is over. But they have well performed their part, and given us some useful lessons. Now, some fine day, let the bulbs be exposed to the sun and air until well dried, and then put in the cellar for safe keeping until another season of flowers. Roses need not be covered yet. They bear the cold well. Even the choice monthlies designed for the winter sitting room, must not be hurried into close, warm, quarters. They had better stand on the porch awhile. But notice the Chrysanthemums. Now is their time of triumph. Jack Frost cannot make them bend to him. Among the early snows they blossom still. What a bright "good morning" they give us after one of these biting nights. What mysterious principle of life is theirs? So frail and yet so strong! Emblems of immortality. Thus the good man's soul, when its surroundings die, plumes its pinions for that clime where "everlasting spring abides, and never fading flowers."

The cars furnish a good place for the study of human nature. How involuntarily we sit in judgment upon the characters of our fellow travelers! How trifling an act will cause them to rise or fall in our esteem! Is there some strange magnetic influence by which we are attracted or repelled, or is it only the offshoot of plain common sense?

I was on board for a night trip. In the absence of sleeping cars, the passengers had arranged themselves as best they could. Some had generously appropriated two entire seats, and with the aid of coat, shawl, carpet bag, etc., seemed likely to pass a comfortable night. Others sat crowded and erect.

One little company soon attracted my attention. The man had evidently taken good care of number one. Stretched at full length upon the seat he was enjoying a serene snooze. Opposite sat his wife and baby. How tired she looked as the hours went on! Occasionally she would snatch a nap, but all the while holding the little one in her arms,—with such a care at her heart she could not sleep long. I had no patience with Lazybones, as I inwardly named him, and put it down in my own mind that he ought not to have a wife or baby either. At length, opening one eye dreamily, it chanced to fall upon them in the corner, when presto, change! He rose at once, gave one good stretch to his cramped limbs, prepared upon part

of his seat a nice bed for baby, took it tenderly from its mother's arms, and laid it down without waking it. Then, arranging coats and shawls with dispatch, his weary wife sank down upon them with such a trusting, grateful look that I knew her burden was gone—and so it proved. Till broad daylight she slept, apparently without one anxious thought. And well she might. Did baby wake,—strong arms were ready for it, and gently was it soothed to rest. Faithful, untiring sentinel that he was! I really felt like shaking hands and begging pardon for my harsh judgment at first. But considering that this would place me in an embarrassing situation, I resolved to be more deliberate in forming an opinion of the character of others, and write this down to deepen the impression.

I have been turning a pair of sheets to-day. It is good economy, as they will last a third longer. After they become thin and worn in the middle, rip open the seam, sewing the opposite sides together. My good, prudent mother, taught me this, and I can never feel quite easy until it is done.

Graham bread should be freely eaten through the winter months. If rightly made it is both healthy and palatable. It should not be stiff enough to mould, but only so thick as to be conveniently stirred with a spoon. Set a sponge as for other bread. After rising, add one half teaspoonful of molasses, (some prefer it not so sweet,) and one teaspoonful soda, to sponge sufficient for one loaf. Thicken with flour as above. If kept moderately warm it will soon be ready for baking. It is even better when fresh sour milk can be had, to be stirred up with that, (adding more soda,) and baked at once.

Composition Cake.—Three eggs, one-half teaspoonful of butter, one and a half of sugar, two and a half of flour, one-half cupful sweet milk, one teaspoonful of cream of tartar, one-half teaspoonful of soda, a little salt. This is sufficiently rich for almost any occasion. Flavored and frosted it is a good loaf cake. Baked in shallow pans it is nice for jelly cake, or in patty pans for fancy cake. It is a convenient and reliable rule for the housekeeper.

A favorite and simple cake is the raised cake. Take one coffee cup of light bread dough, add one egg, one cup of sugar, one-half cup of butter, a little salt and nutmeg, one-half teaspoonful of soda, and raisins, if desired. Mix all together with the hand very smooth. Let it stand half an hour, and bake.

I have received some brackets and a card rack from Nellie, which are very pretty. They are made of cigar boxes, [I am glad these, for once, can be put to a respectable use,] cut with a knife into fanciful shapes, and varnished. They can be arranged in clusters, or scattered about the walls, surmounted with a delicate vase of flowers, choice shells, or anything ornamental. Her letter gives a description of a Sabbath School she had visited. It is held in a pleasant hall in town, secured for the purpose. Brackets adorn the walls, with vases of flowers in their season. Wreaths and mottoes of evergreen here and there—"Get wisdom," "He shall gather the lambs in His arms," "Enter His gates with thanksgiving," "Love one another." A recess in one part of the room for the infant class. Above it this motto—"The Bird's Nest." A fountain in front of the desk. Three or four instruments accompany the voices in their songs of praise. It is refreshing thus to see the beautiful made to serve the good.

Dreary, desolate, chill, November. The verdure has gone from the meadow, the trees have doffed their royal robes, the skies are gray and leaden. We shiver about, saying winter has not yet come, and knowing too well we are not prepared for its coming. Young people linger to chat upon the streets, but with blue lips, and red noses, and chills that curdle the blood. Benny runs in from his play, and though stoutly protesting he is not cold at all, his fingers are red as cherries, and he joins the rest encircling the stove, no doubt to keep that warm. True winter has not come. It is not summer, neither is it spring. Can it be autumn? It is not sleighing, neither is it decent wheeling. There is no pleasure in riding, none in walking. Well, well, can nothing be said in its praise? Do neither moon nor stars appear? Ah,

nestled somewhere among its thirty revolving suns is one dear day, so bright and gladsome, that with a halo of beauty, it illumines the rest, redeeming the whole to the rights and honors of the sisterhood of months. Thanksgiving Day! How timely its coming, how beneficent its mission! How fitting that with grateful hearts we enter into the courts of the Lord, and "sing praises unto Him with the timbrel and harp!" "Let everything that hath breath praise the Lord." The native born New Englander, though thousands of miles, it may be, from the old homestead, welcomes and celebrates its annual return. How busy are his thoughts with the memories of childhood! Father and mother, brothers and sisters, again surround the family board. The portly turkey has the chief place of honor, while at its right the chicken pie of ample dimensions modestly bides its time. Vegetables of all kinds seud up their grateful incense, and cranberry sauce, jellies, pickles and celery give variety to the scene. But to the child the next course has a more thrilling pleasure. Plum pudding now has the place of the turkey, while circled about it are choice flaky pies of every conceivable kind. Willie has often before been put off with the smaller half of one piece. Now look at his plate! He thinks he will take some of each, and mother replies he shall have just as much as he wants. Of course he can't dispose of it all, but how sagely he reasons that it might make him sick, and he'll not be such a fool as to spoil all the fun in that way. Now hurrah for play! With pants tucked into boots, with mittens and muffler, with sled and skates too, was there ever a boy so happy as he! The young people of the neighborhood come in for the evening, and gathering round the fireside crack nuts and jokes together. Little Lucy, with the blue eyes and flaxen curls, whom Willie in his own mind pronounces by far the handsomest lady (?) in the room, he gallantly offers to draw home on his sled, and thus ends the programme of Thanksgiving Day years ago. We are not to draw a parallel between it and that of the present. Its delights seem ever new, and each return demands a richer and more grateful offering for the mercies of another year.

Now, surely, winter is just at hand. Flannel wrappers and drawers, woolen stockings, and substantial shoes and boots, must forthwith be put into service. They cost something indeed—but not so much as a cold and cough that no doctor's skill can arrest, not so much as a new made grave among the snows, the vacant place at the table, and the broken hearts of the bereaved.

But how fares it with the poor and unfortunate? Cannot a few garments be spared from our comfortable stock? Cannot words of tender sympathy and encouragement be spoken, or useful hints, that shall stimulate to truer economy, and more hopeful, persevering labor.—"Inasmuch as ye have done it unto one of these, ye have done it unto Me."

An Old Housekeeper's Advice to all young housekeepers in the country is to furnish their rooms with good Ingrain carpets, (all wool). Don't deceive yourself with the economical idea of rag or hemp carpets. The clean floor is greatly preferable. Those who are averse to scrubbing could have painted floors. The shade of newly planed pine boards, it seems to me, would be appropriate for the floor of the common room, dark colors showing the dust, and giving a gloomy appearance to the room. For the same reasons, select a carpet not too dark.

Graham Bread.—To every quart of unbolted wheat meal add one cup of molasses, and one tablespoonful of lard or butter. Make it up with milk and yeast. When risen, work in a little soda, make it into loaves, raise again, and bake.

Ginger Drops.—Two tablespoonfuls of molasses, one of lard, half a cup of sour milk, one teaspoonful of soda. Will be better with one egg, but can be made without. Flour enough to make a batter that will drop easily. Bake quickly.

Poor Man's Cake.—One tablespoonful of butter, one egg, one cup of sugar, one of sweet milk or cream, one teaspoonful of soda and two of cream of tartar, mixed dry in two cups of flour.

BOYS & GIRLS' COLUMNS.

Which Premium Will You Take?

The wide-awake boys and girls who read these columns have probably looked over the list of valuable premiums in the first part of the paper. The most energetic among them have already commenced taking subscribers, that they may secure that music-box, or a watch, a gun, a melodeon, perhaps some aim as high as one of the pianos. Such go-ahead characters need no encouragement from us. In a few weeks their lists will be complete, and they will have the satisfaction of owning some choice article honorably earned by their own efforts, which will be far better than to have asked father or some other friend for the money. Some, however, are still looking and longing, but have not yet mustered up courage to undertake the work. They dislike to ask for subscriptions, they say, because it looks like begging. That is a great mistake. Whoever induces another to subscribe for a good paper does him a favor. The thousands of good hints and suggestions, the beautiful engravings, the interesting stories, and other good things which the *Agriculturist* brings to its readers every month, will confer on each a benefit worth many times the subscription price. We ask no one to beg, but to offer the money's worth and more. So take heart, young friends. There are many in almost every neighborhood who will readily subscribe if you will let them examine a number, and point out to them its many attractive features. It always gives us great pleasure to send premiums to our young friends, and we have remembered hundreds of them in this way. Who will earn a piano within the next three months? If you should fail to find enough for that, the melodeon or some other valuable premium will be reached—there will surely be good pay for all you accomplish.

A Faithful Sentinel.

Nearly 1700 years ago the city of Pompeii was buried by ashes and lava thrown out from the volcano Vesuvius. Since its discovery under the mound where it had lain so long undisturbed, an immense number of interesting relics have been brought to light—household utensils, works of art, tools of the trades, and remains of the former inhabitants. Among the latter was a skeleton that might be called a monument of fidelity. It was that of a Roman sentinel stationed at the gate of the city. Military law required him to remain at his post until ordered away, no matter what should come. He might have properly said: "The eruption of a volcano is an exception to all common law; I have a right now to run for my life." But no, that, he thought, would bring dishonor, and he preferred death. He stood firm, the ashes falling thick around him; deeper and deeper they gathered, slowly burying him, yet he stirred not, and there he found his tomb! After seventeen centuries they found his skeleton standing erect, clad in its rusty armor, the helmet on his empty skull, and his bowy fingers still grasping his spear, his own monument to his faithfulness.

Our Old Boys and Girls.

It is pleasing to notice the great number of men and women who, on receiving the *American Agriculturist*, open first to the Boys' and Girls' Department. This is true of at least five-sixths of those we have noticed who

call at the office for their monthly numbers. Another indication of the same fact is the large number of answers to problems that come from adults. We have published puzzles made by Presidents of Colleges and Judges of Courts, showing that they have not forgotten to be young. It is in every way desirable to keep a young heart as long as possible. Americans are probably the oldest of civilized people. The proverb "Care killed a cat" (which, you know, is said to have nine lives) is at least partly realized here. The cares and perplexities of business are suffered to take too much time and attention, and people grow old fast. An hour a day of downright play would lengthen the lives of most people and make the life itself richer in enjoyment and in power. We invite our friends who are old in years but young in feeling, and those who desire to become so, to take a frolic occasionally with the young folks in these columns. Tell them a good story (let it be short), set them to puzzling over some ingenious problem, show them how to make a new toy—in short amuse them and yourselves at the same time, and thus secure a welcome benefit all around.

A Boy with his Eyes Open.

Many years ago, a lad thirteen years old was sent to school in a town on the coast of Ireland. Like other boys he often roamed by the seashore, collected shells, caught insects, picked up seaweed and gathered flowers, but, unlike most, while others forgot or threw them away, or only half observed them, he bore them in his thoughts, compared one with another, kept and reconsidered them, asked questions and looked at books, and so, by degrees, acquired information and a habit of observation which influenced the course of his whole life. Any boy could have done the same, but none of his companions did it, and so he only gained the distinction which such a course persevered in is sure to bring. One day he found a plant differing from any he had seen in all his careful observation of the surrounding country. He looked in botanical works, but could find no description of it, so at last he sent it to a distinguished botanist to learn its name. The gentleman not only cheerfully gave the information, but complimented him on his sharp-sightedness and close observation, which, of course, inspired him to new effort. Although he was soon called to enter business life, he continued to study nature with open eyes, and was soon rewarded by discovering new species of shells and plants. From one step to another he passed on, until he became the distinguished naturalist, Dr. W. H. Harvey, whose death is recorded in our recent foreign exchanges, accompanied by a sketch of his life. In the course of his studies he visited many parts of the globe, discovered and described a great number of new species, and enjoyed the highest respect of the scientific world. Boys, and girls too, keep your eyes open. There are thousands of undiscovered facts all over the world waiting for some careful sighted observer to note them, and by so doing to distinguish himself and benefit the race.

New Puzzles to be Answered.

No. 285. *Mathematical Problem.* Contributed to the *American Agriculturist* by A. J. Pierce.—A man has a spring at the bottom of an irregular hill. To reach it, he first descends by 6 steps, each 8 inches high and 6 inches wide; then walks along a level plane 20 feet, then descends an inclined plane 30 feet, depressing at an angle

of 10 degrees from the horizontal; then descends another inclined plane 12½ feet in which at every 5 feet slope he descends 3 feet. Required, 1st, the whole horizontal distance; 2d, the perpendicular distance; 3d, the distance in a direct line; 4th, the angle of depression.

No. 287. *Illustrated Rebus.*—Very good advice to all.

No. 288. *Puzzle Picture.*—Why should there be eleven animals more of the same kind shown, in this pen?

Answers to Problems and Puzzles.

The following are answers to the puzzles, etc., in the October number, page 373. No. 280. *Illustrated Rebus.*—

A man intent on charity,
Above base fear or discontent,
Twixt man and man sees nought amiss,
Nor sees a Judas in a kiss.

No. 281. *Illustrated Rebus.*—Baronet. No. 282. *Riddle.*—A Watch. No. 283. *Puzzle Picture.*—Oyster stew, (Oysters two). No. 284. *Puzzle Picture.*—It is sole, (soul) is bent on it. The following have sent in correct answers to puzzles, etc., in October and former numbers. Abm. Lutz, Robert J. Phillips, L. W. Bridgers, S. M. Hunter, James Redmond, R. Baird, Wapsier, "Kubin," Benjamin Doe, (we don't know the article,) James W. Grath, J. A. Dawson, Augustus C. Benzby, "A. B. C.," M. H. Kelsey, R. L. Selden, John Ober, Ezra Hambey, Adam Snyder, Matthew Simpson, J. R. Wilkinson, School Miss, Wilbur Buzzell, S. M. Hertzler, Frederic E. Willis, E. and Ellen L. Rankin, Andrew Jackson, "E. W.," "A. M.," "A. L. W. S.," Ollie M. Suke, Emma Davis, "Wide-asleep," W. H. Corter, Laura Dickson, Hugh U. Kay, George H. Lawrence, Samuel Dwight Drury, "Old Dominion," Thomas W. Raine, "G. H. C.," L. M. Wright, Mrs. George Bresner, E. T. Bell, J. Milton Snyder, Mary Vandegrift, Aaron B. Leach, Frank H. Marston, Cyrus T. Fox, C. Boice, John Kinsey, D. G. Jones, John McNeal, H. J. Meixel, M. G. Mulloney, E. Leonard.

"Papa," said a bright-eyed little girl one day, "I believe mamma loves you better'n she does me." Papa had his doubts upon the subject, but concluded it was not best to deny the charge. She meditated thoughtfully about it for some time, evidently constraining her father's silence as unfavorable to her side of the question. "Well," said she at last, "I 'spose its all right; you're the biggest, and it takes more to love you."

No. 285. *Puzzle Picture.*—The hare is evidently afraid to venture from his hole. Look carefully at the picture, and find where the danger lies; if successful, you can then enjoy seeing others of your friends look for it.

Waiting, but not Watching.

It will take that jar a long time to fill, my little man, at the present rate. As long as it will for Mr. Spend-easy to get rich, or Mr. Fun-lover to grow learned. Things are not apt to prosper in this world unless they are properly watched on all sides, and the out-go as well as the income looked after. Evidently the boy is in no hurry; he appears very comfortable—by his looks we should say he had eaten a very good dinner. Perhaps, though, he is thinking of something more important than his water jar. Perhaps he is in a day dream, imagining himself riding in some fine coach he has watched passing his cottage home, or a tall soldier with gay clothes. We cannot read his thoughts, but whatever they are, our advice to him is: "Attend to the business in hand; let that be well done first." A boy who does this will gain a character that will almost insure success in whatever he undertakes. Think of this when there are chores to do, or lessons to learn, or an errand to attend to. If tempted to turn aside from the business in hand, think of the water-jar that was so long being filled.

About Bells.

Who invented bells? Perhaps Jubal and Tubal Cain. These brothers are mentioned in the Bible as being the first musicians, and the first metal workers. We only know, however, that bells were used very early in the history of man. They are mentioned by old Hebrew writers as being used by the priests in religious services. They have been associated with worship in almost all countries, being used mostly to call the people together. Among some sects bells receive a baptism with much ceremony before being used for the church service. Names have long been given to large bells in some parts of Europe. The tones of bells are associated with so many events, marriages, deaths, alarms, rejoicings, etc., it is not strange that they should awaken superstitious feelings and beliefs among the ignorant. In former times they were rung when thunder storms were approaching, to frighten away the evil spirits that were supposed to control the winds and the lightning.

Bells are made principally of copper and tin. Silver and gold have been employed, and iron has also been cast into bell form. They are also manufactured from steel, but thus far those of "bell metal," or copper and tin, are most numerous. In this country there are no bells of very large size, compared with the monsters that have been cast in Europe. The largest one here is said to be that once used for a fire bell at the City Hall Park, New York. It weighs about 20,000 lbs. It is said that when the bell previously used, weighing about 10,000 lbs. was broken, a proposition to replace it was opposed in the Common Council, because of the great cost of so large a one. Finally a member, by way of joke, moved that a

bell of 20,000 lbs. be cast. One and another voted for it in sport, until the motion was carried; the Mayor approved it, and the bell was made. It had a deep, mellow, far reaching tone, being heard miles away, and in the night its voice telling of danger was solemn and impressive. It was cracked sometime since, and has recently been broken to pieces to be recast into four bells to weigh 5000 each. A bell weighing 20,400 lbs. hangs in the Notre

was easy to see by the flushed face and nervous manner of the lady that she had been greatly hurried to get herself and children ready. Presently the fare was asked for, and the lady began looking for her purse. It seems that the family were going in different directions at the end of the stage ride, and they had divided their funds accordingly. The purse could not be found. "I have left it on the table in my room," said the lady meekly.

"Just like you," snarled out the man, "I do wish you'd be more careful." The poor woman said nothing, but her quivering lip spoke her feelings, and awakened the sympathies of all present. Meantime the man was fumbling for his pocket-book, first in one pocket, then another—three times he "went through" his clothes, but no money could be found. "I declare," exclaimed he, "if I haven't left my money at home too! So much for being in a hurry." A quiet twinkle took the place of the tear that had been struggling in the eye of his wife, and a hearty laugh burst from the passengers, who greatly enjoyed his discomfiture. The matter was at last arranged by a loan from a friend who knew the parties, and they went on their way with something to remember.

A Lesson in Politeness.

An elderly gentleman recently entered a street car in which the writer was riding. The seats were all occupied, and the new comer after glancing up and down the sides and finding no vacant place, took a position to stand as comfortably as possible. Just then a lad about twelve years old arose and insisted on the gentleman taking his seat, which the latter did, thanking the boy for his politeness. After riding a short distance, the gentleman took from his pocket a passage ticket and presented it to the boy, who at first declined it, but afterward took

WAITING, BUT NOT WATCHING.—Drawn and Engraved for the American Agriculturist.

Dame Cathedral in Montreal. Several bells in Europe weigh from 25,000 to 40,000 lbs. The Great Bell of Moscow, the largest ever cast, is estimated to weigh 443,773 lbs. The metal alone is worth over \$300,000. It was cast in 1653, by order of Empress Anna, but was never hung. While yet in the pit where it was cast, the foundry above it was burned in the great conflagration of Moscow, while hot, water was poured upon it and a large piece was cracked out. It remained there for many years, until, in 1837, the Emperor Nicholas caused it to be raised and placed upon a granite pedestal. It has been consecrated as a chapel; the door is in the opening made by the piece falling out. Since the above was written, we have received some further particulars about this bell from Mr. Judd, who visited it.

Danger of Hasty Words.

A gentleman relates the following, which he witnessed recently while traveling in a stage in New Jersey. A man entered, followed by his wife and three children. It

it, more to please the gentleman than to save his fare. "I want to encourage the boy in his politeness," remarked he, "by showing him that it is appreciated." Not long after an elderly woman with a little girl, probably her grand-daughter, entered the car. The old gentleman who was sitting near the door, immediately arose and gave her his place, which she took as a matter of course, without even saying "thank you." Presently a man sitting next to this woman left the car, and she immediately tried to pull her little girl into the vacant seat, although the old gentleman who had so gallantly yielded his place was now about to sit down again. "Madam," said he, sternly, "that is so piggish, I will not allow it!" and took the seat. The rebuke was severe, but well deserved. The contrast of politeness and selfishness, and the assertion of the claims of courtesy by the old gentleman, caused a smile to go around the car, and furnished a good lesson. It is in little things like this that real character is shown: he who is of kind disposition and refined feelings, will manifest it in his conduct even in trifles.

HERALD OF HEALTH FOR 1868.

THREE NUMBERS FREE!

Every person who values good habits, temperance, fine health, and who would secure for his or her children beauty, symmetry, fine vigorous constitutions, should subscribe.

The N. Y. Tribune says:

THE HERALD OF HEALTH well sustains the high standard it has held forth since the commencement of the new series.

Dr. Dio Lewis, writes:

Dear Dr. Holbrook:—THE HERALD OF HEALTH delights us. The friends of Physiological Christianity must make it in circulation what you have made it in scope and spirit—cosmopolitan. I am deeply gratified with its broad, genial, catholic spirit.

MOSES COIT TYLER writes:

Everybody to whom I have shown it, of late, expresses astonishment and delight. People say: "Why, it's a grand Magazine—racy, practical, liberal, strong, and full, too, of all kinds of most important information!"

Our Monthly has been a great success in 1867. Those who subscribe at once for 1868 will get OCTOBER, NOVEMBER, and DECEMBER NUMBERS FREE. Those who send a Club of Thirty Subscribers for 1868 and \$60 will get a Wheeler & Wilson Sewing Machine worth \$55 as a premium. \$2 a year; samples 20 cents.

MILLER, WOOD & CO.,
15 Laight St., New York.

THE NORTHWESTERN MUTUAL LIFE INSURANCE CO.,

OFFICE No. 416 MAIN STREET, MILWAUKEE, WIS.

HAS 18,000 MEMBERS AND \$2,500,000 ASSETS;

thus ranking among the 25 New York companies *third* in number of members, *fifth* in amount of insurance, and *sixth* in amount of assets.

IT IS A PURELY MUTUAL COMPANY:

that is, an ASSOCIATION OF POLICY-HOLDERS, managed by men selected BY THEMSELVES, FROM THEMSELVES, FOR THEMSELVES. Thus all officers and members are ALIKE INTERESTED, each one is a PARTNER in the whole business, entitled at any time to his share of the Company's funds, but by provisions of the charter is not liable beyond the premiums he has already paid. It thus adapts its plans to the benefit of its members, adopts all real improvements, and aims to be

A MODEL LIFE INSURANCE COMPANY.

It was one of the first to adopt the popular feature known in insurance circles as the NON-FORFEITING PLAN, and now APPLIES IT TO ALL THE POLICIES IT ISSUES.

IT IS THE ONLY COMPANY that adopts the full benefit of the Note System, without doing a credit business or destroying the cash principle; and also gives the note privilege to the poor man, who needs it most and takes a small policy.

IT IS THE ONLY COMPANY (with one exception) that makes the FIRST payment on a ten premium policy secure its TENTH of the policy as well as each other payment.

IT IS THE ONLY COMPANY which gives a PROPORTIONATE amount of full-paid insurance after two annual premiums (if other premiums are not paid) on ordinary life and endowment policies.

IT WILL LOAN A MEMBER a sum equivalent to the surrender value of his policy; and thus often helps a member in extremity to keep his policy in force. Policy-holders permitted to travel anywhere in the United States or in Europe, but risks in the far South not sought.

Few appreciate the ADVANTAGE OF ITS LOCATION at the West, where the money can be SAFELY loaned at higher rates than at the East.

\$1,000 LOANED FOR 50 YEARS AT 6 PER CENT. PRODUCES \$ 18,420 15.

\$1,000 " " 50 " " 8 " " " 46,901 61.

\$1,000 " " 50 " " 10 " " " 117,290 85.

And thinking men know that money can be loaned with care at the West (where nearly all property is rapidly enhancing in value) quite as SAFELY, if not MORE SAFELY, than in other communities. Therefore, as the rate of mortality is also low at the West, its

DIVIDENDS MUST BE LARGE.

Dividends made annually, to commence three years after date of the policy, but to equal in number the years of insurance, and

DISTRIBUTED TO POLICY-HOLDERS ONLY,

there being no Stockholders to absorb the Surplus or control the Company for selfish purposes.

AGENTS WANTED AT THE EAST.

For a Policy or an Agency apply to the officers.

A NEW BOOK. THE GRAPE VINE.

By FREDERICK MOHR,
DOCTOR OF PHILOSOPHY AND MEDICINE.

Translated from the German, and accompanied with
Hints on the Propagation and General Treatment of American Varieties.

By HORTICOLA.

This work is mainly devoted to the most elementary matters. It explains the structure and mode of growth of the vine so clearly that no intelligent person who reads it need be in doubt what to do with his vines. It has been well translated, and a chapter on the propagation of American varieties has been substituted for the original one on multiplying the European grape. As anatomy is the foundation of surgery, so is a knowledge of the structure of the vine to the vine dresser. In both cases it is as important to know when and where to cut, and how.

CONTENTS.

Development and Structure of the Grape Vine.
The Node; The Branch; Reasons for Pruning; Pruning.
Training on Trellises; Treatment in Summer; Plantations.
Vines Trained along the Garden Walk.
Trellises on Walls; Tree Trellises.
Vines Trained to Trellises; Bronner's Method.
Time Required for Covering a Trellis.
Manuring the Vine; Age of Vineyard.
The Rising Sap in the Vine; The Grape Disease.
Treatment of Vines Injured by Frost.
Implements; Proper Time to Perform Work on the Vine.
Constituents of the Vine and their Distribution.
Propagation of the Vine: By Layers; By Cuttings; By Grafting; By Inarching; By Seeds.
Hybridization.

American Varieties—General Management; Planting; Pruning; Pinching; Covering in Fall.

A NEW WORK. SMALL FRUIT CULTURIST.

By ANDREW S. FULLER,

PRACTICAL HORTICULTURIST, RIDGEWOOD, BERGEN CO., N. J.

A new work, and the only one devoted to Small Fruits. Special treatises of this kind have the advantage that the author can more thoroughly discuss his subject, and go into greater detail, than in a work embracing both large and small fruits. The work covers the whole ground of Propagation, Culture, Varieties, Packing for Market, etc.

CONTENTS: INTRODUCTION—I. BARBERRY—II. STRAWBERRY—III. RASPBERRY—IV. BLACKBERRY—V. DWARF CHERRY—VI. CURRANT—VII. GOOSEBERRY—VIII. CORNELIAN CHERRY—IX. CRANBERRY—X. HUCKLEBERRY—XI. SHEPHERDIA—XII. PREPARATION FOR GATHERING FRUIT.

We predict that this work will bring Mr. Fuller many enemies, as he has given his opinion about varieties without reserve. On the other hand it will the more strongly endear him to all true lovers of horticulture, as these wish to have the merits of fruit given without reference to the persons who introduce them.

While very full on all the small fruits, the Currants and Raspberries have been more carefully elaborated than ever before, and in this important part of his book, the author has had the invaluable counsel of Charles Downing. The chapter on gathering and packing fruit is a valuable one, and in it are figured all the baskets and boxes now in common use. The book is very finely and thoroughly illustrated, and makes an admirable companion to his Grape Culturist.

DRAINING FOR PROFIT

AND

DRAINING FOR HEALTH.

By GEO. E. WARING, JR.,

ENGINEER OF THE DRAINAGE OF CENTRAL PARK, NEW YORK.

Illustrated.

TABLE OF CONTENTS:

LAND TO BE DRAINED AND THE

REASONS WHY.—Indications of the need of draining.—Sources of water.—Objections to too much water.—Wet sub-soil.

HOW DRAINS ACT AND HOW

THEY AFFECT THE SOIL.—Characteristics of well laid tile drain.—Surface-water and rain water beneficial, springs and soakage water injurious.—Cracking of stiff clays.—Evaporation and filtration.—Rain fall.—Evaporation.—Temperature.—Drought.—Porosity or mellowness.—Chemical action in the soil.

HOW TO GO TO WORK TO LAY

OUT A SYSTEM OF DRAINS.—Amateur draining.—Maps.—Levelling Instruments.—Outlets and location of drains.—Main drains.—Spring water.—Fall.—Tiles.—Depth and distance apart.—Direction of laterals.—Collars.—Discharge of water from drains.

HOW TO MAKE THE DRAINS.—

Tools.—Marking the lines.—Water courses.—Outlet.—Silt Basins.—Opening the ditches.—Grading.—Tile laying.—Connections.—Covering the tile and filling in.—Collecting the water of springs.—Amending the map.

HOW TO TAKE CARE OF DRAINS

AND DRAINED LAND.—Removing obstructions.—Mistake of substituting large tiles for small ones which have become obstructed.—Heavy lands should not be trampled while wet.

WHAT DRAINING COSTS.

Draining, expensive work.—Their permanence and lasting effects.—Cheapness versus economy.—Details of cost.—(1. Engineering and Superintendence.—2. Digging the ditches.—3. Grading the bottoms.—4. Tile and tile laying.—5. Covering and filling.—6. Outlets and Silt Basins.)

WILL IT PAY?

Increased crops required to pay cost of draining.—(Corn, Wheat, Rye, Oats, Potatoes, Barley, Hay, Cotton, Tobacco.)—Instances of profit.—Benefit of draining in facilitating farm work.

HOW TO MAKE DRAINING TILES.

Materials.—Preparation of earths.—Moulding tile machines.—Drying and rolling.—Burning.—Kilns.—General arrangement of a tiler.

THE RECLAIMING OF SALT

MARSHES.—Extent of marshes on the Atlantic Coast.—The English Fens.—Harlaem Lake.—The exclusion of sea water.—Removal of the causes of inundation from the upland.—Removal of rain fall and water of filtration.—Embankments.—Muskies.—Rivers and Creeks.—Outlet of drainage.

MALARIAL DISEASES.

Fever and Ague.—Neuralgia.—Vicinity of New York.—Dr. Bartlett on Periodical Fever.—Dr. Metcalf's Report to U. S. Sanitary Commission.—La Roche on the effects of Malarial Fever.—Dr. Salisbury on the "Cause of Malarial Fevers."—English experience.—Reports to the British Parliament.—Cause of Malaria removed by draining.

HOUSE AND TOWN DRAINAGE.

Sewerage.—The use of pipes.—The new outfall sewers in London.—The use of steam pumps to secure outlets.—Utilization of sewage matters in agriculture.—Effects of imperfect house drainage on health.—Typhoid fever.—The Westminster fever in London.—Epidemic at the Maplewood Young Ladies Institute in Pittsfield, Mass.—Lambeth Square, London.—Back drainage.—Water supply.—General Board of Health, (England).

SENT POST-PAID.

PRICE, \$1.50.

Just Published
A NEW WORK ON APPLES.

AMERICAN POMOLOGY.

APPLES.

By DOCT. JOHN A. WARDER,

PRESIDENT OHIO POMOLOGICAL SOCIETY; VICE-PRESIDENT
AMERICAN POMOLOGICAL SOCIETY, ETC.

293 Illustrations.

To pomologists a work by Dr. Warder will need no commendation. Though a citizen of Ohio, he is so sure to be at any pomological gathering, be it East or West, that the whole country claims him, and if any one has a right to entitle his work *American Pomology* it is certainly Dr. Warder. The present is the first instalment of a work intended to cover the whole ground. In it the author has attempted the difficult task of bringing apples into something like order.

This volume has about 750 pages, the first 375 of which are devoted to the discussion of the general subjects of propagation, nursery culture, selection and planting, cultivation of orchards, care of fruit, insects, and the like; the remainder is occupied with descriptions of apples. With the richness of material at hand, the trouble was to decide what to leave out. It will be found that while the old and standard varieties are not neglected, the new and promising sorts, especially those of the South and West, have prominence. A list of selections for different localities by eminent orchardists is a valuable portion of the volume, while the Analytical Index or *Catalogue Raisonné*, as the French would say, is the most extended American fruit list ever published, and gives evidence of a fearful amount of labor.

This differs from any fruit book heretofore published in this country, in its complete classification of apples. The author gives the principal European systems and modestly puts forth his own to be tested by practice. He divides apples into four classes, according to their forms. Each of these classes is sub-divided by other obvious characters, and it would seem that any apple described in the book might be easily identified. We trust that this will prove a great help to the pomologist.

Fruit-growers will welcome this book as a valuable and long-wished for addition to pomological literature, and it will be found equally useful to the novice and the experienced orchardist. The work has 293 illustrations, is printed on good paper and well bound.

SENT POST-PAID, PRICE \$3.00.

ORANGE JUDD & CO.,
245 Broadway and 41 Park Row, N. Y.

A NEW WORK.
GARDENING FOR PROFIT,

IN THE MARKET AND FAMILY GARDEN.

BY PETER HENDERSON.

Illustrated.

This is the first work on Market Gardening ever published in this country. Its author is well known as a market gardener of eighteen years' successful experience. In this work he has recorded this experience, and given without reservation the methods necessary to the profitable culture of the commercial or

MARKET GARDEN.

It is a work for which there has long been a demand, and one which will commend itself, not only to those who grow vegetables for sale, but to the cultivator of the

FAMILY GARDEN

To whom it presents methods quite different from the old ones generally practiced. It is an

ORIGINAL AND PURELY AMERICAN

work, and not made up, as books on gardening too often are, by quotations from foreign authors.

Everything is made perfectly plain, and the subject treated in all its details, from the selection of the soil to preparing the products for market. Frames, Hot-beds, and Forcing Houses, the management of which is usually so troublesome to the novice, are fully described, and the conditions of success and causes of failure clearly stated.

The success of the market gardeners near New York City is proverbial, and this is the only work that sets forth the means by which this success has been attained. Valuable hints are given to those who would raise Vegetables at the South for northern markets.

The following synopsis of its contents will show the scope of the work:

Men Fitted for the Business of Gardening.
The Amount of Capital Required and Working Force per Acre.
Profits of Market Gardening.
Location, Situation, and Laying Out.
Soils, Drainage, and Preparation.
Manures. Implements.
Uses and Management of Cold Frames.
Formation and Management of Hot-beds
Forcing Pits or Green-houses.
Seeds and Seed Raising.
How, When, and Where to Sow Seeds.
Transplanting. Insects.
Packing of Vegetables for Shipping.
Preservation of Vegetables in Winter.
Vegetables, their Varieties and Cultivation.

SENT POST-PAID. PRICE, \$1.50.

We shall be pleased to have parties call and examine stock.

HOLTON & ZUNDELL,

Haverstraw, Rockland Co., N. Y.

Kittatinny Blackberry at the West.

Among the many testimonials received by the subscriber, the following in regard to this splendid berry from a gentleman in Fulton Co., Ill., may suffice:—

"The Kittatinny plants got of you, spring of '66, fruited this season most abundantly,—one week earlier than my Lawtons on the same grounds and location, and the smallest branch withstood the winter without any injury whatever."

The subscriber and several others here have also fruited it thoroughly and most satisfactorily the past season. Strong Plants \$20 per 100; \$150 per 1,000. **F. K. PHOENIX**, Bloomington, Ill.

LARGE IMPORTATION OF ITALIAN QUEENS.
I have just arrived with 100 Italian Queens. Terms of sale will be advertised in the spring.
ADAM GRIMM, Jefferson, Wisconsin.

READ! READ!

THE PRAIRIE FARMER

Is Published WEEKLY at
CHICAGO, ILLINOIS.

The PRAIRIE FARMER is a Family and Fireside Journal, devoted to the interests of AGRICULTURE, HORTICULTURE, MARKETS and the HOUSEHOLD.

The PRAIRIE FARMER will enter upon its Twenty-eighth year of publication, January 1st, 1893.

The PRAIRIE FARMER is the oldest and most widely circulated Rural Journal in the West.

The PRAIRIE FARMER should be taken and read by every family in the land.

The PRAIRIE FARMER is a weekly paper of sixteen large octavo pages and is printed on fine white paper.

The PRAIRIE FARMER is promptly mailed to its subscribers EVERY WEEK—thus keeping its readers fully posted upon the current matters of interest of Horticulture, Agriculture and Markets, &c., &c.

The PRAIRIE FARMER is edited with great ability, and it has a large corps of special, practical and noted Contributors.

The PRAIRIE FARMER is a WEEKLY publication, and is furnished at the low price of Two Dollars per year.

The PRAIRIE FARMER will be sent to the end of December 1893 to New Subscribers who send in their names during the months of November and December marked "New" with Two Dollars, from the time the names are received.

The PRAIRIE FARMER COMPANY will give liberal Premiums to all who get up clubs—large or small.

Specimen copies sent to any address, free. For full particulars—Premium list, etc.—Address—

PRAIRIE FARMER COMPANY,
161 Clark St., Chicago, Ill.

Factory at Melrose, Mass. General Agents, Messrs. WHEELER, PARSONS & CO., New York. Messrs. BIGELOW BROS. & KENNARD, Boston, and for sale by the trade generally. Every movement warranted.

The TREMONT WATCH CO. manufacture the only DUST-PROOF Watch movement in this country. They have a branch establishment in Switzerland, under the personal supervision of Mr. A. J. DENISON, the ORIGINAL of the American system of watch-making, where they produce their Balances and Escapements of a superior quality. The cheap skilled labor of Europe, working thus on the AMERICAN SYSTEM, enables them to offer a superior article at a low rate.

The Country Gentleman.

All New Subscribers to the CULTIVATOR & COUNTRY GENTLEMAN for 1893, received previous to December 31st, 1892, with the money, WILL RECEIVE THAT PAPER WEEKLY FROM THE DATE OF REMITTANCE TO JANUARY 1st, 1893.

THE CULTIVATOR & COUNTRY GENTLEMAN is published in large weekly Numbers of 16 to 20 pages each, and designed to include EVERY DEPARTMENT of Agriculture, Stock-Raising, Horticulture and Domestic Economy.

The Publishers prefer using the following extracts from well-informed sources, rather than to speak for themselves:

The *Maine Farmer* speaks of THE COUNTRY GENTLEMAN as "STANDING AT THE HEAD OF THE AGRICULTURAL PRESS OF THE COUNTRY."

The *Scottish Farmer* calls THE COUNTRY GENTLEMAN "THE BEST OF ALL THE AMERICAN NEWSPAPERS devoted to matters of Rural Economy."

The *Gardeners' Monthly* says that THE COUNTRY GENTLEMAN is "Conducted with a Degree of Talent equal to any European journal, and superior to most of them."

The *Canada Farmers' Advocate* says: "We are in receipt of Agricultural publications from various parts of the world, but for truthful accounts, well written practical articles, and general management of the paper, we have seen NONE AT ALL TO COMPARE WITH THE CULTIVATOR & COUNTRY GENTLEMAN, published in the United States."

TERMS:

The Terms are lower than those of any other paper of similar standing: One copy, \$2.50 per year; Four copies \$9; Eight copies, \$16.

COPELAND'S COUNTRY LIFE.

A Compendium

OF

Agricultural & Horticultural
Practical Knowledge.

Embracing Descriptions, Hints, Suggestions and Details of great value to every one interested in Fruit, Flowers, Vegetables, or Farm Crops. It contains 926 large Octavo Pages, and 250 Engravings. Describing and Illustrating nearly the whole range of topics of interest to the FARMER, the GARDENER, the FRUIT CULTURIST, and the AMATEUR.

It is adapted not only to those owning large and Elegant Estates, but contains directions for the best arrangement of the smallest Plots, down to the City Yard, the Roof or Window Garden, or the simple Flower Stand. It also gives an abstract of the Principles, Construction and Management of AQUARIUMS. Among numerous other matters it treats of

Draining. Giving best methods, estimates of cost, trenches, tiles, etc., thus enabling almost any one properly to perform this important work.

Cattle are carefully noticed with reference to the special merits of different breeds for dairying or fattening.

Sheep Management, including Breeding, Feeding, Prices, Profits, etc., receives attention, and a very full treatise on the Merinos is given.

Grape Culture occupies a large space, embracing the opinions of men in all parts of the country, as to best sorts, planting, training, diseases, and general management for home use or marketing.

Full Lists of Ornamental Trees and Shrubs, Fruits, Flowers, Green and Hot-house Plants, etc., are given, with directions for management each month in the year.

The Kitchen Garden receives particular attention, with reference to the best way to grow and preserve each kind of Vegetable.

In short, as its name indicates, the book treats of almost every subject that needs consideration by those living in the country, or having anything to do with the cultivation of the soil.

SENT POST-PAID PRICE \$5.00.

ORANGE JUDD & CO.,

245 Broadway and 41 Park Row, N. Y.

New Book of Flowers.

By JOSEPH BRECK, Practical Horticulturist.

Beautifully Illustrated.

This work, while preserving scientific accuracy, is written in a familiar style, and with the enthusiasm of a life-long lover of flowers. Its teachings are eminently practical, and cover all branches of out of door gardening.

Bulbs.

The cultivation of bulbs, whether in-doors or in the open ground, is clearly described, and such instructions are given as will insure success with these favorite plants.

Annuals.

All the finer annuals are described, and the peculiar treatment necessary for each given in full.

Herbaceous Perennials.

This justly favorite class of plants is given here more at length than in any work with which we are acquainted.

Bedding Plants.

The treatment of the popular kinds of bedding plants is given, together with that of Dahlias, Chrysanthemums and such as usually fall under the head of florist's flowers.

Flowering Shrubs.

A separate section is devoted to the hardy flowering shrubs, including a very full chapter upon the

Rose.

We have no work which is so safe a guide to the novice in gardening, or that imparts the necessary information in a style so free from technicalities. Not the least interesting part of the work is the author's personal experience, as he tells not only how he succeeded, but the mistakes he committed. Thus far it is

"The Book of Flowers."

SENT POST-PAID. PRICE, \$1.75.

ORANGE JUDD & CO., Publishers.

WARDER'S

Hedges and Evergreens.

This is the only book wholly devoted to the cultivation, pruning, and management of plants suitable for American hedging, especially the Maclura, or OSAGE ORANGE; illustrated with engravings of plants, implements, and processes; to which is added a Treatise on Evergreens, their varieties, propagation, culture, etc. By J. A. WARDER. 12mo, 291 pp. SENT POST-PAID. PRICE \$1.50.

ORANGE JUDD & CO., Publishers.

NEW BOOKS.

Saunders' Domestic Poultry.

By B. M. SAUNDERS.

New Edition Revised and Enlarged.

This Book contains Articles on the Preferable Breeds of Farm-Yard Poultry, Their History and Leading Characteristics, with Complete Instructions for Breeding and Fattening, and Preparing for Exhibition at Poultry Shows, etc., etc., derived from the Author's Experience and Observation.

The work is compact, full of valuable hints and information, and beautifully illustrated.

An appendix contains an account of *Poultry breeding on a large scale*, as practiced in the neighborhood of Paris, and is a very important addition to the work.

Price, paper 40 cts., cloth 75 cts.

ORANGE JUDD & CO., Publishers.

Money in the Swamps.

PEAT! PEAT! PEAT!

FUEL—MANURE.

WHERE TO FIND IT.

HOW TO MAKE AND USE IT.

ITS VALUE.

A NEW WORK ON PEAT,

THOROUGH AND PRACTICAL;

By PROF. SAMUEL W. JOHNSON, of Yale College.

It gives a full history of PEAT, MUCK, etc., telling what they are, where found, and how to estimate their value.

It describes the various methods of using Peat for manure, as an absorbent, as an ameliorator of the soil, etc. and it is especially explicit in regard to the

USE OF PEAT AS FUEL,

describing minutely the various processes employed in preparing it to burn, from the simplest to the most complicated; such as are in use in this country, and Europe. It is illustrated with many Engravings of machines, etc.

The work is invaluable to those having Peat or Muck swamps, or wishing to invest in Peat Companies.

The Miniature Fruit Garden.

OR THE CULTURE OF

Pyramidal and Bush Fruit Trees.

BY THOMAS RIVERS.

Nothing is more gratifying than the cultivation of dwarf fruit trees, and this work tells how to do it successfully.

Dwarf Apples and Pears

are beautiful ornaments, besides being useful in giving abundant crops of fruit; they can be grown in

Small Gardens and City Yards,

and be readily removed. The work also gives the manner of training upon walls and trellises.

Root Pruning

is fully explained, and methods of protection from frosts are given.

Dwarf Cherries and Plums

are treated of as are other dwarf trees. Directions are also given for growing

Figs and Filberts.

This little work is full of suggestions to the cultivator, and like all the writings of its venerable author, bears the marks of long experience in the practice of fruit growing.

SENT POST-PAID. - - - PRICE, \$1.00

ORANGE JUDD & CO., Publishers.

My Vineyard at Lakeview;

Or, Successful Grape Culture.

To any one who wishes to grow grapes, whether a single vine or a vineyard, this book is full of valuable teachings. The author gives not only his success, but what is of quite as much importance, his failure. It tells just what the beginner in grape culture wishes to know, with the charm that always attends the relation of personal experience.

It is especially valuable as giving an account of the processes actually followed in

Celebrated Grape Regions

in Western New York and on the shores and islands of Lake Erie.

This book is noticed by a writer in the Horticulturist for August last as follows: "Two works very different in character and value have just been published and seem to demand a passing notice. The better and less pretentious of the two is 'My Vineyard at Lakeview,' a charming little book that professes to give the actual experience of a western grape grower, detailing not only his successes, but his blunders and failures. It is written in a pleasant style, without any attempt at display, and contains much advice that will prove useful to a beginner—the more useful, because derived from the experience of a man who had no leisure for fanciful experiments, but has been obliged to make his vineyard support himself and his family."

SENT POST-PAID. - - - PRICE \$1.50.

OUR PREMIUM LIST

Is unusually attractive. Any boy or girl can earn a nice present or a library of books, with little exertion.

Send for Circular, and a stamp for sample copy of the Magazine.

HURD & HOUGHTON, Publishers,
 459 Broome-st., New York.

IMPORTANT TO OWNERS OF STOCK.

The American Stock Journal AND FARMERS' AND STOCK BREEDERS' ADVERTISER.

A First-class Monthly Journal, devoted to Farming and Stock Breeding. Each number contains 36 large double-column pages, illustrated with numerous engravings. Only \$1 a year. Specimen copies free, for stamp, with list of splendid Premiums to Agents.

HORSE AND CATTLE DOCTOR, FREE.

The publishers of the *American Stock Journal* have established a Veterinary Department in the columns of the Journal, which is placed under the charge of a distinguished Veterinary Professor, whose duty it is to receive questions as to the ailments or injuries of all kinds of stock, and to answer in print, in connection with the question, how they should be treated for a cure. These prescriptions are given gratis, and thus every subscriber to the Journal has always at his command a Veterinary Surgeon, free of charge. Every Farmer and Stock Breeder should subscribe for it.

Sent Free, Three Months for Nothing.

Every new subscriber for 1868, received by the 1st of January, will receive the October, November, and December numbers of 1867, free, making over 500 large double-column pages of reading matter in the 15 numbers. All for the low price of \$1.00. Address
 N. P. BOYER & CO., Gunm Tree, Chester Co., Pa.

NEW PARLOR GAMES.

The undersigned respectfully announce the following New Parlor Games for the Holidays of 1867:

OLIVER TWIST.—A New and Elegant Parlor Game for any number of Players, Based on the Celebrated Story of the same name by Charles Dickens. 60 cents.

This new and superb parlor game differs from any hitherto published, and is extremely fascinating and interesting in its method of playing. It can be engaged in by any number of persons, and affords an exhaustless fund of entertainment for the Home Circle and the Social Party. It consists of sixty cards, twenty-six of them being illustrated with engravings of the leading characters, the whole enclosed, with full directions, in a handsome Box, richly embossed in Blue and Gold, and printed in Carmine.

SHAKESPEARIAN ORACLE.—A New Game of Fortune. 50 cents.

"I am sir Oracle,
 And when I open my mouth let no dog bark."
Merchant of Venice, Act I, Sc. 1.

The character of this Game is sufficiently indicated by its title. It forms a unique and charming recreation, and is at times wonderful in its revelations. To persons of fine taste its style and matter cannot fail to be highly pleasing and satisfactory.

MIXED PICKLES.—A Very Merry Game for one Person or Three. 30 cents.

This may be termed a merry solitaire; and though no skill is required in playing it, it will serve as an amusing and constantly-varying pastime for one or three persons. Any number may at the same time act as lookers-on or listeners, be interested in its developments, and convulsed with laughter over its results.

MATCH AND CATCH.—A Merry Picture Game for the Young Folks at Home. 30 cents.

Designed for the youngest of the young folks, and can be played by those who cannot read—the playing being guided by the pictures, which are fantastic and amusing. It will prove to be always attractive, and will keep a party of little ones pleasantly employed for hours.

SQUAILS.—The New English Game. 30 cents.

We offer a people's edition of this new and popular English Game, capable of affording as much entertainment as the higher cost sets. The prices heretofore have ranged from one dollar to five dollars. Full directions for playing, with Definitions of Terms employed, accompany each game.

Also, New Editions of the following Popular Games: THE MOST LAUGHABLE THING ON EARTH. Box 50 cts., Env. 25 cts. THREE MERRY MEN. Box 50 cts., Env. 25 cts. KOMICAL KONVERSATION KARDS. Box 30 cts. CHOPPED-UP MONKEY. Box 20 cts., Env. 15 cts. Of which upwards of One Hundred Thousand have been sold.

Any or all of the above sent post-paid.

ADAMS & CO., Publishers, 23 Bromfield-st., Boston.

IONA AND ISRAELLA GRAPES.

It is a fact worthy of the attention of all who are about to plant vines, that the Iona and Israella Grapes have been rapidly gaining in reputation despite of all adverse interests and consequent efforts at disparagement, while all others have been losing in comparison.

The few adverse reports of last season should have included all other kinds also, for all of the same age suffered equally, and none would have suffered at all under the proper course of management as directed in "The Manual."

From all the great West, (with exception only of part of Missouri), as well as from all other quarters generally, we have the same favorable reports, (from good plants under fair treatment), while the quality of the fruit distances all competitors for table and for wine. Israella is also an excellent wine-grape, as shown by trial.

I offer vines for garden and vineyard of excellent quality at most favorable rates to purchasers.

For Price Lists and account of performance as shown by testimonials from all quarters, send stamp.

"Manual of the Vine," a full, thorough treatise, most profusely illustrated, sent for fifty cents.

C. W. GRANT,

Iona, near Peekskill, Westchester Co., N. Y.

VINES AT WHOLESALE

To Dealers. For sale this fall, in one lot, about 5,000 very choice vines. Layers and transplants 2 and 3 years old of Iona, Israella, Adirondac, &c., first-rate plants for the retail trade. Also, a large quantity of Grape Wood for sale. Address
A. F. TAIT, Woodstock Vineyard,
Morrisania, Westchester Co., N. Y.

Great Reduction for Cash.

I will sell a limited number of my Grape Vines for cash only, at a reduction of 10 per cent. from my regular rates, as advertised here below.

Parties wishing to avail themselves of this opportunity to purchase vines of the best quality at extremely low figures, should not delay sending their orders at once, as the number which I propose to sell at the reduced rate is not large, and will probably soon be all taken, and after these are sold the full rates will be charged again. Orders will be filled in rotation as they are received.

My regular rates for the leading varieties are as follows:

- CONCORD, No. 1, 25c. each; \$2 per doz.; \$6 per 50; \$10 per 100; \$15 per 1000; \$100 per 10,000.
" No. 2, 20c. each; \$1.50 per doz.; \$4.50 per 50; \$8 per 100; \$60 per 1000; \$500 per 10,000.
IONA, No. 1, 50c. each; \$5 per doz.; \$12.50 per 50; \$20 per 100; \$175 per 1000; \$1,500 per 10,000.
" No. 2, 40c. each; \$4 per doz.; \$8 per 50; \$15 per 100; \$125 per 1000; \$1,000 per 10,000.
HARTFORD PROLIFIC, No. 1, 50c. each; \$4 per doz.; \$10 per 50; \$15 per 100; \$140 per 1000.
" No. 2, 30c. each; \$3 per doz.; \$7.50 per 50; \$12 per 100.
CLINTON, No. 1, 25c. each; \$2 per doz.; \$5 per 50; \$8 per 100; \$65 per 1000; \$600 per 10,000.

See my advertisement in the September and October Nos. I will warrant my vines all true to name, and of the quality represented, and if they are not satisfactory, they can be shipped back at my expense, and I will return the money. Do not delay, but order immediately.

What Farmers and Planters Say about
Double Refined Poudrette, made by
The Lodi Manufacturing Co.

Extract from a letter received from Professor Martin, of Hampden, Sidney College, Virginia, dated July 1st, 1867.
"The Double Refined Poudrette is operating like a charm on my Crop, and attracting universal attention from all beholders. I am already satisfied that it is the cheapest and surest renovator of our worn-out lands."

SALISBURY, N. C., Aug. 10th, 1867.

JAMES R. DEY, Esq.:
Dear Sir: I can safely say that your Double Refined Poudrette is far superior to any other fertilizer for Cotton; for I have given it a fair trial this season.

Yours, JEHU FOSTER, JR.
ELLAVILLE, Ga., Oct. 4th, 1867.

Dear Sir: I think your Double Refined Poudrette I purchased of you last spring increased my Cotton crop 150 lbs. per acre. I put it upon worn-out pine land at the rate of 200 lbs. per acre, drilled in with the seed.

Yours, &c., S. MONTGOMERY.
NEWBERN, N. C., Oct. 4th, 1867.

JAMES R. DEY, Esq., Prest.:

Dear Sir: I tried the experiment of planting three or four rows of Cotton, each with a different fertilizer. That on which the Double Refined Poudrette was used was the earliest to come up, and continued to be the most thriving plants. This has been a very bad season to test any fertilizer, but the Poudrette has shown what it can do in an unfavorable season. Very respectfully yours,

ROBBINS, STYSON & CO.
CAMBRIDGE, N. Y., Oct. 7, 1867.

Sirs: I used Ground Bone, Hoyt's Super-Phosphate, and your Double Refined Poudrette, and the Poudrette was best of all. I sold to a number of farmers, and we all think it increased our corn crop one-quarter. We used it on potatoes and it did equally well.

HORACE VALENTINE.
SAVANNAH, Ga., Sept. 25th, 1867.

JAMES R. DEY, Pres't.:

Dear Sir: I used the Double Refined Poudrette bought of you last spring, on corn. I think it increased the yield one-half. I consider it an excellent manure.

Respectfully, T. HOLCOMBE.
HIGH SHOALS, Ga., Oct. 4th, 1867.

JAMES R. DEY, Esq.:

Sir: The Double Refined Poudrette I bought for two other parties in connection with myself; one of them used it on Cotton and Corn, and thinks it answered finely—the other put it on Cotton, on very poor ground, and thinks it doubled his crop. I used it on Corn, it answered finely, and was thought by the hands that cultivated the crop to be fully equal to Rhodes' Super-Phosphate. I also used it on Cotton, and I am clearly of opinion that it is the best and cheapest fertilizer in use. I expect to order several tons this winter.

Yours very respectfully, ISAAC POWELL.
For sale by the Company at \$25 per ton of 2000 lbs. 400 to 600 lbs. will bring a good crop of wheat on poor soil.

NITRO-PHOSPHATE OF LIME.—This article is equal to Peruvian guano, made from floured Night Soil and Bone. 200 lbs. is an ample dressing for an acre of Wheat, Corn, or Cotton, and is cheaper than any Phosphate in market, taking its effects into consideration. Price \$60 per ton.

For Information, Circulars, &c., address
LODI MANUFACTURING CO.,
66 Cortlandt-st., New York.

THE LODI MANUFACTURING CO.,

(Established in 1840.)
Offer for sale a new article of Double Refined Poudrette, made from Night Soil, free from all impurities, deodorized, dried, and ground fine. Plowed or drilled in with wheat or rye, at the rate of 400 lbs. per acre, it will grow a heavy crop. Price, \$25 per ton. Address
LODI MANUFACTURING CO.,
66 Cortlandt-st., New York.

FISH GUANO.

The cheapest and best fertilizer in use, manufactured and sold by the "Mystic Oil Company," Mystic Bridge, Conn. It is pressed very dry, put up in barrels, and sent to any part of the United States for \$30 per ton, in quantities less than 25 tons. For 25 tons and upwards, \$25 per ton. A dried and fine ground article is sold at \$45 per ton for 10 to 25 tons, \$40 per ton for 25 tons and upward, and for \$50 per ton for less than 10 tons, delivered on board vessel or R. R. at Mystic. Admirable for market gardening, grain, cotton, and other crops. Orders may be addressed to WM. CLIFT, Jr., 56 East 26th st., N. Y., or D. S. MILLS, Pres't., Mystic Bridge, Conn.

Dangerous Explosions Impossible.

Thoroughbred Premium Chester White Pigs.

Progeny of Hogs that have taken State and United States Premiums. For sale singly or in Pairs (not akin), of any age. Carefully boxed and shipped by Express to any part of the United States. *Their safe arrival insured.*

Our Pigs have always taken the highest premium wherever exhibited. They have all the good qualities desirable in a Hog; they are quiet, kept easily, have a good square form, deep and wide chest, very heavy hams and shoulders, broad in the back, short head and legs, and without exception always white; they readily fatten while young, or at any age, and will grow to weigh from 500 to 800 lbs., at 14 or 16 months old. They will make more pork in a given length of time, with a given quantity of food, than any other breed of Hogs. We have had them to weigh 1,230 lbs. at 21 months old.

We always have a large stock of Hogs on hand, of all ages, from 1 to 18 months old, and can fill orders at any time. We insure the safe arrival of the Pigs.

They are carefully boxed, with feed and trough; the Express or Railroad Agents feed and water them.

CASHMERE GOATS!!!

I offer for sale a very superior and beautiful lot of CASHMERE KIDS, of 1867, ready to ship early in November. I have bred my flock of CASHMERE GOATS with great care, using select males each year, since my purchase of the "Davis importation" in 1855. For purity of blood and fineness and value of fleece, my flock is unsurpassed by any in America.

RICHARD PETERS,
Atlanta, Ga.

Cashmere! Cashmere!

We have just received direct from the district of Angora, in Asia Minor, a new importation of Angora (Shawl) Goats, (known in this country as Cashmere), which we offer for sale at moderate prices.

For Circulars and Prices, address N. P. BOYER & CO., Gum Tree, Chester Co., Pa.

MARK THUS.—Our reputation for shipping CHESTER WHITES of pure blood, and of fine quality, is established beyond a doubt. We have never shipped a Pig that was condemned. We doubt if there is any other breeder in the country who can say the same. We guarantee satisfaction. Circular sent free. JAMES YOUNG, Jr. & CO., Marshakton, Chester Co., Pa.

VALUABLE PLANTATION FOR SALE, near ALBANY, GA., one of the most healthy locations in America, where consumptives regain their health: the winters are *delightfully* mild; yet a combination of breezes, peculiar to this section, makes the summer day and night singularly comfortable. White men and labor on land as well as in any part of the North, sun-stroke never occurs here, water is excellent, the Plantation has two sets of buildings, and can be divided into two farms. The land and location are the most desirable in all the South, in a district where families from the North are safe in every respect, and find plenty of good, kind neighbors. The hatchery is buried deep here, *not to be disturbed*. The writer is from the far North, and has enjoyed perfect health here, and has made more on this place this year raising cotton and cane than can be made in 10 years in the North, with the same ease. Sugar-cane is exceedingly profitable here. Choice Fruits, the Peach, Fig, Pomegranate, etc., etc., are abundant; see *Ang. Agriculturist*. This is the best place in the world to keep cattle, they *never* need feeding and keep fat nearly all the year. The beef is the *best quality*. An abundance of butter is also obtained with no expense, with as good a market for both, within 12 miles on a fine road, as New York City. The Savannah Railroad Depot is 12 miles from this Plantation, soon to be built within 2 miles. Present fare from here to New York by New York and Savannah Steamers, three times a week, and Railroad to Albany, Ga., \$31; time, 4 days. 50 Cattle for sale with the place, at \$6 a head. Excellent and experienced laborers can be obtained for \$15 a month, *without board*. Religious Privileges and society excellent. One Church, and Baptist and Methodist Preaching *close by*. This is a rare opportunity; from \$6000 to \$10,000 will be needed.

Call on L. C. SHAW, Express Agent, Albany, or, address
J. W. HUNTEEN, Albany, Ga.

ATTENTION!—ALL WANTING FARMS!—Cheap Farm and Fruit Lands, Village Lots, Water-Powers for manufacturing, for sale at Bricksburg, Ocean Co., New Jersey, 44 miles from New York, on railroad to Philadelphia.

Soil, fine loam, superior for all crops. Country just rolling enough for beauty and utility. Climate mild and proverbially healthy. Water soft and pure. No fever and ague. Sold only to actual settlers on easy terms. Price per acre \$25 and upward. For circulars and maps, address HOLT, C. M. BELL, President, No. 133 Broadway, New York. V. S. HOLT, Agent, Bricksburg.

FOR SALE—Farm of 254 Acres, with good improvement, 18 miles from Baltimore, Md., fronting on the Frederick Turnpike, above Elliott's City. Will be sold very low, say *45 dollars per acre*. Also, 500 Farms and Country seats for sale. Apply to "Maryland and Virginia Land Office," Northwest corner of St. Paul and Lexington sts., Baltimore, Md. E. LIVEZEY.

WANTED—Farms and Village Property, for which 20 per cent. cash and balance in good farming lands in Iowa will be paid. 7000 Acres to choose from, in eight different counties, in the Des Moines Valley. Address, giving particulars, A. S. WHITE, Goshen, Ind.

FARMERS AND DAIRYMEN, if you want to economize in feed, use the *Eureka Cutting Box* for Straw and Fodder. It has taken more first premiums than any other. Also, A NEW TRAP POWER on entirely a new principle, which will meet the objections made to others now in the field. All warranted in every particular. Send for Circular. BLONTER, DAY & CO., Mansfield, Ohio.

Torrey's Patent Weather Strips

Exclude Wind, Rain, Snow and Dust from Doors and Windows of every description.

They save in fuel one half, and preserve health by the prevention of drafts, so productive of colds.

FRANKLIN TRACT.—20,000 acres on railroad, New Jersey—25 miles south of Philadelphia, good soil, mild, healthful climate. Low prices; in lots to suit buyers. Some improved farms. Map and full information sent free. Address MORRIS & CO., Newfield, Gloucester Co., N. J.

ENDLESS AMUSEMENT

FOR

BOYS AND GIRLS.

Crandall's Improved Building Blocks, described in April number of the *American Agriculturist*, page 147, furnish a most attractive amusement for children. They are very simple in construction, will stand years of children's handling without breaking, and give renewed pleasure daily.

CHURCHES,

DWELLINGS;

BARNs,

MILLS,

FENCES,

FURNITURE, etc.,

in almost endless variety, can be built with them, and when finished, the structure remains firm so that it can be carried about without falling to pieces.

For developing the ingenuity and taste of children they are unequalled. Having given these blocks a practical trial in their own families, the publishers of the *Agriculturist* were so well pleased with them, that they consented to take the general agency for their sale.

The Blocks are put up in neat boxes, each box containing a set, and a card giving various designs of buildings. Price per Set; Plain, \$2.00; Painted, red, white, and blue, No. 1, \$3.00; No. 2, \$2.00; No. 3, \$1.50. A liberal discount will be made to dealers. Address

Quinby's Bee Keeping.

By M. QUINBY, Practical Bee-keeper. Fully Illustrated. Entirely new. The result of 35 years' of successful experience—with directions for all contingencies that can ordinarily occur; treating of Breeding, Movable-Comb and other Hives, Pasturage, Robbing, Feeding, Swarming, Queens, Diseases, Anger, Encumbrances, Wax, Transferring, Sagacity, Wintering, Care of Honey, Italian Bees, Purchasing, etc. Bee-keepers will find this new work of Mr. Quinby's fully up to the times in all practical matter.

Sent Post-paid.

Price \$1.50.

Gratifying Opinions of the Press.

From the Christian Intelligencer.

"Quinby's Work is the very best. It has long been regarded as of the highest authority in the matters concerning which it treats."

From Moore's Rural New Yorker.

"This is a newly written and illustrated edition of Mr. Q.'s former work. That has proved of value to thousands of Bee-keepers, and this, with its riper experience and added knowledge, can not fail of giving better satisfaction. Thirty-five years experience!—What beginner in bee-keeping will not bring this to his aid? We notice the author has no Patent Hive to introduce, and expresses his opinions freely on the merits and demerits of the various hives seeking popular favor."

From the Vermont Farmer.

"The book is written in familiar style, with the endeavor to be practical rather than scientific, thereby making it a guide to the tyro in Apian knowledge, as well as a standard work of reference for the more experienced bee-keepers."

From the N. Y. Christian Advocate.

"All bee-keepers should have this manual, and others may read it as a book of wonders."

SENT POST-PAID.

PRICE \$1.50.

ORANGE JUDD & CO., Publishers.

FLAX CULTURE.

A NEW AND VERY VALUABLE WORK, consisting of full directions, from selection of ground and seed to preparation and marketing of crop, as given by a number of experienced growers. 8vo, paper. PRICE 50 CENTS.

HOP CULTURE.

PRACTICAL DETAILS fully given, from the Selection and Preparation of the SOIL, SETTING and CULTIVATION of the Plants, to PICKING, DRYING, PRESSING, and MARKETING the Crop. By Ten Experienced Cultivators. Illustrated with over forty engravings. Edited by PROF. GEORGE THURBER. 8vo, paper. PRICE 40 CENTS.

TOBACCO CULTURE.

This is by far the most useful and valuable work ever issued on this subject. It contains full details for the Selecting and Preparing of the Seed and Soil, Harvesting, Curing, and Marketing the Crop, with Illustrative Engravings of the operations. The work was prepared by FOURTEEN EXPERIENCED TOBACCO GROWERS, residing in different parts of the country. It also contains Notes on the Tobacco Worm, with Illustrations. Octavo, 43 pp., in neat paper covers. PRICE 25 CENTS.

ONIONS.

How to Raise them Profitably.

Practical Details, given very plainly by Seventeen Onion Growers of long experience, residing in different parts of the country. No more valuable work of its size was ever issued. Octavo, 32 pp. Neat paper covers. Price 20 cents.

ORANGE JUDD & CO.,

245 Broadway and 41 Park Row, N. Y.

THE AMERICAN AGRICULTURAL ANNUAL for 1867.

A New Year-Book,

CONTAINING

AN ALMANAC,

Hints About Work for Each Month,

Recent Progress in Agriculture, and

A Review of the Past Year, together with numerous very valuable contributed articles, and convenient Tables.

The Essay on Draining, by Col. Waring, Engineer of the Drainage of the N. Y. Central Park, is by far the most complete presentation of the subject which has been made for many years in this country.

Some of the Newest and Best Potatoes, with his own mode of culture, are described by one of the most successful cultivators of Westchester County, N. Y., Wm. S. Carpenter.

The Culture of Sorghum, with the latest views in regard to the production of Syrup and Sugar, is discussed by Wm. Clough, Esq., Editor of the Sorgho Journal.

How to Train the Horse.—Mr. Headley's Hints on Training and his Views in regard to his Mind and Temper deserve the attention of every horse owner.

The Culture of Wheat, is discussed practically and philosophically, by Mr. Harris.

John Johnston's Practice in Fattening Sheep, like every thing from his ripe experience, is very valuable.

Essential Features of a Good Barn.—Dr. F. M. Hexamer consults durability in the structure and economy in farm labor, security of crops, health and comfort of stock, in this admirable plan.

The above are but a few of the articles comprised in this little volume—and which make it not only

A Record of Past Progress and Experience—but

A Hand-Book for the Present—and

A Guide for the Future.

This volume is the first of a series which we expect to issue annually, intending to make them a record of what happens each year best worth knowing and remembering, pertaining to Agriculture, in a convenient form for preservation and reference.

Price, fancy paper covers, 50 cts.; cloth, 75 cents.

Sent Post-paid.

ORANGE JUDD & CO.,

245 Broadway and 41 Park Row, N. Y.

THE AMERICAN HORTICULTURAL ANNUAL for 1867,

A Year-Book for the Gardener, The Fruit Grower and the Amateur.

NOW READY.

This is the first of a series of Annuals intended to give a record of Horticultural progress.

IT CONTAINS

An Almanac and Calendar for each MONTH, giving Hints for Work in the various departments.

Useful Tables, giving amount of Seed to sow a given space; number of Seeds to the ounce, etc.

How Horseradish is Grown for Market, by Peter Henderson. An article worth the price of the work to the grower for market.

Growing Grape Vines from Cuttings without Artificial Heat, by a simple process.

Home Decorations, IVY, HANGING BASKETS, etc. Instructions for the making, planting and management of these beautiful ornaments by A. Bridgeman.

The New Apples of 1866.—The new varieties first brought to notice the past year; as also Southern kinds first fruited at the North, by Doct. J. A. Warder.

New or Noteworthy Pears.—A valuable article, by P. Barry.

Native Grapes in 1866, from Notes furnished by Charles Downing, Geo. W. Campbell, J. A. Warder, A. S. Fuller, and other grape growers.

Small Fruits in 1866.—Accounts of new varieties and older ones not yet fully tested. By A. S. Fuller.

The Newer Garden Vegetables.—The result of experiments with new culinary plants, by Pearing Burr, Jr., J. J. H. Gregory, and others.

The Rarer Evergreens that have proved Valuable.—By Thomas Meehan.

The New Roses in 1866.—Brief descriptions of the novelties, by John Saul.

New Bedding and other Plants of 1866.—An account of how the recent importations have done the past year, by Peter Henderson.

The New Varieties of Gladiolus.—All the new ones noticed, by George Such.

Engravings of Fruits, Flowers, etc.—A useful list of those published in 1866.

Horticultural Books and Periodicals in 1866.—A list giving title, publishers name and price.

Nurserymen, Seedsmen and Florists.—A list of the most prominent Establishments.

With many other articles not here enumerated.

Fully Illustrated,

with Engravings made especially for the work.

A neat volume of 150 pages. Price, fancy paper covers, 50 cents; cloth, 75 cents. Sent Post-paid.

ORANGE JUDD & CO.,

245 Broadway and 41 Park Row, N. Y.

(Business Notices \$2.50 per Agate Line of Space.)

ESTABLISHED 1861.

THE GREAT AMERICAN TEA COMPANY

HAVE JUST RECEIVED
TWO FULL CARCOES
OF THE
FINEST NEW CROP TEAS.

22,000 HALF CHESTS by ship *Golden State*.
12,000 HALF CHESTS by ship *George Shotton*.

In addition to these large cargoes of Black and Japan Teas, the Company are constantly receiving large invoices of the finest quality of Green Teas from the Moyune district of China, which are unrivaled for fineness and delicacy of flavor.

To give our readers an idea of the profits which have been made in the Tea trade, we will start with the American houses, leaving out of the account entirely the profits of the Chinese factors.

1st. The American house in China or Japan makes large profits on their sales or shipments—and some of the richest retired merchants in the country have made their immense fortunes through their houses in China.

2d. The Banker makes large profits upon the foreign exchange used in the purchase of Teas.

3d. The Importer makes a profit of 30 to 50 per cent. in many cases.

4th. On its arrival here it is sold by the cargo, and the Purchaser sells it to the Speculator in invoices of 1000 to 2000 packages, at an average profit of about 10 per cent.

5th. The Speculator sells it to the Wholesale Tea Dealer in lines at a profit of 10 to 15 per cent.

6th. The Wholesale Tea Dealer sells it to the Wholesale Grocer in lots to suit his trade, at a profit of about 10 per cent.

7th. The Wholesale Grocer sells it to the Retail Dealer at a profit of 15 to 25 per cent.

8th. The Retailer sells it to the Consumer for ALL THE PROFIT HE CAN GET.

When you have added to these eight profits as many brokerages, cartages, storages, cooperages and wastes, and add the original cost of the Tea, it will be perceived what the consumer has to pay. And now we propose to show why we can sell so very much lower than other dealers.

We propose to do away with all these various profits and brokerages, cartages, storages, cooperages and wastes, with the exception of a small commission, paid for purchasing to our correspondents in China and Japan, one earriage, and a small profit to ourselves—which, on our large sales, will amply pay us.

By our system of supplying Clubs throughout the country, consumers in all parts of the United States can receive their Teas at the same price (with the small additional expense of transportation), as though they bought them at our warehouses in this city.

Some parties inquire of us how they shall proceed to get up a Club. The answer is simply this: Let each person wishing to join in a Club, say how much tea or coffee he wants, and select the kind and price from our Price List, as published in the paper or in our circulars. Write the names, kinds, and amounts plainly on the list as seen in the Club Order published below, and when the Club is complete send it to us by mail, and we will put each party's goods in separate packages, and mark the name upon them, with the cost, so there need be no confusion in their distribution—each party getting exactly what he orders, and no more. The cost of transportation the members can divide equitably among themselves.

Parties sending Club or other orders for less than thirty dollars had better send Post-office Drafts or money with their orders, to save the expense of collections by express; but larger orders we will forward by express, to collect on delivery.

Hereafter we will send a complimentary package to the party getting up the Club. Our profits are small, but we will be as liberal as we can afford. We send no complimentary package for Clubs less than \$30.

Parties getting their Teas of us may confidently rely upon getting them pure and fresh, as they come direct from the Custom House stores to our Warehouses.

We warrant all the goods we sell to give entire satisfaction. If they are not satisfactory, they can be returned at our expense within 30 days, and have the money refunded.

The Company have selected the following kinds from their stock, which they recommend to meet the wants of clubs. They are sold at cargo prices, the same as the Company sell them in New York, as the list of prices will show.

PRICE LIST OF TEAS:

OOLONG (Black), 70c., 80c., 90c., best \$1.25 lb.
MIXED, (Green and Black), 70c., 80c., 90c., best \$1 per lb.
ENGLISH BREAKFAST (Black), 80c., 90c., \$1, \$1.10, best \$1.20 per pound.
IMPERIAL (Green), 80c., 90c., \$1, \$1.10, best \$1.25 per pound.

YOUNG HYSON (Green), 80c., 90c., \$1, \$1.10, best \$1.25 per pound.
UNCOLORED JAPAN, 90c., \$1, \$1.10, best \$1.25 per pound.
GUNPOWDER, (Green), \$1.25, best \$1.50 per pound.

COFFEES ROASTED AND GROUND DAILY.

GROUND COFFEE, 20c., 25c., 30c., 35c., best 40c. per pound. Hotels, Saloons, Boarding-house keepers, and Families who use large quantities of Coffee, can economize in that article by using our FRENCH BREAKFAST AND DINNER COFFEE, which we sell at the low price of 30c. per pound, and warrant to give perfect satisfaction.

Consumers can save from 50c. to \$1 per pound by purchasing their Teas of the

GREAT AMERICAN TEA COMPANY,

Nos. 31 and 33 VESEY STREET.

CLUB ORDER.

Edwards, St. Lawrence Co., N. Y.,
June 3, 1867.

THE GREAT AMERICAN TEA COMPANY,
31 and 33 Vesey Street, New York.

DEAR SIR: I herewith send you another order for Tea. The last was duly received, and gives general satisfaction. As long as you send us such good Tea, you may expect a continuation of our patronage. As a further evidence that the subscribers were satisfied, you will observe that I send you the names of all those that sent before who were nearly out of Tea, with a large addition of new subscribers. Accept my thanks for the complimentary package. Ship this as the other, and oblige.

Your obt. servant,

DAVID C. MCKEE.

N. B.—All villages and towns where a large number reside, by Clubbing together, can reduce the cost of their Teas and Coffees about one-third (beside the Express charges,) by sending directly to "The Great American Tea Company."

BEWARE of all concerns that advertise themselves as branches of our Establishment, or copy our name either wholly or in part, as they are *bogus* or *imitations*. We have no branches, and do not, in any case, authorize the use of our name.

Post-Office orders and Drafts, make payable to the order of "Great American Tea Company." Direct letters and orders to the

GREAT AMERICAN TEA COMPY,

Nos. 31 and 33 VESEY-ST.,

Post-Office Box, 5,643, New York City.

FRANKLIN BRICK MACHINE.

Justly celebrated for perfect simplicity, great strength, and immense compressing power, is GUARANTEED, with eight men and two horses, to self-temper the clay and make 3,000 to 3,500 elegant bricks per hour. J. H. RENICK, Proprietor, No. 71 Broadway, New York, Room 25.

CHARLES WILDER,
MANUFACTURER OF WOODRUFF'S IMPROVED
PORTABLE BAROMETERS.
Also, all kinds of Common and Fancy THERMOMETERS, in Tin, Copper, Wood, Glass, Morocco and Ivory Cases. Thermometers for Physicians, Chemists, Brewers, Dyers, Manufacturers, Vulcanizers and Dairy use. PETERBORO, N. H. Agents Wanted. Send for Circular.

Rural Improvements.

Robert Morris Copeland, author of Country Life, furnishes plans and advice for laying out or improving public or private grounds. Refers to John M. Forbes, Nathaniel Thayer, Boston; Francis G. Shaw, New York; Rufus Waterman, Providence, R. I. Office, 40 Barristers' Hall, Boston, Mass.

Ives' Seedling Buds, 800,000!

Vines in quantity of Ives, Concord, (150,000), Delaware, etc. Plants delivered free by mail and Express, at retail rates, cash advanced. Ives, 1 year No. 1, \$18; 2 years No. 1, \$25 per 100. Concord, 1 year No. 1, \$8; 2 years No. 1, \$12 per 100. Catalogue, Illustrated Circular, free.
M. H. LEWIS & CO., Sandusky, Ohio.

GRAPE VINES at IONA.

My stock comprises all of the leading kinds, including Ives' Seedling, but principally consists of

IONA, ISRAELLA and DELAWARE.

The performance of the Iona and Israella generally throughout all of the vine-region of the country, leaves no doubt in the minds of those best informed, that upon these now rests chiefly the prospect of the eminent success of grape culture in America.

Attention to the record of the Iona during the past four years will be instructive to all who desire to plant vines for any purpose throughout the whole vine-growing region of the country. (See statement of its performance, page 424.)

My stock of these kinds is very large, and of surpassing quality. My unequalled facilities and the result of the past years warrant the belief that I can make more advantageous terms to buyers than can be done by any other propagator. Price List sent on application with stamp.

Prices for best vines for Garden or Vineyard, as low as can be afforded, and some choice lots even lower.

C. W. GRANT,

IONA, near Peekskill,

Westchester Co., N. Y.

WASHERS AND WRINGERS.

THE

Cannot be surpassed or equaled by any other Wringer for durability, till the expiration of the patent for the "COG WHEEL REGULATOR" or "STOP-GEAR." No other Wringer is licensed under this Patent.

Many who sell the UNIVERSAL WRINGER keep also the

DOTY WASHING MACHINE;

which is really as great a LABOR and CLOTHES SAVER as the Wringer.
It washes perfectly, without wearing or rubbing the clothes at all, and with great ease and rapidly.
On receipt of the Retail price, from places where no one is selling, we will send either or both machines from New York.

Prices—Family Washer, \$14. No. 1½ Wringer, \$10. No. 2 Wringer, \$8.50.

A supply of the Wringers and Washers is always kept on hand in Chicago, Cincinnati, Cleveland, Janesville and St. Louis, boxed ready for shipment, at about New York prices.

Large discounts made to wholesale purchasers. Circulars, giving Wholesale and Retail prices, sent free.

These Machines are adopted by the American Agriculturist as Premiums, and endorsed by its Editors as the best in market—for recommendations see back numbers.

R. C. BROWNING, General Agent,
No. 32 Cortlandt-st., New York,
(Opposite Merchant's Hotel.)

CRESYLIC SOAP.

A PERFECT DISINFECTANT
(Patented).

For Disinfecting, Deodorizing, and Purifying Cellars; Hospitals, Tenement Houses, &c. Also, for Exterminating Roaches, Bugs, and Insects of all kinds.

Manufactured solely by

JAMES BUCHAN & CO.,

190 Elizabeth-st., New York.

TRY IT A QUARTER!—A NEW

Quarter of Moore's RURAL NEW YORKER, the Great Rural and Family Weekly, begins Oct. 5, and the 13 numbers (Oct. to Jan.) will be sent, on trial, for ONLY FIFTY CENTS. Full price \$3 a year. Vol. XIX begins in January. Try it a Quarter or Year!

Address, D. D. T. MOORE, Rochester, N. Y.

STAMMERING CURED.

By BATES' PATENT APPLIANCES. For Pamphlets, &c., address SIMPSON & CO., 277 West 23d-st., New York.

NEW SERIES—No. 251

THE INTERRUPTED SUPPER.—AFTER A PAINTING BY LUDWIG BECKMAN, DUSSELDORF.—Engraved for the American Agriculturist.

One of the pests of European agriculture is the rabbit, which breeds seven times in a year, and as it produces eight at a birth, it is estimated that the progeny of a single pair would in four years amount to the enormous number of 1,274,480. It is fortunate that they have so many enemies, besides man, to keep them in check. Rabbits and hares are much alike, but differ in their habits—the hare is a solitary animal, and

makes its nest or "form" on the ground, while the rabbit burrows and lives in large colonies. Naturalists place all our animals that are usually called rabbits among the hares, of which we have in our entire territory some twenty species. Our common species is the *Lepus sylvaticus*, found throughout the greater part of the United States. It retains its brown color all winter, while the Northern Hare, *Lepus Americanus*,

which has a more northern range, is brown in summer, and white in winter. Both hares and rabbits are exceedingly timid, and for their safety from their enemies rely upon their fleetness. Our domestic rabbits are supposed to be varieties of the European *L. cuniculus*. The above group admirably represents characteristics common to these animals—contentment when no danger is suspected, and great timidity when alarmed.

AMERICAN AGRICULTURIST.

NEW-YORK, DECEMBER, 1867.

Hail winter, the resting time of vegetable life. We gather strength in sleep, and by repose. So do the animals, to which man is so close akin in his physical and even intellectual structure. Plants also undergo internal changes which fit them for the new life of the spring. The maple stem contains little sugar during the season of growth, but gains it from the changes which occur to the contents of its cells during the period of rest. The grasses and winter grains ripen their roots, so to speak, and we presume that no vegetables which maintain their vitality through the cold season, approach the spring unchanged, but they are better prepared to commence a new growth. The soil firmly bound by the frost fetters is no exception to the rule of improvement. Simple freezing is very beneficial, freezing and thawing still more so, and the more thorough the exposure to the action of the elements, the greater the advantages. Particles of plant food, before unavailable, are brought into a condition to be dissolved by water, and taken up by the plants. Stiff clays are ameliorated, peaty soils are made friable, and a volume might be written on the good effects of frost on the soil. It makes up to the dwellers in the temperate and frigid zones the lack of the intenser action of warm airs, moisture, fermentation, and decay upon the soil and its constituents, occurring in the tropics.

Rest is not a folding of the hands in idleness, that is *rust*, or its equivalent. A change is more resting than a cessation of labor. If the hands rest, let us set the brain at work, and let the social qualities find useful employment, for thus shall we be invigorated in body and mind, and all the better prepared for hard work when it comes. After all, the rest of winter, to most farmers, is more in change of work than in anything else. Work enough may be done in the shortest day to give any man good digestion, and to soften even a hed of straw.

The interest in Farmers' Club meetings, and in other similar gatherings, will flag, if especial efforts be not made by those who have the ordering of them to make every meeting attractive by drawing out from the members facts useful to all, imparting some practically useful knowledge, giving away seeds, grafts, roots, duplicate catalogues and circulars, etc. Here let us drop a hint, which, in our experience, has always worked well. If the secretary, at each meeting, distributes all the articles of the kinds enumerated that he has on hand to the members present, be they many or few, saving none for delinquent or absent ones, the meetings will be much better attended.

The Retrospect.—The last month of the year is upon us. Our volume closes with it, but we neither shut our books, nor lay down our pens. The Sabbath of the year is for our readers, not for us, with whom every month is like its fellows. Yet these brief halts upon the march are pleasant, as we cast the eye back over the way we have come, and take our bearings, and make ready to move forward into the unknown but hopeful future. The year has been one long to be remembered as presenting the anomaly of a parching drought and most damaging rains, sweeping hand in hand, as it were, across the continent; yet our prosperity, as an agricultural people, is great. Most of our products are sought for at high prices, and we have much to sell. The diseases which have threatened our stock, have passed away, means of intercommunication have greatly increased, so that access to markets, with remunerative prices are offered even to the corn growers and herdsmen of our out-most borders. The peaceful conquests of labor and of the strife of trade are noticeable everywhere. Each section is being bound to the other by cords of iron, and bonds of commercial intercourse. The mutual dependence of each portion of the country upon the other for real prosperity, is every day more strongly apparent.

Hints About Work.

The winter evenings have come, and it is a matter of the first importance that a portion of them should be devoted to the cultivation of the mind. The summer has necessarily been devoted to labor. In the winter, Nature puts a barrier upon many of our labors, and we should take advantage of the interval to read upon topics that have been deferred for want of time to discuss them. The mind needs cultivation as much as the soil, and it is generally the state of the mind that makes farming profitable or otherwise. The brain is more and more showing its power every year in economizing farm labor, and no man can afford to remain in ignorance of the manifold appliances that help his industry. Keep the mind improving, and make all your farm operations a means of mental culture. Look back over the past year, and see wherein you have made bad plans, or failed to carry out good ones. Determine what practices have been profitable and what ought to be abandoned. Every year's operations ought to have its lessons for the thinking farmer, and settle some principles.

Books.—These are becoming more and more necessary upon the farm. The more a man knows, the more he needs to know in every calling in life. "A little learning is a dangerous thing." There has been a great mental quickening upon the farm within the past ten years, and multitudes of workers have got smattering of the science of agriculture. They have got out of the ruts in which they were comparatively safe, and have ventured upon experiments. They need more light to guide them; and to this end they must read the writings of men farther advanced than themselves, and thus avail themselves of their knowledge. The books made by practical farmers, gardeners, and fruit-growers, embody the experience of a life-time and are invaluable to those who come after them. The man who masters this experience saves himself from a multitude of losses, and puts himself in the way to make large gains. "Draiving for Profit" is a book that ought to be in every farmer's hands. Get the best books on your business, and study them with a view to following such teachings as are adapted to your soil and climate.

Periodicals.—These are indispensable now to keep a man abreast of his times. No investment pays better than a few dollars in the best agricultural and horticultural journals. Farming is progressive like the other arts, and there is money saved and gained in the hints which these papers drop in their monthly or weekly visits.

Circulating Libraries, will furnish much that one is not able to purchase for himself. These should be established in every town, and provision made for their regular increase. At least exchange books and periodicals with your neighbors. They are great educators. Your children will read something, and you may as well direct their education as to leave it to others. A home well supplied with good books and papers is rarely deserted for places of vicious resort.

Schools.—Keep your children in the best schools. Make the free schools as good as they can be, but if there are better, use them. There is no compensation for the loss of the advantages of education.

Accounts.—Have everything settled up by the close of this month, and ascertain definitely the result of the year's transactions. Know whether you have gained or lost, and how much. Farmers are more negligent than any other class in this matter. They have much barter with their neighbors, and at the store or market town, and often accounts run for years without any settlement. They do not know how they stand with the world, and cannot tell whether any crop they cultivate is a loss or gain to them. This is bad farming, and often leads to bad morality. Keep accounts and settle them once a year, for your own sake as well as your neighbors'. Begin the next year with a clean balance sheet.

Protection against Frost.—The cellar may be made frost-proof originally, by good underpinning and double glazed windows. If this has not been done, make a thick bank of earth, tan-bark, sea weed, or

straw. The roots have cost quite too much labor to be ruined by frost. A well protected cellar makes the whole house warmer and saves fuel. Protect water pipes and pumps, and if the pipes chance to get frozen, wrap them in flannel and pour hot water upon them to thaw them out. Save plumbers' bills by timely attention.

Fodder.—This has cost money to raise and should be carefully used. Feed regularly, and only so much as an animal eats up clean. There is waste in irregular, or over-feeding. If you fodder in the yard let it be under a shed, with racks to put the hay in. Stocks should be brought to the barn and foddered there. It is wasteful to scatter hay upon the ground. Much of it is trampled and lost.

Live Stock of all kinds should have the owners' daily supervision. If others do the work, his eyes should see that it is well done. Few hired men can be trusted to do things constantly according to directions. In the very cold weather there is a constant temptation to consult his own ease rather than the comfort of the animals entrusted to his care. Feed and water regularly, and shelter all cattle in barns or sheds. Pine boards are cheaper than hay and grain. Keep salt within reach of horses, cattle, and sheep. A large lump of rock salt is best for this purpose. If they can lick when they please, they will not take it in excess. Attend to ventilation in barns and stables, and give the animals the benefit of the sun for a while on clear days. Keep all animals in a thriving condition.

Colls and Steers.—Improve the leisure of the season to break them in to work. The smooth snow path makes light loads, and their strength should not be much taxed at first.

Horses.—The horse above all animals wants careful handling. See that the shoes are well put on, and the caulks sharpened as icy weather approaches. Warm blankets save fodder and promote health. If the young folks go on a sleigh ride, insist upon the horse blanket to keep company with the robes for Tom and his sweetheart. There will be bills enough to settle without a sick horse in the stable to be doctored.

Working Oxen should be kept shod and caulked, if used. Keep up the flesh by generous feeding. A lean working ox is poor property.

Cows.—Keep the stables clean and well bedded at night. Sprinkle plaster or dried peat upon the floors when cleaned out, to save the ammonia and to avoid injury to the eyes of the cows. Ventilate thoroughly, and from the top of the barn if possible. Give them an opportunity to exercise an hour or two in the warmest part of the day. Keep the horns ornamented with balls, if they are inclined to be quarrelsome. Plan to have one or more farrow, or new milch cows for winter. There is no substitute for a plenty of good milk in the family.

Hogs ought to be well fattened by Christmas. Pork is made much more economically in warm than in freezing weather. Pay great attention to the quarters of the animals. Good sties with plenty of straw are cheaper than meal to keep up the animal heat. The pig is cleanly in his habits, and will keep himself clean if you give him a dry lodging place and straw. Corn meal is high this year, and the root crop is short, and pork will probably cost the Eastern farmer about all it comes to. Cooked food pays best.

Poultry is one of the most attractive features of the barn-yard, and when well cared for nothing pays better. In fattening geese and ducks, give them a pen for two weeks before killing. Hens and turkeys we have thought fattened quite as well at large. But they should be fed frequently with a variety of food, and have all they can eat. Arrange to have eggs in winter. A room on the south side of a hill, with plenty of glass, is almost indispensable. The birds must have animal food in some form, broken shells, and dust to roll in. Eggs in winter always bring a high price in city markets. Select for layers the early pullets of last spring. For plans of poultry houses see back numbers.

Manure.—Attend to its manufacture early and late, in summer and winter. Your success in hus-

bandry depends mainly upon this article. It pays even upon good lands by making them better, and securing larger and more economical crops. Be avaricious of fertilizers. It is often convenient to draw muck and peat from the banks of ditches that have been dug in the summer. We have found it quite practicable to dig muck in winter after the surface is frozen hard enough to bear teams. Some swamps are accessible at this time that cannot be approached in summer. A farmer can never have too much muck on hand, if he has an acre of meadow that does not produce three tons of hay.

Wood-cutting and Lumber.—Now is the time to lay in a stock of wood for the year. Well-seasoned wood saves fuel, time, money, and the temper of the housewife. Much of the comfort of a family depends upon the kitchen fire. Rails have also to be provided upon many farms. Posts are wanted, and joists, planks, and boards. Saw-mill logs are much more easily carried upon sleds than upon carts. Improve the first good snow to move them.

The Ice Harvest.—Secure this as soon as the ice is six inches thick. This sometimes comes in December, and does not come again. If an ice-house is wanting, build one. See plans of inexpensive ice-houses, in back volumes. Ice is at once a luxury and a necessary in summer. The dairy is better managed with it, and many perishable articles can be preserved that would otherwise be lost.

Tools.—Now that the season is ended, overhaul all implements and vehicles. Repair damages, and if new tools are wanted, secure them, to be ready for next year's operations. If these have no abiding place, build a tool-house without delay, and illustrate that motto: "A place for every thing, and every thing in its place."

Seeds.—Get a complete assortment for next year. Much of the success of farming depends upon this item. For corn select sound ears, and those growing two ears upon a stalk. Keep the ears in a dry, warm room, until thoroughly cured. Much poor seed corn is planted every year, and people wonder why it does not come up. Early seed potatoes should be secured now. It often makes a difference of half a price whether a crop is marketed in July or October. Burn up the old garden seeds and get a new stock from some reliable seedsman. Our present postage law brings a seed store to every man's door, and he has no excuse for planting seed that are most too good to throw away, but not quite good enough to come up. Doubtful seeds will not pay when good ones can had for love or money.

Work in the Horticultural Department.

Now that cold weather has well-nigh put a stop to out-of-door work, it is well to take a look ahead and, before the present year has expired, give thought to the labors of the one that is so soon to open. It is a pleasant thing about horticulture that it is always progressive, and that perfection is never attained in any department. That which we now consider the perfect fruit or flower will, in ten years, be looked upon as unworthy of cultivation. It is this succession of novelties, this striving after improvement, that lends such a charm to horticultural pursuits. Each year's experience teaches better ways of cultivation, and gives us new knowledge of the things we cultivate. Fortunate is he who makes use of each year's teachings, and still more fortunate if he has the means and the will to add to them the experience of others. Now at this season, when one can be a student without feeling that he is neglecting other matters, it is well to gather up the scattered hints that are hidden in papers that were laid aside in the busy season, and to look at the recent books that have been written in his particular department. It is not possible that men like Warder, Thomas, Fuller, Henderson, and others, can write a book upon matters to which their lives have been devoted, without giving some information that may be turned to practical account. Commending the horticulturist to his books and journals, we give the few items of out-door work that belong to the month.

Orchard and Nursery.

In the Southern States, and in favorable seasons at the North, much of the work of plowing and subsoiling, and making ready for spring planting, may be done. Every favorable opportunity of this kind should be seized upon. Planting an orchard implies a promise to take care of it; trees set last fall should be occasionally looked to, to see that they are safe from domestic animals.

Fences must be in a condition to keep out horses, cattle, and sheep, as well as those thoughtless people who, when snow covers the ground, strike a straight line for their destination without regard to the damage they may do.

Rabbits are often destructive to young orchards, and various preventives have been from time to time proposed. The simplest of these, and the one largely followed at the West, is to sprinkle the trunks of the trees with blood, or, what answers the same purpose, rub them with a piece of fresh liver.

Mice like to work under cover, and if dead weeds or other litter lie close to the trees, they will be very apt to bark them. Clear away all rubbish, and after a snow fall, go around and press the snow firmly around the trunks. Surrounding the base of the trunk with a cylinder of tin or sheet iron may be practised where there are not many trees. A solid, smooth mound of earth, about a foot high, will protect them; but when snow covers this, the mice will work under it if it is not trampled hard.

Standing Water in the orchard must be prevented by opening surface drains where they are needed.

Cions may be cut any time, provided the twigs be not frozen. Choose good, well ripened shoots, of last season's growth; tie in bundles and label with the greatest care. To insure against the loss of the tag, it is well to mark one of the cions in each bundle also. Whittle a flat place at the large end of the twig, and then cut a number in Roman numerals, which shall serve as a reference to a memorandum. Saw-dust is better than sand for preserving the cions; keep in a cool place.

Catalogues should be consulted, and the list of trees for spring planting made out. Our advice is to always buy of the nearest reliable nurseryman.

Manure may be applied to the orchard—not a little near the tree, but over the whole surface.

Fruit in store is to be kept at as low and even a temperature as practicable, without freezing. Choice pears that have been well kept bring a good price, especially as the holidays approach.

Nursery stock can now be propagated by root-grafting. This work is done in-doors, in unpleasant weather; while the mild days are employed in heading back and shaping the last season's growth of young trees. Look to trees that were

Heeled-in for the winter, and see that no water stands around them and that the banking of earth is not washed away by heavy rains.

Fruit Garden.

The general directions for the orchard are for the most part applicable here.

Protection of those plants that need it is usually done too soon; when the ground becomes crusts it is time enough. Tender raspberries may be bent down and covered with earth, and a mulch put over the strawberry beds, as noted on page 450.

Snow, if it accumulates in the heads of dwarf trees, should be shaken out while it is yet light.

Grape Vines, if yet unpruned, may be attended to on mild days. Even the hardiest do all the better if laid down and covered with earth. Make cuttings and bury them, or callus them by the process recommended last month on page 409.

Pruning of dwarf trees may be done, provided no large wounds are made.

Kitchen Garden.

Wherever the condition of the ground will allow of the use of the plow and spade, a great deal may be done to save valuable time in the spring. To

this end all rubbish should be cleared up, and everything made snug and neat.

Roots that are already in pits should be covered as the cold increases, and when winter fairly sets in, the pits should be banked over with about two feet of soil, neatly rounded off, to shed rains. Hardy roots, such as horse-radish, parsnips, and salsify, may have some litter thrown over them, and thus prolong the season during which they may be dug.

Celery, stored in trenches as heretofore directed, will also need to be covered gradually, commencing with a few inches of leaves or litter, and as the cold increases, adding a covering of earth.

Covering of standing crops of kale, shallots, spinach, etc., will need to be done in localities where the winter is severe. Near the coast, salt hay is used for this purpose, and is an excellent material, but straw or leaves are more generally available.

Cabbages and other plants in cold frames will require constant attention, and are more likely to suffer from heat than from cold. Give them air by lifting the sash even in freezing weather, and on mild days remove the sashes altogether.

Seeds should be in a place secure from mice and moisture as well as great extremes of temperature. Have every parcel correctly marked with its contents as well as date of growth. Destroy all seeds of doubtful identity or vitality.

Tools may be overhauled and repaired, and everything put in working order for spring.

Mauure.—This is the key to successful gardening, and its accumulation is one of the kinds of hoarding that we advocate. In most large towns there are waste fertilizers that are worth carting away.

Flower Garden and Lawn.

With the departure of the Chrysanthemums, the borders are bare of flowers. Those who have been thoughtful enough to introduce Rhododendrons, Kalmias, and other evergreens for winter effect, can now enjoy their cheerful appearance.

Protection must be given to many tender shrubs. Where the case admits of it, laying down and covering with earth is the readiest as well as one of the best ways. Half hardy Roses, Clematises, Wistarias, (in very cold places,) and the like, winter nicely under a covering of earth, provided the spot is so well drained that water cannot settle about them.

Evergreen boughs, especially those of the red cedar, may be placed over low shrubs to protect them.

Lawns should have a good top dressing of rich compost.

Evergreens, as well as dense clumps of shrubbery and evergreen hedges, not of proper form, are very apt to get bent out of shape if not broken down by heavy accumulations of snow. Such accidents should be prevented by removing the snow while it is still light and can be readily shaken off.

Green and Hot-Houses.

The management of fires will require some judgment, especially in a month in which a fine, mild day is often succeeded by a very cold night. In the greenhouse, the thermometer should not go below 38° at night, and reach 55° or 60° in the day-time. Give air wherever it is safe to do so.

Arrange the plants to the best advantage. Renew sticks and labels, and have all in complete order.

Insects must be fought at the start. At the first appearance of the green fly, or aphid, make a smoke with tobacco. The syringe will keep the red spider in check. Page's Sprinkler is excellent for this.

Cacti, and all plants that are in a state of rest, need but very little water, while growing ones should not be allowed to lag for the want of it.

Bulbs that were potted for house decoration may be brought into a warm place, a few pots at a time, to keep up a succession of flowers.

Hanging Baskets, so much in demand for the holidays, should be filled. Ivy is the ground work, and it is better to fill a basket with this alone than to crowd a lot of unsuitable things into it.

Apiary in Dec.—Prepared by M. Quinby.

Give the bees liberty to fly during the last warm days, and when the weather is too cool to allow of their flight, they may be put into winter quarters. Strong stocks should be selected for storing, especially if there are but few hives. Poor stocks do not generate heat enough to prevent them from perishing. If kept in a room, which should be perfectly dark, it requires about 50 stocks to produce sufficient heat. Smaller numbers may be kept in a dry cellar, or be buried. In September, 1865, we gave an article on burying hives, with an illustration. Very strong stocks will winter on the stand, and better in the straw hive than in any other. In any case, there should be proper ventilation. Wooden hives should be well protected by straw. If the entrance to the hive is so large that mice can get in, cover it with wire cloth, leaving room for the passage of the bees. Now is a good time to make hives, and to study up the subject of bee culture. The works of Quinby and Langstroth should be in the hands of every apiarian, as they not only give full direction for practice, but discuss the curious habits, and remarkable physiology of the bee.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the *American Agriculturist*, show at a glance the transactions for the month ending Nov. 18, 1867, and also for the preceding month:

1. TRANSACTIONS AT THE NEW-YORK MARKETS.
RECEIPTS. Flour, Wheat, Corn, Rye, Barley, Oats.
25 days this m'th 503,000 3,598,000 2,191,000 377,000 1,108,000 2,719,000
25 days last m'th 437,000 2,216,000 1,750,000 189,000 805,000 1,210,000

SALES. Flour, Wheat, Corn, Rye, Oats, Barley.
25 days this m'th 376,000 3,314,000 2,520,000 189,000 2,818,000 817,000
25 days last m'th 441,000 1,802,000 2,911,000 350,000 2,916,000 513,000

2. Comparison with same period at this time last year.
RECEIPTS. Flour, Wheat, Corn, Rye, Barley, Oats.
25 days 1867... 503,000 3,598,000 2,491,000 377,000 1,108,000 2,719,000
25 days 1866... 321,000 1,213,000 1,496,000 107,000 2,184,000 849,000

SALES. Flour, Wheat, Corn, Rye, Oats, Barley.
25 days 1867... 376,000 3,314,000 2,520,000 189,000 2,818,000 817,000
25 days 1866... 363,000 2,045,000 5,679,000 476,000 1,313,000 2,135,000

3. Exports from New York, Jan. 1 to Nov. 16:

	Flour.	Wheat.	Corn.	Rye.	Oats.	Barley.
1867...	688,623	3,252,969	6,900,420	349,195	111,970	886,863
1866...	511,065	340,735	10,559,000	192,489	1,067,567	484,561

4. Stock of grain in store at New York:

	Wheat.	Corn.	Rye.	Barley.	Oats.	Malt.
Nov. 12...	941,129	1,951,706	134,513	361,053	2,246,752	52,155
Oct. 15...	167,698	957,664	7,300	32,793	890,897	57,977
Sept. 10...	130,532	1,154,892	500	9,976	135,577	61,508
Aug. 13...	91,171	868,724	32,785	12,376	200,819	48,632
July 15...	245,500	160,780	66,086	21,390	206,703	31,700
June 11...	578,279	217,796	117,257	69,643	379,805	16,311
May 15...	731,330	261,092	186,801	145,706	608,494	16,461

5. Receipts of Breadstuffs at tide water at Albany, May 1st to October 31st:

	Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.
1867...	280,509	5,999,101	14,009,100	635,193	2,392,500	5,819,100
1866...	213,900	3,393,000	23,135,900	857,509	3,210,900	7,795,400

Gold has been much depressed since our last. It has been down to 138½, and thereafter up to 141. It closed on Saturday, Nov. 16th @ 139½.... The breadstuff market has been rather more active, but, under increased supplies, and the decline in gold, prices have been quoted lower generally. The home trade have been buying freely. The export demand has also been good, particularly for low grades of flour, and for spring wheat. Prices of wheat closed in favor of buyers. Corn has not been much sought after, save for home use. It has generally ruled at figures above the limits of shippers, and comparatively few foreign orders have been executed. The market for it closed weak and drooping. Rye and Barley have been held quite firmly, and have been in fair request. Oats have been mostly controlled by speculators, who hold about two-thirds of the stock here, and under whose management the market prices have been subject to frequent and extreme fluctuations. The closing transactions on the 16th inst. were of considerable magnitude, but mainly on speculative account at higher and rising prices.... Provisions have been generally lower, and less inquired for, though Lard, Bacon, and Butter attracted more attention towards the close, and were quoted stronger in price.... Cotton has been in better supply and less active demand at easier and drooping rates.... Wool has been freely offered at reduced figures, and toward the close has been in rather better demand, especially fine fleece, largely on speculation.... Hay, Hops, and Tobacco have been in good demand, and buoyant.

CURRENT WHOLESALE PRICES.

Total in four weeks... 26,354 298 4,877 131,352 135,846

Average per week..... 6,588 74 1,219 30,338 33,851

While beeves have fallen off about 430 per week, as compared with the previous month, the supply has still exceeded the demand. Sheep, too, have been less freely offered, but swine more than make up for the deficiency. In fact, meats of all kinds have been, and still continue to be, a drug upon the market. Cheap poultry is a strong competitor of beef, mutton, and pork.

Beef Cattle.—For the last month but very few really good cattle have come forward, owners holding such for the holidays when fat beeves are in demand. In their places are large numbers of thin steers, dry cows, and old oxen, sent to market when out-door feed failed, the expense of feeding hay and grain being heavy. The majority of those who bought cattle in the high markets last spring, and grazed them during the summer, lost all the cost of pasturage, and in many cases more. The decline in price being fully equal to the gain in weight. The market continues in a depressed condition, with too much state poultry, selling by the ton at 6 @ 10 cts. per lb, to cause a quick demand for beef. On the 12th, the date of our last cattle report, immense quantities of soft turkeys and chickens were sold at 5 cts. per lb, the weather being rainy. At the present time, 16 cts. per lb net weight is the outside price for extra fat steers, while good to prime are selling at 13 @ 15 cts., and common to fair at 8 @ 12 cts., the average being about 13½ cts....

Milk Cows.—These are in quick demand, with a scarcity of good milkers. Ordinary cows are little called for, the high price of milk and increased expense of keeping, causing buyers to select only good cows. For such they pay \$90 @ \$110, and when something extra is offered, \$125 is frequently obtained. We noticed a large native cow, with perhaps one-fourth Durham blood, reputed to give 20 quarts per day, sold at \$140, without the calf, which of itself was worth \$15. Ordinary to fair cows are selling at \$65 @ \$85....

Calves.—Fat veals for the butcher are scarce, and will sell readily at 12½ @ 13 cts. per lb, live weight. Common to fair calves are worth 8 @ 11 cts. Some large and very fat calves, six months old, were sold at \$51 each....

Sheep.—These continue to come forward faster than they can be sold. Instead of going upon winter feed, they are rushed into market. The decline of wool, too, is leading farmers to diminish their flocks. They are ½ cent per lb lower than last month, fat sheep of 95 @ 100 lbs. selling at 5½ @ 5½ cts. per lb, live weight, while common to fair go off at 4 @ 5 cts. Choice lambs bring 7 cts., ordinary to good, 6 @ 6½ cts. per lb, weighed alive....

Swine.—Hogs have been coming in faster than at any time since the fall of 1863, but prices are no lower than they were the last of December, and the beginning of the present year; but fully ½ cent lower than one month ago. The quality is improving, most of the poor trash having been sent off. Prime hogs are now worth 7 @ 7½ cts., with fair at 6½ cts., and common at 6 @ 6½ cts. per lb, live weight.

THE AMERICAN HORTICULTURAL ANNUAL for 1868.

The second number of this serial will be ready about the holidays, and will contain a popular record of horticultural progress during the past year, besides valuable articles from

EMINENT HORTICULTURISTS.

Among those who contributed to its pages are
Hon. Marshall P. Wilder, Doctor John A. Warder,
Peter Henderson, S. B. Parsons,
Thomas Meehan, Jas. J. H. Gregory,
Josiah Hoopes, George Such,
Wm. S. Carpenter, Andrew S. Fuller,
Geo. W. Campbell, John Saul,
Doctor Van Kenren, James Vick, and other well-known pomological and floricultural writers.

The engravings which have been prepared expressly for the work, are numerous, and of a character that will make it the

MOST BEAUTIFULLY ILLUSTRATED

work of its kind ever published in this or any other country. Tables, Lists of Nurserymen, Seedsmen, and Florists, and other useful matters of reference.

Price, in fancy paper covers, 50 cts.; in cloth, 75 cts.

THE AMERICAN AGRICULTURAL ANNUAL for 1868.

The volume will be ready toward the close of the present month, and will contain much of interest to every agriculturist. Besides the general record of agricultural progress, it will contain a valuable article on

Factory Dairy Practice, by Gardner B. Weeks, Esq., Secretary of the American Dairywomen's Association, in which he discusses the reasons for the best practice and the most approved apparatus, buildings, etc., fully illustrated, and is equally interesting to the practical dairyman and to the novice;—an article on

Sewers and Earth Closets in their relations to Agriculture, by Col. Geo. E. Waring, Jr.;—one upon

Winter Wheat, describing, with engravings, new and valuable varieties, by John Johnston;—one upon

Scythes and Cradles, by John W. Douglas, (fully illustrated;) also articles on **HORSE BREAKING** and on **BITTING COLTS**, by Sam. F. Hendly, Esq., (illustrated.) On **RECENT PROGRESS IN AGRICULTURAL SCIENCE**, by Prof. S. W. Johnson; on **Commercial Fertilizers**, Veterinary Medicine and Jurisprudence, Farm Architecture, Progress of Invention Affecting Agriculture, etc.

It is intended that the work shall be practical, excellent in beauty of its illustrations, and in its adaptation to the wants of American Farmers, superior to anything of the kind heretofore published.

In its general features it will be like the Agricultural Annual for 1867, containing an Almanac and Calendar, and there will be added a list of dealers in Agricultural Implements, Seeds, etc. Price, fancy pa., 50c.; clo., 75c.

Containing a great variety of items, including many good hints and suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

The End of the Volume.—With this issue we close volume 26th of the *American Agriculturist*. We have neither time nor inclination for valedictory addresses to our readers. We believe that we can, however, congratulate ourselves on having not only done all we agreed to, but more. Our prospectus promises only thirty-two pages, and we have in every month given more than that, and we believe that we have in good part fulfilled our pledge to make the paper better than ever before. The next number will begin volume 27—(how fast we grow old!) and we enter upon it with increased facilities for meeting our obligations to our readers. A new building gives us the long needed room, and with an abundant working force in the business, editorial and mechanical departments, we are warranted in saying that the coming volume will be better than any of its predecessors. We feel that our old readers are well enough satisfied to continue with us, and that many will express their satisfaction by an early renewal of their subscriptions, and also in making the *Agriculturist* known to their friends. The publishers offer remarkable inducements to personal effort, as will be seen by the premium lists on

another page. With all pleasant holiday greetings to old and young, we turn our attention to preparing them a brilliant and varied number for the new year.

A New Work upon Cotton Culture, by J. B. Lyman. This work has been prepared to meet a growing want, and is a complete manual of cotton growing, intended for those who are unfamiliar with the production of this crop. It discusses climate, the farm, stock, implements, preparation of soil, and planting, cultivation, picking, ginning, baling, and marketing. A calendar of monthly operations, a discussion of the extent of the cotton lands, the varieties of the cotton plant, and the insects and diseases that molest it, form the second part of the work, which also includes valuable statistics and suggestions. An additional chapter has been prepared by J. R. Sypher, Esq., upon Cotton-Seed and its Uses, giving the details of manufacturing the oil; the whole forming a handsome, illustrated volume of about 275 pages. Ready this month. Price, by mail, \$1.50.

Louisiana Fair.—The State Fair at Baton Rouge was postponed on account of the prevalence of yellow fever, until after frosts should have stopped the disease, and rendered the State salubrious. It is now announced for the 23d of December and days following. The similar postponement of the Mechanical and Agricultural Fair at New Orleans, to January 7th, will render it possible for exhibitors to attend both fairs. A great object which the managers of these fairs have in view is the introduction of labor-saving machinery of all kinds, especially such as under the old regime found little favor. Substitutes for manual labor are the great need of the South now. These States are almost entirely destitute of those little conveniences found in the North, such valuable auxiliaries to household economy—washing machines, wringers, improved churns, improved pumps, etc. The popular idea among manufacturers that such things would not sell was well founded when Dinah and Pompey, "Uncle" and "Auntie," had to do the work. Now, the case is different, and the easier Phillis and Cato work, and the more they can do, the less care and labor come upon the heads of the household. We hope these departments will soon be well filled, and there will be abundant time for many of our readers, who have wares to exhibit, if they start after reading this.

Castor Beans and Broom-Corn.—Numerous inquiries have come from Tennessee and other States concerning the cultivation of these articles. We are glad to see our friends there turning their attention to a varied husbandry, and shall always be glad to aid them. The subjects mentioned have been put into competent hands, and articles upon their culture will shortly appear.

Boston Fun.—Boston is the embodiment of "down East." We like Boston, we like its people, and above all we like its Horticultural Journals, as we are sure of a laugh at least once a month. Now, who would suspect the staid and dignified Hovey's Magazine of provoking a smile?—But it does. In January last our Horticultural Annual was published, and in September this journal notices it. That is funny enough, but see what it says: "Much or the greater part of this has appeared previously in our pages, but is here condensed for the use of those who like the rapid path to knowledge and have no time to obtain really valuable information."—Oh, Hovey! You didn't find that where the most of your good things come from—in the Gardener's Chronicle—did you? This venerable magazine is getting so lively that its young rival, the *American Journal of Horticulture*, is becoming funny also. It takes pains to inform us in *Italics* as follows: "The illustrations which we shall use will be made for the subjects which they represent. They are paid for by us, and the description given will be our own." As this is in the announcement for 1868, the question naturally occurs, were not former illustrations "made for the subjects which they represent?" and were they not "paid for?" It is too much of a conundrum for us—we give it up.

A Good Religious Newspaper.—In addition to the *Agriculturist*, every family should have the help which a good religious newspaper will give in forming the character of the children, and keeping the minds of the older ones alive to the progress and the wants of the world. We cheerfully commend the Methodist, published in this city, as a first class paper of its denomination, wide awake, progressive, and conducted with eminent literary ability.

Russian Sweet Potato.—Several of our Western friends have been swindled by chaps selling the seed of the "Russian Sweet Potato" at \$2 a package. One of the seed papers and a few of the seeds have been sent us. The directions for planting are signed by "Frank Delaine, Gardner, Long Island," who gives as references A. T. Stewart, S. S. Fitch, M. D., and G. V. Big-

low, New York. The seeds are apparently millet. Why cannot people exercise a little common sense about such things and know that novelties do not first make their appearance in the hands of peddlers? New things are always talked about in the papers long before they become common enough to be hawked about the country.

Mathushek Pianos.—We are pleased to notice that these pianos, which were selected for our premium list after careful examination, received the highest premiums at the late fair of the American Institute.

No Grafts, No Seeds.—We have more than once expressed our inability to comply with requests for grafts and seeds. We scarcely ever publish an illustration of a new plant or fruit but we have several applications for cuttings or seeds. It would give us pleasure to comply with these requests were it in our power, but it often happens that the things described are entirely new, and we do not even possess a plant ourselves. We mention the source from which our illustrations are obtained, and applications should be made there.

Poultry Exhibition.—The first Annual Exhibition of the American Poultry Society will be held in this City, commencing Tuesday, Dec. 3d, instead of during the last week in November, as previously announced. We understand arrangements have been made to insure a large and interesting Exhibition. The Premium List, which is very attractive, and all other information on the subject will be furnished by Mr. A. M. Halsted, Secretary, 68 Pearl-street, New York.

The Pennsylvania Horticultural Society.—Our report of the annual show of this society was crowded out last month, and we can now only briefly record its success, and congratulate the thoroughly alive association on the completion of its new and beautiful hall. The exhibition was very strong in specimen plants, and we doubt if so fine a show could be made elsewhere in the country. Grapes were well represented, and other fruits moderately so. One of the most noticeable things in the fruit line was a collection of apples from Franklin Davis & Co., Richmond, Va. This comprised 163 kinds, and took the first premium. The display of vegetables was fine, as it always is here, where they have an equal chance with Pineapples and other costly luxuries.

Sundry Humbugs.—There seems to be little that is new in the humbug line, but many of the old schemers that have been "shown up" in the columns of the *Agriculturist* are still at work, sometimes in new places and sometimes under different names, but with the same old story, told in flattering and golden words to deceive the unwary. Has any one of our readers, who, "just for the fun of the thing," has tried his hand in some one of these wonderfully sure and rapid ways of making money, ever received satisfactory returns? We have not been advised of such a circumstance in a correspondence amounting to thousands of letters. The lottery scheme leads, in swindling humbugs, and everything with tickets to be drawn should be avoided by all honest people. Clark, Webster & Co., who have before appeared in the columns of the *Agriculturist*, are now sending out circulars, advising parties that one of their tickets has drawn a prize valued at \$200, and on paying an assessment of \$10 the prize will be forwarded. Singularly enough, all the prizes drawn, so far as heard from, are valued at \$200, and consist of two hundred shares in the "SAND RIVER PETROLEUM COMPANY." We are not informed as to when this company was chartered, or who are the principal stockholders. It does not appear in the stock lists, but the same article was given out a year or two ago by one J. D. Miller, a humbug, at No. 526 Broadway. Any one sending \$10 for this drawn prize, will get in return, if anything, about one-eighth of a cent's worth of printed paper, and will find that he has "Struck-He" more explosive than "Bowen's Eureka," which needs fire to "blow it up." "Sand River" is "bust" when you get it. This will be a fair representation of any one of the swindling lottery schemes, circulars of which are being sent all over the country. "Gettysburg Asylum Association" is a lottery, and consequently a humbug, and should be avoided. One would not be excused for stealing money, though a part of it might be given to the poor. As the holidays approach, the watch and jewelry swindle circulars are on the increase. We advise all our readers not to waste their money or insult their friends by buying or presenting the bogus stuff that is offered by these swindlers. See the November number of the *Agriculturist* for a fair exposition of all this class of dealers. Temple, Richardson & Co., (bogus,) send out circulars to advertising agents, containing advertisements of many firms in this city of high standing, and ask the price for inserting in different papers. On receiving a reply, the advertisement of Wright, Brothers &

Co., dealers in bogus watches, is sent instead of any of those of the respectable firms whose names have been used without authority. It is better to buy a ten dollar watch or any other article that is worth the money, of a dealer whom you know, than to send it to a villain expecting to get a hundred dollar article in return, and get nothing, or a bogus thing of no value. A *Chicago Dodge*.—"E. C. S." Franklin Co., Me., sends us a letter, which we received from a Chicago sharper. Said sharper writes that he has bought out the business of a firm in Ann Arbor, and finds by their books that "E. C. S." has sent money for an obscene publication, which had not been forwarded. He asks for sixty-four cents to pay the postage, when he will send the book. "E. C. S." hopes you may get it Mr. Chi-Carr-go. There are villains so wretched as to send circulars to respectable people of both sexes too vile to be mentioned in a public journal. In most cases the overdose is its own antidote, but lest some invalid and unwary persons should catch at these straws, we advise all to burn at sight every paper that savors of quackery or villainy. Of this class are C. D. Murphy & Co., L. J. Merton & Co., Kuhn & Co., Reeves & Tuttle, Hosea B. Carter, Charles Elmer. Many parties send humbug tickets and notices of prizes drawn, etc., to us for collection, offering liberal commissions, or half the proceeds for collection. Money could be made more rapidly and more honorably by gathering rags in the streets than by running after one of these villainous schemes, and we include lotteries, gift sales and gift enterprises of every kind. We have the assurance from hundreds, that our exposures of humbugs during the year have saved thousands of dollars, mostly to the poor, and themselves from many regrets. Our efforts in this line will be continued, and we invite all our readers to assist us by sending information, circulars, etc., with responsible names (not for publication), and by calling attention to our articles on this subject, and thus saving thousands more.

Letters Once More.—We have requested that those who send postage for a reply should send a stamp and no more. We do not write letters for pay, and when 50 cents or a dollar is sent, it is only a letter to return the change. Letter writing is done when it will not interfere with other matter. We answer all we can, but some are quite unanswerable—such as those entirely without the scope of this paper.

Fine Marigolds.—Mr. John Hague, an English gardener who has made his home at Clinton, Iowa, sent us some specimens of his French Marigolds. For richness of color and regularity of form, they are superior to anything we have seen. Mr. H. has made them a specialty for ten years, and his flowers are an interesting illustration of what can be done by careful cultivation and selection, with a flower that, in its ordinary form is not very highly prized.

Plants in Rooms.—"Reader." We have answered this once before. Plants, as many as can be kept in a sleeping or sitting room, will not vitiate the air as much as an extra person or a burning lamp. The odor of some flowers is often unpleasant to sensitive persons and invalids. So far as that goes, they are injurious. We know a person who is made very sick by the smell of cheese, another who cannot tolerate the odor of vinegar, and two who cannot sit comfortably at a table where there are green peas. These things are "injurious" to these particular persons.

Nebraska Plums and Cherries.—S. L. Bullis, Mich. We do not know which particular things Mr. R. O. Thompson describes, nor do we much care. All these western carculio-proof plums are varieties of the common wild plum, of which there are a plenty in your State. The cherry, two feet high, is the sand cherry, worthless as to fruit, but pretty as a bush.

Tree Seeds.—We can answer some twenty letters by saying that J. M. Thorburn & Co., 15 John st., New York, issue each year a catalogue of tree seeds, and that Thomas Meehan, Germantown, Penn., also sells tree seeds, and makes a specialty of seeds of evergreens and hedge plants.

"Some Pumpkins" is the heading under which Mr. F. W. Livingston, of Illinois, sends a description of a specimen of a young plant that was found within a sound pumpkin. The radicle is 3 inches long, has seed leaves and a well developed plumule. It is not a very rare occurrence, and we have several times noticed it in pumpkins that had been left for some weeks on exhibition in our office, and we have many times seen seeds of oranges that had germinated within the fruit. Warmth, moisture, and air, are the conditions that induce germination. We can readily see how the first two may be present, and from what we now know of the diffusion of

gases, it is easy to see that air is readily supplied. There are some plants the seeds of which always germinate before the fruit is severed from its connection with them.

Water Cress.—B. D. Overton. The cress sent to market is generally cultivated. Running water with a gravelly bottom is required, and the plantation is made by putting in pieces of the plant, and securing them in place by means of stones. It spreads rapidly, and will take care of itself.

Strawberry Tree.—W. J. Brown. A species of *Enonymus*, or Spindle-tree, is sometimes called Strawberry-bush or strawberry-tree, from the color and appearance of its fruit. No tree bears strawberries.

Herbaceous Perennials.—S. C. P. By these we mean those plants the roots of which live from year to year, while the top dies down in winter. The common Peony, Columbines, Rhubarb, and Horseradish are familiar examples.

Balsam Fir.—M. A. Runyon. The cones are not to be planted, but the small seeds contained between the scales. Keep the seeds in the cones, and remove them in spring, and sow as soon as the frost is out.

Fuchsias Won't Bloom.—"Subscriber," Tullytown.—The want of success in blooming Fuchsias is a common complaint. There are very few varieties that are winter bloomers. The best way to treat them is to allow them to rest in the fall, in a cool cellar where they will not freeze. They will need but very little water, but should not get absolutely dry. In February or March, bring them to a warm room, and previously pruning into shape, give water, and they will soon begin to grow. When they once start, give them all the water they need and all the light you can.

Heating Small Green-Houses.—Several ask by letter if a green-house cannot be warmed by gas, kerosene, and gasoline stoves. Leaving out of consideration the expense in case of gas, and the risk attending the use of the other things, we say yes, provided the stove has a flue to carry off the products of combustion. Do not think that, because the combustion of these is not attended with smoke, that nothing results from it. Either of them, burned without ample provision for carrying off the invisible gases thus produced, will be sure to kill the plants. Putting a pan of water on the stove, as one suggests, will be of no use as far as this goes.

Barn Cellars.—Uncle David says that, the manure made in his barn cellar, by forty hogs, in six months, is worth more than the hogs themselves. Study it up, farmers. We have great confidence in what Uncle David says, for he is great on barns.

Ground Vinery.—W. L. wishes those who have tried the ground vinery to give their experience. In England, this manner of growing grapes is followed with success. We gave in June, 1866, an account of it with an illustration.

Grape Trellis or Arbor.—"Subscriber," Archibald, Pa., proposes to build an arbor with old gas pipe, and asks: "Will not the iron injure the vines in severe winters?" Not at all; the iron is no colder than the vine. It only feels so, because it is a better conductor. Old telegraph wire will answer for your trellis, provided it is not weakened by rust. Best to try it first with a powerful strain.

Vergalien Pears.—Mr. J. W. Davis, of Hammondsport, N. Y., sent to our Grape Show some specimens of this fine old pear. They were perfect—and nothing can be better than this variety in its best estate—and recalled the time when this was the leading variety at the East. No cracks and bitter rot at Pleasant Valley.

Propagating the Oleander.—W. B. B., Elk River, Minn. This roots very readily. For your purpose, the old way of putting cuttings of the past season's growth in a bottle of water will answer. Several things are called myrtle, and we do not know which one you mean.

Barberry for Hedges.—Mrs. M. A. B., Mass. This shrub makes a very attractive and effective hedge, and would undoubtedly do well in your region. It should be thoroughly cultivated until it is well established.

Jujube.—S. O. Chase, R. I. The Jujube is a tree, growing in the Mediterranean countries, and as it is not hardy in the north of France, it would probably

not succeed with you. Formerly its acid fruit was used in making the Jujube paste. The article now sold under that name is made of sugar and cheap Gum Arabic, (Gum Senegal,) flavored and colored. We are told that the cheaper kinds are only sugar and gelatine.

Agricultural College, at Amherst, Mass.—N. F. This institution opened in October with 34 scholars. The course of study extends over four years, and promises to give a good literary and scientific education at moderate cost. W. S. Clark is the President, and will give you any further information you desire.

Large Beets.—Joseph Bridge, of Detroit, took the premium at the Michigan State Fair, for Turnip Rooted Blood Beets, weighing 14½ pounds each, and for Mangel wurzels, weighing 18 to 22 pounds each. The seed of the Mangels were sown June 5th.

Lake Mahopae.—Uncle David says that the medical institution, located at this beautiful place, is a real boon to the afflicted, being only the second asylum of the kind in the world. He has been there with one of his friends, and staid quite long enough to satisfy himself that the establishment is of the right kind, properly conducted, and calculated greatly to relieve, and in many cases absolutely cure epileptic and paralytic diseases. We have great confidence in what Uncle David says, and besides that, we know that Doct. Echeverria has a good reputation among medical men, and is well known as a writer upon the forms of disease to which he gives special attention.

Lilies in B. C.—Mrs. Brooks. The Martagon and other lilies you mention should succeed with you. We can only account for your failure by supposing that the bulbs had been too long out of the ground. They will not bear a great deal of drying.

Planting Corn in Drills.—John Johnston, of Geneva, has proved that this practice secures about one-fourth more corn, and twice as much fodder as when the corn is planted in rows both ways. About eighteen acres are planted in a day, with two horses and a drill.

Winter Mutch for Grass Lands.—B. F. G. Nothing is so cheap as grass, and it is pretty well settled by our best farmers that pastures and meadows should not be fed closely in the fall. Give them time to make their own covering. Coarse manure or straw is good, but more expensive.

Feeding Fowls.—K. G. The old birds as well as the chickens should be fed frequently, or, what is better, let them have access to food and water constantly. If allowed to feed themselves, they will eat a little at a time, and frequently, and this is much better for them than to cram their crops full. Give them corn on the cob or in a platform box, where the weight of the hens will lift the cover, and they can help themselves.

Buckwheat Short-cake.—B. F. C. Two cups of buttermilk, one teaspoonful of soda-saleratus, a piece of shortening the size of a butternut, and buckwheat flour to make a stiff batter. Bake in a moderately-beated oven 20 minutes. This makes one tin full.

Tainted Barrels.—People will still salt their meat in this kind of package, and spoil it for food. Some think that they succeed in cleansing them by thorough soaking, others char them, but the only really infallible remedy is a new barrel. The cooper will tell you he never knew it fail, and he knows. Not that a tainted cask cannot be cleansed; but we know no way that will be surely successful. Who does?

When to Take Up Old Meadows.—G. F. N. If a mowing field does not yield a ton of hay to the acre, either plow and manure or top dress. It does not pay to cut hay from it in its present condition.

Wheat Crop of England.—J. B. Lawes, of Rothamsted, Eng., estimates it as twenty per cent. short of the average.

Yeast.—Pare six good-sized potatoes, and boil with them three handfuls of hops; also put into an open vessel one cup of sugar, half a cup of salt, half a cup of ginger; pour the boiled hops and potatoes, while hot, through a sieve, rubbing a little, making, when strained, one gallon. When lukewarm, add one cup of good yeast, and when a froth rises, put all in a jug, and cork tight. This will keep good for three months. Use one c.p. for five or six loaves. No flour! Sent by Lois Steele

Mark all subscriptions sent in as *New* or *Old*.

How to Remit:—Checks on New-York Banks or Bankers are best for large sums; make them payable to the order of Orange Judd & Co.

Post-Office Money Orders may be obtained at nearly every county seat, in all the cities, and in many of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, as many hundreds have been sent to us *without any loss*.

Registered Letters, under the new system, which went into effect June 1st, are a very safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. *Observe, the Registry fee, as well as postage, must be paid in stamps at the office where the letter is mailed, or it will be liable to be sent to the Dead Letter Office. Buy and affix the stamps both for postage and registry, put in the money and seal the letter in the presence of the postmaster, and take his receipt for it.* Letters sent in this way to us are at our risk.

New Increase Clubs begun early in the autumn. This may be done at any time by sending with each new name the club price. If any reader started with the intention of getting a particular premium, and he has obtained it, he may still go on, and add to his club at the same rates as before, and secure another premium. All names sent by one person, though at different times, and from different places, are counted in the premium club if for the same volume of the paper, and if each list of names is marked "for premium," when sent in; or the rates may be decreased. For example: Any one having sent 10 subscribers for \$12, may afterwards add 10 names more for \$8, making a club of 20 subscribers for \$20, and so of other club rates.

Profitable Investments. — Good Books.—The books which are to be found upon our list, (see advertisements in this and other numbers,) are such as *pay the reader*. They have been prepared with great care, and by men who understand what they write about. It is easy to convince any one that expenditure in this direction must prove a profitable investment. Take, for example, the work entitled "Gardening for Profit." It was written by a practical, successful gardener, who gives, in detail, the results of many years' experience in his business, and in a clear, common sense way which all can understand. The cost of this book, \$1.50, is a mere trifle when compared with the valuable information received. Mr. Henderson, the author, is not satisfied unless his gross receipts are \$1000 from an acre on the average, and this amount, he informs us, he often receives. Take another, "Draining for Profit and Health," a book which fully explains the subject of Land Drainage; telling what land should be drained; how to do it; what it costs; what it pays, etc., etc.—a book costing only \$1.50, and which ought to be in every farmer's hands. Take the "Small Fruit Culturist," or the "Grape Culturist," costing \$1.50 each; or the larger book, "American Pomology," for \$3.00. No one interested in Fruit Culture, can read these works without getting hints or information which he will value far beyond their cost. Here, too, are works on the management of Stock of all kinds, on Architecture, Chemistry, Plants, Flowers, Trees, and many other subjects connected with work on the Farm, and in the Garden and Household. This is a kind of reading that not only puts money in a man's pocket, but makes him and his family wiser, happier, and better. These are books that pay.

Good Papers.—Money paid for a good family paper is well invested. In what way could the small sum of \$1.50 be made to return so much as to invest it in a periodical, as richly freighted with valuable information, fresh every month, as is the *American Agriculturist*?—designed for every member of the Household.

Bound Volumes—Covers.—Now that the last number of Volume 26 is out, we shall bind up a supply of this volume in our regular style, neat black cloth covers, with gilt title on back, complete index, etc. Price, per volume, \$2, at our store, or \$2.50, if to be sent by mail. We can furnish any of the previous ten volumes, (16 to 25,) at the same rate; or we will supply them *unbound* for \$1.50, at the store, 24 cents extra if to be sent by mail. Volumes sent to the office are bound in our uniform style for 75 cents each, and missing numbers will be supplied at 12 cents each. We keep the covers or "jackets" on hand, into which any bookbinder can easily insert the numbers. Price of covers, 50 cents each; or 60 cents, if sent by mail.

Save Your Index Sheet.—The Index and Title page of this volume will be found in this number, put in *loose* to save cutting the threads. It is thus all ready to be placed in front of the January, (1867,) number in stitching or binding the volume.

NOW

Your subscription ends, if it is one of those that were given for Volume 26, 1867, as this number for December is the last of that volume. Our friends can all tell whether this is so; and if so, we earnestly invite you all

To renew your subscription at once, thus securing a prompt delivery of the January number, the first of Volume 27. We have already received thousands of new subscribers, and we hope also to retain the old ones.

NOW

It is as easy, no doubt, for our readers to renew subscriptions to-day as at a later date, and it will be a very great convenience to us if they will please attend to this the First of this present month of December.

There is a large amount of work to be done in arranging names in the entry and mail books, and we wish to do this as early as possible, so as to send off the New-Year's number in good season.

NOW

Please send in your own names, and any others that you may have secured. We point to the beautiful and valuable volume closing with this number as an indication of what the next will be.

Here are between 400 and 500 large pages crowded full of valuable articles, illustrated by hundreds of costly engravings, and providing reading for all the members of the family.

The American Agriculturist,

A Home Paper,
AND THE
BEST PAPER
FOR THE
FARM,
GARDEN, and
HOUSEHOLD.

For \$1.50
A YEAR.

4 Copies, . . . \$5
10 Copies, . . . 12
20 or more Copies, . . . \$1 each.

NOW

Is the Time to

RENEW.

A New Year's Present for the Boys and Girls.—We ask all fathers and mothers to notice that the *American Agriculturist* is a paper for the *Farm, Garden, and Household*, and that it contains a special and interesting Department for *Children and Youth*. What more pleasing or useful present could a father, mother, or other friend give to the boys and girls than a copy of this paper, with its beautiful engravings and instructive articles? Said a father to us, "My children watch eagerly every month for the coming of the *Agriculturist*, and I never have to look that paper over before putting it into their hands for fear it will contain something I would not have them read." This would be a New Year's gift received each month.

Clubs of Subscribers need not all be at one Post-Office.—We wish to encourage the getting up of large lists, and it costs much less to mail a large number in one package than separately. This induces us to make the reductions in our terms to clubs of four or more names. But we are quite willing to receive names from several post-offices, if sent by the same canvasser; for such names often become the centers of new clubs.

A Good Dictionary should be in every household, and be kept where it is always readily accessible. Although not as costly as some of our premiums, we consider it one of the most valuable, because it is one of the most useful. It can be obtained by procuring nineteen subscribers to the *Agriculturist*, at the regular rates, or sixty-five at the club rates. The dictionary we offer is Worcester's Large Illustrated, and this was selected because it is the one we should choose for ourselves if we were limited to a single dictionary. This is one of our popular premiums, and we should be glad to send out a great many more of them.

Chromo-Lithography.—This is a term applied to a process of printing in colors which has within a few years been brought to great perfection. We have seen some specimens from the New York Chromo-lithographic Company which in color and execution so closely resemble oil paintings, that an unskilled person would never suppose them to be produced by any process of printing. We would suggest to the publishers that as this process is intended to popularize works of art, they give us subjects that are not so purely foreign as those they have thus far brought out.

Send us the Specimens.—Benjamin Mize—locality not given—writes that "We have perfect wheat and chess on the same head." This is just one of the things that we have long wanted to see, and will thank Mr. M. if he will allow us the opportunity of doing so.

The Newsboys' Lodging House.—If a New York newsboy should make his appearance in a country village he would be as much of a curiosity as an elephant. Ragged and dirty, yet bright and shrewd, an infant in years, but old in experience—homeless, and often friendless, he is altogether a character the like of which is only found in large cities, and nowhere of the genuine type save in New York. Several years ago, the Children's Aid Society did a good thing in establishing a lodging house, where these homeless boys could get a good meal and a lodging for a small sum, and those who wished to, could save their earnings. This has been a most useful institution, and now the Society, feeling the need of a permanent location, wish to procure a building. We have not room for their appeal for aid in this work, but we commend this charity to those who are looking for some way in which to do good. Mr. C. L. Braec, at the office of the Children's Aid Society, No. 8 East 4th street, will give all information concerning it.

Bottling Cider.—R. H. E., Lafayette, Ind. Cider for bottling should be fermented at a low temperature, and racked off from the sediment after it is clear.

Hanging Baskets.—"Minnie," Grampton Hills. The hanging baskets sold in the city are mainly of three kinds: those made of pottery, those of wire, to be lined with moss, and what are called rustic baskets, which are made of wooden bowls, ornamented by tacking on bits of vines, knots, burs, cones, etc. A deep wooden bowl, an old oyster keg cut down, a child's toy pail, or some similar receptacle may be used—anything that will hold enough earth. Those sold are generally too shallow. The vessel need not be water-tight; a little moss put over the cracks will make all right. The outside may be "rusticated" by tacking on split twigs, pieces of bark, vines, or whatever suits the fancy. These may be left of their natural color, or painted brown and varnished. Handles may be of willow or rattan.

Abdominal Tumor in a Horse.—Dr. G. W. Booth, of Harrison Co., Ind., writes: "If you will allow me a space in your paper, I will relate a very singular case which will probably interest farmers and horse-men generally. It is that of a horse of Mr. J. C. Lopp, of this place. This spring, while plowing for corn, Mr. Lopp noticed that his horse began to lose his appetite, and grow thin, and soon noticed that he passed his urine with difficulty. After trying the various diuretics usually resorted to, he called in several of the horse-wise men of the neighborhood, and had their opinions as to the nature of the disease, and its treatment. The horse gradually grew worse, and in two or three weeks died. At the post mortem, upon cutting him open, we found a tumor lying in the right side, to which were attached the right kidney and liver. The tumor would have filled a half bushel measure, and was composed of lobules from the size of a walnut up to the size of a man's double fist, attached by a pedicle to each other. When cut into, the lobules presented the shining appearance of kidney structure, but were of a grayish color."

Cows Holding Up Their Milk.—C. E. Pond, Kansas. It seems as if there must be some way of influencing a cow to give down her milk, but we know of no specific remedy. The usual causes are, we think, jealousy for her calf, and nervousness. A cow always used to kind treatment should not be jealous of her milker. One which does not suckle her own calf at all will not be jealous on its account. One of a nervous temperament may be quieted if fed or "messed" in a stall or loose box at the time of milking. A nervous cow ought to be handled by a quiet, gentle person. Boisterousness in the yard or stable, and rough usage, will get cows into all sorts of bad habits.

Ventilation of the Soil.—"S. B." of Long Island. The suggestion made is not new. Experiments in artificial aëration of the soil have been made, and by means of pipes, and the advantages, if not imperceptible, found to be unremunerative. The passage of wind over the surface, and the property of infinite diffusion which air and its constituents, in common with all gaseous bodies, possess, is equivalent to thorough ventilation, as far down into the soil as good drainage exists.

Watering - Troughs on Highways.—A common thing in New England—less frequently found in the Middle States, and very rare at the West (or as the new phrase is) "Interior." Why is this?

Asphaltum Floors for Stables.—These may be made without fear of injury from frost, if not laid in very cold weather.

Chess.—A. W. B., West Meriden. The German told you an old tradition. This, and all other ways of converting wheat into chess, was tried by a committee of the New York State Society, several years ago. Cutting off the roots of wheat is about as likely to convert it into chess as cutting a horse's tail is to make a donkey of him.

Salt and Lime.—We hold it as settled that for most, if not all, manurial purposes, lime slaked with a strong brine is decidedly superior to simply slaked lime, with or without a separate application of salt.

Sorghum and its Products.—An account of recent investigations concerning the value of Sorghum in sugar production, etc., by F. L. Stewart, 240 pages, 12mo., J. B. Lippincott, Phila. We consider it a valuable contribution to our literature on this subject. Price \$1.50.

Facts about Peat.—As an article of fuel, etc., by T. H. Leavitt, 3d Edition, 316 pages, 12mo., published by Lee & Shepard, Boston. A neat work, exhibiting commendable research, and of general interest. Mr. Leavitt is practically familiar with his subject, and the inventor of a condensing mill. For sale at the *American Agriculturist* Office. Price, \$1.50.

A Soldering Iron, a bar of solder, and a little pulverized rosin, will be found a good investment for farmers. Many leaks can be stopped, much time saved, and also many dimes. The art of soldering is an easy one to acquire.

Farm Boiler and Steamer.—"J. H. D." Hampden Co., Mass. The apparatus, invented by D. K. Prindle, of East Bethany, N. Y., is a neat and effective apparatus for cooking feed, steaming roots or coarse fodder, boiling water in vats or tubs, for scalding hogs, steaming timber, and many other purposes for which either a caldron set on a furnace or on an arch, or

a low pressure steam boiler is employed. It has been used, and has the approval of many of our best farmers.

Cost of Keeping Sheep at the South.—In Union County, S. C., it is estimated at 28½ cents a head to winter a flock, and the profits at two dollars a head per year.

Feeding Cabbages, Stumps and All.—"J. L." Westchester Co., N. Y., says: "In feeding cabbages, I have found the stumps cut in small pieces nearly down to the roots and slightly steamed and mixed with bran, very much relished and eaten clean."

Plowing with One Line and with Left-hand Plows.—Our pictures in the July number have been the subjects of so many and so differing criticisms, that we are forced to think they are pretty near right. Still the common usage, which is a very safe guide, differs a little from our representations. Instead of attaching the line from the head of the off horse to the head of the nigh one, it is usually attached to the girth. J. D. Smalley, of Stark Co., O., says the single rein should be buckled into a ring in the bridle rein, and recommends passing the rein through a ring attached by a short strap to the crupper, in order to hold it up better.

Clotty Milk in One Teat.—"F. C. C." Wisconsin, has a cow which gave clotty milk from one teat at a time, different teats being affected. This is a mild stage of garget, and the cow would probably be cured by a dose of 1 lb. of epsom salts, and ½ oz. of ginger mixed with molasses. If the cow manifests feverishness, add half an ounce of saltpeter, and be very thorough about milking. If more than one teat is affected, or if the bag is sore, milk several times a day, and washing it with warm water, knead it gently each time. Warm grease is often applied with advantage after the washing. The farmers' remedy is Garget-root, or Poke-root, of which a few ounces are given, shaved up with the feed. It is laxative, and usually efficacious, but not always at hand. "J. B. J." says: "Take a handful of Poke-root, chop it fine, boil till tender, and give it to the cow in feed or slops." He has never known it to fail.

Oysters and Salmon at Salt Lake.

—M. M. Oysters reach their perfection only in tide-water streams and bays where they have a constant alternation of salt and fresh water. We are not aware that they will thrive under any other conditions. There is no chance for them at Great Salt Lake. Salmon must have access to the varied fare of the ocean in order to do their best. They frequently add threefold to their weight on their first visit to the sea. It is not at all probable that they would do well in the streams of the Great Basin. But the artificial propagation of fish that do not require these conditions can be carried on to any extent in those waters. The hatching of fish eggs is represented by experts in the business to be much more sure than the hatching of the eggs of the domestic fowls. They are easily transported. There is no conceivable limit to their multiplication but the want of rivers, and food for them. We were told that the whole expense of putting fifty millions of shad into the Connecticut River did not exceed fifty dollars. Black bass, salmon, trout, pike, pickerel, and white fish, are desirable sorts to propagate in freshwater streams and lakes. Dr. Garlick's little work on fish culture is the best that has fallen under our notice, but this work is out of print. A new edition, with the latest information, should be immediately issued.

Cheap Homes.—"J. W." Under the Homestead Law, one hundred and sixty acres of land can be obtained in Missonri for \$18. Improved farms can be bought at from \$5 to \$10 per acre. Churches, schools, and good society are not guaranteed.

The Early Goodrich Potato.—"R. P." We have good reports of this seedling from all quarters. It is very productive, not liable to rot, and of good quality. It is a good time to lay in your seed now.

The Wheat Crop of the United States is estimated at 225,000,000 of bushels, the largest ever raised, and of good quality. There will be little sprouted or musty grain in market.

The Crops in Europe.—There is a short crop of wheat in France, Belgium, Spain, and Poland. A good deal of wheat, flour, and corn is already sent out from this country, and breadstuffs will be one of our large items of export for the year.

The Farmer's Home Journal is one of the best of the young agricultural papers of the West. It is published at Lexington, Ky., by our friend, J. J. Miller, Esq. We wish him the largest success in his labors.

Journal of the Farm.—The first number of a journal of 16 pages, with the above title, has reached us. It is published by Baugh & Sons, Philadelphia, who say, "the proprietors wish it distinctly understood that it is published for the express purpose of making more generally known, and thereby increasing the sale of *Baugh's Raw Bone Phosphate*, of which they are sole manufacturers." Now, there is no misunderstanding this, and it is much more open and fair than those sheets published in the interest of some particular establishment, and which make believe all the time that they are not. We are not informed how often the journal is to be issued. If there is any virtue in Phosphate, the first issue contains enough of it to make its circulation grow rapidly, but besides its "phosphatic diathesis," as the doctors say, it presents much well-considered reading matter.

Cotton Culture and Manure.—A. B. This crop has been very generally cultivated without manure, and the product has been from one-third of a bale to one bale per acre, according to the quality of the soil. A subscriber expresses his surprise that we should recommend so much as a ton of fish guano to the acre for this crop, costing perhaps fifty dollars delivered. Dr. N. B. Cloud, of Alabama, demonstrated twenty years ago that two and three bales even per acre could be raised more economically than the same quantity on five or six acres. It is mainly a question of manure and thorough cultivation. We are aware that two hundred pounds to the acre is used, with a crop of one-half to three-fourths of a bale. It is much better husbandry to use more manure, and get more cotton.

500 Loads of Well Weathered Muck.—A. Halett, of Portage Co., Ohio, has 500 loads of well weathered muck, and proposes to send to New York for superphosphate of lime, at \$60 per ton, to compost with it. Don't do it. Spend your money for something nearer home. Perhaps you can buy stable manure; with one load of this, and three of the muck, you may make fully three loads of manure, worth as much as good yard manure next spring. Perhaps you can get bone dust, or burnt bones, cheaply, if you can add 50 pounds to the load of compost. The woolen waste of factories, the wastes of soap boilers, of paper makers, horn turners, etc., are all valuable, and may often be used without a basis of animal manure with the muck. Pen your hogs on the muck, (under cover, if possible,) and throw out the contents of the pen upon a compost heap, as often as it is well worked over. Mingle muck with the manure in the barn-yard, so that it shall thoroughly pervade the whole. Throw it under the horses and cattle in the stables, taking it out clean at least once a week. Any way to impregnate it with the fermenting principle of annual manure, urine, or barn-yard leachings will make good manure of it. The compost will be all the better if bones, wood-ashes, and other inorganic substances of manurial value are added and thoroughly intermingled with it.

Selecting Seed Corn.—G. F. Choose ears from the stalks that bear two or three, taking the best. Hang them up to dry in a room that has the full benefit of the sun or a fire. If once thoroughly dried, it is easily kept. Much labor is saved by having well cured seed corn.

Mowing Machines and John Bull.—They cut grass well, John admits, but they also cut off the heads of sitting pheasants and partridges. What can John do without his game? What is an estate worth if it does not afford shooting for the aristocracy? Mowers and reapers are democratic institutions.

Vinegar from Sorghum Juice.—It can be made in a few weeks, treated as cider, without evaporation. But it is better to boil it, so as to bring the impurities to the surface, and skim. The more it is exposed to the air the sooner it will become good vinegar.

The Harison Potato.—The reports from this variety are wonderfully favorable. It has withstood both drouth and wet better than any other potato. It has everywhere given good crops. Cut to single eyes and planted singly, it has yielded fully 100 for one, and in some cases, no doubt, 200 for one. J. T. Mapes, of Orange Co., reports an increase of 180 good marketable potatoes, besides some small ones, for one planted.

Farming in Colorado is said to be making rapid progress, considering the obstacles they have to contend with. In Puebla County, every spot that can be watered is plowed and cultivated. They have already spent a hundred thousand dollars for dams and ditches. About 600,000 acres are under cultivation in the whole territory. Not a very attractive country, where every foot of land has to be irrigated to produce a crop.

Native Woods.—In the prize list of the late Nova Scotia Agricultural and Industrial Exhibition, we find several unusual and very sensible premiums offered. Among others is one for the best collection of native woods, prepared to show the bark, as well as longitudinal and transverse sections, polished and plain. But very few are familiar with the appearance of our native woods, other than the few kinds that have a commercial value. Such a collection at any fair would be far more instructive than many things for which prizes are given.

Clearing Heavily Timbered Land.

—Some of our readers are anxious for information about new and good ways of clearing land, banding the timber, and cultivating of the cleared forest.

Difficulty with Tile Drains.—“Pennsylvania” writes that he has trouble with his drains. The water finds its way from the surface into the drains directly during hard rains. They are tile drains, laid four feet deep, two rods apart, in stiff clay hard pan soil. He finds, besides, that drains laid two and a half feet deep answer fully as well. Our correspondent has exactly the soil in which *well laid* tile drains, four feet deep, would pay best. His drains, we doubt not, were laid thus. The ditch was dug, the tiles laid, sods placed upon the tiles; stones upon the sods followed, and finally it was filled up with the soil. Such a drain is, of course, little or no better than a two-foot one. The joints of the tiles should have been protected with scraps of tin, leather, or regular collars; the clay, free from big hard lumps, should have been thrown upon the tiles to the depth of a foot or sixteen inches, and rammed down so hard that not a drop of water could flow down into the tiles. It must all flow up, as explained on page 418, (Sept.). N. B. Always run the drains straight down hill.

Machines for Lifting Stones.—D. I.

A. Bolles' machine is a good one, moving with two wheels. Packer's is a more recent patent, and has some improvements. Either will lift stones weighing six tons or more, and place them in a wall. Any first class agricultural warehouse will put you in the way to find them. The price is \$300 and upward.

Fattening Food for Horses.—“W.

C. R.” asks, “What are the merits of corn meal, ground coarse, and then boiled or cooked into a sort of mush, mixed with cut feed, as a food for fattening horses?” —We know of nothing that will fatten a horse quicker than corn meal on cut hay, unless it be the same with the addition of a little oil-cake daily, which is most excellent. Cooking the meal is, no doubt, an improvement, and it would probably be better yet to cook hay and all.

Indiana State Fair.—This came off at Terre Haute, the first week in October, and was the most successful fair ever held in the State. The grounds selected for the exhibition were about forty acres, on the National road, a mile or more east of the city. It was a charming spot, shaded with black walnuts, sugar maples, and oaks of magnificent proportions. The arrangements were very good for the display of farm products, and the show was a credit to the State. The fruits and vegetables showed the effects of the drought, but there were enough fine specimens to make a good show. The fair run quite too much to horse-racing, and displeased many of the sober-minded citizens, who could not quite see the propriety of this part of the fair. Perhaps they will make their influence felt more at the annual meeting, when the arrangements are made for the next fair. The receipts were about \$21,000, and the expenses \$15,000, which makes a good show financially.

Vault Supplied with Coal Ashes.—

“If a shallow privy vault is well supplied with sifted coal ashes, and the contents removed once a month, will that be sufficient?” Yes, if it be well worked over. If frozen, it should be laid in a heap till spring, and then mixed.

Iowa State Fair.—

This was held at Clinton, and for so young a State, the show was creditable, exceeding, we understand, all former State fairs. The receipts very nearly reached \$8,000. A leading feature of the first day was the trial of cultivators. A field of corn had been planted a few weeks previous that the competitors might have a fair opportunity to show what work their machines could do. It shows the strong hold which the improved cultivators have taken upon the farming public, that there were twenty competitors with walking and riding machines for one horse or two. They all did their work well, completely stirring the ground and burying all weeds. Deere & Co., of Moline, Ill., took the first prize for sulky cultivator. The question of dispensing wholly with the hand-hoe in the cultivation of field crops, is one in which all parts of the country have a

deep interest. The West has solved the problem, and we have now several styles of cultivators that will completely take care of a crop from the time it is planted until it may safely be laid by. The inevitable result of this improvement will be that field crops will be much more frequently and faithfully cultivated, and that corn and potatoes will be cheaper. The cattle were not out in large numbers, and the sheep attracted little notice. The hogs were good, especially the Chester Whites, which seem to take the lead at all the State fairs. The display of fruit and flowers was uncommonly good. Apples, pears, and grapes were well represented. The dairy products were not what we had a right to expect. In the Fine Art Hall there was a fine display in Natural History, and Secretary Schaffer made broad his phylacteries with the fowls of the air, insects, mammals and reptiles. We once heard murder treated as one of the fine arts, and there is no impropriety perhaps in putting scorpions, spiders, hen hawks, and rattlesnakes in the same category. The multitudes had to go home in the rain, but this failed to damp their ardor. They had a jolly good time and are ready for the next one of the same sort.

A Correction.—Some of our fine drawings are from the facile pencil of Mr. W. J. Hayes, and in indicating this fact, we have sometimes put “N. A.” after his name. As Mr. H. is not a member of the National Academy, and does not wish to appear to assume titles that do not belong to him, we cheerfully admit that the mistake was our own. There is a growing feeling among artists that “N. A.” is a title of very little value.

Fruit Preserving House in New

York.—At our Grape Show, Mr. W. S. Carpenter exhibited specimens from a new fruit house which has been erected under the Nyce patent. Peaches, early sorts, were only tolerably well preserved, but early pears were in very fine condition. Bartlett's were as green as when picked from the tree, and Washington, a pear that matures in August, was in fine eating condition and of excellent quality. We understand that those interested in this enterprise are well pleased with its success thus far.

American Pomological Society.—

The Secretary, F. R. Elliot, of Cleveland, Ohio, has issued a circular to members, asking each “to aid the making up of the Society's biennial report by contributing immediately any information you have relative to new seedlings, and the values of different fruits, diseases, soils, etc., in your section of the country. You are also invited to forward samples of any new seedling or unnamed fruits by express, to the address of the Secretary, that he may make comparison, drawings and descriptions. Any fruits thus forwarded, the names of which are unknown to him, will be again transmitted to pomologists for the desired information. The American, United States, and Merchants Union Express Companies have generously offered to transport all sample packages of fruit for this purpose FREE. Due credit will be given to contributors.”

Are Hickory Nuts Seeds?—D. D., Min-

field, Ind., asks if there “is yet any decision as to whether or not Hickory nuts are available as seeds.” Some one some time ago decided that they were *not* seeds. We have forgotten now who it was that gave the opinion, but it was some official who probably knows better than nature does. It is a great pity that our friends living on the prairies, where trees are needed, cannot get certain tree seeds by mail, because they happen to be called nuts, while potatoes are available in any quantities, yet they are neither seeds, roots nor cuttings.

A Grape Growers' Meeting.—

The Grape Show, noticed elsewhere, brought together quite a large number of pomologists, not only from the immediate vicinity, but from considerable distances. Several having expressed a desire to hold a discussion on grapes, a meeting was called for Friday, October 25th, in the spacious room on the second floor of the *Agriculturist* building. The Hon. Marshall P. Wilder was chosen chairman by acclamation, and Mr. James Hogg was elected secretary. Col. Wilder, on taking the chair, expressed his gratification at meeting so many interested in grape culture. He was recently from the grape countries of Europe, and felt confident that our own country would before many years be not only a great grape-growing, but a wine producing country. He believed that the value of a grape should be estimated by its wine producing capabilities.

Docteur E. Van Keuren, of Hammondsport, Steuben Co., gave an account of the Pleasant Valley region. We have already given a sketch of this grape region, and omit Dr. V. K.'s description of the locality. There are three companies organized for the purpose of cultivating the grape and making wine, and \$500,000 are invested in this industry. Four-fifths of the crops are Catawba. Vines are always healthy, almost entirely free from rot, and very

slightly affected with mildew. The past season was very dry, and fruit ripened well. Concord healthy, occasionally rotting. Delaware hardy, and holds its foliage. Diana sensitive to cold, rots in some places. Allen's Hybrid first fruited this year, and ripened well. No experience with Roger's Hybrids. Lydia promises well. Rebecca good. Isabella later than Hartford Prolific. Alvey and Norton's Virginia are somewhat grown for wine, and give a must of 90°. Iona has been extensively planted, is a good grower, and ripens its fruit later than Delaware.

Gen. J. S. Negley, of Pittsburgh, Pa., representing Mr. Knox. Pittsburgh is a favorable locality for the grape. Have tried all varieties. Catawba does well, Concord and Hartford Prolific, the most robust. Creveling hardy and productive, but with a loose bunch. Delaware gives a good crop once in three years. It is fickle, and requires good culture. It ables to ripen its crop even when the vines have been defoliated by mildew. Iona ripens unevenly, and is no better than a good Catawba. Isabella no better than Isabella. Adirondac, a complete failure. Maxatawny, Anna and Martha are the best white grapes. Elsinburgh and Alvey, the best for wine. Several of Rogers' Hybrids are very promising, differing in aroma and character of flesh.

Mr. J. W. Bailey, of Plattsburgh, N. Y. His fruit set ten days later than usual, otherwise the season had been favorable. No mildew except on Allen's Hybrid. Adirondac colored August 25th, and bore large crops, one vine had from 300 to 400 pounds. A frost about September 20th prevented their attaining their full flavor. Hartford ripens perfectly, and the Delaware generally. None of Rogers' Hybrids are first quality, though some are valuable at the North. Concord, though healthy and vigorous, is too late, and entirely unsatisfactory.

Docteur C. W. Grant stated that in his locality the season had been very unfavorable to fruit growing. The Iona and Isabella had done better than any others. Comparisons as to time of maturing should be made between vines of equal age. The Isabella was the first to ripen, and the last to fall from the vines; its must stood at 75°, and upwards, that of Iona, 89° to 93°.

Remarks were also made by Messrs. Beach, Townsend, Cornell, Bushnell, Dr. Trimble, and several others, but we are not able to give a more extended report.

Early Potatoes.—S. M. The Early Goodrich and the Sebee are very popular varieties.

Grapes from California.—

Probably most of our readers are aware that the climate of California allows of the open air culture of those varieties of European grape that with us can only be grown in glass structures. We were much interested in the results of an experiment of shipping a quantity of these grapes to New York. They were sent by Mr. Wm. McP. Hill, of Sonoma, Cal., on October 10th, arrived in New York on October 30th, and were opened on November 2d. Two methods of packing were tried, each bunch was wrapped in paper, one lot packed in chaff, and a corresponding lot packed in sawdust. The Rose of Peru, a black and most lusciously sweet grape, was in both cases nearly spoiled. Muscat of Alexandria came better in sawdust than in chaff, but not particularly well in either. Flame colored Tokay bore carriage better than the others, and those packed in sawdust came in fine condition. The transportation of grapes from California presents difficulties, which will doubtless be overcome, and we hope to see the magnificent clusters from its vineyards abundant in our eastern cities.

The Lake Shore Grape-growers'

Meeting.—Engagements elsewhere prevented our attending this meeting, and we are indebted to George W. Campbell, Delaware, Ohio, for the following summary. The Annual Exhibition of the Lake Shore Grape-growers' Association, at Elyria, Lorain Co., Ohio, on the 15th, 16th, and 17th of October, was well attended, the tables well filled with specimens of grapes and wines, and the show of grapes of unusual excellence in all the leading varieties in cultivation. There were 146 entries for the several premiums offered on grapes, and 187 plates of grapes on exhibition. For the premiums on wines, there were 23 entries, and 47 bottles exhibited. Catawbas were in great profusion, of very large size, finely colored, and of quality never surpassed in this region. Notwithstanding the rot in the early part of the season, the crop will be large in the aggregate, and it is expected the wine of this season will be of the finest quality. Delawares were also largely exhibited, and of size of bunches and berries absolutely unequalled at any previous exhibition in Ohio. The quality this season is also unusually good. Repeated tests of must from a quantity pressed at Cleveland, for wine, gave, by Oechsle's scale, the unparalleled weight of 116°. The first premium for “the best 10 bunches of one variety, quality to rule,” was unanimously awarded to the Delaware; the second to the Catawba; the Iona and Diana also competing. A magnificent single cane of Delaware was exhibited, about 5 feet

high, bearing 71 well developed and perfectly ripened bunches. Ionas were not largely exhibited, and specimens were generally rather inferior; bunches loose and straggling, and imperfectly ripened. A few fair bunches from Lockport, N. Y., and from Erie Co., Ohio, were the best on exhibition, tolerably well ripened, but not equal to samples shown in former years. Reports in discussion and from private sources indicated that this variety had not generally met the expectations of planters. A few handsome, compact clusters of Israella and Adirondac were exhibited, about equal to those shown on former occasions. Dianas of remarkable size and excellence, with very heavy shouldered, compact bunches, beautifully colored, were shown, both from the Lake Shore region, and also from Crooked Lake, N. Y. The Detroit grape was again on exhibition; but it was difficult to see any material difference between it and the Catawba, though the specimens shown were a little smaller, and the bunches a little more compact than the average of Catawbas. The general impression seemed to be that it was the Catawba, grown with some favorable advantages of location or position. The Lydia was represented by some fair specimens; bunches medium, compact; quality good. Cuyahoga was also shown of rather better quality than for two or three years past. Several plates of Rebeccas from the vicinity of Cleveland were very handsome; bunches large, compact, and fine. The sandy soil of that region seems well adapted to the growth of this variety. The Lorain grape was again on exhibition this season; a very handsome grape, closely resembling the foreign white Chasselas, though its foliage is decidedly native. Bunch medium to large; berry large, slightly oval, semi-transparent; slightly pulpy, with pleasant sub-acid flavor. A seedling, evidently from the Delaware, originated at Dansville, N. Y., received the first premium for best unnamed seedling native grape. It resembles the Delaware in color and general appearance; berries about the same size, bunches smaller; more pulpy; pleasant flavor, but quite strong, foxy odor. In no respect superior to Delaware. In addition to the single cane of Delaware before mentioned, very fine canes of Catawba, Isabella, Concord, Diana, and some others, were exhibited, indicating extraordinary productiveness, with great size and beauty of bunches and berries. The Walter was not on exhibition—its originator being, perhaps, better satisfied with publishing pictures exaggerating it about *four times* larger than any specimens yet exhibited. Rogers' Hybrids were not largely represented, and the specimens were mostly rather indifferent. Some fine No. 15, were on exhibition from Cleveland. No other numbers were shown worthy of special notice. The Wines on exhibition were good samples of still and sparkling, of various kinds, though generally not of any remarkable excellence above those exhibited in former years. Some Ives' Seedling wine from Cincinnati received special attention, and was really a fine, red wine of high character. Some pure sparkling Delaware, bottled during natural fermentation, and without the addition of sugar, was also regarded as very superior.

The Grape Exhibition at 245 Broadway.—The occupancy of the new office was fitly "solemnized" as the French say, by a magnificent show of native grapes, a display that would be fine at any season, but at the late date of Oct. 21st was something remarkable.

As no general notice was given of our intention to hold an exhibition, some explanation is due to the many friends who were unable to participate in it. After our October issue had gone to press, we received an application from Mr. Knox for permission to show his grapes at our new office, on Oct. 17th; this was readily acceded to, but the carpenters' work being delayed, the time was postponed to the 21st. As it was too late to extend a general invitation to grape-growers, we sent circulars by mail to such as we thought might be able to get their fruit here in time, and these were responded to by a sufficient number to make up, in addition to Mr. Knox's collection, one of the finest displays ever seen in the city. In addition to the fruit, there was a large exhibition of vines, which gave an opportunity for comparing the products of different nurseries. Although we did not ask for contributions of wines, or other fruits than grapes, a few specimens of each were brought in, and are noticed elsewhere. In this exhibition no prizes were offered and no determinations made by any other committee than the public. Each exhibitor was at liberty to advocate his own fruits or vines—a plan which seemed to be satisfactory to all concerned. At the exhibitions of the Imperial Horticultural Society of France there are no prizes offered, and the same thing is being advocated in England. From our experience in October, we feel sure that it will bring out a larger number of contributors, and on the whole avoid much dissipation. At the late meeting of the Lake Shore Grape-growers' Association, there were 25 samples of Catawba so nearly alike, that the committee excused itself for its award on the plea that it must be made to

somebody, and regretted that they had no more premiums to give to others equally deserving with the recipient.

The exhibition was open for three days, and was each day visited by thousands of interested spectators. On the 25th, at the suggestion of several grape-growers, an impromptu meeting was held for discussion. An abstract of its proceedings will be found in another item. Subjoined is a list of entries in the order in which they were taken by the entry clerk, and on page 450 will be found notes upon many of the varieties.

J. Knox, Pittsburgh, Pa., by Gen. J. S. Negley: Concord, Hartford, Creveling, Ives, Elsingbury, Heribmont, Martha, Anna, Taylor, Maxatawny, Clinton, Rogers' Hybrids Nos. 1, 2, 3, 4, 5, 9, 13, 14, 15, 19, 28, 30, 32, 33, 34, 36, 39, 41, 43, 44, Salem, Rachel, Cuyahoga, Miner's Seedling, Northern Muscadine, Mary Ann, North Carolina Seedling, Oporto, Perkins, Cigar Box, Diana, To Kalon, Union Village, Norton's Virginia, Logan, Adirondac, Louisa, York Madeira, Isabella, Mottled, Catawba, Iona, Israella, Alvey, Rebecca, Delaware. Besides samples in plates, many of the varieties were exhibited in 5-lb. boxes. Large fruiting canes of Concord, Delaware and Heribmont were shown.—C. M. Beach, West Hartford, Conn.: Iona, Israella.—Jas. A. Requa, America, N. Y.: Salem.—Chas. Siedhof, North Hoboken: Weehawken, Union Village, Jersey Black, Alvey.—Jno. W. Bailey & Co., Plattsburgh, N. Y.: Adirondac.—L. Phillips & Son, Berlin Heights, O.: 2 plates Iona.—B. F. Hopkins, Brownhelm, O.: 1 box Iona.—B. Summers, Vermillion, Erie Co., O.: 3 plates Iona.—J. H. Ricketts, Newburgh, N. Y.: Iona, Clinton, Cuyahoga, Heribmont, Allen's Hybrid, Israella, Rebecca, Creveling.—Leander Clark, Newburgh, N. Y.: Isabella, Montgomery, Delaware.—Charles Downing, Newburgh, N. Y.: Iona, Delaware, Israella.—J. F. Lowry, Berlin Heights, O.: 2 plates Iona.—C. W. Grant, Iona, near Peekskill, N. Y.: Several plates Iona, amounting in all to about 30 lbs., 5 plates Israella.—H. Cornell, Newburgh, N. Y.: 2 plates Iona.—Pleasant Valley Wine Co., Hammondsport, N. Y., by E. Van Keuren: Catawba, Diana, Delaware.—D. S. Wagener, Crooked Lake, near Hammondsport, N. Y.: Diana, and Catawba, in five-pound boxes, and Iona.—Olin Brothers, Springfield, Mass.: 2 Unnamed Seedlings.—Jacob Newkirk, Hudson City, N. J.: Raspberries.—Chas. Arnold, Paris, Canada: Seedlings 1, 2, 16, 5 (white).—Geo. W. McDowell, Crooked Lake, N. Y.: Kenka.—VINES. The following were exhibited and many of them sold:—Peter De Pew & Son, Nyack, N. Y.: Ionas and Allen's Hybrid, 1 year; the latter in pot.—F. F. Merceron, Catawissa, Pa.: Creveling, Concord, Delaware, Clinton, Taylor, Franklin.—Richardson & Bellows, Geneva, N. Y.: Ionas and Israelas, 1 year.—J. F. Martin, Mt. Washington, O.: Ives' Seedling.—Lyman Basset, North Haven, Conn.: Concord and Hartford Prolific.—L. L. Whitlock, 37 Park Row, N. Y., had seventy entries of vines, showing the manner in which he unites "all nurseries in one." We have not space for the list, but it includes both standard sorts and novelties.—J. W. Hammore, Newburgh, N. Y.: Salem, Iona, Israella, a large and fine assortment of various grades.—J. F. Deliot, Sing Sing, N. Y.: Iona, Israella, Adirondac, Delaware, Creveling, Rebecca, Allen's Hybrid, several numbers of each sort. J. W. Bailey, Plattsburgh, N. Y.: Adirondac, 1, 2, and 3 year vines.—N. H. Lindley, Bridgeport, Conn.: Salem, Rogers' No. 15, Rogers' No. 19, Ionas.—C. S. Mason, West Hartford, Conn.: Iona Nos 1 and 2, Allen's Hybrid, Israella, and very fine Iona wood.—A. F. Tait, Morrisania, N. Y.: Iona and Adirondac transplants and layers, Concord layers, Iona grafted, Concord, Israella, Iona and Adirondac wood.—C. W. Grant, Iona, N. Y.: Iona, 1 year.—Besides Grape-vines, L. L. Whitlock presented an interesting collection of young evergreens, and Lyman Basset, New Haven, Conn., exhibited the Clarke Raspberry, with canes 10 feet high, large in proportion, and remarkably healthy, vigorous, and well-ripened.

Editorial Jottings in Europe.

"....CRACOW SALT MINES, Sept. 2.... A vivid description of these wonderful mines, read in a school-book of my boyhood days, produced a strong desire to visit them that has never left me, and which to-day, nearly forty years afterward, has been gratified. At Trzebinia, about 200 miles south of Warsaw, on the route to Vienna, we turned aside 27 miles to Cracow, which is in Austrian Poland, and about 260 miles northeast of Vienna. Cracow is an old city, formerly containing 80,000 inhabitants, but reduced to less than half that number since the dismemberment of Poland. There are many fine buildings, the relics of former days, but everything is in a decaying condition. The people themselves look sad and dispirited, and I could not but feel sorrowful for them as I looked at the graves of Kosciuszko, Sobieski, and of other heroes, and recalled the valor of this people who stemmed and broke the tide of Mohametanism, when its immense armies seemed about to overflow all Europe....

The chief Salt Mines are at Wieliczka, 7 miles southeast of Cracow.... A party of fifteen of us, men, women, and children, enveloped in long white frocks, and flannel caps, and supplied with two dozen Bengal lights to illuminate the caverns, and accompanied by six guides carrying large lamps, descended first through the shaft about 400 feet. Each one was seated in a rope sling, and the sling ropes were arranged in two clusters, one above the other, all the ropes being bound together above our heads into one immense cable that was wound upon a windlass turned by horse-power—a comical sight, resembling two huge bunches of grapes, (or white ghosts) let down by a string. Landing upon the firm salt bed we quickly clambered out of our slings, and found ourselves in a large artificial cavern, the walls of which were solid rocks of pure salt, but of a dark color. From this point we wandered some two miles or more, descending by steps cut in the salt here and there, or through inclined passages, until we were 800 or 900 feet below the surface, and we could have gone down 1,800 feet. Above, around, and under our feet, there is nothing but the rocks of salt as hard and firmer than compact white chalk, but without any cracks or seams, save here and there a slight bed or layer of stone or clay. Immense rooms, halls, chapels, a dance hall, and altars, statues, obelisks, chandeliers, etc., cut in salt instead of marble, were visited in various parts of the mine, which extends nearly two miles from east to west, and over $\frac{1}{2}$ mile north and south. Some of the passage ways, high enough to walk in, and wide enough for small hand-cars on iron rails, were 20 to 50 rods in length. At one point we crossed a lake, perhaps 100 feet in diameter, in a large boat—the only water, or dampness even, that we met with. Our visit was very opportune, as we were preceded by a large party of wealthy gentlemen and ladies who had caused the preparation of thousands of lighted lamps, candles, Chinese lanterns, extensive fire-works, cannon, rockets, that echoed and re-echoed through the caverns like a hundred peals of deafening thunder. They had with them a large brass band, which, on learning that a party of Americans were approaching, struck up one of our national airs, as we entered a large cavern. The effect upon us was thrilling beyond measure. Those not too much affected tried to join in "My Country 'tis of thee, Sweet land of liberty, etc."—and this, 800 feet beneath the soil "where Kosciuszko fell,"—away in Austrian Poland! You can imagine our emotions better than I can describe them!.... After wandering for hours, and having seen but a small part of the mines, but enough to satisfy us fully, we returned to the surface in the same novel manner as we had descended. The most timid ladies in our company fully enjoyed the whole excursion, excepting the firing of the cannon.... These mines have been worked for at least 900 years. The salt grows purer or more transparent the further downward it is penetrated. In some places the workmen blast out large blocks, but usually it is worked out the same as stone or marble from the quarries. Great pieces are undermined with the pick-axe, and then split off with wedges. These are broken into cubic blocks of a foot, more or less. In one place we saw them hewing salt blocks into the shape of barrels, and putting the staves and hoops around the blocks. The chips of salt were beaten into a compact mass in other barrels. The salt is a government monopoly, and the amount taken out depends upon the demand. More than a million of zentners of salt per year have been quarried during many years past....

"....VIENNA, Austria, Sept. 6th.... I have been pleasantly disappointed in this city. The buildings are generally in excellent style, and, except in the central part or the old city—the streets are wide, and all are neat and well kept. There is an intelligent look in the countenances of all the people, an elasticity of step, and an air of business activity and thrift visible on all sides, such as I have not seen anywhere else in Central Europe. I have not noticed a single beggar here, (always excepting the hotel employees, who crowd around you at your departure, each with an outstretched hand for "pour boire," or "drink-money"—though you have paid your bill in full, "service" included,) and nowhere else have I seen so few people in poor dress, wearing apparel so cheap, and other articles also—excepting the charges at the hotels, the proprietors of which seem to be proud of the reputation of charging higher than is done anywhere else in Europe.... I forgot to tell you that for 200 miles of the route from Cracow here, we passed through a most charming agricultural region. In clean, thorough culture, and in good crops and abundant fruit, I have seldom seen a region superior to this. Fine pears were offered by women at many of the stations, three, four, or five for the kreutzer (or $\frac{1}{2}$ cent l.). Large orchards of heavily loaded plum trees were frequent, and so abundant was this fruit that you could get your hat full of splendid great plums for a penny or two. The Curculio is evidently a stranger to this region. I don't wonder at the thrift of Vienna, when it is backed by such a rich farming region as the long and wide Valley of the March River."

Fruit-eating Bats—Flying Foxes.

In the last number of the *American Agriculturist*, we introduced to our readers a member of the very interesting order of animals—flying mammals—or bats. From what we then wrote it might well be supposed that all bats live upon insects chiefly, and altogether upon animal food, but this is not the case, though all occurring in this country do. There are about forty species inhabiting the warmer parts of Asia and Africa, which live upon fruit, and do great damage to the orchards, especially to plantations of figs. These are generally bats of very large size, and to impress the fact that there are vegetarians even among bats, as well as to show the manner in which they close their skinny pinions when in repose, we present an engraving of the largest of the well-known bats, the Flying Fox of India, (*Pteropus rubricollis*.) This animal measures five feet from tip to tip of its expanded wings, and its head and body together are about one foot in length. Unlike the Vampire bat, which is not more than half as large, it is not dangerous to man or animals, except when attacked, when it defends itself as well as it can. The damage which flocks of these animals might do may easily be imagined when we consider the losses which we experience from birds. The Flying Foxes will work their way under or through nets, and unless trees are enclosed in bamboo cages, they can hardly be excluded. Their attacks are made during the night also, which renders it still more difficult to guard against them. Their name is given them from their color, and from the foxlike shape of their heads.

The American Sable.—(*Mustilla Americana*.)

This beautiful animal, of which we give a careful and well executed engraving, is entirely different from the Sable of Siberia, the fur of which is so highly prized. Still, the American Sable approaches its namesake somewhat in the beauty of its coat, but is a much larger animal. It is so closely related to the Pine Marten of Europe as to have been regarded as identical by several naturalists. The home of this animal is in the trees of densely wooded regions where birds and squirrels abound, which constitute its chief food, and to which it is a very destructive enemy. It will pursue almost any of the smaller animals, and easily overtake and kill them; the red squirrel and some of the weasel tribe alone being agile

FLYING FOX—(*Pteropus rubricollis*.)

enough to escape. It climbs the highest trees like a squirrel, attacks owls, crows, and other birds in their nests, and sucks the eggs, or devours the young. The Sable is about 20 inches long, exclusive of the tail, which is about 10 inches. The fur is tawny to dark brown, in some cases approaching black—the darker and brighter, the more valuable. Both the size and color vary greatly. The head is light col-

AMERICAN SABLE—(*Mustilla Americana*.)

ored, and the throat and sides of the neck are white. The head is long and pointed; the somewhat-pointed ears, broad and short. The tail is

busily and club-shaped. The geographical range of the Sable is across the continent, between the 40th and 68th parallels of latitude, and throughout this region it is diligently hunted. Trappers establish what is called a "Sable line," often 60 or 70 miles in length. This is a series of traps, eight or ten to the mile, made by driving stakes into the ground to form three sides of a hollow square; over the fourth side, one end of a log or trunk of a young tree is suspended, being held up by a round stick resting upon another which is baited with a bird, squirrel, or piece of venison. The least disturbance of the bait causes the sticks to roll, and the log to fall. It often happens that wolverines, fishers, and occasionally foxes, tear open these traps, destroying bait and game for miles along the "line." The trapper passes continually back and forth, spending some part of his time in hunting other game, but visiting all his sable traps as often as once in two weeks. The fur is best between the last of October and the first of April. The female, as her time approaches, takes possession of an abandoned bird's nest in a hollow tree, or ousts the occupants, and in this she brings forth six or eight young. Were it not for the persistence with which these animals are hunted, they would be much more numerous; as it is they hardly hold their own from year to year in those parts where they are abundant enough to pay for hunting them, for they exhibit very little cunning in avoiding traps, and it is hardly probable that the natural timidity of the animal will ever be so far overcome as to render it obnoxious to agriculture in destroying birds.

Tim Bunker on Base Ball Clubs.

"Don't you think they are running on't into the ground?" asked Seth Twiggs, as he stopped at my garden fence, when I was gathering squashes this morning. "I du declare there'll be a slim chance to get anybody to work, if things keeps on in this way. We shall be as bad off as they are among the Indians, where the women do all the drudgery, and the men play all the time they ain't fightin'. I hired Kiah Frink and another White Oaker to come down and help me husk, and they had to leave right away arter dinner to go to a base ball match. They said they wouldn't stop for double wages, for they could make more money on the ball ground betting. They knew which side was gwine to win. Pretty state of things!" Seth thought the case was so

clear that he didn't wait for an answer, but walked off in his usual cloud of smoke. This evening, Mrs. Bunker took up the Hookertown Gazette, and read, "Shadtown victorious! the White Oaks nowhere!! The score stood 27 to 9. Great interest has been taken in this match from the well-known fact that both parties had been training for it for a month past, and large sums had been staked upon the result. It is said that the White Oakers practiced by moonlight while they were burning their coal pits, and the picked nine of the Shadtown Club have made a business of playing ball six days in a week for the last month. Of course, they bore off the honors."

"Honors!" exclaimed Sally, lifting her gold bowed spectacles to the top of her forehead, and looking over to me. "When we were young, Timothy, it used to be an honor for a young man to lay a straight furrow, or to mow a wide swath. But now they've beat their plowshares into ball clubs, and the loafers that can play ball best carry off all the honors. It seems to me, Timothy, that we are getting considerable ahead of the days of prophecy. The plowshares and pruning hooks is the Bible ideal of a perfect state of society. When grown up men exchange plowed fields and orchards for the ball ground, and make a bat stick their coat of arms, I think they are progressing the wrong way."

This set me to thinking about this base ball business. For it has ceased to be a mere amusement, and, with some people, has got to be as much of a business as catching fish or making brooms. I believe in the division of labor and in new kinds of business, but it is a question whether this is going to add anything to the common wealth or happiness. I believe in athletic sports and games of skill, and have no doubt that there is a place for them in every well-regulated society. Base ball, as we used to play it when I was a boy at school, was a very healthful recreation. It was a change from sedentary habits that the boys needed. I should think it might be a good thing for college boys and clerks in the city. But what do people want of it whose lives are already full of labor? It can only add to their weariness, and detract from the interest and pleasure that every man should take in his daily toil. After a man has spent three or four hours in a game, he is pretty well used up for the day, and is in rather poor trim for work next morning. Base ball, as it is played now, is getting to be a great nuisance.

It seriously interferes with the business of life. Seth Twiggs' ease is just what has happened to me a dozen times this summer, and is happening all over the country. When I get a gang of men into the hay field, and have the hay all ready to go into the barn, I do not want to have half of them quit at three o'clock in the afternoon for a ball match. It breaks up all my plans for the day, and necessarily leaves a part of my hay to stand out over night. Over in Shadtown, they build ships, and when a man gets a contract to drive his ship through in a given time, it's a great vexation to have a part of his force absent two or three days in a week, to attend a ball match. Many kinds of mechanical labor are done by contract, and it subjects a contractor to very serious loss if he cannot depend upon his laborers.

It is a great waste of time and money, and few men can afford it. Most laboring men need the avails of their six days' work for the support of their families and for the accumulation of capital enough to carry on business for them-

selves. One day in the week is a serious loss to them. But if a man joins a base ball club, the loss of time is only a small item. He must have a suit expressly to play ball in, costing, say twenty-five dollars. Then, there must be a club-room, nicely fitted up, where the members meet for business, and on state occasions, when they receive guests from abroad. Then they must have their entertainments—which means speers. Then they must, of course, accept all invitations to attend matches, no matter at how great a distance. Come to foot up the invitation fees, taxes, traveling expenses, speers, and lost time, a young man finds himself three or four hundred dollars out of pocket at the close of the year. This may be all very agreeable pastime, but how few can afford it even in the city! And if they could, there are still more serious objections to it.

It leads very naturally to bad company. I know the young men that make up the ball clubs of Hookertown, Shadtown, and the White Oaks, and I have seen their guests. They are not such men as I should want my John to associate with. Some of them are what they call gentlemen's sons, with plenty of money and no business, which is very bad. Others have business, and neglect it to play ball, which is still worse. Some are average farmers and mechanics, rather green at the play, not yet spoiled, but in a fair way to be. Others are confirmed loafers, rather seedy, and far on the downhill road. They are vulgar and profane; but pithy, bat, and catch splendidly, for the game is their only business. It can't do a young man much good to be brought in contact with such characters. The manners and morals of the ball ground are much more likely to mar than to mend him. The tendency of the game, as now managed, is toward idleness, gambling, and dissipation. It makes good ball players, but bad farmers and mechanics, bad husbands and fathers. I am not ready to have the plow beams whittled into ball clubs just yet.

Then it is rather a low aim in life. There is something noble in making a first-rate farmer. That means cheaper bread and meat for the nation. To be a good mechanic is praiseworthy. It means better homes for the people, and better tools to do their work. But to be a first-rate ball player, or to be one of a champion nine,—what does it amount to? If Shadtown beats the White Oakers all hollow, who is the better for it? General Trowbridge came through Hookertown last week in his splendid turn-out, and when opposite the widow Taft's, a little noisy cur came out, and barked at his carriage, as if he thought he could stop it. He succeeded, and the general jumped out, and walloped the cur soundly, and sent him yelling through the gate. This brought the widow to the door in a somewhat excited state; "Wall, general, that's a big victory for you! You've whipt a one-eyed cur." It strikes me that the base ball victories are about on a par with the general's. Shadtown is triumphant, but the White Oakers still live. Yours, to command,

TIMOTHY BUNKER, Esq.

Hookertown, Oct. 25th, 1867.

THE KIDNEY VETCH.—The Kidney Vetch, (*Anthyllis Vulneraria*), one of the wild plants of England, having been proposed as a valuable forage plant, was analysed by Prof. Voelcker. The plant was examined in the form of hay, with the result that it was found to contain scarcely half the amount of fatty matters, was poorer in flesh-forming compounds, and had a

great deal more indigestible woody fibre than either clover hay or good meadow hay. Prof. V. thinks it might be more valuable if fed green.

Walks and Talks on the Farm.—No. 48.

(Continued from page 440.)

We have a cheese factory in successful operation here in the wheat district, and another is about to be established. This is what I have always wished. I do not see why we cannot make as good cheese here as is made in Herkimer County or the Western Reserve. We can raise just as good grass, and more of it. With plenty of wheat, barley, and oat straw, corn stalks, pea and bean haulm, and clover hay so abundant that many farmers still plow it under for manure, we can winter our cows much cheaper than in the dairy districts. On my farm I can winter three times as much stock as I keep through the summer. In the dairy districts, where the farms are devoted almost exclusively to grass, and where, consequently, the cows must be wintered principally on hay, the number of cows to be kept must be determined by the ability of the farmer to carry them through the winter.

The cost of feeding a cow on hay through the winter must form a large item in the expense of keeping a dairy, and yet it is strange that nearly all our writers on dairying say little on this point. They give us very minute directions as to feeding the cows in the spring, after they come in, but say nothing in regard to feeding them during the winter. And yet it seems to me the latter is, if anything, the more important point. The cow needs to accumulate strength during the winter to enable her to stand the great strain on her constitution during calving, as well as through the long period of milking.

A cow will eat 3 pounds of hay a day to each 100 pounds of her live weight. If she weighs 800 pounds, she will eat 24 pounds of hay, or 168 pounds a week. If fed on hay alone from December 1st to May 1st, (22 weeks,) she would consume 3,696 pounds. A cow weighing 1000 pounds would eat in the same time 4,620 pounds, or a little over 2½ tons. Horsfall, the best authority we have on feeding dairy cows, says it requires 20 pounds of hay a day for the maintenance of a store cow. In other words, it takes this amount merely to support the vital functions—the cow will give no milk, nor increase in weight. She will merely live. According to this, it requires a little over a ton and a half of hay to keep a cow from December to May, without getting anything in return. When cows are fed three per cent. of their live weight, of good hay, per day, we may reasonably expect more or less milk, or an increase in flesh or fat.

If it takes 20 pounds of hay a day to keep a cow alive, we should never forget that all our profit comes from the food the cow consumes over and above this amount. Mr. Horsfall had a cow that, for the sake of the experiment, he fed on hay alone. She was a rather small cow, but noted for her usefulness as a good milker. At the time of calving her third calf, November 12th, she was in rather high condition, and gave 17 quarts of milk a day. On the 1st of January, at the commencement of the experiment, she weighed 980 pounds, and was giving 15½ quarts of milk a day. She was allowed all the hay she would eat, and consumed, on an average, 28 pounds per day. On March 5th, her yield had fallen off to 9½ quarts per day, and the cow then weighed only 896 pounds—a loss of 84 pounds. On the average, during the experiment of nine weeks, she gave 12½ quarts per day.

Another cow fed according to Mr. Horsfall's system on steamed food, gave 18 quarts per day at the time of calving, October 8th, and at the commencement of the experiment, January 1st, 15½ quarts per day. She then weighed 1092 pounds. She gave, on the average, 14 quarts per day, and at the end of the experiment weighed 1176 pounds—a gain of 56 pounds.

Mr. Horsfall figures up the result as follows:

No. 1. Average yield of milk per day 12½ quarts @ 1 cents.....	\$3.50
Deduct loss of flesh, 9½ @ 12 cents.....	1.12
	\$2.38
23 pounds of hay per day, @ \$17.14 per ton.....	1.68
Profit per week.....	\$0.70

No. 2. Average yield of milk per day 14 quarts, @ 4 cents.....	\$3.92
Gain of flesh 6¼ pounds, @ 12 cents.....	.75
	\$4.67

Hay, 63 pounds per week.....	54c.
Straw and oat shells.....	30c.
Mangel wurzel.....	24c. \$1.08
Rape-cake, 35 pounds; Bran, 10½ pounds; Malt combs, 10½ pnds;	
Bean meal, 10½ pounds.....	97 2.05
Profit per week.....	\$2.62

"The richer quality of the manure," Mr. H. well observes, "will probably compensate for the extra labor, cooking, and attention bestowed." The profits from the cow fed on hay are 70 cents per week, while from the cow fed on rich food they are \$2.62 per week. It is true, if we take merely the cost of the food and the value of the milk, the profit from the two cows is nearly identical, or \$1.82 from the hay-fed cow, and \$1.87 from the high-fed cow. And there are many people who would figure in this way. They would leave out of the question the gain or loss of flesh.

The 9½ pounds of flesh which the cow lost per week either went to make milk or to support the animal. It was equivalent to a certain amount of food. Thanks to the investigations of Lawes and Gilbert, we know what this flesh which an animal lost is composed of, or, at all events, we know what the flesh which an animal gains is composed of, and we may well suppose that within certain limits they are identical.

One hundred pounds increase of beef cattle is composed of:

Water.....	24.6 pounds
Mineral matter.....	1.47 "
Nitrogenous compounds.....	7.69 "
Fat.....	66.2 "

Now it is very evident that 12 cents per pound is rather a low estimate of the value of such animal food.

The carcass of a half-fat ox is composed of—

Water.....	54.00 per cent.
Mineral matter.....	5.56 "
Nitrogenous compounds.....	17.8 "
Fat.....	22.6 "

Even the carcass of a "fat ox" contains 45.6 per cent. of water; and such beef sells in New York for 17 cents per pound, and I think it would not be difficult to show that butchers and consumers really pay us from 20 to 25 cents for every pound of increase we put on a well bred, half-fat ox. What does a thin steer sell for in New York, and what a fat one? I have frequently seen "extra" cattle quoted at 18 cents, and "inferior" at 8 cts. But let us assume that a "half-fat ox" brings 12 cents per lb. "estimated dressed weight for the four quarters," and the "fat ox" 17 cents. The "half-fat ox," analysed by Lawes and Gilbert, weighed, alive, after fasting, 1232 pounds; the carcass, 797¾ pounds. At 12 cents per pound, he would bring \$95.73.

The "fat ox," analysed by Lawes and Gilbert,

weighed, alive, after fasting, 1419 pounds, and dressed 939½ pounds. At 17 cents per lb. this ox would bring \$149.71.

Now, the difference between the two, in live weight, is 187 pounds. One was kept fattening till he had increased 187 pounds more than the other. Mr. Horsfall reckons this increase of flesh at 12 cents per pound. What do the New York butchers estimate it at? At 12 cents per pound, it comes to \$22.44. But the butchers will pay \$95.73 for the one animal, and \$149.71 for the other. In other words, they pay for this 187 pounds of increased live weight \$53.98, or over 28¾ cents per pound.

This 9½ pounds of flesh which the cow lost each week would contain over 6 pounds of fat, equivalent to over 7 pounds of butter. There is no record of how much butter the 12½ quarts of milk contained, but it would be of full average quality if it gave a pound a day, and consequently the whole of the butter obtained might have come from the fat which had been stored up in the cow previous to calving. But this 9½ pounds of flesh, so called, would contain only about 12 ounces of nitrogenous compounds, while the milk obtained during the week contained probably six or seven pounds. Nearly the whole of this must have come from the food. And this will account, in some measure, for the well known fact that milch cows require a more nitrogenous food than fattening animals.

But excuse me. You have been out in the cold all day, and I know that a warm stove and a talk about "nitrogenous food" will put any farmer to sleep.

The matter has, however, a very important practical bearing, and a young farmer, at least, should make himself acquainted with the subject. The old people may be excused. It is just as easy to learn the difference between nitrogenous food and carbonaceous food as it is to learn the difference between haw and gee. But I will not use the terms any more than is necessary. In short, it may be said that theory and practice both indicate that it is most economical to feed milch cows high enough to enable them to give all the milk they can secrete, and to lay on fat at the same time.

The drouth still continues in this section, and fears are entertained that winter may set in before we have rain enough to start the springs. Should such be the case, we shall surely be troubled to get water for the stock. Many farmers now have to drive their cattle to the canal or to the nearest stream; and water for the hogs has to be carried in barrels. It has been vain to think of fall plowing. Heavy soil is as dry and as hard as a rock—and it is this kind of land, rather than the sandy loams, that is most benefited by fall plowing. Wheat has come up very unevenly. Where the ground is loose and moist, the wheat is too rank; while on the dry, lumpy "clay spots," much of it is barely out of the ground. It has been splendid weather for doing fall work—digging potatoes, husking corn, etc. But the stalks are so dry and brittle, that it is almost impossible to tie up the bundles. Pigs that are well fed grow rapidly this mild weather, but corn is so high that farmers are selling them before they are half or quarter fat. Buyers are picking them up at about 5 cents per pound. One of my neighbors was selling cider the other day, and was asked if he had put any water in it. "Water," said he, "no, sir; not this year. Water is a good deal scarcer than cider."

The Cotton Moth.—(*Ophiusa xyliana*.)

Again the destructive larvæ of this insect have done great damage to the cotton crop.

Of late years their reappearance has been more frequent, and at shorter intervals, although not always over the entire cotton-growing region.

It is strange that so little has been published of their nature and habits; and that of that little still less has been at all correct. Here is a representation of the parent moth, as nearly correct as it is possible to make wood cuts which must be printed on ordinary paper by a power press. Few of the beautiful and delicate markings can be shown; but in form, true proportions, and general markings, the likeness is correct. So of the larva, or *Cotton worm*, and the chrysalis.

The insect has never been even authoritatively named.

Fabricius describes an entirely different insect under the name of *Noctua xyliana*.

Jay gives a pretty good description of the true Cotton-moth, styling it *Noctua xyliana*, "which name," the late Dr. T. W. Harris remarks in a letter to the writer of this, "was a good and proper name for the insect, as the subject was understood by Mr. Jay, who did not pretend to know much of the *Lepidoptera*. *Ophiusa xyliana* better accords with the present state of the science." That name, first published by myself, on the above authority, seems now to be adopted. I will spare you any lengthy history of the previous appearances of the insects, or any attempt at a scientific disquisition, and confine myself to a familiar sketch of their habits, and their effects upon the crop, probable manner of hibernating, and possible means of heading them off.

It is difficult, nay, well-nigh impossible, to speak positively as to the *where* or *when* of the first appearance of an insect which spreads itself over so vast an extent of country, and possesses such wonderful powers of migration for a thing so frail.

This present year, I heard of them early in June, as being then at work in a small crop of Sea Island or Long-stapled Cotton on the farm of Judge Jones, at Virginia Point, on the main-land opposite the city of Galveston—the extreme southern portion of the main-land at that point.

Although doubts were expressed as to their being the real "*Simon pure*," I found they were so. They were few in number, and thinly spread over a scattering crop of cotton. They had been reported on the extreme southern plantations at the mouth of the Brazos and of Old Caney rivers, some 50 or 60 miles west and south of Virginia Point, several days before. They soon spread northward, utterly destroying the crops in some localities, doing partial damage to others, and in some places appearing only in small numbers. In old times, the injury would have been deemed quite serious wherever they appeared, but now, all of the cotton the worm spared will not be picked.

And this has been the invariable history of their advent each season of their appearance. They first show themselves to the extreme south and south-west, and thence spread rapidly into the interior.

The *worm* cannot exist without a plentiful supply of its only food. The egg is extremely fragile, and deposited, I believe, invariably on the leaf of the cotton plant. In no instance have I been able to keep the chrysalis long beyond the time of the appearance of the perfect insect. It is the *Moth*, then, that *hibernates*.

The winters upon the Texas seaboard are mild and of short duration. Very frequently the cotton plant is in leaf all winter. I was shown a prodigiously tall and strong stalk of cotton, cut from a *stool* of the plant, which had become perennial, or had at least held its own for many winters, in the lovely Valley of the Guadalupe, not far from the village of Cacer, throwing up these immense shoots each spring. Now, under these circumstances, the life of

Fig. 1.—WORM.

the moth would need to be preserved but a very few weeks, to enable it to perform its errand, in perpetuating its species. The first deposited eggs and the first larvæ would be exposed to many casualties; yet, a very few escaping these, would soon produce untold millions. I have never been able to preserve the moth alive longer than from three to seven days. But the period of the existence of all such insects depends so greatly upon the degree of moisture and heat of the atmosphere, their supply of food, etc., that that is no criterion.

During the lifetime of the moth, in summer, they may be seen in the evening, flitting from blossom to blossom of the cotton plant, the cow-pea, etc., feeding upon the nectar of the flowers.

The female deposits from four to six hundred eggs, thinly scattered over the under side of the leaves of the cotton plant. The egg is minute, round, flatish, and of a whitish-green color.

The larvæ are hatched forth in from two to five days; almost invariably in two days of moist, warm weather. When hatched, they are very minute. About the fifth and sixth days, they begin to increase rapidly in size, and are voraciously destructive. From the tenth to the fifteenth day, generally about the eleventh and twelfth, they enter the *chrysalis* state. The worm draws the edge of a leaf over itself, by means of numerous silken threads, until completely enveloped, and there, if undisturbed, undergoes its transformation. Fig. 1 represents a full-grown worm. Fig. 2 is an outline of a moth, to show its natural size, and fig. 3 a moth enlarged to show its markings more distinctly.

A very few days are required by the worm of the second or third crop to devour not only every leaf, blossom bud, and blossom, but the *calyx* leaves, also, at the base of the *bolls*, fully and partially grown; when the *lobes* which hold the cotton open entirely back, and allow the cotton to drop on the merest touch.

From this sketch of the nature and habits of these insects, it will be seen how difficult, if not impossible, would be the task of destroying them by the use of the finger and thumb or seissors, as in the case of the tobacco worms, which are of great size and few in number comparatively. I have experimented with every means that has been suggested through an active outdoor life; and the conclusion arrived at, is: Destroy the moth, as you may, with fires and lights, or pick off and kill the worm; if a single cotton grower in a large district neglects to do the same, your labor is in vain.

The plant must be rendered obnoxious to the moth, so that she will not deposit her eggs upon it. Then your indolent or indifferent neighbor suffers for his neglect instead of yourself.

Investigations and experiments recently made, at home and in Europe, to find a cure for *Scab*

and *Foot-rot* in sheep, led me to the discovery that, of all known substances, the comparatively recently discovered acid, known as *Carbolic*, formed into a saponaceous compound, was the most obnoxious to all insect life.

I brought home a moderate quantity of *McDougall's Sheep Dip*, and first experimented with that. It is, in fact, a *Carbolic soft soap*, into a solution of which sheep are dipped, and thereby cured of scab.

But I found that the insects in our clear, warm, dry climate possess a strength, vitality, and power of revivication, if I may use the expression, unknown to the same species in England; and that to destroy the scab insect, fleas on dogs, etc., a much stronger solution had to be used here than there, and under different treatment.

But in the yet more recently discovered *Cresylic Acid* we have the very thing that was wanted.

I will leave the manufacturers of this soap to speak for themselves,—except as to our present subject. I found that upon the cotton plants sprinkled with a solution of this soap, *no cotton moth thereafter deposited an egg!*

Is not this fact worthy of further experiment, not only on the cotton plant, but upon all other vegetable life threatened by insects,—the plum

Fig. 3.—MOTH ENLARGED.

by the curculio; the apple and pear by the canker-worm; the grape and the rose by the rose-bug; all young plants by aphides, and, above all, the wheat by the fly? Soon after the Cotton-worm first appeared, this season, I urged that others should try similar experiments. Many did so, and almost every experimenter made the same report—"if the mixture is used in sufficient strength to kill the worm, it also destroys the leaf of the plant." Exactly. But there is no necessity for trying to destroy the worm. Let him go, if any are there, but prevent the moth depositing any more eggs. Yours, T. A.

Poultry—Close Breeding, etc.

It is gratifying to observe the rapid increase of a very healthy interest in poultry and poultry breeding, which is manifesting itself almost all over the country. An American Society has been formed, which it is hoped will take high ground, uniting the various clubs, societies, and individual poultry breeders in various parts of North America, and being by them used for advancing their own interests by exchange of birds, information, etc., besides the advantage in having a certain uniformity of rules and standards. Writing to the *Agriculturist* on this general subject, Mr. S. B. Heiyes, of York Co., Pa., remarks:

"A greater interest than heretofore has recently been manifested in poultry, because of the great number of reliable persons who have gone into importing and rearing valuable varieties of poultry, both for ornament and use.

That the general interest is greater is plainly seen from the crowds assembling around the poultry coops at our County fairs, where a

greater and better variety of all domestic fowls has been placed upon exhibition than our State fairs could boast of a few years ago.

While this is the fact, there are a great many truths which can be promulgated only by the united action of individuals, as a society. The majority of breeders are ignorant of the many evils (and of the few good results) attending close, or in-and-in, breeding. They start out with a few noble specimens, and in a very few years their darling fowls have lost size and good qualities; they become discouraged, and abandon every effort to raise fine poultry. Proper instruction from well organized societies would obviate this.—Permit me to state two remarkable phenomena, results of close breeding, that were submitted to my consideration lately. Jos. Shuman, near York Co., Pa., a gentleman who raises nothing but Sumatra game, (having procured his stock from Albertus Welsh, who bought of Bennett's imported stock,) by continually breeding from the same strain has produced perfectly white Sumatras; a change from black to white. They are beautiful specimens, with dark legs, and compact bodies containing greater weight in small superficies than any other breed with which I am familiar. Samuel Dick, Esq., of the same County, from a stock of Buff Shanghaes, which I have also traced back to importation, has also produced fine specimens of pure white. May not the White Leghorn have been produced by breeding from the same strain of Black Spanish? They possess all their characteristics, and, if bred closely, will produce black offspring, which I know beyond a doubt. That good may result from this practice, I do not deny, but that "like will produce like," is not always true when we overstep the bounds of nature.

It is conceded that all of our varieties of turkeys have sprung from the wild bird. Domestication and in-and-in breeding have given us fowls differing widely from the original in color, bearing, and size, and possessing traits unknown in the original, as the custom of the White Holland turkey to lay extensively in the fall."

Breeding of Swine.

The careless way in which swine are bred entails upon them enfeebled constitutions, proneness to disease, inability to make the best use of their feed, grow rapidly, fatten rapidly, and make hard, firm flesh, with little offal. Close attention to breeding and to health will quickly develop in this plastic race an astonishing aptitude to take on fat, rapid change of form, approaching nearer and nearer whatever may be taken as a standard, and a soundness of constitution which is increasingly hereditary. We have not a doubt that many of the ills from which mankind suffer come directly or indirectly from pork eating. Nevertheless, we believe that reasonable attention to the health of swine would result in so much greater healthfulness of pork, that it might be eaten by persons able to take so hearty food, with impunity. Jefferson Co., N. Y., has long been noted for its fine hogs. The State fairs have repeatedly witnessed fine exhibitions coming from that County, and we have almost come to regard any Jefferson Co. farmer as authority on hogs. Mr. M. Pierson, who dates thence, writes:

"I was glad to see something in the *Agriculturist* in regard to breeding this indispensable, yet most neglected, carelessly fed and bred, of all domestic animals—the hog. Messrs. Bidwell Bros., of Minnesota, speak well in their sugges-

Fig. 2.—MOTH.

tions on the breeding of swine, in the August No., p. 279, of the *Agriculturist*. But they do not cover the whole ground. In the first place we do not pay attention enough to the *breed*. We should get the best breed we can find, and then be very particular *how* we breed. The great object is to get a hog that will make the greatest weight on a given amount of food, in a given time, with the least offal. As the hog is the only animal that is bred for flesh alone, it should be so managed that it will pay to raise and fatten them for breeding animals. We should select those approaching nearest our ideal of a perfect hog, and avoid in-and-in breeding. In crossing or lining we should be careful to correct defects in one, by selecting for its mate another good in those particular points in which the former fails, and always keep our breeders after they have been tested and found to be what we want as long as they will breed. And always keep them fleshy, as flesh will become a natural condition after a few generations, if they are not allowed to run down. I believe we may just as well have a breed that will mature in eight or ten months and dress from 300 to 400 lbs., and this done too, on three-fourths the food that it would require to attain the same weight with our "old-fashioned hogs" in eighteen or twenty months, and an inferior quality of pork at that. I am not a swine breeder, but I know how it is done, and how it should be done, for I have a neighbor who has put the foregoing practical rules to the test for the past ten years, and his pigs are easily made to dress 350 to 400 lbs. at nine months, as hundreds of pork makers in this county can affirm. And I have no doubt that this County alone is more than ten thousand dollars better off for his enterprise in this direction. He is rewarded by having made a fortune in the business. Not only this County but this State and many others, as well as Canada, are yearly benefited by one man conducting this business in a sensible way, and as every other sensible farmer should."

[We can mention other good farmers who are doing much in the same way, and are making hog-raising for pork, profitable even at the East. For ourselves we very well know that there is no profit in raising hogs for pork alone, unless prices of corn rule low, and those for pork, high. It is not for their flesh alone that *we* raise hogs, but for their service as manure makers, and this should be borne in mind by the farmer.—ED.]

Killing Time for Hogs and Beef.

The subject of killing domestic animals for food comes directly home to every farmer and farmer's wife in the country. Slaughtering is not so pleasant to the farmer as the preliminary labors of breeding, raising, and fattening, neither are the labors it imposes upon the good-wife so agreeable as preparing the fat spare-ribs and sirloin roasting pieces for the table, yet both are equally necessary.

It is very desirable to have cold weather for the operation, and as our cold days are very likely to come in threes or fours, there seldom being more than four consecutive very cold days, and usually but three, it is best to be ready, and take the first clear cold day for the work, and trust to the two following to freeze what meat is to be kept fresh. In regard to pork, that is almost all to be salted or smoked, this is not very important, yet it is much more convenient and pleasant to handle meat that is firm and cold than that which is flabby.

The most convenient way for a farmer to handle

heavy hogs in slaughtering is to have a block and tackle to swing the hog by while bleeding, the rope being made fast to one hind leg below the hock. By the same tackle he is lifted and lowered into the tub of hot water in scalding for the removal of the bristles. The dressing table should be level with the tub, and as soon as one hog is scalded and lifted out upon the table, the rope may be attached to another. It will not be necessary to use the tackle to lift the hogs out of the tub, for this may be done easily if two ropes, held apart by three or four rungs, like a piece of rope-ladder, are fastened to the table, and lie in and across the tub, so that the hog will lie upon them; taking hold of the ends of the ropes two men can lift and roll out a heavy hog easily.

In cutting up beef, it is important to remember that the object is not simply to get it all into small pieces, but to have the pieces of such shape, and so cut with relation to the bones, that the meat will cook to the best advantage, cut up well, appear well on the table, and more than all, be most palatable and nutritious. All this depends much upon the cutting up of the carcass.

There are many approved ways of doing this, and we cannot now discuss them, but may give two general hints, which, if followed, will be satisfactory to everybody. *First*, cut so that the pieces, when brought to the table, may be cut *across the fibre*, as squarely as possible. *Second*, so divide the carcass that each part shall have its due proportion of bone. This is difficult indeed, for the shins and knuckles will have much bone and little meat, the end of the ribs too, and the piece including the great bones of the hip and pelvis will be disproportionately bony, and pieces cut from the leg for smoked beef and salting may properly be quite free from bone; nevertheless, retail butchers know they must ever *try* to make a fair division of the bone among their customers, and the result is much more satisfactorily shaped pieces than if this principle were not heeded.

Indian Corn—Fertilization—How to Gain Two Ears to a Stalk.

A few weeks since a gentleman handed us two neatly made sections of ears of Western corn, from the farm of Wm. F. Thompson, Logan County, Ill. In themselves they were not very extraordinary, but the sections were carefully cut, and the corn being of a bright yellow edged with white, in one, and clear yellow in the other, contrasted beautifully with the red scales on the outside of the cob, and with the clear white within. We have not a doubt that many of the readers of the *Agriculturist* will be struck with the beauty of these rosette-like figures, and be surprised to find out what they are, for there are many among them familiar with the Dent or Horsetooth corn only as it comes to market, and with whom a 10-rowed or 12-rowed variety of corn is a rarity. The corn of the North-eastern States is the 8-rowed white or yellow flint, the season generally being too short for the Dent varieties. In the smaller figure, (2,) at several points, the filament connecting the kernel with the pith in the center of the cob may be distinctly traced. In all, it might have been dissected out, with a little care. At the opposite end of the kernel there is a little elevated point at which another filament, the silk, was attached. Through the silk, as is well known, the fertilizing influence of the pollen, coming from the "spindles" or "tassels," at the tops of the corn stalks in the field, descends to the kernels. Now, inasmuch as a

kernel is seldom fertilized by the pollen of the stalk on which it grows, and, as the kernel is thus the joint offspring of different corn plants, variations of color in the kernels of the same ear often occur. There are, besides, other influences communicated which do not show themselves in the color or shape of the grain.

A remarkable fact has lately been brought to our attention by Mr. H. S. Bidwell, (Bidwell Bro's.) of St. Paul, who was recently traveling in Tennessee, where he saw a field of common corn, which usually yields an average of not more than one good ear to the stalk, bearing almost uniformly two, and often three ears. The result, he informs us, had been brought about in this way. It occurred to the farmer that, as the kernel usually derived its origin, as we have described, from two different plants,

Fig. 1.—SECTION OF 24-ROWED CORN.

saying the seed corn from stalks bearing two ears was not enough; he must see to it that the kernel germs were fertilized by similar stalks. So he planted every year a special patch for seed, and carefully cut off all the spindles on stalks where two or more ears were not set. The result was an improvement year by year in the quantity of corn, as well as in the manner in which it grew. The principle has a wide application in the improvement of the different kinds of farm and garden produce. In the breeding of animals, the qualities expected from the male, and those which usually are inherited from the dam, are to a degree understood, and the application of similar principles in breeding

Fig. 2.—SECTION OF 22-ROWED CORN.

vegetables is certainly legitimate. The fact above stated has so good a foundation in sound reasoning, that we give it to our readers, anticipating its publication in the "American Agricultural Annual," which is now in press.

THE NEW SEEDLING POTATOES.—This has been a season to test the new varieties of potatoes. The long continued rains have induced rot, and the disease has prevailed to a much greater extent than for several years. We planted the Cuzco on gravelly loam, and had a good crop, with no appearance of disease. A neighbor planted the Peachblow on the same kind of soil, and did not get his seed back again. A second neighbor, in an adjoining field, planted the same, and did not get enough to pay for his labor. The disease was probably owing entirely to the varieties of the potato planted. The Cuzco is one of Goodrich's Seedlings which we have planted for six years with uniform success. The Garnet Chili and Pink-eyed Rusty Coat are equally free from rot, yield well, and are of fair quality. The Early Goodrich and the Harrison are also sound, and very productive. The new seedlings are generally much more free from rot than the old varieties, and ought to be universally adopted. Millions of dollars would have been saved to the country if these seedlings had been planted this season. Get your stock of seed potatoes early, while they are plenty and comparatively cheap.

Smoking Meats in a Small Way.

Economical farmer folks and others are often put to their wits to arrange for smoking the small quantities of meat they require for their own households, and to have at the same time a safe place to keep such meats away from flies. Barrels are occasionally used to smoke meat in, and they do very well to give the flesh the smell and flavor of smoke, but that is all. Long exposure heats the meat, and often repeating the operation is apt to cause decay at the centre, the smoke not penetrating, and the warmth affecting the meat. We are inclined to adopt, at least to make trial of, the following suggestion, and propose it to our readers as susceptible of such modifications as may be deemed expedient. The figure represents one of the casks in which British hardware is imported, though any hogshead will do. They are made of heavy, hard wood, thick and strong, and very strongly hooped. The heads are easily removed, and the casks may be made tight by pitching the seams, if not by simply tighten-

APPARATUS FOR SMOKING MEATS.

ing the hoops. We mention these because they are cheaply obtained in most of our large cities. Take out one head of the cask, and set in it a number of hooks, upon which to hang the hams, shoulders, or sausages, cut a hole in the top in which to insert a 2-inch tin pipe, extending half way or more to the bottom, and, replacing this head, take out the other. If the position of the hoops is such that it can be done, a door may be cut, as shown in the engraving, through which the interior may be reached conveniently. If we dig a channel in

the ground some 8 or 10 feet in length, and lay a course of 8-inch drain tiles in it, putting in a piece of old stove pipe in which to make the smoke-fire at one end, and turning the last tile up perpendicularly out of the ground at the other, the smoke will be sufficiently cooled in its passage through the tiles, not to affect the meat. Should the draft be too great or the smoke too warm, a flat stone might be laid over the end of the tile, and an inch above it, being supported on stakes or bricks. Our cask may be set over this; the smoke will rise and fill it, the tin pipe drawing it off when filled down to its end, and providing a draught, which, if excessive, may be checked by pressing the conical top on tight. Should a door be cut it would be necessary to have it close as snugly as possible, and if one cannot conveniently be made, the plan is still feasible, for by a block and tackle the cask may be lifted and held upright, and meat put in or taken out.

The cask should be set in a cool shed, or out-building, with an earth floor, so that in warm weather, when it will remain some days unopened, the earth may be brushed up around the chime to keep flies and insects away more effectually. During the warm weather an occasional "smudge" would, we think, enable us to keep well cured meat without difficulty.

Tight Embankments in Draining—Security against Muskrats.

The great obstacle to success in reclaiming salt marshes is the muskrat, as every one knows who has much experience in this business. You can shut out the water very readily by making your embankment high enough and thick enough. Perfect security against the encroachments of water is only a question of a little more earth taken from the inside ditch. But while you are glorying in the completeness of your work, a family of muskrats locate generally near the outlet or tide-gate, and commence their mining operations. They burrow above and below the tide-gate, and meeting in the middle the water immediately follows, and a breach is made in your dyke, the first spring-tide. To head them off various devices have been suggested and tried; concrete walls, filling a section with clay and ramming, iron plates, planks, and lastly, plates of burnt clay. This last is suggested by a correspondent who asks: "Why could not the tile men make and sell suitable tiles—a merchantable article, say 1 foot by 3 feet, and a half-inch thick? To facilitate the driving of these brick plates into the mud, an iron driver might be made with a blade a foot wide to cut through the sods and the mud. Do you not think these could be made cheaply, and that they would answer even better than iron?" No doubt brick plank could be made and put in position, but we do not see the need of them. For making the dyke tight immediately around the tide-gate, we doubt if anything can be found cheaper and more effectual than good hemlock or chestnut plank. These will last fifty years or more, and if the instincts of the muskrat be studied a little, we may guard against his assaults.

Col. Waring, in his able work upon *Draining for Profit*, says: "The bed of the creek should be filled in back of the dam for a distance of at least fifty yards, to a height greater than that at which water will stand in the interior drains—

say to within three feet of the surface—so that there shall never be a body of water standing within that distance of the dam. It should be a cardinal rule with all who are engaged in the construction of such works, never to allow two bodies of water, one on each side of the bank, to be nearer than twenty-five yards of each other, and fifty yards would be better. Muskrats do not bore through a bank, as is often supposed, to make a passage from one body of water to another, (they would find an easier road over

EMBANKMENT.

the top;) but they delight in any elevated mound in which they can make their homes above the water level, and have its entrance beneath the surface, so that their land enemies can not invade them. When they enter for this purpose, only from one side of the dyke, they will do no harm, but if another colony is at the same time boring in from the other side, there is great danger that their burrows will connect, and thus form a channel for the admission of water, and destroy the work. A disregard of this requirement has caused thousands of acres of salt marsh that had been enclosed by dykes having a ditch on each side, (much the cheapest way to make them,) to be abandoned, and it has induced the invention of various costly devices for the protection of embankments against these attacks." These the author condemns.

We have, then, only to keep in mind this instinct of the muskrat to make a dyke perfectly secure. In fig. 1, we have a view of a dyke and an inside ditch well adapted to ordinary locations. The only change we would make in it, suggested by our experience, is the enlargement of the border between the dyke and the ditch. This is put at three feet. We should prefer twenty, for greater security against the muskrats, and for better drainage. The rats would probably be content with the ditch border and would not touch the bank at all. The drainage nearest the ditch is most perfect, and the meadow would have the benefit of it, instead of the bank which does not need it. The strip between the bank and the ditch is as good as any part of the reclaimed land, and could be more conveniently mowed and raked with machines if it were twenty feet wide, than if it were only three. It would cost a little more to make this broad border, but it would be the cheaper in the end.

The greatest inconvenience we ever suffered from muskrats was their attacks upon the ditch borders and upon the tide-gate. The borders, in some places, were honeycombed, and the tide-gate was repeatedly eaten through until we lined it with yellow metal, which proved a little too tough for them. But with all their assaults, the gate that was put in, in November, 1855, is still doing good service. The idea of resorting to iron plates, to dam out the sea water from the Hackensack meadows, is simply ridiculous. That great improvement needs no such costly outlay. The clay or tenacious mud found just beneath the surface of a salt marsh is usually as good a material as could be desired for an embankment. For a fuller discussion of this very important matter we refer our readers to Col. Waring's work.

Pear Culture on the Connecticut Coast.

A correspondent from near Stonington, Conn., sends us the following notes upon pears:

"Stonington, Mystic, and other places near L. I. Sound, have felt very strongly the recent impulse given to fruit-growing, and during the last ten years much progress has been made, especially in the cultivation of the pear. It is rare to find out of the vicinity of Boston so many private gardens so well stocked with good fruit. The pear does even better near the shore than the apple. In no one of the last ten years has there been a general failure of the crop. It has contributed not a little to the success of pear culture that the old pastures of this early settled town are quite well stocked with pear trees. Many seedlings come up in by-places, and these, in many instances, have been transplanted, and make the best of stocks for grafting. We have sometimes taken up these seedlings, six or eight inches in diameter, by the frozen ball method, and by gradually grafting them with desirable fruit have got it early and in great abundance.

"The Flemish Beauty, for the early part of the period mentioned, was a first-rate variety. The trees grew with sufficient rapidity, came early into bearing, gave a fair russet pear with a red cheek, and it was thought to be one of the best for this region. But of late years it cracks so badly that the fruit men are quite out of patience with it and are grafting it with better sorts. It will have to be abandoned. The Beurre Diel cracks to some extent, and is considered doubtful. The Duchesse d'Angoulême does well on the lighter soils, but is hardly worth cultivating in heavy loams. The Bartlett sustains its well-earned reputation. The Julienne, on a dry, warm soil, is a first-rate summer pear, bearing regular and abundant crops. The Tyson is superb, beautiful in color, and tastes better than it looks. The Paradise of Autumn is of the most exquisite flavor, bears abundantly every year, and has this remarkable quality that the imperfect specimens are nearly deficient in flavor. It is worthy of much more general cultivation. The St. Ghislain is also about as good as it can be, and bears regular and abundant crops. It has a very sprightly, vinous, flavor, that leaves nothing to be desired. The Belle Lucrative is an early and abundant bearer upon the quince, and good enough for those who like a rich, saccharine fruit. The Muskingum is perhaps the most popular pear of this region. It comes in about a week or ten days earlier than the Bartlett, is nearly as large, is a much better fruit, and bears uniformly good crops every year. The Vicar of Winkfield, always a good baking pear, is here, when well grown, good enough for any man's table. We have eaten it in January when it was quite equal to the White Doyenne. The Bloodgood is very poor, or we have been exceedingly unfortunate in the specimens produced. The Dearborn's Seedling improves as the trees get age, but at its best estate is hardly up to its reputation. The Glou Moreceau very generally cracks as badly as the White Doyenne. But we saw a large basket of them at Mystic, this fall, the product of a single tree, worthy of their highest fame. Pear culture has taken deep root here, and will be likely to spread into orchard culture. The crop is so generally reliable that it could not fail to be largely profitable."

FROZEN PLANTS.—When plants in pots become frozen, they may often be saved by judi-

cious treatment, provided the freezing is not very severe. The way to complete the work of the frost is to bring the plant into a warm room, or, still worse, to attempt to thaw it with warm water. Leave it in a cool place where the thawing will be very gradual, and where the sun will not reach it. Trees frozen in transportation are to be treated in a similar manner. Place the box or parcel in a dark, cool cellar, or, if it be not convenient to do that, cover it thickly with straw or coarse hay, or bury it in the earth—any way to avoid a sudden change.

The Papaw.

The Papaw, (*Asimina triloba*), called also the *Custard Apple*, is widely distributed over the Western and Southern States. Its favorite localities are the bottom lands, though it grows readily on higher ground, and thousands of the young seedlings are seen springing up in the fresh clearings. The tree grows to the height of thirty feet, and begins to bear fruit quite early, when it may be called a shrub. The fruit is three or four inches long, and more resembles the fig banana in shape and size than any thing we are acquainted with. It is less regular in its form and more rounded at the ends. It is of a greenish-yellow color when ripe, has a thin, delicate skin, and a sweetish pulp, in which are imbedded a dozen or more seeds, looking like thin, brown beans. The engraving represents one of the natural size. The leaf, flower and fruit are illustrated in Jan., 1864, page 20. The fruit is highly relished by some persons, and we have even heard it eulogized as the most delicious of all. But to most tastes it is lacking in character. It is even more neutral than fresh ripe figs, which many consider insipid. It is abundantly offered for sale, with other fall fruits, in the markets of Louisville and other Western cities. We occasionally noticed trees standing in the yards of that city, and near the farm-houses in Indiana, but we are not aware that any systematic attempts have been made for its cultivation, or that any departures have taken place from the native type of the forests. The original fruit is much more promising than many of those which have been so long cultivated and are now so highly prized. If it were taken in hand by the pomologists we have no doubt it could be made to break into rich and palatable varieties and become as popular as the banana, which is now quite as common and cheap in the New York market as the pear. The tree is as ornamental as the cherry, which it somewhat resembles in general contour. Though a native of regions lying south of forty degrees of North latitude, it would probably bear removal and become acclimated several degrees further north, and keep company with the peach and the cherry. Could the Horticultural Societies of the Western States do better than to offer a handsome premium for the first new variety of the Papaw?

PAPAW SEED.

Constitution of a Horticultural Society.

Numerous requests have been made for a form of constitution for a Horticultural Society. The best we have seen is that of the Warsaw, Ill., Hort. Society, because it is the briefest. We are indebted to Mr. F. Starr for a copy of this constitution, to which we have made some slight amendments. When a body of live hor-

ticulturists meet for the promotion of the cause, they will, if animated by the right spirit, prefer to be troubled with as little constitution as possible. There are in every community certain individuals who like to belong to societies for the opportunity it gives them to show their powers in expounding the constitution. We have known more than one society broken up because it had too strong a constitution. Another great trouble in all such societies is the everlasting talker, who occupies time, but never says anything. The hard work in all such associations falls upon a few, and it is well to put those in office who have horticulture at heart, and will work for the love of it.

CONSTITUTION.—Sec. 1. This Association shall be known as "— Horticultural Society."

Sec. 2. Its object shall be the advancement of the science of Pomology, and of the art of Horticulture, and the collection and preservation of statistics of fruit culture in ——— County.

Sec. 3. Its members shall consist of annual members, paying an annual fee of one dollar, and of honorary members, who shall consist only of persons of distinguished merit in horticulture or kindred sciences, who may, by vote, be invited to participate in the privileges of the Society. The wives of members shall be members without fee. Membership shall cease with the expiration of the year for which the fee is paid.

Sec. 4. Its officers shall consist of a President, Vice-President, and Secretary, who shall also act as Treasurer; all of whom shall be elected at the December meeting in each year, and serve until their successors are elected. These shall constitute the Executive Committee.

Sec. 5. The Executive Committee shall have charge of the property of the Society, have power to call special meetings, and attend to any executive business not otherwise provided for in the By-Laws or by especial vote of the Society.

Sec. 6. This Society shall hold monthly or other meetings as may be determined by By-Laws or resolution.

Sec. 7. This Constitution may be amended at any regular meeting by two-thirds vote of the members present, notice having been given at the preceding regular meeting.

FOREIGN ITEMS.—We glean the following notes from our recent French journals:

Thornless Gooseberry.—The Billiard Gooseberry, the fruit of good quality, the bush rather a slow grower, but without thorns.

Japanese Maples, with much divided and colored leaves, are figured in rival journals, which disagree about names. We have known the same things for several years in the collection of Mr. James Hogg, of this city, who always has some rare Japanese or other plants.

Camellia-flowered Double Peach.—This very ornamental peach, which we figured two years or more ago, fruits quite freely in France, and is said to bear a cling-stone peach of good quality.

Forcing Lilacs.—For the Paris market alone Lilacs are forced to bloom in winter by the hundred thousand. With the necessary heat and not much light, the common lilac blooms white.

Unseasonable Flowering.—Near Lyons, and in other parts of France, the unusually dry season followed by rains, caused the apple, pear, and plum trees to flower in great numbers.

The Sweet Potato as a Window Plant.—This is recommended as a plant for the dwelling, on account of the fine green of its leaves. We have seen it now and then in use in this country.

[COPYRIGHT SECURED.]

A MEMBER OF THE HUMANE SOCIETY. — Engraved for the American Agriculturist, after a Painting by Sir Edwin Landseer.

The Newfoundland Dog.

We know it is heretical for an agricultural paper now-a-days to see much that is good in dogs, but we cannot help it, especially when one is presented to our consideration like this in the engraving, which is a portrait by Landseer, of the full-blooded Newfoundland dog which received the medal of the Humane Society of London, for saving the lives of several drowning persons. It is certainly an astonishingly faithful representation of a good Newfoundland.

This variety is usually classed with the Spaniels, and is probably in some degree related to the Esquimaux dogs. There are two quite distinct families, the large and the small, and these have indefinitely intermingled. All are marked by a long body, broad chest, pointed head, large and fully webbed feet, great intelligence, dignity of demeanor, excessive fondness for water. The coat is always shaggy or closely curling. They are animals of great power and endurance, and by the natives of the island whence they come, were extensively used for hauling wood from the back country to the shore; a pack of four or six traveling off with what would be a good load for a horse. The Newfoundland makes an excellent watch-dog, unless he has been taught to make friends with everybody, after which he is nearly worthless for this purpose. Kept chained, he becomes very alert,

and often unfriendly, though he seldom inflicts serious injuries. These dogs are possessed of a peculiar instinct, which leads them to bring out of the water almost everything which falls into it. Hence the endeavor to rescue drowning persons, in which they have been successful in numerous instances. In point of intelligence the Newfoundland ranks, among dogs, second only to the Scotch Cooley or Shepherd dog. They are the safest of dogs to have as playmates for children, and nothing can exceed the gallant care and attention one will pay his mistress or her children if allowed to walk with them, or otherwise act as their protector.

In a careful enumeration of canine virtues, we think all familiar with this noble breed will accord to it almost every one. The attachment of a Newfoundland to his master is great, but it is remarkable that any person in real distress need not call in vain upon the dog for aid that he can give. In the water, with great sagacity he holds up the drowning man's head and swims to shore; men or children floundering and freezing in deep snows are dragged out and brought to notice; in fact, wherever he finds a human being in distress he serves him if he can. These noble dogs have repeatedly been known to undergo great hardships in order to bring succor to entire strangers. On their native island, the dogs used to be hard worked during the winter and turned loose in the spring in a

half-starved condition. Preferring mutton and game to codfish heads and offal, they are naturally inclined to the sports of the chase, and it is said that flocks often suffer. No doubt a natural proclivity thus strengthened is hard to correct in subsequent generations, — still we do not think that Newfoundland dogs are worse sheep-killers than others. Dogs of the large breed of Newfoundlands often stand 30 to 32 inches high, while the smaller ones, sometimes called St. John's dogs, measure only about two feet — a notable difference. In character they are much alike. As a watch-dog the cross with the Mastiff is greatly valued. When the Setter is crossed with a dog of the smaller breed, an animal of great service to the sportsman as a retriever, is produced, the dog retaining that faculty of the Newfoundland which leads it to bring things out of the water, to fetch and carry so naturally and handily — while it has some of the lightness and agility of the Setter.

Upon the island of New Foundland little attention has been paid to breeding these dogs, and the best animals have been sold freely for prices very small in comparison with what they will readily bring in England or the United States; the result is that the breed of the island has not improved, and it is probable that better dogs may be obtained elsewhere. The larger breed is common upon the coast of Labrador, and here fine specimens have been obtained.

BLACK ALDER—(*Ilex verticillata*.)

Our Showy-fruited Shrubs.

There are many shrubs that are quite as effective, (if not more so), in fruit as in flower, and which, upon the shedding of their leaves prolong our enjoyment of them by the pleasing colors of their berries. Leaving the exotics out of the question for the present, we find that our own shrubs present us with a great range of color, from the pure white of the Snowberry of the West, through the rich purple of the *Callicarpa* of the South, and the intense scarlet of the Black Alder, to the black of the *Viburnums*. Our present object is to call attention to one that is so common everywhere that its value as an ornamental plant has been overlooked. In early winter we find, in many places, the swamps in a blaze of scarlet, in strong contrast to the general dreariness of the landscape. This brilliant appearance is due to the fruit of the Black Alder, *Ilex verticillata*. By the older botanists it was called *Prinos verticillatus*, but it is now regarded as an *Ilex* or Holly, with deciduous leaves. The shrub is very common, grows from five to ten feet high, and in cultivation can easily be made to assume a symmetrical form. The flowers are small, white, and not very showy, both sterile and fertile ones being borne on the same bush. The berries are bright scarlet, very numerous, and contain six or eight seeds. The above engraving gives the size and shape of the leaves as well as of the berries.

"Solomon in all his Glory."

We are told that "Solomon in all his glory" was not arrayed like one of the "Lilies of the field." While writers have perplexed themselves in the endeavor to determine what particular plant is referred to as the lily of the

field, we think that the figure has sufficient force if we accept it as applying to our garden lilies, for some of these have a gorgeousness and a glory truly regal, and they are "lilies of the field" in some parts of the world. We are at a loss to account for the comparative rarity of lilies in our gardens, when the majority of them possess every element of popularity. They present a great variety in coloring, height, time of flowering, and most of them are quite hardy and need not be replanted for several years. It is true that some of the rarer sorts are expensive; the catalogues give a wide range of prices, from 15c. to \$5.00 per bulb. Those who do not strive to possess every new thing can forego the more rare and costly ones, and at an expense of from 30 to 50c. procure sorts that will be well worth the money, and which will in a few years multiply to such

an extent that one will soon have an abundance of bulbs to give to less fortunate friends. Our admiration was greatly excited over a box of lilies sent us last summer by Mr. James Vick, of Rochester, N. Y., which presented some shades of color we had not before seen. Mr. V. not only deals in seeds and bulbs, but raises them, not in a garden, but on a farm, and his many acres, all aglow with the choicest flowers, form one of the notable sights to be seen near that most beautiful of inland cities—Rochester. All the lily requires is to be planted in a good, deep, rich, mellow soil, and be let alone, except to supply a stake to support the taller kinds. Most of the bulbs will, the first season, make two that will flower the next year, and each of these will again subdivide. Besides this, numerous small bulbs or offsets will be formed, which, after growing a year or two, will give flowers. When the clump becomes too crowded, the bulbs may be lifted in the fall or very early in the spring, divided and replanted. This natural multiplication is usually rapid enough for ordinary cultivators, but the florist who has to supply them by hundreds and thousands must work faster. The lily bulb is covered with scales overlapping one another, and each one of these scales, which is in reality the thickened base of the leaf of the previous season, is capable, when placed under proper conditions, of producing a new plant. The scales are carefully broken off from the bulb and planted in sand or sandy earth in boxes, taking care to leave at least a third of the upper part of the scale above the surface. The boxes are kept in a cool green-house, and not too moist, until a small bulb, (and sometimes two), is found at the base of each scale. When these bulbs push out roots, they are potted in richer earth. The outer scales are generally used for the purpose, and the bulb is still left in a salable condition. We

TURK'S CAP LILY—(*Lilium Martagon*.)

enumerate a few of the desirable sorts, with the remark that they may be planted as long as the ground remains open in the autumn, and as soon as the first leaves it in the spring.

WHITE LILY, *Lilium candidum*, one of the oldest and commonest, as well as the best, of the genus. Long ago chosen as an emblem of purity, it has in it those elements of beauty, that, as old and as common as it is, have enabled it for nearly two centuries to hold a place in our gardens against all new comers. There are double and striped-leaved varieties of this, but they all appear like monsters when contrasted with the simple dignity and purity of the original. It grows about four feet in height.

THE LONG-FLOWERED LILY, *Lilium longiflorum*, is also white flowered and fragrant, but it has fewer and much longer flowers than the foregoing, and grows only about 18 inches high.

THE TURK'S CAP LILY, *Lilium Martagon*, grows from 3 to 5 feet high, bears a great many flowers, and perhaps varies more in color than any other species,—from white to deep purple. Our engraving is taken from a lilac colored specimen, with dark purple spots, from Mr. Vick.

THE CHALCEDONIAN LILY, *Lilium Chalcedonicum*, is another tall-growing species with most brilliant scarlet flowers, the petals of which are more strongly recurved than those of the species shown in the engraving. Omitting many other equally fine species, we notice the

JAPAN LILIES, *Lilium speciosum*, or *L. lancifolium* of the catalogues. These, which formerly sold for \$5 a bulb, can be had now for 50 cents or less, and we do not know how the same amount can be expended in flowers to produce more satisfaction. There are several varieties, varying in their marking, and even a pure white one. Most are, however, white, with more or less abundant red or rose-colored spots. It is difficult to convince one unacquainted with this

lily that so beautiful a flower is as hardy as a horseradish root. *Lilium giganteum*, *L. Brownii*, and *L. auratum*, are among the high priced bulbs. We must not forget to say a word for our native species, of which *L. Canadense*, *L. Philadelphicum*, and *L. superbum*, are the most common. If these be marked when in flower, and the bulbs transferred to the garden when the foliage has withered, they will repay the trouble.

A Self-closing Gate or "Stile."

In last month's *Agriculturist*, (page 405,) is an illustration of a self-closing double entrance gate. A recent number of the (English) *Journal of Horticulture* gives a single gate, or, as it

Fig. 1.—GATE CLOSED.

is called there, a "Somersetshire Stile;" though a stile, properly speaking, is a set of steps to pass over a fence or hedge. The construction is quite simple, and there are probably many places in which it would be found more useful than a swinging gate, as it is self-closing and self-fastening. Fig. 1 represents the gate closed, and fig. 2 gives it half open and open; the letters refer to the same parts in both. Two posts are set, united by a cross-piece below; one of the posts, *b*, has at its top a slit to receive the cross-bar, *a*; this bar at one end passes in-

Fig. 2.—GATE OPEN.

to a mortise in the other post, and is fixed by a pin upon which it moves, and the other end is made long enough to be shaped into a projecting handle. A perpendicular piece, or pendant, *e*, is attached to the cross-bar, *a*, by means of a pivot, at *e*, and at the lower end it has a ring which runs upon the iron rod, *d*. The action of the different parts in opening is shown in fig. 2. In the description no dimensions are given, nor are there any particulars beyond what are here stated. It is thought of sufficient utility in England to patent it. We have no doubt that some one here will patent this, as has

been done with several sliding gates and other simple contrivances that we have published.

Covering Strawberries in Winter.

The object of covering strawberries at the approach of winter is often misapprehended. It sometimes happens that a novice covers his plants and finds a large portion of them dead in spring. He has overdone the thing, and taken too much care of his favorites. The object is not so much to keep frost from the plant, as to protect both tops and roots from the disastrous effects of alternate freezing and thawing. Hence the covering should be put on with discrimination, and while it may be quite thick between the rows, it should not be more than an inch or so in depth over the plants themselves. In all good cultivation the plants are covered, and this serves the double purpose of protecting them from injury by alternate heat and cold, and when left on, as it should be, it keeps down the weeds and prevents the fruit from becoming soiled by contact with the earth. As to the material to be used, that will depend much upon the resources of the locality. Probably the worst materials are tan-bark and sawdust, not that they do not afford sufficient protection, but because they soil the fruit quite as much as if it were exposed to damage from the earth. Near the coast, "salt hay" is much used, and where it is obtainable, nothing can be better. It is made from a wiry kind of grass, that preserves its elasticity in a remarkable degree. Perhaps the most generally used material is straw. Oat straw, thrashed by the flail, is preferred by some cultivators, but any kind will answer. With machine-thrashed straw it is well to throw a sprinkling of earth over it to hold it in place until the snows and frosts secure it. Do the same when leaves are employed to cover the plants; these make an excellent mulch, as do spent hops from the breweries. Pine straw—fallen pine leaves—where they are abundant, are capital for the purpose. Corn-stalks are used in some parts of the West with success, and lastly, nature's own covering—snow, if we could but secure its permanency, is, as far as winter protection goes, the best covering of all.

Improvement in Tomatoes.

There are now before the public some twenty or more kinds of tomatoes; several of these have been produced within a few years, and have been put forth with great claims to superior quality, earliness, and productiveness. We find that people try one or more of these new kinds every year, and go back to the Early Smooth Red. We cannot suppose that those who "originate" these varieties are not honest in their statements concerning the superiority of their favorites. The readiness with which the tomato varies is well known by all who have had any experience in growing it, and the trouble is that any particular sort does not have its peculiarities sufficiently fixed by a number of years' careful selection before it is put before the public as a new variety. Carelessness in saving seed, that is, in not selecting typical specimens, is sufficient in some cases to destroy the distinctive character in a single year. If a kind with some marked peculiarity were propagated from cuttings, there would not be such different opinions concerning varieties, but with a plant having so strong a tendency to variation, it is hardly to be expected that it should remain true when raised from the seed each year, unless the

greatest care were taken in selecting for seed only those fruits that presented the desired form and other qualities in the strongest degree.

Two of the varieties most prominent just now are Tilden's and Keyes'. Tilden's, which is usually fine at the West, is not generally successful at the East, where it is disposed to depart from the typical form. Keyes' is said to be, in some parts of Massachusetts, "thirty days earlier than any other variety," while Mr. Gregory finds it at Marblehead, in the same State, later than several others, and at the Michigan Agricultural College, it stands third on the list in regard to earliness. Prof. Prentiss, of the above named institution, reports to the *Prairie Farmer* the results of his experiments with twenty-three varieties. He says: "Estimating their value by their average qualities, the finest, most desirable tomatoes now before the public, are the Tilden, Red Valencia, Collins, and Foard, these being mentioned in the order of their merit; and to these four should be added the old-fashioned Early Smooth Red, as being the earliest good variety yet produced." Another equally careful cultivator in another locality would probably make a different list. We hope that no more names will be added to our catalogues unless the varieties have some marked qualities that have become so well fixed by a course of careful breeding, so to speak, that they may be in a measure permanent. Any one who has a good sort, like the Early Smooth Red, to start with, can, by selecting the earliest good specimens from the most fruitful plants, obtain an improved variety. By continuing to do this from year to year, the superior quality of plants from such seed will be so manifest that he will have little need to run after new sorts.

Notes on Grapes and Grape Culture.

Our notes on grapes in Missouri and Ohio must give way to those gathered at the Grape Exhibition held at the office of the *Agriculturist*, on the 24th of October—an account of which will be found in our "Basket" columns.

Rogers' Hybrids.—Here are 20 varieties of these grapes, all grown by Mr. Knox. We have gone over them carefully, and our mouth burns smartly after the operation. We never see these grapes without regretting that so many of them were ever offered for sale. Their general characters are a small bunch and a large berry that readily falls from the stem. A thick skin and tough pulp are found in many, but to all these defects there are some exceptions. Some of the numbers will no doubt acquire a permanent standing, while the majority may be classed as too good to throw away, and not good enough to keep. Of the earlier numbers, 4, 9, and 15 seem to us the best. No. 4 was noticed last month, and we have nothing to add to our description. No. 9 is a dark Catawba color, smaller than No. 4, and much less showy. A very sugary grape, but not tender enough to be first class. No. 15, large berry and good-sized bunch, nearly black; flesh very "meaty," and resembles a Black Hamburg as far as this quality goes. Not so sweet as No. 9. Of the later numbers, 33, 39, 41, 43 and 44, are all large, black, berries, and in character of flesh resemble No. 15, but some are sweeter and more vinous. From the specimens before us we should say that 39 is better than the others. The bunches from young vines are small, but if a large one can be obtained this will become a favorite.

Salem.—Only small and indifferent bunches were sent, and it is not fair to judge from these.

If what we have is a fair sample, we consider it inferior to No. 39, but we wait another year before forming a definite opinion of this.

Keuka.—Exhibited by Geo. W. McDowell, of Crooked Lake, Steuben Co., N. Y. It is an early black grape, and claimed to be a seedling. Judging from the fruit alone, we cannot see in what it differs from the Logan, which variety it resembles in being very seedy. But little is known of it outside of its place of origin.

Martha.—Mention was made of this in last month's notes. We cannot agree with the high estimate which some put upon this variety, but we have no doubt it will please a large class who like a very sweet grape, without sprightliness. The flesh of the Martha is peculiarly buttery, and the skin very tender.

There are three grapes which much resemble each other in general characters, that are especial favorites with us: the Herbmont, Elsinburgh, and Alvey. They deserve to be better known, as they are first class fruits in every respect save that of size.

Herbmont.—A large, very compact bunch; berry medium, black, with a fine bloom. Vine too tender for general cultivation at the North. Mr. Knox exhibited fine specimens and a cane with the grapes upon it to show its abundant bearing. It requires a still more favorable locality than his to reach its full development, the specimens shown by him not being equal in quality to those we tested in Missouri.

Elsinburgh.—A looser bunch and smaller berry than Herbmont. Vine quite hardy; fruit very spirited and vinous. Excellent for amateur culture, but not sufficiently attractive in appearance to be a market sort.

Alvey.—This is a larger berry than either of the two foregoing. Ripens perfectly around New York, and is, if possible, still better further south. Mr. Fuller says, "too small for a table grape," in which we cannot agree with him, as the berries are larger than those of the Delaware. Mr. Mead thinks it the same as the Lenoire, but if we have the true Lenoire, the two are quite distinct. Tender, sweet, rich, sprightly, with a very thin skin, on which account it can never be a market grape, but for family use it hardly has a superior.

Iona.—Through the exertions of Dr. Grant, a fine show was made of this variety, embracing specimens from Ohio, New York, and Connecticut. Those from Ohio were the best ripened, but suffered somewhat from long carriage. The specimens exhibited by Mr. Beach, of Hartford, Conn., were very handsome, but were picked too soon, in anticipation of a frost. Our opinion of the high character of this grape was expressed in our notes last month.

Adirondac.—No specimens were equal to what we have seen in previous years. Those from Mr. Bailey were far from the standard, on account of continued wet weather. It is a great pity that so fine a grape is not more reliable.

Catawba.—Mr. Knox exhibited specimens of a depth of color and beauty of bloom hardly to be excelled in the celebrated Lake Shore Region.

North Carolina.—A showy grape, somewhat after the style of Hartford Prolific, but with larger and better berries, and nearly as early as that variety. A good market sort.

Muscogee.—Exhibited by Mr. Richards, of Fordham, N. Y. A small fruit, of the Herbmont class. It much resembles that variety in quality, but ripens earlier. We have never seen the fruit except from the gentleman above named.

Weehawken.—A seedling by Doct. Siedhof from a Crimean grape. The specimens were

shown under great disadvantage, as, from a misunderstanding as to the time of the exhibition, they had been packed a week. It is a white grape, with all the characters of the European varieties, very productive, and with Doct. S., healthy in a locality where mildew is abundant.

Unnamed Seedlings.—Olm Brothers, Springfield, Mass., sent two; one a grape much like the Elsinburgh, and the other resembling the Catawba. The last named has all the appearance of a good Catawba, and is quite as good, with a rather loose bunch, but it ripens perfectly before that variety is colored.

Mr. Arnold, of Paris, Canada, sent two of his seedlings, obtained, as we understand, by hybridizing the Clinton with exotic sorts. No. 5 is a white, or rather green grape, inclining to amber; a long bunch without shoulders; small sized berry, sprightly in flavor, and of good character. No. 2 is a compact bunch, usually with a large shoulder; berry of medium size, black, with a fine bloom; flesh tender, very juicy, and rather acid, but vinous. Mr. A. states that the specimens are not in their best condition, as the vines were nearly defoliated by a hail storm before the fruit ripened. He has certainly reason to be pleased with his success in raising seedlings, and we look with interest to the reports of their trial in localities further south.

The Profits of a Small Place.

A correspondent, M. S., in a New England town, is so much pleased with the results of his attempts at gardening that he desires to give his experience for the encouragement of others. We give his letter as a specimen of many we receive of similar purport. It is not practicable for us to publish many accounts of this kind, but we are, as our readers know, as much interested in the success of small gardens as in that of large ones.

"About ten years ago I purchased a house and a small parcel of ground about fifty rods from the principal business street in N—; said ground located on the east side of a steep hill, dimensions 225 ft. x 30 ft., surrounded on the north and west by a bluff of rocks, 30 or 40 feet high. This land was considered worthless by former owners. I found on it two old apple trees, which bore only a few gnarly apples; these I had thoroughly scraped, washed with soft soap, tops cut off, and grafted with Baldwin apples.

I had the ground dug over to the depth of a foot and a half or two feet, the stones taken out (small ones buried, larger put into wall,) and the land thoroughly supplied with manure. About half of the ground was terraced and set out with fruit trees, the rest devoted to vegetables.

As a result we have annually of vegetables,—early peas, potatoes, green corn, cucumbers, beets, tomatoes, pole beans,—from one to three bushels each; of asparagus, pie plant, onions, carrots, parsnips, summer squashes; winter squashes, rock turnips, cabbage, a supply for family use; of fruits we have, (on an average), two bushels of strawberries and currants; from two to five bushels of grapes; one bushel of quinces; from four to six barrels of apples; and pears from twenty-five trees, half of them bearing, the oldest yielding about half a bushel. These embrace sixteen varieties, so arranged as to ripen monthly from August to March. We also have a limited supply of cherries and peaches.

A word in conclusion with regard to *expense* and *profits*, the former of which, in any undertaking of this kind, is a *bugbear* to so many, be-

ing, as they say, so much greater than the profits. I would prove the contrary from my own experience. 1st. The profits from a small pear nursery, 20 x 30, pay the expense of fertilizing and preparing the ground for planting. 2nd. The benefit in point of health gained by garden labor more than repays all necessary toil; to say nothing also of the pleasure which one feels in watching for the anticipated results of all his care and labor. 3rd. The expense of supplying the tables from one's own garden is much less than the cost of purchasing from the market, which would average a dollar a day during the greater part of the season."

Earth Worms in Flower Pots.

Sometimes horticultural troubles seem to be epidemic, and we have a succession of letters all of the same purport, as is now the case with reference to the common Earth or Angle-worm in flower pots. There is a difference of opinion in regard to the food of worms, some claiming that they actually eat the roots of plants, while others hold that they live upon the decaying matter contained in the soil. Whichever may be the case, there is no doubt that they do much injury to potted plants; in passing through the soil in all directions they not only perforate it with small channels, but they so compact it that is difficult to water a plant thoroughly, as the water will run off by the worm holes before the mass becomes wetted through. Worms should be kept from entering the pots, and those already in them should be removed. Those who, in taking up plants, use common garden soil for potting, are quite apt to introduce the trouble themselves. Potting soil should be prepared beforehand and frequently worked over, during which operation the worms may be seen and picked out. Worms frequently enter pots that are set outdoors for the summer, or are plunged in the borders. We have frequently cautioned against this in our "Notes for the Month." The pots should be set upon a layer of coal ashes, and when they are plunged, a quantity of ashes should be placed in the bottom of the hole made for the reception of the pot.

When a pot is infested by them, it is not very difficult to remove them. We have found that if the earth is allowed to get as dry as may be without injury to the plant, the worms will usually collect together, probably attracted by the moisture of one another, at the bottom or sides of the pot. By turning the ball of earth out of the pot they may be removed. This turning out the earth from a pot seems to those who have never practised it, a difficult operation as well as one dangerous to the plant. It is very easily done, and will not disturb the growth of any but very recently potted plants, in which case the roots have not sufficiently permeated the earth to hold it together in a ball. Spread the fingers of the left hand over the surface of the earth, invert the pot, and hold it in the right hand; then give the edge of the pot a slight downward rap upon the edge of a table, shelf, or the like, and out will come the ball, which must be carefully received in the left hand. A few pickings in this way will soon free the pots of worms. Where the trouble occurs with plants in boxes or in tubs, some other means must be resorted to. An infusion of soot is very disagreeable to them, and will drive them to the surface; this, to many plants, will act as a manure. Lime water will kill the worms; it is made by slaking a lump of lime of the size of

one's fist, and stirring it in a pailful of water. When the liquid has become perfectly clear, it may be used in moderate quantity upon the earth containing robust shrubs. We have no experience in its use upon tender plants, and that must be a matter of experiment.

The Lizard's-tail.

One of the most pleasing of our aquatic plants is the Lizard's-tail, (*Saururus cernuus*.) It is very common in wet places, from New York westward and southward, where it forms large masses of pale-green foliage against which are

LIZARD'S-TAIL—(*Saururus cernuus*.)

contrasted the graceful spikes of white flowers, which are interesting from the simplicity of their structure; they have neither calyx or corolla, but are made up entirely of stamens and pistils, sheltered by a little bract or scale. These flowers are very much crowded upon the stem, and together make quite a show. They have a very pleasing fragrance, and as they open gradually, the period of flowering lasts for a long while. The engraving is from a small specimen, but it shows the shape of the leaves and the drooping character of the flower spike, the peculiar form of which, somewhat resembling a Lizard's tail has given it its common name as well as its botanical one—*Saururus*. Those who have a pond or stream of water on their grounds, should introduce this plant to ornament the margins.

Judging of Fruits at Fairs.

There are two sorts of fruit committees—those who do their work faithfully and conscientiously, and those who merely look at the fruit and make their award at once. We place very little reliance upon fruit premiums at fairs, unless we know who awarded them. A very good instance of thoroughness in a committee, though not exactly on fruits, came under our

notice at the autumnal Exhibition of the Pennsylvania State Horticultural Society. The committee on vegetables had some fifteen varieties of potatoes to decide upon; instead of going by the eye alone, samples of each were boiled and thoroughly tested, each member of the committee making his marks as to flavor, texture, etc. It would be an excellent thing if an uniform system of marking or "points" could be established for fruit judges. It often happens that the largest fruit is by no means the best—and an award made upon size alone would be unfair, as others might excel it in form, color, and flavor. What we need is a comparison which shall take all the characters into account.

English pomologists are very much exercised just now upon the subject of grape judging, and column after column appears in their different journals, until one is tired of so much talk upon a simple question, which, after all, is only this: Shall grapes be tasted by judges, or shall the flavor be inferred from the color? One would think that some national issue was at stake, so earnestly are both sides advocated. One writer suggests something like what we would have adopted for all fruits. For grapes he proposes the following marks as standard of perfection: Color and bloom, 5; flavor, 5; size of bunch, 2; form of bunch, 1; size of berry, 2; total, 15. According to this scale a grape perfect in every respect, would be marked 15. As perfection is seldom attained in every particular, each quality is marked by itself and the whole added up. Thus a sample of grapes is submitted to a committee. One member marks in this way: Color and bloom, 4; flavor, 2½; size of bunch, 1; shape of bunch, ½; size of berry, 2; total, 10. If every member of the committee makes the same total, very well; if not, the various totals are added together and

divided by the number composing the committee. We hope to see something of this kind adopted for all fruits. When awards are made for the "best exhibited," we get very little idea of what was the character of the fruit that took the prize.

Peat Moss and its Uses.

Almost every one is familiar with the peat bog, usually a cold, low, wet place, covered with moss of a very pale green color, and of a peculiar, spongy, nature, and furnishing, besides the moss, a number of shrubs and other plants that are rarely met with in other localities. The Peat Mosses proper belong to the genus *Sphagnum*, of which we have in the United States about 20 species, some of them very local in their range, while others extend from New England to the Gulf States, and some of our most abundant ones are found also in Europe. The figure shows one of the commonest species, and gives an idea of the general appearance of them all—the distinctions between the species being founded on characters that would be noticed only by the botanical student. The long, weak stem is furnished with clusters of short branches, which at the top of the stem are crowded into a sort of head.

The branches are covered with leaves, which are so very small that in our engraving they appear like minute scales upon the branches. Under a strong magnifier the leaves are interesting objects, most of the cells of which they are composed containing a spiral filament, which gives them a very pretty marking. The spores, or reproductive dust, are contained in small globular capsules, about the size of a pin's head, which at the time of their maturity open by a lid and liberate the spores. A short distance below the surface of the bog we find the moss in a decaying state, gradually being converted into peat. Sufficient has recently been said on the subject of peat, the production of which is the most important use of the moss, but it renders no mean service to the horticulturist, and we mention it on this account. Moss is one of those minor aids to the horticulturist of which he seldom knows the value until deprived of it. From its spongy character it absorbs water readily, and parts with it slowly. This, together with the fact that it is one of the few vegetable substances that can be kept moist for a long time without fermenting or decaying, renders it the most valuable packing material we possess. Indeed for surrounding the roots of living plants during their transportation, there is nothing that can replace it. Its softness and elasticity make it an agreeable material to work with. In Europe, the moss rubbed to a coarse powder is used to pack those seeds which it is desirable to prevent from becoming too dry. Some bog plants, such as *Sarracenus*, and some Orchids, are most successfully grown in pots filled with *Spagnum*, and it is often used over the "corks" that are placed in the bottom of a flower pot for drainage. Hyacinths and such bulbs as are grown in water, succeed admirably in pots or baskets filled with it. Nurserymen and florists who live near the bogs usually collect the moss themselves, but large quantities of it are sent from New Jersey to those portions of the West where it does not grow.

We have no statistics upon the subject, but suspect that in the aggregate the trade in this plant must amount to a considerable sum. When first gathered the moss is quite heavy, on account of the water it holds, and if it is to be transported to any great distance, it should be spread thinly and dried.

SPHAGNUM.

THE MINER PLUM.—Several have sent us specimens of this fruit. It seems to be a seedling of our common native plum, of rather larger size than the wild fruit. It has a very thick skin which is said to be curculio proof, though its immunity from curculio is more probably due to its late blooming. It is of fair flavor, and is a showy fruit, which would, no doubt, sell well in the market. We are glad to welcome this improvement in one of our native fruits.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

What to Do with a Person apparently Drowned.

Many lives are annually lost by drowning, which might be saved did those present at the recovery of the body know just what to do. These casualties usually occur in places where medical aid is long in reaching the patient, and he suffers often from neglect, but perhaps more frequently from the rude, though well-meant, endeavors of the spectators to restore life. The Royal National Life-boat Association, of England, has published a series of brief directions for the treatment of those apparently drowned. These are compiled by some of the most eminent medical men in England, and are distributed throughout the navy and at all the army stations of that country. Now that the skating season, a time at which accidents are very frequent, is at hand, we think we shall do a timely service

with the face downwards, and one of the arms under the forehead, in which position all fluids will more readily escape by the mouth, and the tongue itself will fall forward, leaving the entrance into the windpipe free. Assist this operation by wiping and cleansing the mouth. If satisfactory breathing commences, use the treatment described below to promote warmth. If there be only slight breathing—or no breathing—or if the breathing fail, then—

To Excite Breathing

—Turn the patient well and instantly on the side, supporting the head, and excite the nostrils with snuff, hartshorn, and

Fig. 3.—SILVESTER'S METHOD OF INDUCING INSPIRATION.

smelling salts, or tickle the throat with a feather, etc., if these are at hand. Rub the chest and face warm, or dash cold water, or cold and hot water alternately, on them. If there be no success, lose not a moment, but instantly—

To Imitate Breathing

—Replace the patient on the face, raising and supporting the chest well on a folded coat or other article of dress. Turn the body very gently on the side and a little beyond, and then briskly on the face, back again, repeating these measures cautiously, efficiently, and perseveringly, about

with the efforts being made to restore breathing.

III.—Should these efforts not prove successful in from two to five minutes, proceed to imitate breathing by Dr. Silvester's method, as follows:—

Place the patient on the back on a flat surface, inclined a little upwards from the feet; support the head and shoulders on a small, firm cushion, or folded coat placed under the shoulder-blades.

Draw forward the patient's tongue, and keep it projecting beyond the lips; an elastic band over the tongue and under the chin will answer this purpose, or a piece of string or tape may be tied around them, or by raising the lower jaw, the teeth may be made to retain the tongue in that position. Remove all tight clothing about the neck and chest.

To Imitate the Movements of Breathing.—Standing at the patient's head, grasp the arms just above the elbows, and draw the arms gently and steadily upwards above the head, and keep them stretched upwards for two seconds. (By this means air is drawn into the lungs.) Then turn down the patient's arms, and press them gently and firmly for two seconds against the sides of the chest. (By this means air is pressed out of the lungs.) Repeat these measures

Fig. 1.—MANNER OF INDUCING INSPIRATION.

in reproducing the essential portions of these directions with the accompanying illustrations. In accidents of this kind, as well as in others, it is important to keep spectators from crowding about the patient and thus preventing free access of air.

I.—Send immediately for medical assistance, blankets, and dry clothing, but proceed to treat the patient *instantly* on the spot, in the open air, with the face downward, whether on shore or afloat; exposing the face, neck, and chest to the wind, except in severe weather; remove all tight clothing from the neck and chest, especially the braces.

The points to be aimed at are—first and *immediately*, the RESTORATION OF BREATHING; and secondly, the PROMOTION OF WARMTH AND CIRCULATION.

The efforts to restore breathing must be commenced immediately and energetically, and persevered in for one or two hours, or until a medical man has pronounced that life is extinct. Efforts to promote Warmth and Circulation, beyond removing the wet clothes and drying the skin, must not be made until the first appearance of natural breathing; for if circulation be induced before breathing has recommenced, the restoration to life will be endangered.

the side and a little beyond, and then briskly on the face, back again, repeating these measures cautiously, efficiently, and perseveringly, about fifteen times in the minute, or once every four or five seconds, occasionally varying the side. By placing the patient on the chest, the weight of the body forces the air out; when turned on the side, this pressure is removed, and air enters the chest. On each occasion that the body is replaced on the face, make uniform but efficient pressure with brisk movement, on the back, between and below the shoulder-blades or bones on each side, removing the pressure immediately before turning the body on the side. During the whole of the operations let one person attend solely to the movements of the head and of the arm placed under it. The first measure increases the expiration—the second commences inspiration. The result is Respiration or Natural Breathing; and if not too late, Life.

Fig. 4.—SILVESTER'S METHOD OF INDUCING EXPIRATION.

alternately, deliberately, and perseveringly, about fifteen times in a minute, until a spontaneous effort to respire is perceived; then immediately cease, and proceed to INDUCE CIRCULATION AND WARMTH.

IV.—TREATMENT AFTER NATURAL BREATHING HAS BEEN RESTORED.—To Promote Warmth and Circulation.—Commence rubbing the limbs upwards, with firm, grasping pressure, and energy, using handkerchiefs, flannels, etc. The friction must be continued under the blanket or over the dry clothing.

Promote the warmth of the body by hot flannels, bottles, or bladders of hot water, heated bricks, etc., at the pit of the stomach, the armpits, between the thighs, and at the soles of the feet. If the patient has been carried to a house after respiration has been restored, be careful to let the air play freely about the room. On the restoration of life, a teaspoonful of warm water should be given; and then, if the power of swallowing has returned, small quantities of wine, warm brandy and water, or coffee, should be administered. The patient should be kept in bed, and a disposition to sleep encouraged.

GENERAL OBSERVATIONS.—The above treatment

Fig. 2.—MANNER OF INDUCING EXPIRATION.

II.—TO RESTORE BREATHING.—To Clear the Throat.—Place the patient on the floor or ground

operations are being proceeded with, dry the hands and feet, and as soon as dry clothing or blankets

should be persevered in for some hours, as it is an erroneous opinion that persons are irrevocable because life does not soon appear, persons having been restored after persevering for many hours.

CAUTIONS.—Avoid rough usage, and do not allow the body to remain on the back unless the tongue is secured. Under no circumstances hold the body up by the feet. On no account place it in a warm bath unless under medical direction, and even then it should only be employed as a momentary excitant.

Extracts from Miss Collins' Prize Essay.

We housekeepers know that this is really the busiest season of the year, but the work is so agreeable and is interspersed with so much that is delightfully mysterious, we never think of its being work at all, and only regret we have not each two pairs of hands, that we might accomplish more. Christmas is so near, and then—well—Charlie is coming home from Chicago, and Willie from New York. They will come so late, we must have the tree all trimmed, the presents hung, and the candles ready to be lighted before they arrive. What a pity we cannot have

Fig. 1. TREE LIGHTED WITH GAS.

gas out here in the country, and so have a Christmas tree drop-light, like the one cousin Tom has in Liverpool! The most vivid imagination could scarcely convert our little candles and lamps (I beg their pardon for mentioning it. May their shadows never be less,) into the fifty bright jets which illuminated their tree; or transform Jennie's doll, which will hover with outstretched arms over our tree, suspended from the ceiling by a string around her waist—a contrivance of Ralph's—into the silver Christ-child nestling in the upper branches, "all

radiant with light as with a flood of glory," as Tom described it in his letter to Ralph. Father says if the Petroleum Oil Gas Co. gets to work, and does as well as he thinks it will, we shall have our house lighted with the gas before another Christmas. I don't suppose father would get us a drop with fifty lights, but one with six or eight, as in figures 1 and 2, would be very nice among our candles and lamps. Yes, eight, opened to the best advantage, as shown in figure 1, would quite set off a tree.

Fig. 3.—DROP OPENED.

Our new stove came to-day. It is an Empire Gas Burner, just like the one we have in the sitting-room, only this has a door in front. Ralph always makes such an ado about putting in the coal, because he has to lift off the urn from the top of the stove, and get some one to hold up the inside lid, while he empties the scuttle. This lid is opened by means of a damper just outside, which is always hot. I have burned my fingers many a time, and my handkerchiefs too, and scorched my dress into the bargain, holding the damper for Ralph. It would stay open itself when we first bought the stove a year or two

Fig. 4.

Fig. 5.

ago, but will not now. I will ravel Jennie's old black worsted hood, and knit some holders diamond-shaped or octagonal in form, (figs. 4 and 5,) and embroider a wreath or cluster of flowers in the middle on canvas, (fig. 6); then pull out the canvas threads, crochet a bright border and line them with old silk. No; it will be better to let Jennie make them, and then

Fig. 6.

put them on the tree for mother. She was just telling me she had finished stitching the strawberry seeds into the emeries, and wanted another job. She made most of the emeries. I cut out the strong cotton bags, and let her sew them up over a similarly shaped woolen sack filled with emery. She made the red silk sacks, and fastened them on, ready for the green leaves and the cord. She stitched in the seeds with yellow saddler's silk. I think they are very pretty, and she is delighted with them. (See figures 7, 8, 9, and 10.)

Fig. 8.

Mother has been making a jar of mince meat to-day for the winter. Father said he would remain at home this morning and chop mince meat, if Ralph preferred to go for the drain tiles, and so they are progressing famously. Sister Kate, who is somewhat of an invalid, stoned the raisins, and chopped half of them, and washed the currants. Mother cooked the meat yesterday. She is very particular to have it put into boiling water, and to keep it boiling briskly all the time, in order to preserve all the juices in the meat. Mother thinks the jar will last all winter. We

Fig. 9.

chop the apples, a few at a time, as we want to make the pies, and mix well together with cold water or clean snow. Ralph says he believes every one in the house had a hand in the mince meat except Jennie and grand-father; but Katie says grand-father did most of her chopping for her, and she is sure Jennie had a hand in the raisins pretty often. Mother uses considerable snow and ice water in cooking, always wetting the pie-crust with one or the other.

Leaves from the Diary of a Young Housekeeper.—No. XII.

PRIZE ESSAY BY MRS. LAURA E. LYMAN, STAMFORD, CT.

December 10th.—We have had a busy week of it, but our butchering is done, the pork salted down, some of it packed in snow to be eaten fresh, the lard put down, and sausage meat prepared. We do not either of us believe much in the use of pork, but where the animals are young, and killed soon after they attain their growth, we think they are less injurious than when they are allowed to live a year in a low condition, and then suddenly fattened for slaughter. Edward has been very careful of their food, that it be wholesome and well cooked, and has not permitted them to root in the ground, believing that the disease which has injured the pork market so seriously is aggravated by their eating earth-worms, of which they are very fond. In rendering the lard, which was a matter that I considered strictly in my department, I was very careful to keep the fire at all times moderate, so as to entirely prevent that scorching which so much damages the flavor of this important ingredient in cookery, and the most scrupulous cleanliness was observed in every part of the process. When the lard was partly cool, I dipped it into large earthen jars or crocks, holding about four gallons, and set it away in the pantry, carefully covered. It is as white as snow and cuts like butter. Edward chopped my sausage meat and I put it into little bags made of old clean domestic, which I rolled until they were round, and then dipped them in hot lard and set them into a firkin. These bags or rolls are five inches in diameter, and ten or twelve in length. I added some flour to the meat when I spiced and salted it, so that I can cut these rolls into slices and fry them without their breaking into

pieces. Mother tried putting sausage meat into skins and making it into cakes, but at last settled down upon this mode as at once the least troublesome and the most satisfactory of all. If during the January thaw they should become mouldy and threaten to spoil, I have but to put them into a baking-pan and scald them thoroughly. I spiced them with sage, summer savory, a little thyme and black pepper. As a breakfast dish they are very convenient, and quickly prepared for the table.

The pigs' heads and feet I made into head-cheese. After scalding and scraping them carefully, I put them all into a large pot, salted them, and let them boil until they fell all to pieces. When partly cool I picked the whole mass over carefully, excluding the bones and everything unpalatable, and then added pepper, sage, summer savory and vinegar, until it was quite sour, and put it away to cool. Cut in slices it makes a very good dish for supper or luncheon, and is a pleasant change from dried beef and cold tongue. The longer I keep house the more I am impressed with the desirableness of abridging, as far as possible, the daily task of preparing meals. This I am doing by baking in large quantities, now it is cold weather, enough bread at a time to last a week, and pies and cakes for two or three. I try to have something always ready for breakfast, so that meal can be prepared in the shortest time possible, and while Sue is getting it ready I make any preparations that may be necessary for dinner, a tapioca pudding, perhaps, so that Sue can do all the rest and leave me undisturbed to work on my machine. This I find is a great saving of time, and by being beforehand with my cooking, I do not find it burdensome, and my meals are always ready in season. The best way of keeping bread is to put it when cool from baking into a tin box or trunk with a tight cover, and set it in the cellar or in a cool closet. The bread box should be frequently scalded and kept perfectly sweet. Bread in this way may be made to last a week without injury to its flavor. When it becomes a little stale I toast it, and with butter melted in warm milk and poured over it, it is very palatable, and a quick breakfast dish.

December 15th.—My husband returned from town the other day, where he had been with a load of produce, and brought home among other things a dozen yards of heavy gray flannel to be made up into underclothing. He is a great believer in flannel, particularly for farm laborers, to be worn next the skin at all seasons of the year. When he was in the army, (for he served a year under Banks in the Southwest,) he wore it constantly, and attributes his unbroken health in a great degree to that precaution. Since his return he has kept up the excellent practice, and has persuaded me to adopt it also, and I have never suffered so little from colds as so far during this season. During these long winter evenings Edward has been reading aloud, and among other valuable practical suggestions we have both been very much impressed by an article on "The Health of Farmers and Farmers' Wives," printed in the Patent Office Reports for 1863. How much good Congress could do if it would take this excellent article and print it in a pamphlet form for general distribution! It would do so much more good than the electioneering documents which are so profusely scattered at the national expense. It seems to me that any well-informed person after reading this piece would adopt flannel as the material to be worn next the skin for the rest of his life. The remarks of the author, too, about the discomfort and the danger to health that attend the usual manner of washing, particularly in winter, made such an impression upon Edward's mind that he determined immediately to investigate the claims of the different washing machines. When we were at the fair we saw a number and observed their operation. It seemed to us that the principle upon which Doty's washer proceeds is the best; his patent does not attempt what nearly all the others do, to rub the clothes between fluted surfaces of wood, which must wear them more or less. I told Edward I liked the Doty washer, and he purchased one. We are delighted with it, and wonder how we ever got along without it.

BOYS & GIRLS' COLUMNS.

A Curious Box.

A few days since we were much interested and not a little puzzled in examining a box procured at one of the toy stores. It was so constructed that a drawer, occupying the whole of the inside, could be pushed out from either of the four sides. How one drawer could thus cross another was the mystery. Upon taking it apart,

however, it was found, like most puzzles, to be very simple when you once know how it is done. We here give engravings representing the various parts. The arrows show the direction in which one piece is to be introduced to the other parts. Thus a square box, (5,) is to be placed in a box open at each end, (4). The skeleton box, (3), is to be placed in 2, then 5 and 4 can be slid into the opening, and the box is complete. The parts need to be made to exactly fit, and will exercise your care with tools as well as your ingenuity in making it.

Christmas Presents.

We trust the custom of making presents on Christmas day will never cease. Our young friends are all of the same mind, without doubt. Many of them are already imagining the good things they will receive, and planning pleasant surprises for their friends. The shop-keepers are laying in their stock of toys, books, games, etc., with which to supply the demand for presents, and Santa Claus is making up his famous pack for the great occasion. What to give is often a perplexing question. A gift will be all the more valued, if it is appropriate. We should hardly think of selecting a Bible as a present to a minister, though it is often thoughtlessly done. It is to be supposed that one of his profession is already supplied with that book. Better add a new Encyclopedia, or some recent historical works to his library; or better still make up a purse and let him select the articles he most needs. A periodical like the *Agriculturist*, or some favorite magazine for a year, is almost always a pleasing gift. It will remind the recipient of your affection each time it comes to hand. In general, select useful articles for presents. Even children are better pleased with such things, especially if they are also ornamental, than with toys which will soon be broken or cast aside as tiresome. Perhaps a clothes wringer or washing machine would please mother much better than a gold ring, while father would prize a new umbrella or some other serviceable article. Consult both the wants and the tastes of your friend, in selecting a gift. Especially should the poor be remembered during the holiday season. In no way can we better commemorate the event which brought Heaven's great gift to men. See that the heart of every poor widow and orphan is made glad by abundant bounty. Their smiles and gratitude will give greater satisfaction than the reception of costly presents, and a blessing is promised to those who remember the friendless. May a Merry Christ-

mas gladden the hearts and brighten the lives of all our large *Agriculturist* family from Maine to California.

An Ignorant Engineer.

What would be thought of an engineer who was ignorant of the number of wheels and springs in his engine, which he had run for fifteen years or more, and of the uses of many of them? You would expect that the apparatus would soon be out of order, and that a fearful explosion or other calamity would occur, bringing the whole machinery into ruin. Well, then, my young friend of fifteen years old, there is no more wonderful piece of machinery than the one you are to have the care of as long as you live—your own body. How many pieces in the frame-work? How many springs? What goes on inside of the works? How are they to be kept in good running order? What will injure the stomach? What will hurt the brain? What will increase the power of the muscles, and how may the nerves be kept steady? For want of such knowledge hundreds of calamities are daily taking place. There is a man who says he is dyspeptic. He is thin, sallow, and miserable; every thing he eats disagrees with him. His machinery runs badly—it must be mended, or it will soon cease running. When a boy he used to stuff himself with good things, not only at meal times, but whenever he could find any thing that tasted good. He overworked his machinery. There goes a man limping with rheumatism. His springs are rusty. He did not know how to use them properly. Another is red, bloated, nervous, unsteady in his walk, dim of sight, and ready to break down all over. He has spoiled his machinery with alcohol. It would be as wise to pour oil of vitriol among the wheels of a watch, to brighten them, as to try to sharpen up the faculties of man by stimulants. Whatever book you read or neglect, (always excepting the Bible), do not fail to buy or borrow one on Physiology. Learn the parts of your body, their uses, how to take care of them, and put your knowledge into practice. Don't be an ignorant engineer, when your engine is so precious.

A Ride by Wind-Power.

At the Fair of the American Institute just closed in this city, a new apparatus was exhibited, for conveying passengers and freight, called the Pneumatic Railway. A large tube, seven feet in diameter, was laid across the room from one gallery to another, a distance of about one hundred feet. Tracks were laid on the bottom of this tube, and a car placed on these, large enough to hold twelve persons. We joined a company of passengers, and presently found ourselves passing through the tube at considerable speed, and then back again to the entrance. There was no smoke, nor steam, nor machinery in connection with the car. The power which moved the vehicle, however, was produced by a steam engine in another part of the building. By means of shafts and

belts, connected with the engine, a large wheel, in front of one end of the tube, was made to turn rapidly. This wheel was made something on the plan of a boy's wind-mill. The blades were set diagonally, so that, when turned in one direction, it drew the air out of the tube. When this was done, the air in front of the car being partly exhausted, the air behind it pressed against the car, and so forced it along. The principle was the same as that by which any thing is pumped or sucked through a tube. When the motion of the wheel was reversed, the air forced into the tube against the car, caused it to move in a contrary direction, and so the vehicle was driven back and forth. The inventors claim that this plan will work through very long tubes, and that in this way passengers may be rapidly and cheaply carried from place to place. If the invention succeeds, some of you may live to be blown through from New York to Washington.

New Puzzles to be Answered.

No. 290. Illustrated Rebus.—A very cheering truth.

Send New Puzzles.

We are always pleased to receive new puzzles, and to publish them if they are of sufficient merit. Where engravings are necessary, make a drawing if you can, but that is not indispensable, if the description is clear. Do not be discouraged if your contributions do not appear. The mental exercise required to originate a good problem will of itself be worth making a trial. We do not want puzzles you have seen published elsewhere, or which are

old in your neighborhood. Hundreds of such have been rejected. Always send the answers with the puzzles. The kind of puzzles is left to your own fancy. A good mathematician can amuse and instruct our readers with interesting problems. Practical ones are preferred. Whatever will call out thought, and also amuse, will find a welcome place.

Answers to Problems and Puzzles.

The following are answers to the puzzles, etc., in the November number, page 415. No. 285. Puzzle Picture.—A fox is watching for the hare. His outline may be traced by following the lower branches on the right hand side of the picture.... No. 286. Mathematical Problem.—1st, 62.01 ft.; 2d, 16.71 ft.; 3d, 64.25 ft.; 4th, 15°4' very nearly.... No. 287. Illustrated Rebus.—Bear this in mind; withstand misfortune and misfortune will stay not with you.... No. 288. Puzzle Picture.—Because every pound should contain at least twelve ounces.

No. 289. Labyrinth.—Find your way from the entrance to the fortune in the center, without crossing a line.

Our Railroad.

Such a journey! Frank was chief engineer, after the train was built. George superintended that, and Susie, who is now tired out by her labors and her ride, helped, by bringing the pot-lid and the sieve, when we were all wondering where to get wheels for our locomotive. "We'll call it the Grand Trunk Rail-Road," said Robert, who remembers what he reads, and has been studying about the Pacific Rail-Road. At last we had it all fixed. There were two first class carriages, made of chairs from the parlor; a second class, which the great arm-chair furnished; a roll of Tribunes answered for a stove-pipe—"it's a first-rate 'blower,'" said George. Then we set Dolly where she could see us start, and, waving her good-bye, off we went full steam for California. Now you who have traveled thousands of miles on real rail-roads will smile at our make-believe, but I don't think you ever had half the fun that we did on our journey. We could have just such weather and just such scenery as we pleased. Sometimes we made the snow block up the track, and then had a grand time shoveling out, snowballing, shaking off the snow from our clothes, and going ahead all right again. Then we ran down a herd of buffaloes, but did not get off the track; and occasionally we passed through a long tunnel, by drawing the curtains over the windows and making it very dark. If you want the pleasure without the pains of traveling, just try our plan once, and if you know how to make it work, you will agree that there is no road like it in the world. FANNIE.

Garibaldi.

Few names in modern history rank above this illustrious hero of Italy. Without titled rank or money, by the power of his own character, he shakes the thrones of Europe. He was born in Nice, Italy, July 4th, 1807, and was educated as a sailor by his father, who followed that calling. He was remarkable for his affection for his parents, his sincerity to his companions, and his generosity and bravery to those needing help. When twenty-eight years old, a visit to Rome so impressed him with hatred of tyranny, that he joined those who sought to revolutionize the government, and was, in consequence, ere long exiled from his native land. After various wanderings he went to South America, where he was soon engaged in aiding the Republic of Uruguay in achieving her independence of Brazil. In this war he was severely wounded and made prisoner, but escaped, and continued to render great service to those whose cause he had espoused. While there he married a South American woman of great energy, who became his companion in all his dangers by sea and land. In a subsequent war with Buenos Ayres, by his skill and bravery he saved Montevideo from capture. In 1843 Garibaldi returned to Europe, and was soon in command among the republicans in Italy, who had expelled the Pope and were striving to establish a new government. With the greatest heroism he fought the French and Austrians who joined to restore the ancient dynasty, until he was overpowered by numbers, and compelled to flee in disguise. During these disasters his wife died, and he was left almost heartbroken. Banished again from Italy, he came to New York, and supported himself by making candles in a factory on Staten Island. Next he resumed his former

occupation as sailor, made several voyages in the Pacific, and finally returned in command of a Peruvian bark. Then being invited to return to his native city, Nice, he lived there in retirement until the breaking out of the war with Austria, in which he engaged with his usual resolution and spirit, and contributed largely to the success of the Italian arms, and the establishment of Victor Emmanuel upon the throne. Now we find him moving again for the deliverance of the Roman States from the government of the Pope, and the eyes of the world are upon him. Whatever may be his success in this enter-

little birds who wove from them warm linings for their nests. Tot said no more, but appeared very thoughtful. I had business to transact in a neighboring town, and it was quite dark before we returned. It was a beautiful night, and the heavens shone with stars. "I say," exclaimed Totty, pointing his chubby hand upward as he uttered his favorite phrase, "I say, Uncle James, I know what stars is." "You are a wise infant, Tot," I replied. "Perhaps you will condescend to enlighten your uncle on the subject?" "I know what stars is," repeated Tot, disdaining to notice what I said. "Cause you see the

great big sun he goes clean across the sky and some of him sticks to the rough places like the sheep's hairs sticks to the tree, and" concluded Totty triumphantly, "them's stars, them's." Tot has signed the pledge. He can just write enough to write his name, but he insisted on signing with the rest of the family, and sign he did. One of the farm hands, (for Tot now lives in the country), who had signed it, went on a journey into the lowlands along the lake shore where the farm is situated. While returning he became very thirsty and called for a glass of water at a house by the wayside. He was told that the water in the well had been spoiled by a large piece of meat which had accidentally fallen into it but that he was welcome to a glass of cider. Being very thirsty indeed, he so far forgot himself as to drink it. When he returned home he related the circumstance. When he had finished, Tot, with his eyes filled with tears came up to his knee and said: "I say, Phil, how far was you from the lake?" "A full ten mile," said Philip, looking a little conscience-stricken. "Well, Phil," said the child, with a tremor in his voice, "I'd have walked there and back again 'fore I'd a broken the pledge."

A Bully Rebuked.

The Springfield Republican relates the following as having occurred in a railroad car in Massachusetts. As the train was about starting, a well dressed, gentlemanly appearing, but very black man came in and took a vacant seat beside a white man. The latter at once sprang up and, with an oath, exclaimed, "Do you suppose I am going to sit by a nigger?" Then pushing rudely past he sought another place in the seat with a young student who was just returning home from his university. He had no sooner taken his new place than the young man

sprang up, saying, "Do you suppose I will sit with you?" and went and sat down by the colored man. "Would you rather sit by a nigger than a white man?" shouted the enraged individual whose company he had left. "I prefer to sit with a gentleman," replied the student. "Do you say I'm not a gentleman?" quickly asked the other. "Gentlemen do not use profane language, neither do they insult people on account of their color," was the answer. "You shall be taken care of, you impudent young jackanapes," said the first speaker shaking his fist menacingly. "I will take care of him," quietly remarked the colored man, who until this time, had remained silent. The tone of voice was so full of meaning, and the powerful frame of the speaker so full of muscle, that the bully at once sneaked quietly into his seat, to digest as best he might his inglorious defeat and the unconcealed scorn of his fellow-travelers. It is to be hoped that he learned the lesson that to be a gentleman one must do something more than merely assume the name; actions speak much louder than words.

THE RAIL-ROAD RIDE. — Engraved for the American Agriculturist.

prise, his fame is secure, and his name will be remembered as one of the most unselfish and heroic of patriots.

Little "Tot."

A correspondent to the *American Agriculturist* writes: "I once knew a little fellow whose real name was 'Obadiah,' but who, having a decided objection to that name, insisted on being called 'Tot.' He had a wise little head full of queer thoughts, and used, when a very little fellow, to ask very odd questions. He was about five years old when I one day took him out to ride. We had a very pleasant drive over a quiet country road, and 'Tot' who was a city child, little accustomed to country life or scenes, sat drinking in the beauty of the landscape without a word until he broke out with an abrupt 'Hello!' 'Well, Totty,' said I. 'I say, do 'os sheep's hairs grow on trees?' He had noticed tufts of wool which had been left by some passing flock of sheep, on the thorns of a hedge opposite us. I explained the matter to him and told him what windfalls these bits of wool were to the

Herald of Health for 1868.

3 Numbers Free.

The objects of this Journal are:

TO PREVENT DISEASE

AND

TO RESTORE HEALTH.

It aims to effect this by teaching

HOW TO LIVE.

It presents the laws of Health, and the proper way to observe them, points out the manner in which they are most liable to be broken, suggests the means of recovering from the penalties of their violation; in short, gives attention to all topics affecting the

PHYSICAL CONDITION.

It numbers among its contributors some of the

Most Eminent Writers.

Among these are

HORACE GREELEY,
HENRY WARD BEECHER,
DIO LEWIS,
MOSES COIT TYLER,
DR. H. W. BELLOWES,
ALICE AND PHOEBE CARY,
MRS. GLEASON,
PROF. RUFUS K. BROWNE,

and many others.

Every number contains facts, hints, and suggestions that will, if properly followed,

Save Many Years Subscription

IN

DOCTORS' BILLS.

The press and individuals throughout the entire country have given the most cordial testimony in favor of the worth of the

HERALD OF HEALTH.

The New York Tribune says:

THE HERALD OF HEALTH well sustains the high standard which it has held forth since the commencement of the new series. In fulfilling its task as a "preacher of righteousness" in the department of Physical Culture, it enjoys the aid of numerous sound thinkers and able writers, whose contributions give popular interest and, in many cases, permanent value to its contents.

HON. GERRITT SMITH writes:

"I value this periodical very highly. Were it thickly scattered over the whole land, what a power it would prove! "Professor Tyler's 'Athletic Club' is worth more than the price of each number it appears in. By the way, he is one of the most brilliant and racy of all our writers.

A LIFE SAVED BY READING THE HERALD OF HEALTH.—"SPRINGFIELD, O., December 21, 1866. MILLER, WOOD & CO. —Gents: I would inform you that I have not received my HERALD for November, and as I have preserved them through all its changes for about eighteen years, I wish to have it.

"I was a poor dyspeptic, pronounced by my physician to be in the last stage of consumption—had night sweats, a violent cough, was given up as incurable, and I made my will, supposing I would die in a few weeks. I settled with my physicians and everybody else, and was expecting that a few days would close up my earthly career. At that time I got your publications, and without any other information I treated myself as well as I could from reading those works, and in less than six months my health was quite good, and in twelve months I had good health, and have had, with but slight exceptions, ever since. I am now in my 6th year, and I farm, and did husk corn day after day this fall with young men and made a full hand, and I found I could lead the most of them. I credit the above works with my good health, though I have quite a library of books on the system you advocate in your journal. I expect to read it while it advocates its present principles.

A. MOOREHOUSE."

Those who subscribe at once for 1868 will get OCTOBER, NOVEMBER, and DECEMBER NUMBERS FREE. Those who send a Club of Thirty Subscribers for 1868 and \$50 will get a Wheeler & Wilson Sewing Machine worth \$55 as a premium. \$2 a year; samples 20 cents.

**MOORE'S RURAL NEW-YORKER,
A WEEKLY JOURNAL,**

Established in 1850,—which is the Leading and Largest-Circulating RURAL, FAMILY, LITERARY and GENERAL NEWSPAPER on the Continent—most conclusive evidence that it is THE BEST PAPER OF ITS CLASS!

**THE RURAL IS ABLY EDITED,
PROFUSELY ILLUSTRATED,
NEATLY PRINTED.**

IT IS PRACTICAL,

IT IS SCIENTIFIC,

IT IS USEFUL.

MORAL IN TONE,

**PURE IN SENTIMENT,
HIGHLY ENTERTAINING.**

THE RURAL is unequalled in Value and Variety of Contents, and unique in Appearance. It embraces a greater variety of Agricultural, Horticultural, Scientific, Educational, Literary and News Matter, interspersed with many Engravings, than any other journal—rendering it by far the most complete combination of PRACTICAL, INSTRUCTIVE, ENTERTAINING and TIMELY Journalistic Reading in America. Its ample pages comprise Departments devoted to or including

Agriculture,	Choice Literature,
Horticulture,	Science and Art,
Sheep Husbandry,	Education,
Grazing, Dairying,	Youth's Reading,
Rural Architecture,	General News,
Domestic Economy,	Commerce, Markets,

With Illustrations, Tales, Essays, Music, Poetry, Rebus, Enigmas, &c., &c.

THE RURAL EMPLOYS THE BEST TALENT

IN ALL DEPARTMENTS,

Practical, Scientific and Literary.

Among its EDITORS, CONTRIBUTORS and CORRESPONDENTS are many of the most experienced and successful Farmers, Planters, Wool Growers, Horticulturists, Gardeners, Scholars, &c.,—including eminent Soil Cultivators, Breeders and Graziers, Scientists, Literateurs, LL. D.'s, D. D.'s, M. D.'s, Presidents and Professors of Colleges, and others of note and decided ability. For example, its SHEEP HUSBANDRY Department is Edited by the Hon. HENRY S. RANDALL, LL. D., (author of "The Practical Shepherd," "Sheep Husbandry in the South," &c., and Pres't. of the National Wool Growers' Association,) the best authority on the subject in this country.

Whether located in Town or Country
YOU WANT THE RURAL.

YOUR FAMILY WANT IT.

YOUR NEIGHBORS WANT IT.

For it is adapted to the wants of all, and has thousands of readers in Cities and Villages in addition to its immense circulation among the Rural Population of the whole Country,—East and West, North and South.

—♦—
THE RURAL NEW-YORKER

Is a National Journal, having enthusiastic friends and admirers in every State and Territory of the Union, and also in Canada, Europe, &c. And while "Excelsior" is its glorious Motto, and "Progress and Improvement" its laudable Objects, it will fully maintain its position as the most Popular and Meritorious Weekly in its Sphere of Journalism. In judging of its price, &c., remember that Moore's RURAL is not a monthly, but a Large and Beautiful Weekly.

FORM, STYLE, TERMS, &c.

THE RURAL comprises Eight Double Quarto Pages,—published in superior style, with Copper-faced Type, Good Paper, and many Appropriate and Costly Engravings, (it being the most profusely Illustrated Weekly in its sphere of Journalism.) A Title Page, Index, &c., given at close of each Volume, complete for binding.

TERMS—Only \$3 a Year; Five Copies for \$14; Seven for \$19; Ten for \$25, &c. A new Quarter commences Oct. 5, and Volume XIX in January. **Now is the Time to Subscribe and form Clubs.** The most liberal inducements to Local Agents, Clubs, &c., but no traveling agents are employed. Specimens, Show-Bills, Premium Lists, &c., SENT FREE—or we will send the 13 numbers of this (Oct. to Jan.) or any preceding Quarter of this year, on trial, or as specimens, for ONLY FIFTY CENTS.

THE CRESYLIC ACID CO.'S

S O A P S

AND SAPONACEOUS COMPOUNDS.

MANUFACTURED AND SOLD

UNDER A LICENSE, BY

JAMES BUCHAN & CO.,

190 Elizabeth Street, New York,

AND FOR SALE BY DRUGGISTS, GROCERS, SEEDSMEN AND DEALERS.

The value of these compounds, and for which Letters-Patent have been granted, is fully established as

DISINFECTANTS, ANTISEPTICS, and Destroyers of Insect and Fungus Life wherever found.

Although the peculiar powers of this acid are of comparatively recent discovery, they are so marked and powerful as to have led at once to their general use, both in Europe and America.

The difficulty at first experienced was, to form such compounds with the acid as should be convenient for use, permanent in their effects, and cheap enough to lead to their every day employment, in the

Dwelling House, the Hospital and Jail, the Ship and the Railroad Car, the Stable, the Sheep-fold and the Cow-house, the Field and Garden.

It was found that this was best and almost solely attained by forming

Soaps & Saponaceous Compounds.

Those offered for use in the

Dwelling-house, include

Laundry, Family and Soft Soaps.

These are not only more powerfully detergent or cleansing than any others in use; but completely disinfect everything washed with them, and render woolens safe from the attacks of moths and other insects. Bedding and other clothing used by the sick, even from the most infectious diseases, as Small-pox, virulent fevers, &c., are completely disinfected by its use; so that they may be immediately used, and with entire safety, by the well in health.

Tables, bedsteads, cupboards, floors, walls, sinks are purified, cleansed, and protected from house-flies, cockroaches, ants, and other insects.

It may be used on the person, even of children, protecting them greatly from infectious diseases, and from insect annoyances, scald-head, &c.

The slight odor of Cresylic acid perceptible when the soap is used, is quickly dissipated by the air.

In Jails, Hospitals, Barracks, on Ship-board, in Crowded Tene-

ments liable to typhoid and other fevers, the use of these soaps *should be made obligatory.*

For the **Stable, the Sheep-fold, the Cow-house, the Pig-pen, Poultry-house, &c.**

Compounds of the more crude *Carbolic acid* were employed. But, in this clear and warm climate it was found that there is a vitality and vigor in insect life which required the more active, yet less acrid *Cresylic acid* to overcome.

The **Black Bar Soap**, for washing horses, cows, pigs, dogs, &c., to rid of and protect them from vermin, flies, &c., is in a convenient and cheap form. Flies, which so incessantly torment horses and cattle in stables and dairies, will not disturb them, if washed over twice a week with this soap. Using it like any other bar soap; but leave a light lather to dry on, rubbing it well in.

The **Death to Screw-worm**, is the best of all remedies for that pest of the Stock-breeder in the South; and for washing galls, sores, whether mere scratches or of the most gangrenous and offensive character, for grease, cracked hoofs, &c., in horses; mange in dogs, &c. It may be used on the person with entire safety; and will cure any of the more ordinary diseases of the skin, as **Ring-worm**, &c.; spread as a plaster, and protected from the air by a covering of oiled silk, &c. Removing twice a day; washing well, using the compound as a soap, and replacing the plaster.

The **Sheep-dip** immediately cures scab in sheep, and destroys all vermin on these sensitive animals, and prevents their return. It is constantly asserted by those who use this Dip for their sheep, that the increase in quantity and improvement in the quality of the wool, is more than equal to the cost and trouble.

The **Foot-rot Ointment** is a quick and infallible cure for that disease.

The **Plant Protector**, if dissolved in water and occasionally sprinkled over trees and plants, will completely protect them from destructive insects.

Different persons in the South experimented with a solution of this compound on the cotton plant, infested by the caterpillar, so destructive to that plant; and state "that, although the worms already on the plant, and which could not be reached by sprinkling from a common watering-pot, lived and matured; not another egg was deposited on the plants thus treated."

From these and experiences in Europe, it is inferred that trees, roses, grape-vines, and other plants, including wheat, threatened by the fly and midge, well syringed with this solution, would be protected from the deposit of the eggs of insects of any kind upon the plants or in the fruit.

Every experiment with watery and other mixtures or compounds, excepting the saponaceous, proved utter failures. If made strong enough to affect the insect, they seriously damaged the plant; and the effects, so far as they were obnoxious to the insect, were quickly dissipated. Not so with the soap mixtures. The effect continues for weeks, even on plants in the open air.

A very weak solution used in the ordinary syringing of plant houses, would entirely prevent insects.

Wheat washed in a solution of the **Protector**, before being sown, is pronounced safe from **Smut**—a fungus, similar in its origin to the **Mildew** on the **Grape**.

If the stems and limbs of trees and plants, infested by any of the species of **Scale** or "Terapin Bug," are coated with a mixture of a creamy solution of the **Protectors**, and the **Cresylic Acid Co.'s Granulated Powder**, laid on with a brush, the insect could no longer exist.

Rabbits, Mice, Squirrels, &c., **will not touch** young trees which have had a cloth, saturated with the compound, rubbed over the stem. Which may be done very quickly with a rag in each hand.

And the **Cutting-Ant** of Western Texas will not ascend a tree, around which a strip of sheep-skin is tied, and occasionally wetted with a solution of this compound.

During the summer months, in the warmer parts of this continent, it is almost impossible to preserve **Hides** from being eaten by certain worms and hard-shelled bugs. Dealers and others use a compound known as "Hide poison"; dangerous in the extreme, if not carefully handled.

The Cresylic Acid Company's

HIDE PRESERVER

is even more effective, being at same time a powerful antiseptic, is perfectly safe to use, and costs much less.

All of these compounds are harmless to animal life, and may be handled with entire safety.

JAMES BUCHAN & CO.,

190 ELIZABETH STREET,

NEW-YORK,

MANUFACTURE AND SELL

THE CRESYLIC ACID COMPANY'S

SAPONACEOUS COMPOUNDS.

DISINFECTING SOAPS.

Soft Soap.—Dark, for floors, ships' decks, etc., in 5 lb. canisters, \$1.25; 10 lb. do., \$2.25; in 50 lb. kegs, at \$10; and in 200 lb. barrels, \$35.

For all the purposes intended, these have double the cleansing powers of ordinary soaps.

No. 1 Soap.—In bars. For all common uses in the house and laundry, for floors, closets, clothing, linens, woollens, bedding, etc., which it thoroughly disinfects and renders obnoxious to all insects.

In 24 lb. boxes, at 13 cents per lb.; and in 60 lb. boxes, at 12½ cents.

Laundry.—A finer soap, for similar purposes, and for the bath, etc.

In 60 lb. boxes, 14 cents per lb.; in 24 lb. boxes, and in 10 paper boxes, containing 6 lbs. each, packed in a case, 15 cents per lb.

Laundry women should not object to the peculiar and not unpleasant smell of the soap. This very odor protects them from any possibility of catching disease from foul or infected clothing; and disappears when the clothes are dried.

These soaps possess a **Bleaching** quality which none others do; and without the slightest damage to the fibre of the cloth.

The **Black Bar-soap**, for destroying vermin on horses, cows, pigs, dogs, etc., and to protect them from flies, in neat cakes enveloped in tin foil, in a cheap and convenient form, in boxes containing 20 cakes, \$2.

The **Death to Screw-worm.**—A soft and very effective ointment, or may be used as a soap; will destroy all insect life or render the locality most obnoxious to them, and forms the best of all washes and ointments for foul and putrid or other sores. The *altering and marking of young stock* may be done with safety even in the extreme south, at any season of the year, by immediately anointing with this preparation.

To that pest of the Southern Stock-breeder, the *Screw-worm*, it is certain death, and is the cheapest and safest remedy ever applied. It not only destroys the worm, but cleanses and quickly heals up the offensive sores made by them. In ordinary cases, a piece of the ointment, as large as the first joint of the finger, pushed into the wound, will effect an immediate cure. But, in serious cases, best to inject a solution two or three times, and then insert the ointment. It is rare that a second application will ever have to be made. Sheep, which rarely recover the attack of the worm under the ordinary treatment of Calomel, various Liniments, etc., are quickly cured by this application.

Sold in canisters containing one pound, at 50 cents, or three pounds, at \$1.

The **Sheep Dip** is sold in canisters of 5 pounds, at \$1.25; 10 pounds, at \$2.25; 50 pound kegs, at \$10; and in barrels, containing 200 pounds, at \$35.

The proportions for dipping large and heavily-fleeced sheep, are *one pound of the com-*

position to five gallons of water for five sheep.

When a number exceeding fifty are dipped, the bath must be replenished after 25 sheep are dipped, with five pounds of the composition dissolved in one gallon of boiling water, added to 24 gallons of water. But for the average of sheep in the United States, and especially if recently shorn, it will be found that this quantity, in these proportions, will suffice for nearly, if not quite, *double the number*. The liquid is placed in an oblong vessel, of sufficient size to immerse two sheep at a time conveniently. The animals are carefully dipped, so that every part is immersed, protecting only the ears, nose and mouth from contact with the liquid. Each sheep should remain a full minute in the bath, and then stand on the *drainer*, or sloping platform alongside the bath-tub, until all the liquid that will, has drained off. Do not turn out during a rain, immediately after dipping. The hands and arms may be freely put in the bath, as it will injure neither skin nor clothes. But, if the sun is shining brightly, it is best to protect the arms by a loose sleeve or other wrapping; otherwise some smarting may be felt. If the smarting is severe, the bath had best be somewhat diluted with water; and especially for weakly sheep or lambs. When *Scab* is actually present, a little of the pure *Dip*, or better still, of the *Death to Screw-worm* should be rubbed on the spots or diseased parts. If first rubbed not too harshly, with a corn-cob, so much the better. There is no danger of reinfection, even in pastures or lots known to be infected with the scab insect. If the lots, pastures, &c., are limited in extent, and badly infested with the *Scab-insects*, wash over with the *Dip*, the stems of trees, posts, &c., against which the sheep have been in the habit of rubbing themselves; as the insects will live there for a long time, ready to attack again these sheep not thoroughly protected by dipping.

A profitable business could be done by
PROFESSIONAL DIPPERS,

charging so much per head, and who could do the work more thoroughly, and at a less actual cost than could be done by those less practised.

Messrs. Buchan & Co. will be glad to treat with parties who desire to engage in the business.

Foot-rot Ointment thoroughly cures and prevents the return of this dangerous disease. Let the animals to be treated, stand for five minutes or so, in the ordinary solution of sheep-dip; which will soften and cleanse the hoofs. Pare and cut away all of the diseased portion; but expose no more fresh surface than can be avoided. Anoint well with the ointment, and especially every diseased part, rubbing a little into the hair as high as the knee. Keep the animals in a dry, clean pasture or lot for a few days, and a cure will not only be affected, but the animal guarded from reinfection for a considerable period.

Sold in canisters of 3 pounds, at \$1.

The **Plant-Protector** is sold in lb. canisters at 50 cts.; 3 lb. do., \$1.00; 5 lb. do. \$1.25; 10 lb. do., \$2.25; 50 lb. kegs, \$10.00, and in barrels, containing 200 lbs., at \$35.

The strength of the solution must be determined by the age and condition of the trees and plants to which it is to be applied. For strong growing plants and trees, out of doors, 5 pounds to 50, or even 100 gallons of water will suffice.

To sprinkle over a crop of wheat, or to be forced in a spray, over and through the growing cotton plants, a still weaker solution would probably have the desired effect of driving off the parent insects.

The Hide Preserver.—This article, dissolved in sufficient boiling water, adding cold water until about the consistency of rich milk, or say five pounds to 30 gallons of water, will, if green or dried hides are coated on both sides with it, completely prevent the attacks of insects. And will cure green hides more thoroughly and in less time than by salt or any other antiseptic.

Sold in canisters of 5 pounds, at \$1.25; 10 pounds, at \$2.25; 50-pound kegs, at \$10; and in barrels containing 200 pounds, at \$35.

Soaps for the Toilet and Bath, and for **Surgical Uses**, are in course of manufacture, and will soon be offered.

The Cresylic Acid Company,

No. 62 Cedar St., New York,

MANUFACTURE AND SELL

GRANULATED DISINFECTING POWDER.

A powerful disinfectant and purifier; and at same time obnoxious to all insect and fungus life.

Cleanly, odor pleasant, convenient for use, effects continuous and lasting.

Sprinkled over the floor before nailing down carpets, matting, or oil-cloth, it absorbs foul smells, contributes to health, and kills or drives off all insects.

Strewn over the yard, in stables, sinks, water-closets, &c., it purifies and deodorizes.

Placed in and about the poultry yard and in the nests, the little pests which usually harass the poultry can no longer exist.

If scattered lightly over the stalls, when dressed up, each morning, foul odors are absorbed and causes of disease destroyed amongst live stock; and hoof-ail, foot-rot, &c., prevented.

Strewn over seed-beds in the garden or field, it gives complete protection to young plants, from insects.

A little of this powder placed in saucers around the sick-room, will purify and disinfect the air, without offending the sick by its odor—

And, if put in the vessels used, will prevent unpleasant smells, and all infection from that most fruitful of causes, the *excreta* of the sick.

A few pounds placed in the coffin will check decay and the consequent offensive odors, for two weeks or more. And if the entire vacant space under, and around, and above the body be filled in with this powder, all decomposition will be arrested for months.

Sold in neat packages at 50c.; in large boxes with sliding tops at \$1.25. And in barrels for stable use, &c.

Insect-Proof Paper

for lining chests to contain furs, woollens, &c.; and closets, pantries, &c., infested by or exposed to ants, cockroaches, or other insects. For spreading under carpets for their more perfect preservation. Being manufactured.

Advertisements, to be sure of insertion, must be received **BEFORE** the 5th of the preceding month.

TERMS—(cash before insertion):

Ordinary Pages—\$1.50 per line. Open Pages—\$2 per line.
Business Notices—\$2.50 per line of space, each insertion.

would inform their Patrons that the *Fourteenth Edition* of their *Celebrated Seed Catalogue and Guide to the Flower and Kitchen Garden* is now in press, and will be published in January. It will contain about *One Hundred and twenty-five pages* of closely printed matter, beautifully illustrated with *One Hundred Engravings of Flowers and Vegetables*, and a descriptive list of upwards of *2,500 varieties of Garden, Field, and Flower Seeds*, with special directions for their culture. Mailed post-paid to all applicants upon receipt of 25 cents. Regular customers supplied without charge. Orders addressed either to New York or Springfield, as above, will be promptly attended to.

B. K. BLISS & SON.

JEROME PARK,

May 25th, 1867.

E. F. BAKER, ESQ.,

DEAR SIR,—We take pleasure in stating that your *HOOF LINIMENT* has cured the Running Horse "Fleetwing," of Quarter Cracks. He ran Two and Three-Quarter Miles yesterday, and Three Miles again to-day, carrying One Hundred and Twenty-eight Pounds, without starting his feet to Crack in the least, and we now consider it a *PERFECT CURE*.

FOR

DOTY'S

WASHING

MACHINE

Washes perfectly without the least injury to clothes, and with great ease to the operator. It is the first and only Clothes Washer which has proved a *GREAT SUCCESS*, and sells rapidly wherever introduced. This, with the *UNIVERSAL CLOTHES WRINGER* (the best) does away with the wash tub and rubbing board, and saves clothes, time, and money. Descriptive circulars sent free.

To introduce these machines, we will send either or both to places where no one is selling, and *send by the freight charges*, on receipt of the retail price. Family Washer, \$14. Universal Wringer, "Extra," \$9. Also, the new *LIGHTNING MEAT CHOPPER*, \$7.

Send for Wholesale Terms Circular.

34 Merchants' Row, Boston, the place of publication, and all letters should be addressed to

R. P. EATON & CO.,

Publishers N. E. Farmer.

Any paper copying the above and calling attention to it shall receive the numbers for 1868 without charge.

We quote the following from the Semi-Weekly Times of Nov. 5, 1867, believing it will be of interest to thousands who want all the Horticultural stock they can buy for the money they have to spare for that purpose.

Whitlock's Horticultural Advertiser.

This is a 12mo. pamphlet of seventy-four pages, gotten up in an attractive style, by L. L. WHITLOCK, No. 37 Park Row, New York City, who proposes to act as a judicious and trustworthy "middle-man" between farmers and gardeners and those who raise trees, vines and shrubs for sale. This is a new arrangement to supply the million with choice vines and trees at low prices. The *Horticultural Advertiser* is Whitlock's medium of communication. Producers offer their stock of trees and vines to him at exceedingly low prices—perhaps twice as low as they will sell to customers direct. Those in want of trees or vines send their orders to him, and thus receive all the advantage of the low prices by simply paying WHITLOCK a small per centage. As the advantage is all on the side of farmers and gardeners, let us look into the practical operation of the system, that the doubting may understand how to take still greater advantage of the facilities for procuring trees. A farmer, for example, near Rochester, N. Y., wants \$500 worth of fruit trees. He desires to superintend digging them himself. Producers hold the same trees at \$1,000; but by writing to New York and paying the middle-man \$25, the farmer saves \$500. This is a liberal advertisement of the agency; but the information imparted to the million by disclosing these honest tricks of the trade seems to be a sufficient excuse for telling those who want trees and vines how to obtain them cheaply and at the same time procure as good ones as if they were to get them by retail. Besides this, the *Horticultural Advertiser* contains much valuable information on the subject of horticulture and pomology. (See Adv.)

STRAWBERRIES.

PLANT THE BEST.

PLANT THE GENUINE.

JUCUNDA—Our No. 700.

At the very head of the list of Strawberries—as vastly superior to any and all others—containing in itself almost every strawberry excellence, we place this wonderful variety.

We claim for it, and have abundance of testimonials to sustain the claim:

1st.—That the plant is healthy, hardy, and of vigorous growth.

2d.—It is remarkably capable of resisting frosts, cold winds, and drought.

3d.—It never fails to produce an immense crop of the finest fruit.

4th.—It is Bisexual, and needs no fertilizer.

5th.—It continues a long time in bearing—the fruit increasing in beauty and brilliancy of color to the last.

6th.—The fruit is of enormous size, ten and twelve berries often filling a pint measure.

7th.—It is of great beauty,—perfect in form, and brilliant in color.

8th.—It is excellent in flavor.

9th.—Its shipping and keeping qualities are most remarkable. To test it in these respects, berries gathered on our Farm, at Pittsburgh, on Monday, and shipped the same day to New York,—over 400 miles—were kept until Friday and Saturday, and then sold for a higher price than other varieties would bring, grown in the neighborhood, and taken fresh into the market.

10th.—It commands the highest price in the best markets,—bringing last season in New York, 60 cents per pint holding ten berries.

11th.—It requires no special treatment—is the least expensive to gather, and is greatly the most profitable strawberry we grow.

12th.—It has been thoroughly tested—8 years on our Farm—and has greatly the advantage in this respect over newer or recently imported varieties.

We subjoin a few testimonials, and for others refer to our Catalogue.

"The plant is as thrifty, vigorous, and hardy, as any I know of; the stout, stocky fruit-stems bearing up a weight of fruit I never saw equaled."

A. W. HARRISON, Sec. Pa. Hort. Soc.

"I consider it the most remarkable fruit of its class that has ever come under my observation."

DR. JNO. A. WARDER, Prest. Ohio Pom. Soc.

"Could corroborate all that others have said of its great beauty, size, and excellence of flavor."

M. B. BATEHAM, Sec. Ohio Pom. Soc.

"A most remarkable point of value in this variety is the great number of extra large berries. I saw great quantities ten to twelve of which filled a pint."

Geo. M. BEELER, Late Sec. Ind. Hort. Soc.

"The Prince among Strawberries. The fruit is enormously large, and the plant wonderfully productive. Fruit very solid, and the richest and most highly flavored of any strawberry I ever tasted."

JOHN H. JENKINS.

"Mr. Knox's Farm at Pittsburgh is the headquarters of this variety. The show of this fruit upon his grounds was this year something wonderful to see. To say that the crop was large, would not express it—it was immense. We never before saw berries run so uniformly large."

Editor American Agriculturist.

"The largest Strawberries seen in this market during the

present season, and probably the finest ever sent here for sale in quantity, were some monstrous Jucundas, sent by the Rev. J. KNOX, of Pittsburgh, Pa. They were extremely large—12 to 15 berries filling a box—of a bright color, and so firm, after their journey of 400 miles, that they might readily be shipped as much farther."

New York Tribune.

For further information in reference to this most wonderful Strawberry, send 10 cents for a Catalogue.

The past season being very favorable with us, we have grown a large stock of superior plants of this variety, the greater portion of which we intend planting, and would plant all, if we had the ground to spare.

We offer strong plants at the following prices:

12 for	\$ 1.00
50 "	3.50
100 "	6.00
200 "	10.00
1,000 "	50.00

At the price per dozen and single hundred, we will send plants by mail when desired. Larger quantities by Express, the purchaser paying Express charges.

Orders will be entered as received, and filled in rotation, at proper season. An acknowledgment, and a circular with brief instructions for cultivation will be sent at once, to all parties from whom we receive orders accompanied with the cash.

NEW EDITION.

We will issue about the 1st of January next, a New Edition of our **Small Fruit Catalogue**, containing descriptions of all **Grapes, Strawberries, Raspberries, Blackberries, Gooseberries, Currants, &c.**, of any merit. Also, Illustrations of the **Martha and Ives Grapes, Jucunda and Fillmore Strawberries, Hornet and Philadelphia Raspberries, Kittatinny and Wilson's Early Blackberries, Cherry and White Grape Currants, &c.**; considerations that should influence the purchaser in the choice of Nursery Stock; select lists, both by mail and Express; the secret of our success in plant, vine, and fruit growing; prices of Stock for Spring of 1868; and much valuable information in reference to Small Fruit Culture.

We will enclose in the above Catalogue, a directed envelope, and an Order List, giving the plainest instructions how to order, and forward to all applicants enclosing 10 cents. As it is desirable to know soon as possible how large an Edition to issue, applicants will please send their names with full address at once.

J. KNOX,

Box 155, Pittsburgh, Pa.

JAMES VICK,

IMPORTER AND GROWER OF

FLOWER and VEGETABLE SEEDS,

ROCHESTER, N. Y.

Vick's Illustrated Catalogue of Seeds and Floral Guide, for 1868, is now in press, and will be ready to send out on the 1st of January next. It will contain about *One Hundred pages*, devoted to full and plain descriptions of the choicest Flowers and Vegetables, with directions for preparing the ground, sowing seed, and after culture, with other invaluable information to the gardener and lover of flowers.

My Catalogue and Floral Guide will be illustrated with more than a hundred fine wood engravings, and a beautiful **Colored Flower Plate**, will be well printed on the finest paper, and make one of the most beautiful, as well as the most instructive work of the kind published.

Sent to all who desire, by mail, post-paid, for ten cents, which is not half the cost. Address

JAMES VICK,
Rochester, N. Y.

Catalogue of Hardy Bulbs published on the first of August.

AGRICULTURAL AND HORTICULTURAL DIRECTORY.

THE PRAIRIE FARMER ANNUAL, DIRECTORY AND ADVERTISER will be issued about the 25th of December. It will be a book of at least 150 pages, with an edition of not less than 10,000 copies, and be distributed to as many individuals, mostly farmers in the Northwest.

The directory is intended to embrace a complete list of Agricultural Implement Manufacturers and Dealers, Seed Merchants and Growers, Nurserymen and Fruit Dealers. All who desire to be recorded in the book will please send in their names, kind of business, and post-office address, at the earliest date possible, accompanied with 50 cents. This will also entitle the person sending to a copy of the work when out. Address

1868.

HOW TO GET

A SEWING MACHINE

WITHOUT ITS COSTING YOU ANY MONEY.

AN EASY, PLEASANT, AND CERTAIN WAY.

The publishers of "ARTHUR'S HOME MAGAZINE," and that elegant and attractive periodical, "THE CHILDREN'S HOUR," edited by F. S. ARTHUR, make the following exceedingly liberal offers:

For twenty subscribers to "The Home Magazine," (Terms \$2 a year), and forty subscribers to "The Children's Hour," (Terms \$1.25 a year), we will send a WILCOX & GIBBS, or a WHEELER & WILSON SEWING MACHINE, worth \$56, manufacturers' cash price.

For thirty subscribers to Children's Hour and twenty-five to Home Magazine, we will send a sewing machine.

For \$60 we will send ten Home Magazines, twenty Children's Hours, and a sewing machine, as above.

The subscribers need not all be sent at one time, nor from the same office.

Specimen numbers of Home Magazine, 15 cents. Specimen numbers of Children's Hour, 10 cents. Circulars accompany them, giving full particulars, and containing besides other and very attractive premium offers.

The Home Magazine is too well known to require special mention, and The Children's Hour is pronounced the purest, most beautiful and attractive juvenile magazine published in this or any other country.

Do not be deterred from making an effort for fear it may be labor lost. Get all the subscribers you can, and if the number falls short, then write to us, and we will let you know what additional sum of money to send in order to secure a machine. We will always make this sum as small as possible. It will range between \$10 and \$20. Remember that the cash price of the machine is \$55.

Address

T. S. ARTHUR & SON,

—1868.—

New York Express.

13 & 15 Park Row.

THE EVENING EXPRESS, SEMI-WEEKLY EXPRESS AND THE WEEKLY EXPRESS FOR 1868, WILL BE PUBLISHED UPON THE FOLLOWING TERMS:

THE EVENING EXPRESS.

Mail subscribers one year, \$9.50.

THE SEMI-WEEKLY EXPRESS.

1 copy 1 year (104 issues), \$4.00	10 copies 1 year.....	28.60	
2 copies 1 year.....	7.00	25 copies 1 year, to one	
5 copies 1 year.....	15.00	address.....	50.00

WEEKLY EXPRESS.

1 copy 1 year (52 issues) ..	\$2.00	10 copies 1 year.....	15.00
3 copies 1 year.....	5.00	20 copies 1 year.....	28.00
5 copies 1 year.....	8.00	50 copies 1 year.....	50.00

We particularly call the special attention of Farmers and Merchants in all parts of the country to our local market and business reports, which are very complete. The Semi-Weekly and Weekly editors will have all the news of the week, up to the hour of going to press.

The EXPRESS, in its Politics, is for the Country, and the whole Country—for the Government, more than the mere Administrators of authority—for the Constitution, more than those who, however exalted they may be in place and power, seek to violate its provisions. It upholds and honors a Union of Equal States, with equal privileges, and with equal and exact justice to all its citizens. It is for the flag altogether, and the Union, and for the existing Constitution, in its spirit, letter, and purpose.

Upon the great future rests the entire hopes of the people. The nation is now burdened with debt and taxes, and it will be the policy of the EXPRESS to reduce these as rapidly as possible, and to restore prosperity to the whole country, North and South. The Publishers invite support and encouragement from all those who, while wishing for one of the best Newspapers in the country, also wish to have a sound Constitutional journal.

Specimens of the EXPRESS sent free, upon application, to any address, and as many as may be wanted.

To Clergymen the Weekly will be sent for One Dollar and fifty cents per annum.

In response to many of our subscribers we have made arrangements to club the Riverside Magazine, and Phrenological Journal with the EXPRESS, on the following terms, viz:

Riverside Magazine and Weekly EXPRESS for one year,.....	3.60
Phrenological Journal and.....	3.50

Riverside Magazine and Semi-Weekly EXPRESS 1 year,.... 5.00

Phrenological Journal and..... 3.50

Remit by Draft, Post-Office money order, or Registered letter, to

LAWYERS should read THE PHRENOLOGICAL JOURNAL, that they may read clients and culprits.

GOODRICH'S

History of the United States.

RE-WITTEN, AND BROUGHT DOWN TO THE PRESENT TIME (1867).

BY WM. H. SEAVEY, A. M.,

Principal of the Girls' High and Normal School, Boston.

This edition of Goodrich's "History of the United States" has been prepared from the latest and most trustworthy authorities. It has been attempted, by brevity of statement and an economical arrangement of matter, to bring the story of our history through the war of the rebellion, without making it so meagre as to be useless or swelling the book to an inconvenient size. To do this, it has been necessary to re-write nearly the whole work, which, (exclusive of an Appendix of 28 pages), including maps, portraits, and many other illustrations, useful chronological tables, and tables of analysis, is comprised in 320 pages 12mo.

The book may be used as three separate histories, or each may be made to assist the other.

The whole forms a carefully prepared work, arranged so as to facilitate the labor of the teacher, and fix the facts stated in the mind of the pupil by various little aids to the memory, the importance of which the practical teacher can well understand.

The book is illustrated by SUPERIOR MAPS. The design has been to show by them the location of every place in the United States mentioned in the history. Much care has also been taken to give acceptable PORTRAITS of the most eminent historical personages.

From D. B. Hagar, Principal State Normal School, Salem, Mass.

I consider it a text-book of extraordinary merit. Its style is clear, compact and interesting; its matter is judiciously selected and arranged; its illustrations are numerous, appropriate, and well executed; its tables of historical analysis, chronological reviews and contemporary chronologies, are of great practical value, and its typographical appearance is highly attractive.

We take pleasure in announcing the publication of the above, and solicit correspondence with School Committees and Teachers with regard to the introduction of the same into schools under their charge.

BREWER & TILESTON, Publishers.

May, 1867.

MECHANICS should read THE PHRENOLOGICAL JOURNAL, and learn how to select boys to learn trades.

IMPORTANT TO OWNERS OF STOCK.

The American Stock Journal

AND

FARMERS' AND STOCK BREEDERS' ADVERTISER.

A First-class Monthly Journal, devoted to Farming and Stock Breeding. Each number contains 36 large double-column pages, illustrated with numerous engravings. Only \$1 a year. Specimen copies free, for stamp, with list of splendid Premiums to Agents.

HORSE AND CATTLE DOCTOR, FREE.

The publishers of the *American Stock Journal* have established a Veterinary Department in the columns of the Journal, which is placed under the charge of a distinguished Veterinary Professor, whose duty it is to receive questions as to the ailments or injuries of all kinds of stock, and to answer in print, in connection with the question, how they should be treated for a cure. These prescriptions are given gratis, and thus every subscriber to the Journal has always at his command a Veterinary Surgeon, free of charge. Every Farmer and Stock Breeder should subscribe for it.

Sent Free, Three Months for Nothing.

Every new subscriber for 1868, received by the 1st of January, will receive the October, November, and December numbers of 1867, free, making over 300 large double-column pages of reading matter in the 15 numbers. All for the low price of \$1.00. Address

N. P. BOYER & CO., Gum Tree, Chester Co., Pa.

WALLACE'S AMERICAN STUD BOOK

Now Ready to Subscribers.

Price \$10.

Dealers supplied. W. C. WEMYSS, 515 Broadway, N.Y.

YOUR DAUGHTER would thank you for THE PHRENOLOGICAL JOURNAL—with its instructions on health and beauty. Only \$3 a year. Address S. R. WELLS, N.Y.

THE HOLIDAY JOURNAL

Of Parlor Plays, Magic Sports, Fireside Games, Pleasing Experiments, Practical Jokes, Queer Problems, Puzzles, Riddles, Charades, Rebuses, Enigmas, Anagrams, Transpositions, Conundrums, &c. SENT FREE. Address ADAMS & CO., Publishers, Boston.

"The Teacher of Penmanship"

tells "how to write," "how to flourish," and "how to draw." Subscribers for 1868 receive the October, November and December numbers, for 1867, free. Valuable and attractive premiums offered to subscribers and those who raise clubs. Only \$1 per year. Send 5 cents to pay postage for sample numbers, to L. S. THOMPSON, Sandusky, Ohio.

BEAR IN MIND

That on receipt of the advertised price, I will mail to your address any Book, Magazine, or cheap publication that may be advertised or issued by any respectable publisher in the United States. A Catalogue will be sent on receipt of a postage stamp. Address O. A. ROORBACH, 122 Nassau-st., New York.

CARPENTERS.—SEND FOR CATALOGUE OF New and Practical Architectural Works, enclosing stamp. A. J. BICKNELL, Publisher, TROY, N. Y.

SCHOOL TEACHERS should read THE PHRENOLOGICAL JOURNAL, and learn to classify their students. Also to govern them wisely. \$3 a year.

Stereopticons and Magic Lanterns,

With the Improved Lime Light, illuminating brilliantly two hundred square feet of canvas, and magnifying the views to that size, at an expense of less than one dollar for a whole evening's exhibition. Easily managed and pays well.

Illustrated priced catalogue of the apparatus, with list of over two thousand artistically colored photographic views on glass, of the War, Scripture History, Choice Statuary, etc., etc., forwarded on application. T. H. McALLISTER, Optician, (of late firm of McAllister & Bro., Phila.,) 49 Nassau-street, New York.

YOUR SON would be greatly benefited by reading THE PHRENOLOGICAL JOURNAL. He would learn how to make the most of himself. \$3 a year.

TWENTY REASONS.

FOR BUYING A

Mason & Hamlin CABINET ORGAN.

1. It is the **BEST INVESTMENT** you can make; safer and bringing greater returns than money loaned at interest or invested in bonds or lands.
2. It will render home attractive, and save more expensive and less beneficial amusements.
3. Its music will cultivate good feeling, and have the best influence.
4. It will enable your sons and daughters to learn to play, and so give them a valuable accomplishment.
5. It will give them facilities to qualify themselves as teachers of music, which is as good as a trade or profession. Thousands of ladies are now pleasantly supporting themselves by teaching music, which they learned merely as an accomplishment. If your daughter has some aptness for music you would better give her a good instrument now, and encourage her to learn to play on it than to give her thousands of dollars some years hence.
6. It will be a pleasure and comfort to yourself during the long winter evenings.
7. It will last a life-time, and you will value it more and more highly.
8. It is easier to learn to play on than a piano-forte, and costs much less.
9. The Mason & Hamlin Cabinet Organs are **THE BEST** instruments of this class in the world.
10. This is proved by the testimony of the best judges. They have been awarded highest premiums at **OVER SEVENTY** industrial competitions, including the **FIRST PRIZE MEDAL** at the **WORLD'S EXPOSITION** at PARIS, this year. In their circulars M. & H. print the testimony of more than three hundred of the best musicians in the country that their instruments excel all others. When one who wishes to sell you an instrument claims that it is recommended as the best by hundreds of the most distinguished organists, ask him to *show you their testimony*. If it has ever been given, he will have it in print.
11. Compare the instruments made by M. & H. side by side with any others; compare them critically and thoroughly, tone by tone, and you can not fail to see superiority in many respects.
12. These instruments are the only ones having the celebrated **AUTOMATIC BELLOW SWELL**, the most important improvement in reed instruments for twenty years.
13. They are the only instruments having **PATENT SELF-ADJUSTING REED VALVES**, and the various other patented improvements of Mason & Hamlin.
14. They are the only reed instruments having clothed mortices.
15. Compare the exteriors and observe that the instruments of M. & H. have the best quality of ivory; ivory fronts to the keys; real ebony and not merely colored black keys; desks made in the most substantial manner of three separate pieces of wood, glued together, and not liable to break, &c., &c. This thoroughness of workmanship, and use of only best material, runs through the whole instrument.
16. The thoroughness of construction of these instruments gives them the **GREATEST DURABILITY**. They are not liable to get out of order.
17. They will improve by age, getting even better in quality of tone.
18. **THEY ARE THE CHEAPEST INSTRUMENTS OF THE CLASS**; not the lowest priced, indeed, though the difference in price between these and inferior instruments is not great. It costs a little more to do the very best work, but is cheapest in the end.
19. It is not safe to trust to the judgment of dealers, who are tempted to think those instruments are the best on which they can make the greatest profits. M. & H. have fixed their prices so low that they cannot afford to pay the large commissions given to dealers by makers of inferior work.
20. Every instrument made by Mason & Hamlin is fully warranted. If it proves defective you can suffer no loss, as their guarantee is above question.

Send for a Circular, which will be sent gratuitously, containing full descriptions and illustrations of the different styles and prices, which vary from \$75 to \$1,000 and upward, each; also with testimony in full from the distinguished organists of the country to the superiority of these instruments.

MASON & HAMLIN,
596 Broadway, New York:
154 Tremont St. Boston.

THE UNIVERSAL CLOTHES WRINGER

HAS BEEN AWARDED THE
FIRST PREMIUM
AT THE FOLLOWING FAIRS:

NEW YORK	1862	1863	1867
PENNSYLVANIA	1863	1864	1867

CONN. RIVER VALLEY	1864	1864	
CHAMPLAIN VALLEY	1864	1864	
AMERICAN INSTITUTE, New York	1863	1865	

The "UNIVERSAL" is the only Wringer ever awarded a **FIRST PREMIUM** at the great Fair of the

AMERICAN INSTITUTE.

The above is the largest **FIRST-CLASS PREMIUM LIST** ever obtained by any article whatever of American manufacture, and more than **FIVE TIMES** greater than that obtained by any other Family Wringer. These premiums were all taken on the **UNIVERSAL FAMILY CLOTHES WRINGER** at the times specified.

We do not attempt to mislead the public by advertising an old list of premiums, without date, by the "M. W. M. Co., manufacturers of" &c., taken mostly on Power Wringers—combined Wringers and Washers, and other articles not now in the market for family use—as is done by some of our would-be competitors.

OVER 300,000

OF THE
UNIVERSAL CLOTHES WRINGERS

have been sold, which is more than the sale of all other Wringers combined, and the late improvements on the "UNIVERSAL" have greatly increased the sale. Sold to Dealers, Jobbers, and the Trade everywhere.

The celebrated "**DOTY CLOTHES WASHER**," also, the new "**LIGHTNING MEAT-CHOPPER**" always on hand for sale. Terms' Circular free.

NEW ENGLAND UNION, a Gold Medal	1865

The "**Novelty**" Wringer has the Patent *Flange Cog* Wheels on both ends of the rolls, which allows them to separate freely at either end. The "**Novelty**" has but one pressure screw, which always ensures an equal pressure the whole length of the rolls.

The "**Novelty**" is fastened to a Tub by the
PATENT CURVED CLAMP,

Which has an equal bearing on a tub the whole length of the Wringer, while all other Wringers are merely fastened to a single stave at each end.

The "**Excelsior**" Wringer is especially adapted to *Set Tube* (City use). It is every way the same as the "**Novelty**," besides having Bailey's Patent Oscillating Conductor Board, which turns the water into a tub on either side of the Wringer, as desired.

N. B. PHELPS & CO., General Agents,
17 Cortlandt-st., New York.
Sold by Dealers in Hardware, House Furnishing Goods and General Merchandise everywhere.

Revolving Diaphragm Churn.

Full particulars in our issue. Send for Circular. PHIL'A WOODEN HOLLOW WARE MFG CO., 482 Broadway, N. Y.

A New Patent Trellis

For Tomatoes, Strawberries, Flowers, &c.

Simple, desirable, and ornamental. For Illustrated Circular, address WILLIAM W. WILCOX, Middletown, Conn.

THE SUBSCRIBER OFFERS FOR SALE the patent for an Ice Hoist or Elevator for filling ice-houses, patented in May last and further improved by letters since, and published in the Scientific American. It being a simple device and working to a charm. Said sale may be for the whole United States. HENRY LITTLE, Middletown, N. Y.

Combined Square, Plumb, Level and Bevel.

The *Scientific American* says: "This instrument is intended to supersede a number of separate tools used in the shop of the mechanic. It is used as a spirit level, try-square, clinometer, bevel protractor, etc., and is suitable for the machinist, wood-worker, draftsman, and surveyor."

The instrument is a rectangular metallic frame or box, on the sides of which are secured graded semicircles. In the top is seated the tube of a spirit level. Pivoted at the center near the bottom is a steel frame with heart-shaped apertures in its side to permit the figures on the scale to be seen when the frame is set at any angle. A thumb-screw with a sliding block secures the pivoted frame in any position desired. The whole instrument is capable of being carried in the pocket, and being wholly of metal—steel and brass—will not be easily broken.

The machinist will find it handy in finishing up six square nuts, in setting the planer head to cut bevels, and in various other operations. The pattern maker can record the angles of his work by its means so that the finisher can work exact to the original design or pattern. The carpenter and joiner can employ it in laying out their work and also in fitting it. It is also a handy article for the use of engineers, surveyors, and others who may be employed in running lines or locating claims." For particulars, address

W. S. BATCHELDER & CO., Sole Agents, Pittsburgh, Pa.

Seasonable Implements.

Horse-Powers, Threshers, and Winnowers, (Wheeler's and Emory's Patent), Panning Mills, Grain Mills, Hay, Straw, and Stalk Cutters, Root Cutters, Wood Sawing Machines, Prindle's Steamer and Farmers' Boiler, Clift's Acrating Churn, Sausage Meat Cutters and Stuffers for family and butchers' use, etc.

G. E. MEISSNER, Richmond P. O.,
Staten Island, N. Y.

CABBAGE SEED, IMPROVED BRUNSWICK.

The Earliest, Shortest Stemmed, and very best Drumhead yet offered. The Boston Market Gardeners all use it in preference to any other, and to show how highly it is esteemed in this state, we will state that it sold readily at \$5.00 per ounce the past season, and all were well satisfied that it is the best variety for either early or late planting; every plant produces a good head, when fully grown, weighing from 20 to 30 lbs., and requiring only ordinary cultivation; the quality is excellent. Mr. John Stone, of Marblehead, Mass., the originator of the well-known Stone Mason Drumhead, allows us to state that he considers it far superior to any Drumhead he has ever seen; he has raised good sized heads the past season in 83 days from planting the seed. We warrant our stock the purest in the country. For sale in 25 or 50 cent packages.

We have also to offer a small quantity of the *Early Boston Market Tomato Seed*, the best variety for market or family use, price 10 cents per package. By enclosing the amount of your order, we will forward the seed free by mail; send early, as our stock is limited. Send for Circulars, and Catalogues of Seeds.

A. SCHLEGEL & CO.,
Seed Warehouse, No. 10 South Market-st.,

FISH GUANO.

The cheapest and best fertilizer in use, manufactured and sold by the "Mystic Oil Company," Mystic Bridge, Conn. It is pressed very dry, put up in barrels, and sent to any part of the United States for \$30 per ton, in quantities less than 25 tons. For 25 tons and upwards, \$25 per ton. A dried and fine ground article is sold at \$45 per ton for 10 to 25 tons, \$40 per ton for 25 tons and upward, and for \$50 per ton for less than 10 tons, delivered on board vessel or R. R. at Mystic. An analysis just made of the fine ground by Prof. Johnson, of Yale College, shows that it contains . . . 6 per cent. of phosphoric acid, and 10.09 per cent. of ammonia, or about two-thirds the quantity contained in Peruvian guano. This indicates a much higher value than the retail price. Admirable for market gardening, grain, cotton, and other crops. Orders may be addressed to WM. CLIFT, Jr., 56 East 26th st., N. Y., or D. S. MILLS, Pres't., Mystic Bridge, Conn.

TWO SEED GROWERS.—The advertisers, seed dealers, solicit correspondence from *Seed Growers* with a view to making purchases of them. Please name seeds grown and prices. Address with references, "SEEDSMEN," Richmond, Va.

Grape Wood True to Name WANTED,

Of the following varieties in exchange for vines. Ives' Seedling, Norton, Reitz, Delaware, Dismal, Hartford Prolific, Rogers' Hybrids, Israel. Will give in exchange for the above, Iona, Adirondack, Creveling, Delaware, Concord, and Hartford. Early correspondence solicited. State variety and number of eyes, and of whom purchased. Dealers and all planting vines should examine my price list before buying. Sent upon application. Address
F. L. FERRY, Canandaigua, N. Y.

HARRISON'S PATENT BEE-FEEDER is simple, convenient, and durable. It may be attached to any hive, and used at any season of the year (in the coldest as well as the warmest weather), with perfect success, and without any interference from bees—either those belonging to the hive or robbers.—Rev. L. L. Langstroth is pleased with it; Mrs. E. S. Tupper strongly recommends it; Col. Jos. Lefel says, "many dollars worth of bees may be saved annually by its use"; all bee-keepers, who have seen it, like it. SIX feeders sent to any address on receipt of \$2.50.
EDWARD HARRISON,
Springfield, OHIO

EXHIBITION OF DITCHING, BRICK, PIPE, AND TILE MACHINES.

PEREMPTORY, CASH AUCTION SALE.

\$100,000 REAL ESTATE, PERSONAL PROPERTY, AND STOCKS,

WILL BE SOLD AT AUCTION DECEMBER 12, PRECISELY AT 10 1-2 O'CLOCK,

ON THEIR RIVER PROPERTY, TO CLOSE UP THE BUSINESS OF

CROSSMAN BROTHERS, OF WOODBRIDGE, MIDDLESEX COUNTY, NEW JERSEY.

One good farm of 63 acres, with one good residence and two tenant houses thereon; together with out buildings, crops, carriages, furniture, 24 horses, 20 head of cattle, and various implements connected with farming, mining, and manufacturing business. Also, a quantity of fire brick; 400,000 common brick; several thousand feet of first quality and damaged drain pipe; several thousand tons of fire clay, suitable for No. 1 fire brick, stove linings, stone ware, drain pipe, alum manufactories, foundry purposes, &c., &c. Five pipe machines that make drain pipe from 2 inches to 23 inches diameter; three clay tempering wheels and circular pits, well paved with blocks of wood set endwise; two substantial common brick machines, (and soak pits), capable of grinding and moulding ordinary clays, at the rate of 2,000 to 3,000 brick per hour, with two horses and six men. Also a water-power flour and grist mill, with two run of stone; turbine water-wheel and new machinery lately fitted up. This mill is located on the property where the business of the company, and the surrounding clay, mining, and manufacturing business, and the facilities for freighting grain to the mill by water, give advantages over distant mills for an excellent custom trade. Also,

TWELVE HUNDRED SHARES

OF

\$50 EACH

IN STOCK OF

The Crossman Clay and Manufacturing Company,

whose capital stock is \$250,000, free from all assessments. The real estate consists of factories, houses, wharf, railroad, connecting all with ship channel; 177 acres of land of which $\frac{1}{4}$ to $\frac{1}{2}$ is underlaid with beds of a variety of such valuable fire clays as are unequaled in quality and value anywhere, excepting in the Woodbridge Clay Mines. Careful estimates show that an acre of our fire clay land produces over half a million dollars' worth of manufactures, or even double the amount in some places. Two responsible members of our company offer to manufacture the more valuable goods at 25 per cent. of their value, and for 50 per cent. of the value of the cheaper goods.

The price of Woodbridge clays constantly and slowly increases, and the price of clay lands rapidly increases. Before clay is freighted, its price is greater than coal after the freight is paid. Consequently good fire clay property is among the best real estate investments of the country.

In addition to the unequalled manufacturing and transportation advantages that this property possesses, another very important and valuable peculiarity of these clay beds is, that they overlie each other up to the surface dirt for a depth of 10 feet to 40 feet thickness. The small quantity of surface dirt is cheaply removed to uncover the fire clay, and leveled off into brick yards, capable of producing next year from 5,000,000 to 10,000,000 bricks to be made from the surface clays. Our other factories and other clay strata produce an equal value of fire brick, drain pipe, etc.

The business of manufacturing these upper strata is profitable; it also uncovers valuable fire clay to be cheaply transported and manufactured into fire brick. In other places upper strata are removed and piled up in the banks at heavy expense, to become a nuisance in obstructing the drainage and proper working of the beds of fire clay, and making the clay costly. The whole present process of stripping, mining, transporting, and manufacturing fire clay, is clumsy, discreditable and costly, to the loss of all consumers, and all connected with it, excepting that the manufacturers and owners of Woodbridge fire clays become wealthy in spite of the present awkward, anti-progressive system.

Many manufacturers of fire brick and drain pipe adhere so firmly to the old-fashioned systems they learned when young, as constituting "experience," and are so opposed to increase of knowledge, under the fear of affecting prices, as not to admit strangers or suspected competitors in their works to see brick made by hand, (or worse made,) or to see drain pipe clumsily and badly made in plunger machines invented and used a lifetime ago. Again, such parties will ignore the inexorable laws of trade, of supply and demand, and vainly endeavor to sustain prices and remove competition by combinations. Again, as will happen in all trades, the most crafty operate against the majority of their honorable competitors and the consumer in fixing prices, by influencing with commissions, and otherwise, such masons, superintendents, captains, or officers, that act for brick consumers, each consumer seeming to think his employees will not accept outside favors, or be influenced by them. While these systems of acquiring wealth prevail in different degrees among clay manufacturers, there are true and great progress and improvements being made by mechanics and inventors of genius in their workshops and in other arts. While the sewing machine and watch manufacturers are rapidly producing their valuable goods by machinery, those classes that must work in the dirt and mud are left behind the age to dig ditches with such spades as Ames made years ago; with such plunger pipe and tile machines as were used a lifetime ago, and are still advocated in treatises on drainage, and make brick with machines no better than Hall's expired brick machine patents, and often with such machines as ruin all that use them. It is as important to secure genius for the unpleasant duties of perfecting inventions to work in dirt and mud, as in the more pleasant duties of perfecting other arts in the workshop. But in such dirt and clay business where physical strength rather than genius has been employed, principally radical improvements have slept, while the whole country and every branch of business suffers thereby. Every branch of trade needs good crops; and still one may ride a thousand miles in some seasons and see one-half the crops thinned out and injured by wet lands capable of being underdrained. Hoping to do our share toward practical improvement for the benefit of ourselves and others, we have purchased three patents of the most radical practical improvements of the age, in the ditching, pipe, and tile business; also the agency of Sword's brick machine for certain districts. They are all from the same workshop of H. Brewer, in Tecumseh, Michigan. We also secured the assistance of two of the inventors of these unequalled machines. They are undoubtedly the best inventors of their day in their line for practical results. These inventors have become acting members of the Crossman Clay and Manufacturing Co. All parties will cheerfully be granted free access to our works, (as yet in a rude state,) to examine our principles: the use and sale of the ditching, tile and brick machines, for the benefit of our company and others; and we do not yet see why these patents and machines will not alone be as much benefit to our company and the country, as any sewing machine or mowing machine, or any great improvement benefits any company and the country. As yet we place the drainage of lands, increase of crops, and decreased price of brick building material, before all other improvements, to benefit all classes. These inventors' machines are of the original and not imitation invention class, that cease when no more ideas can be borrowed. If they live, the company will directly and indirectly receive farther benefits, that cannot now be foreshadowed.

In addition to the great benefit to the company of the sale

of pipe and tile machines that belong directly to the company, and the indirect help by co-operating with the ditching machine, we have located our regular business on the most valuable clay beds known in this country. Our whole combination of stripping, mining, carting, manufacturing, and shipping advantages of clay goods, has been practically tested one by one for eight years, and our present incomplete business was built up from nothing meantime. To secure the benefits of the future better development of legitimate business, the company get the clay property at far less cost than it would bring at auction if the improvements had not been placed on it. This company can manufacture cheaper than all others, it can compete in all markets, but cannot be driven out of all markets; and the company could any time make a profit by selling it at auction, as there is not a fire brick maker in the country that could safely let his competitor get it. This alone practically puts the stock above par at the outset, aside from all benefits from sales of machines and our combination of all advantages. Any reliable dealers and consumers that become stockholders directly or indirectly on account of themselves or friends, will naturally have influence and preference over others in the buying and selling our goods in distant markets. We believe we shall in future make goods of quality and price to place our customers beyond the reach of injurious competition. We believe it will be the interest of buyers of fire brick, drain pipe and tile, and common brick, to take an interest in our company and buy direct from the factory and clay property; also the interest of individuals, clubs, and committees, to take interest with us in starting combined brick and tile yards in country places where clay lands make drainage necessary. By selecting proper men, machinery, and by industry, competence can be attained from clays now lying idle—a gain not appreciated in many places. A Sword's brick machine, and one Tiffany tile machine could, together, make a handsome business in many places where one alone would be less remunerative. Such a tile maker would have no competitors if he secured the agency of Ingraham's ditching machine, as digging cheap and good ditches is equivalent to cheap tile. As an investment for capitalists, this fire clay property, constantly increasing in value, possesses advantages over any other investment yet seen by us or any one else that has yet examined it so far as is yet known. To develop the business, to give consumers, buyers, and investors, a chance, and to exhibit the machinery on the same day to public inspection in these days of locating enterprises behind the Alleghenies and Rocky Mountains, we shall have an auction of from \$50,000 to \$75,000 of our personal stock and much other personal property. \$50,000 of the stock for working capital of the company will be held for sale to secure desirable associates, and, perhaps, sold at the same auction. From one-half to three-fourths of the remaining capital will be principally held by us, the inventors and workers of the company. Not one cent has been or will be spent for influence or personal assistance. The company has more than the full benefit of our former labor and development. Every article put up must be absolutely and rapidly sold by an energetic auctioneer, to enable parties to decide whether or not to bid without delay. The Steamer Magenta will leave Barclay street, New York City, at 7 A. M., Dec. 11th, land at our wharf, and remain long enough to examine everything thoroughly. Also, at the same time and place, Dec. 12th. We do not compete with customers buying clay of us. Tickets out, 30 cents. Excursion tickets to return, 50 cents. For sale at the Astor House. Meals provided on board by giving notice at the Astor House the previous day.

Applications to manufacture machines solicited from manufacturers.

Wanted a young man of superior ability to assist in the office and out-door work of introducing our machinery, and starting tile yards in various sections.

CROSSMAN BROTHERS,

WOODBRIDGE,

MIDDLESEX CO., NEW JERSEY.

THE MAHOPAC HOUSE

For the Relief and Cure of Epileptics and Paralytics.

This Medical Institution for the treatment of Epilepsy Paralysis, and other nervous diseases, is situated on the shores of the beautiful Lake Mahopac, and in one of the healthiest locations of the State. The House is fitted up with every convenience, including gas and modern improvements, for the best comforts of the patients—and also provided with arrangements to administer the different kinds of baths, a room for gymnastic exercise, a billiard table, &c., and everything necessary to the successful treatment of the patients. Cases of Dipsomania or other nervous derangements induced by intemperance, are also admitted into the Institution. For further information address

DR. M. GONZALEZ ECHEVERRIA, Medical Superintendent, Lake Mahopac, Putnam Co., N. Y.

Duff's Mercantile College of Pittsburgh, Pa.

Incorporated by Legislative Charter. The only College of the kind in America, in which the theory and practice of Merchants, Manufacturers, National Bank, Private Bankers and Steamers accounts are perfected and taught by experienced business accountants, upon principles sanctioned by business men for twenty-seven years. Embodied in DUFF'S BOOK-KEEPING, published by Harper & Brothers, New York. A large double quarto, 16 page descriptive circular is mailed free by P. DUFF & SON, Principals.

To Agricultural Societies.

Diplomas for prizes, of beautiful and appropriate designs, plain or in colors, can be had in any quantities of "THE MAJOR & KNAPP Engraving, Lith. & Co., 71 Broadway, New York.

"DOHOREGAN MANOR."

The estate of the late CHARLES CARROLL, of Carrollton. We have for sale as Agents, the Farms of said estate, for many years held by tenantry. They are in area from 100 to 300 acres; will be sold at from \$25 to \$75 per acre, and on very favorable terms. The well-known fertility and healthfulness of this estate, its access by Turnpike and Railroad from Baltimore, 16 miles distant, render location there very desirable. Address for particulars R. W. TEMPLEMAN & CO., Baltimore, Maryland.

ORANGE ORCHARDS AND TIMBER TRACT.

For sale a magnificent Tract on the St. Johns River, East Florida. Healthy, beautiful, and accessible. One of the finest Timber Tracts in the South, and containing hundreds of natural Orange Trees, and with every thing else in climate, soil, and position required for the highest success in that culture. The most safe, easy, agreeable, and profitable crop in the world. Address H. R. DAVIS, "AGRICULTURIST" Office, New York.

FRANKLIN TRACT.—20,000 acres on railroad, New Jersey.—25 miles south of Philadelphia, good soil, mild, healthy climate. Low prices; in lots to suit buyers. Some improved farms, Map and full information sent free. Address MORRIS & CO., Newfield, Gloucester Co., N. J.

10, 20, or 34-ACRE FRUIT FARM FOR Sale. \$2,200, \$6,500, \$9,000. P. SUTTON, Beverly, N. J.

The most economical Crate and Basket in use. Neat, strong, compact, and well ventilated.

Agents wanted in all the fruit growing districts. For sale, the right to manufacture for the Western and Southern States. CIRCULARS SENT FREE.

1,000 POUNDS FRESH PEAR, APPLE, CHERRY, QUINCE, and Mahaleb Seed. Also stocks of all kinds. All at low rates. Agents wanted. Catalogues now ready. 500,000 true Cape Cod Crabapple Plants for upland or meadow culture. True American Scarlet Maple Seedlings, 2 years, \$2.00 per 100; \$15 per 1,000. 500,000 papers Flower and Garden seeds, new growth, to the trade. B. M. WATSON, Old Colony Nurseries and Seed Establishment, Plymouth, Mass.

CLARKE!—The best hardy RASPBERRY, much better than the Philadelphia, \$50 per 100. Sent post-paid by mail on receipt of \$5. Also, Wilson's Early and Kittatinny Blackberries, and other small fruits. MAHLON MOON, Morrisville, Bucks Co., Pa.

"Earl of Sefton" Pigs for Sale.

Bred from stock imported by General Daniel Tyler, in 1855, and warranted pure. Also, "Seftons" crossed with pure "Chester Whites," showing great improvement on the "Chester White" breed. The author of "My Farm of Edgewood," in his "Rural Studies" recently published, calls the Seftons a "trim, sound, long-bodied breed—easy keepers, and giving, with proper care, delicious rasher-bacon." For further information apply personally or by letter to WILLIAM PARKER, Red Bank, Monmouth Co., N. J.

Premium CHESTER White Pigs,

Bred and for sale by GEO. B. HICKMAN, West Chester Chester Co., Pa. Send for Circular and Price List.

PIGS.—2 pairs of Suffolk pigs, crossed upon a Westchester mother of the purest stock. Will be sent as requested. Also, 2 hour pigs of same stock. Address GEO. G. SICKLES, Box 796, New York Post Office.

CREVECEUR, Black Spanish, Gold and Silver Hamburg, White and Grey Dorking, Sebright fowls, Ronen Ducks from imported stock. Also White Leghorn. The entire stock for sale including the imported fowls. Exhibition birds. BENJ. HAINES, Elizabeth, N. J.

SEND STAMP for 16 Pages Description of a great variety of the finest Thoroughbred Imported Animals and Fowls in America. L. B. SILVER, Salem, Ohio.

Poultry Exhibition.

The American Poultry Society will hold their first Annual Exhibition in New York City, during the first week in December. For Circulars, Premium Lists, etc., address

A. M. HALSTED, Corresponding Sec'y, 68 Pearl-st., New York.

FANCY POULTRY FOR SALE.—Grey Dorkings and Brahmas at \$4 per pair, or \$6 per trio. Silver-laced Sebright Bantams and Black Spanish Cocks at \$2 each. Address E. N. BISSELL, Richville, Vermont.

FOR SALE.—ALDERNEY HEIFER CALF, Thoroughbred. Address JOHN BENNETT, Sunman, Ripley Co., Ind.

Thoroughbred Premium Chester

White Pigs.

Progeny of Hogs that have taken State and United States Premiums. For sale singly or in Pairs (not akin), of any age. Carefully boxed and shipped by Express to any part of the United States. Their safe arrival insured.

For Circulars and Prices, address

N. P. BOYER & CO., Gun Tree, Chester Co., Pa.

GRAPE VINES at IONA.

My stock comprises all of the leading kinds, including Ives' Seedling, but principally consists of

IONA, ISRAELLA and DELAWARE.

The performance of the Iona and Israella generally throughout all of the vine region of the country, leaves no doubt in the minds of those best informed, that upon these now rests chiefly the prospect of the eminent success of grape culture in America.

Attention to the record of the Iona during the past four years will be instructive to all who desire to plant vines for any purpose throughout the whole vine-growing region of the country. (See statement of its performance, page 424.)

My stock of these kinds is very large, and of surpassing quality. My unequalled facilities and the result of the past years warrant the belief that I can make more advantageous terms to buyers than can be done by any other propagator. Price List sent on application with stamp.

Prices for best vines for Garden or Vineyard, very greatly reduced, and lower grades still more so: See new price-list and pamphlet.

C. W. GRANT,

IONA, near Peekskill, Westchester Co., N. Y.

BOOKS FOR WINTER EVENINGS.

GOOD BOOKS FOR FARMERS AND OTHERS,

PUBLISHED BY

ORANGE JUDD & CO.,

245 Broadway, New York.

Improve the long Winter Evenings by reading the new Books for the Farm, Garden, and Household.

Either of the Books mentioned in the following list will be sent, post-paid, on receipt of the price.

A VALUABLE HOME LIBRARY.

BACK VOLUMES

OF THE

AMERICAN AGRICULTURIST.

The publishers of the *American Agriculturist*, having preserved the electrotype plates of the back volumes of that paper, from the Sixteenth to the Twenty-sixth Volume complete, can supply any or all of these as may be desired. These volumes contain more varied and interesting information on all matters pertaining to the Farm, Garden, and Household, than can be obtained in books, costing three times as much money. They are profusely illustrated with the best of engravings, and in addition to the large amount of instructive reading matter for the older members of the Household, they contain a Special Department for the Boys and Girls. They, therefore, constitute in themselves a

Most valuable Library for the Farmer's Family or for any other Home.

The price of these volumes, unbound, is \$1.50 each, at the office, or \$1.75, if sent by mail, as they must be post-paid. The price of the same volumes, in neat cloth binding, with gilt title on the back, is \$2.00, at the office, or \$2.50, if sent by mail.

Address, ORANGE JUDD & CO., Publishers, 245 Broadway, New York City.

(Business Notices \$2.50 per Agate Line of Space.)

ESTABLISHED 1861.

THE GREAT AMERICAN TEA COMPANY

HAVE JUST RECEIVED
TWO FULL CARGOES
OF THE
FINEST NEW CROP TEAS.

22,000 HALF CHESTS by ship *Golden State*.
12,000 HALF CHESTS by ship *George Shotton*.

In addition to these large cargoes of Black and Japan Teas, the Company are constantly receiving large invoices of the finest quality of Green Teas from the Moynne district of China, which are unrivaled for fineness and delicacy of flavor.

To give our readers an idea of the profits which have been made in the Tea trade, we will start with the American houses, leaving out of the account entirely the profits of the Chinese factors.

1st. The American house in China or Japan makes large profits on their sales or shipments—and some of the richest retired merchants in the country have made their immense fortunes through their houses in China.

2d. The Banker makes large profits upon the foreign exchange used in the purchase of Teas.

3d. The Importer makes a profit of 30 to 50 per cent. in many cases.

4th. On its arrival here it is sold by the cargo, and the Purchaser sells it to the Speculator in invoices of 1000 to 2000 packages, at an average profit of about 10 per cent.

5th. The Speculator sells it to the Wholesale Tea Dealer in lines at a profit of 10 to 15 per cent.

6th. The Wholesale Tea Dealer sells it to the Wholesale Grocer in lots to suit his trade, at a profit of about 10 per cent.

7th. The Wholesale Grocer sells it to the Retail Dealer at a profit of 15 to 25 per cent.

8th. The Retailer sells it to the Consumer for ALL THE PROFIT HE CAN GET.

When you have added to these eight profits as many brokerages, cartages, storages, cooperages and wastes, and add the original cost of the Tea, it will be perceived what the consumer has to pay. And now we propose to show why we can sell so very much lower than other dealers.

We propose to do away with all these various profits and brokerages, cartages, storages, cooperages and wastes, with the exception of a small commission paid for purchasing to our correspondents in China and Japan, one cartage, and a small profit to ourselves—which, on our large sales, will amply pay us.

By our system of supplying Clubs throughout the country, consumers in all parts of the United States can receive their Teas at the same price (with the small additional expense of transportation), as though they bought them at our warehouses in this city.

Some parties inquire of us how they shall proceed to get up a Club. The answer is simply this: Let each person wishing to join in a Club, say how much tea or coffee he wants, and select the kind and price from our Price List, as published in the paper or in our circulars. Write the names, kinds, and amounts plainly on the list as seen in the Club Order published below, and when the Club is complete send it to us by mail, and we will put each party's goods in separate packages, and mark the name upon them, with the cost, so there need be no confusion in their distribution—each party getting exactly what he orders, and no more. The cost of transportation the members can divide equitably among themselves.

Parties sending Club or other orders for less than thirty dollars had better send Post-office Drafts or money with their orders, to save the expense of collections by express; but larger orders we will forward by express, to collect on delivery.

Hereafter we will send a complimentary package to the party getting up the Club. Our profits are small, but we will be as liberal as we can afford. We send no complimentary package for Clubs less than \$30.

Parties getting their Teas of us may confidently rely upon getting them pure and fresh, as they come direct from the Custom House stores to our Warehouses.

We warrant all the goods we sell to give entire satisfaction. If they are not satisfactory, they can be returned at our expense within 30 days, and have the money refunded.

The Company have selected the following kinds from their stock, which they recommend to meet the wants of clubs. They are sold at cargo prices, the same as the Company sell them in New York, as the list of prices will show.

PRICE LIST OF TEAS:

OOLONG (Black), 70c., 80c., 90c., best \$1 1/2 lb.
MIXED, (Green and Black), 70c., 80c., 90c., best \$1 per lb.
ENGLISH BREAKFAST (Black), 80c., 90c., \$1, \$1.10, best \$1.20 per pound.
IMPERIAL (Green), 80c., 90c., \$1, \$1.10, best \$1.25 per pound.

YOUNG HYSON (Green), 80c., 90c., \$1, \$1.10, best \$1.25 per pound.
UNCOLORED JAPAN, 90c., \$1, \$1.10, best \$1.25 per pound.
GUNPOWDER, (Green), \$1.25, best \$1.50 per pound.

COFFEES ROASTED AND GROUND DAILY.

GROUND COFFEE, 20c., 25c., 30c., 35c., best 40c. per pound.
Hotels, Saloons, Boarding-house keepers, and Families who use large quantities of Coffee, can economize in that article by using our FRENCH BREAKFAST AND DINNER COFFEE, which we sell at the low price of 30c. per pound, and warrant to give perfect satisfaction.

Consumers can save from 50c. to \$1 per pound by purchasing their Teas of the

GREAT AMERICAN TEA COMPANY,

Nos. 31 and 33 VESEY STREET.

Post-Office Box, 5643, New York City.

EVIDENCE AFTER A YEAR'S TRIAL.

Treasury Department,

Fourth Auditor's Office, Washington, Dec. 1, 1867.

Inclosed herewith I send you our regular list for December. It is now twelve months since we began the use of your Teas and Coffees, and I am pleased in being able to say that the satisfaction derived from the use of said articles by the members of this club, instead of being confined to individual instances, is universal and, I think I may safely say, without exception. Thanking you for the many favors received at your hands, I am, sirs, very respectfully, your obedient servant,

L. CASS CARPENTER.

Saxoville, Mass., May 6th, 1867.

The Great American Tea Company,

31 and 33 Vesey Street, New York.

Gents:—The order I sent you on 23d April for Teas came safe to hand on the 1st May, and the amount, \$9.15 was forwarded by M. U. Express. Every one seems delighted with the quality of your Teas. The information spread like a prairie on fire, from house to house, that Teas of excellent quality and delicious flavor were to be had for \$1, and \$1.25 per lb., as the enclosed order speaks more in praise of your teas than I am capable of, knowing that only fourteen days has elapsed between the first order and the second.

Many thanks for the complimentary package, and you will please forward this my second order for \$9.20 soon as convenient.

I remain, yours respectfully,

JOHN REMINGWAY,

Saxoville, Mass.

CLUB ORDER.

Edwards, St. Lawrence Co., N. Y.,
June 3, 1867.

THE GREAT AMERICAN TEA COMPANY,

31 and 33 Vesey Street, New York.

DEAR SIR: I herewith send you another order for Tea. The last was duly received, and gives general satisfaction. As long as you send us such good Tea, you may expect a continuation of our patronage. As a further evidence that the subscribers were satisfied, you will observe that I send you the names of all those that sent before who were nearly out of Tea, with a large addition of new subscribers. Accept my thanks for the complimentary package. Ship this as the other, and oblige,

Your obt servant,

DAVID C. MCKEE.

N. B.—All villages and towns where a large number reside, by Clubbing together, can reduce the cost of their Teas and Coffees about one-third (beside the Express charges,) by sending directly to "The Great American Tea Company."

BEWARE of all concerns that advertise themselves as branches of our Establishment, or copy our name either wholly or in part, as they are *bogus* or *imitations*. We have no branches, and do not, in any case, authorize the use of our name.

Post-Office orders and Drafts, make payable to the order of "Great American Tea Company." Direct letters and orders to the (as below, no more, no less).

Great American Tea Company,

Nos. 31 and 33 VESEY-ST.,

Post-Office Box, 5643, New York City.

NOTICES OF THE PRESS.

From the *American Agriculturist*.

THE GREAT AMERICAN TEA COMPANY.—TO QUERIES:—Before admitting their advertisement, we learned that a large number of our clerks and others had for several months been buying their Tea and Coffee from this Company, without its being known who they were, and that they had been highly pleased with their purchases, both as to quality and price, and were all recommending their friends to the same course. As we have published the advertisement for many months, and received no complaints, we conclude "there is no humbug about the establishment."

Commercial Enterprise.—Among the many things for which New York Merchants are famous, is the magnitude of their enterprises, and the far-reaching character of their ventures. The operations of the present day throw those of a few years back quite into the shade, and often equal those of a similar kind in the commercial marts of the Old World. The recent large purchases of Tea by THE GREAT AMERICAN TEA COMPANY have taken the trade by surprise, and are rather a novelty in this market. The taking up of two cargoes within a week, comprising 12,331 packages Black, and 22,849 do. Japan, for immediate consumption, at a cost of about a million and a half of dollars, indicates the extensive nature of the Company's business, and deserves a passing notice at our hands. The consumption of Tea in this Country is largely on the increase.—*Shipping and Commercial List, N. Y., May 15, 1867.*

TWO MONTHS FREE

UNTIL JANUARY FIRST.

FIGHTING AGAINST WRONG,
and for
THE GOOD, THE TRUE AND THE BEAUTIFUL.

THE VERY HIGHEST PRIZE.

The Cross of the Legion of Honor,

Was conferred on the representative of the

Grover & Baker Sewing Machines,

At the Exposition Universelle, Paris, 1867.

Thus attesting their great superiority over all other Sewing Machines. Salesrooms, 495 Broadway, New York.

Another Grand Triumph.

At the Fair of the American Institute just closed, the Florence Sewing Machine has again carried off the honors, it having been awarded the First Prize, over all competitors. This triumph following close upon the award of the Gold Medal (the highest prize) at the Fair of the Mechanics' Association at Lowell, (the great Fair of New England), in October, establishes beyond question the superiority of the Florence, as a family Sewing Machine. Send for a Circular, 505 Broadway, New York. Brooklyn Office, 431 Fulton-street.
